   1. Connect each surge protective device to the local ground bus in the terminal cabinet with wiring sized as recommended by the manufacturer.
   2. Coordinate to ensure that the 120 V AC power source/supply suppressor is also grounded to the same local ground bus as surge protective devices provided in this Section for the same system.

D. Surge Protective Devices:
   1. Install on low voltage signal or communications conductors entering the building from exterior locations, including those conductors from devices mounted on the exterior of the building.
   2. Provide AC power SPDs on microprocessor-based specialty system rack-mounted equipment.

3.9 AC POWER AND POWER SUPPLY EQUIPMENT

A. Provide power connections from existing panels to specialty equipment.

B. Components connected to power supplies shall be connected to individually fused or PTC outputs.

C. Components specified below shall be provided with battery back-up:
   1. Card access readers, reader interface devices, electric lock power supplies, and control panels.
   2. Intrusion detection system panels and components.
   3. Cellular alarm transmission back-up system.

D. Components specified below shall be connected in their respective locations to the UPS provided under this section:
   1. Equipment and devices located in security equipment racks in the Telecom Spaces and Site Camera Enclosures.
   2. Servers: Access Control System (ACS) servers, Security Communications System (SCS) servers, and Network Video Recorders (NVRs) or Video Surveillance System (VSS) servers and storage media.
   3. Workstations: ACS Workstations, SCS Workstations, and VSS Workstations.
   4. Storage: Direct Attached Storage (DAS) used for ACS, SCS, and VSS storage.
   5. Communications components: rack mounted fiber optic transmission system components and security network (S-LAN) switches.

3.10 MISCELLANEOUS EQUIPMENT

A. Permanently identify with metal tags.

B. Turn over keys, along with manufacturer's certificate stating the quantity of each key made, to the Owner and obtain a signed receipt acknowledging receipt of same.

3.11 OPERATION AND MAINTENANCE DOCUMENTATION PACKAGE

A. These operation and maintenance manual requirements supplement operation and maintenance manual documentation requirements of other Sections of these specifications.

B. Operation and maintenance documentation, in hardback 3-ring loose-leaf binders except full size drawings and CDs, shall cover the specialty systems.

C. The operation and maintenance documentation package shall be submitted as one comprehensive package to the Owner 3 weeks before systems acceptance testing, and shall be updated, revised and completed during, and at completion of, performance verification.

D. Documentation shall be type written and shall contain, at a minimum, the following information.
   1. Contact Information: Contractor's emergency contact information during the warranty period.
   2. Operating Manual: Provide manufacturers' supplied user, programming, maintenance, and trouble-shooting manuals.
   3. Copies of software configuration files and/or programming files, as applicable, on USB drives.
   4. Test Reports and Certifications.
   5. Construction Documents:
      a. As-built drawings (shop drawings updated to reflect field installed conditions). This should include cable numbers, controller designations, wiring diagrams …)
      b. Approved submittals.

E. An electronic copy of Construction Documents shall be included on CD-ROM within each operation and maintenance binder. Close-out materials provided in electronic format shall include As-built drawings, approved submittals, warranty certificates, and test reports.

F. Submit a receipt signed by the Owner acknowledging receipt of the operation and maintenance documentation package.

G. Provide metal cabinets mounted on the wall of the Add Room Name to house the operation and maintenance documentation package. Cabinets shall be approximately 12" wide x 18" high x 6" deep constructed of 18-gauge sheet metal with hinged door with latch. Cabinets shall be painted black and shall be labeled with 0.5" stenciled letters.

3.12 RECORD DRAWINGS

A. Refer to Section 017839, Project Record Documents.

B. A record of field and as-installed conditions shall be maintained at the site, shall be kept current throughout the Project, and shall be used in the preparation of the final record drawings. Field and as-installed conditions shall be recorded on design drawings and shall be marked to indicate addenda, change orders, field changes and selections made during construction.

C. Concurrent with the Substantial Completion, submit 2 sets of prints indicating field and as-installed conditions of wiring and equipment, and incorporating changes made during construction.

D. Upon completion of the Project, submit marked-up design drawings indicating field and as-installed conditions, and shop drawings incorporating changes made during construction for wiring and equipment. Submit the following:
   1. 2 set(s) of bound prints.
   2. Full size PDFs on CD(s).

3.13 MAINTENANCE

A. Equipment operated prior to the date of Substantial Completion shall be maintained in accordance with manufacturers' recommendations.

3.14 INSTRUCTION OF OPERATING PERSONNEL

A. Conduct formal instruction sessions for operating personnel. Conduct 2 similar sessions. The first session shall be conducted at the time of start-up and check-out, and the second session shall be approximately 2 months later. Sessions shall be conducted at the site.

B. Prepare and submit a syllabus describing an overview of the program, describing how the program will be conducted, when and where meetings are to be held, names and company affiliations of lecturers, description of contents and outline for each lecture, and recommended reference material and outside reading. Obtain direction from the Owner on which operating personnel shall be instructed in each system.

C. Sessions shall include:
   1. General familiarization and operating procedures for each specialty systems installation.
   2. Routine maintenance procedures for equipment.
   3. User level programming of programmable systems.

D. Factory-trained technicians shall give operating and maintenance instructions on the specialty systems and equipment.

E. Provide DVD format video of training sessions and a complete record copy of training materials, handouts, and other printed materials used in each training session. Obtain receipt from the Owner acknowledging completion of each item of instruction.

END OF SECTION

SECTION 280513 - CONDUCTORS AND CABLES FOR ELECTRONIC SECURITY

PART 1 GENERAL

1.1 SUMMARY DESCRIPTION

A. This Section covers security conductors and cables.

B. Cable for the interfacing of power and grounding provisions with work provided under these Sections is covered under these Sections.

1.2 RELATED REQUIREMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

B. 271116 - Communications Cabinets, Racks, Frames, And Enclosures.

C. 271323 - Communications Optical Fiber Backbone Cabling.

D. 271513 - Communications Copper Horizontal Cabling.

E. 280500 - Common Work Results for Electronic Security Systems.

F. 280528 - Pathways for Electronic Security.

G. 280800 - Commissioning of Electronic Security.

H. 281000 - Access Control.

I. 281353 - Security IP Network Compatible Intercom Systems.

J. 282000 - Video Surveillance.

K. 283100 - Intrusion Detection.

1.3 REFERENCE STANDARDS

1.4 DEFINITIONS

A. BICSI: Building Industry Consulting Service International.

B. Cross-Connect: A facility enabling the termination of cable elements and their interconnection or cross-connection.

C. RCDD: Registered Communications Distribution Designer.

1.5 SUBMITTALS

A. Action Submittals:
   1. See Section 280500 - Common Work Results for Electronic Security Systems for additional requirements.
   2. Product Data: For each type of product.

B. Information Submittals:
   1. Qualification Data: For installer, installation supervisor, and field inspector.
   2. Source quality-control reports.
   3. Field quality-control reports.

C. Closeout Submittals:
   1. Operations and Maintenance Documentation Package: As defined in Section 280500 - Common Work Results for Electronic Security Systems.

1.6 QUALITY ASSURANCE

A. Installer Qualifications:
   1. Installation Supervision: Installation shall be under the direct supervision of a Technician, who shall be present at all times when Work of this Section is performed at Project site.

PART 2 PRODUCTS

2.1 CABLES, CONNECTORS AND MISCELLANEOUS EQUIPMENT

A. General:
   1. Cable construction, insulation, and jacket shall comply with the requirements for the application for which it is used. Provide type CM or CMG for general use; type CMP for plenum use; and CMR for riser use.
   2. Cables installed in plenum spaces shall be plenum-rated. Plenum-rated cable shall comply with NFPA 262.
   3. Cables and conductors installed in enclosures or raceways underground or in slabs on grade shall be UL listed for use in wet locations.
   4. Provide all labor, equipment, materials, and supervision to install, calibrate, adjust, document, and test the total system as required herein and on the drawings.

B. Power and Grounding Cables:
   1. Except as otherwise specified herein, or indicated on the Drawings, grounding conductors shall be insulated. Insulation shall be rated 600 V. Conductors shall be continuous from connector to connector with no splices. Grounding connectors shall be solid bronze, compression type, designed for use intended.
   2. Power wiring for the extension of power circuits shall be #12 AWG THWN/THHN or XHHN, 600 V, rated at 194°F.

2.2 SECURITY CABLES AND CONDUCTORS

A. Alarm Cabling:
   1. Two unshielded twisted pair, #22 AWG or larger cable (sized for voltage drop) for cabling between addressable alarm or sensor devices.
   2. Unshielded 4-conductor, #20 AWG or larger cable (sized for voltage drop) for cabling to motion detection devices.
   3. Unshielded 2-conductor, #20 AWG or larger cable (sized for voltage drop) for cabling to door contacts.
   4. Manufacturer: Alpha, Belden, CommScope, West Penn, and Windy City Wire.

B. RS-485 Cables:
   1. Two unshielded twisted pairs, #22 AWG, stranded (7x30) tinned copper conductors with overall 100% foil shield.
   2. Flame resistance: nonplenum-rated cable shall comply with UL 1581.
   3. Manufacturer: Alpha, Belden, CommScope, and West Penn.

C. Control Cables:
   1. Multiconductor, color-coded type, #22 AWG or larger conductors (sized for voltage drop), stranded tinned copper for energy limited control circuits. Multiconductor, color-coded type, #14 AWG or larger conductors (sized for voltage drop), stranded tinned copper for other control circuits.
   2. Flame resistance: nonplenum-rated cable shall comply with UL 1581.

D. Access Control Composite Cable:
   1. Four separately jacketed cables for Lock Power, Card Reader, Door Contacts, REX under one yellow plenum rated jacket.
      a. Lock Power: #18 AWG 4-Conductor – stranded bare copper, PVC insulation with a Plenum jacket.
      b. Card Reader: One pair #22 AWG shielded, low-capacity, tinned copper, RS-485, 120 ohms: plus #18 AWG two conductor non-shielded, bare copper PVC insulation with a Plenum jacket..
      c. Door Contacts: #22 AWG 2-Conductor - stranded bare copper, PVC insulation with a Plenum jacket.
      d. REX/PIR: #22 AWG 2-Conductor - stranded bare copper, PVC insulation with a Plenum jacket.
      e. Manufacturer: Windy City Wire, or equal by Belden or West Penn.

2.3 PATCH PANELS, CONNECTORS AND MISCELLANEOUS EQUIPMENT

A. Provide network patch panels, fiber optic cabinets, patch cords, and connectors in accordance with 271513 - Communications Copper Horizontal Cabling and 271523 - Communications Optical Fiber Horizontal Cabling.

PART 3 EXECUTION

3.1 CONDUCTORS AND CABLES

A. General:
   1. Cables and conductors installed in enclosures or raceways underground or in slabs on grade shall be UL listed for use in wet locations.
   2. Install plenum rated cables where cables are not installed in conduits or enclosed wireways.
   3. As a general practice, power cables, and high-level signal cables shall be run on the left side of an equipment rack as viewed from the rear. Other cables shall be run on the right side of an equipment rack, as viewed from the rear.
   4. No cable shall be installed with a bend radius less than that recommended by the cable manufacturer.
   5. Unused cables shall be dressed at each end in heat-shrink tubing and marked as unused.
   6. Heat-shrink tubing shall be used to insulate and dress the ends of outdoor wires and cables, including a separate tube for the ground or drain wire.
   7. No cables shall be wired with a polarity reversal between connectors, at either end. Special care shall be taken when wiring to ensure that constant polarity is maintained.
   8. Remove abandoned cable and dispose of it.

3.2 IDENTIFICATION

A. Identification shall consist of upper-case letters.

B. Cables, regardless of length, shall be marked with preprinted, wrap-around number or letter cable markers at both ends. Markers shall be permanently affixed with heat-shrink tubing. There shall be no unmarked cables at any place in the system. Marking codes used on cables shall be indicated on the record drawings.

3.3 FIELD QUALITY CONTROL:

A. Tests and Inspections:
   1. Provide testing of cable testing and inspections is accordance with 271513 - Communications Copper Horizontal Cabling and 271523 - Communications Optical Fiber Horizontal Cabling.

END OF SECTION

SECTION 280528 - PATHWAYS FOR ELECTRONIC SECURITY

PART 1 GENERAL

1.1 SUMMARY DESCRIPTION

A. This Section covers the Security Pathways (security infrastructure such as conduit, back boxes, etc.).

1.2 RELATED REQUIREMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

B. 280500 - Common Work Results for Electronic Security Systems.

C. 280513 - Conductors and Cables for Electronic Security.

D. 280800 - Commissioning of Electronic Security.

E. 281000 - Access Control.

F. 281353 - Security IP Network Compatible Intercom Systems.

G. 283100 - Intrusion Detection.

1.3 REFERENCE STANDARDS

A. ASTM E84 - Standard Test Method for Surface Burning Characteristics of Building Materials; 2026.

B. ASTM E119 - Standard Test Methods for Fire Tests of Building Construction and Materials; 2024.

C. ASTM E814 - Standard Test Method for Fire Tests of Penetration Firestop Systems; 2024.

D. UL 723 - Standard for Test for Surface Burning Characteristics of Building Materials; Current Edition, Including All Revisions.

1.4 SUBMITTALS

A. Action Submittals: None.

B. Informational Submittals: As defined in Section 280500 - Common Work Results for Electronic Security Systems.

C. Closeout Submittals: None.

PART 2 PRODUCTS

2.1 PATHWAYS IN ACCORDANCE WITH DIVISION 26

A. Conduit shall be in accordance with Section 260533.13 - Conduit for Electrical Systems.

B. Boxes shall be in accordance with Section 260533.16 - Boxes for Electrical Systems.

C. J-Hooks:
   1. J-hooks shall be designed to support a minimum of 80 category 5 communications cables, shall be steel, UL listed for a maximum static load of 50 lbs, and shall be rated for use in plenum environments.

2.2 SLEEVES

A. Wall sleeves shall be galvanized rigid metal conduit or electrical metallic tubing.

B. For floor slabs above grade, plastic core form block-outs shall be used.

2.3 PENETRATION SEALS

A. Firestops:
   1. Firestops shall consist of an asbestos-free fill material, forming/backing/damming materials, and accessories needed to complete a UL classified through-penetration firestopping system. Fill material shall not slump or sag and shall be the required thickness in the fully cured state.
   2. Firestops shall be designed to seal through-penetrations against flame, heat, smoke, and water in compliance with ASTM E84, ASTM E119, ASTM E814, and UL 723.UL 723
   3. Firestops shall be specifically designed and rated for the individual application, including movement, materials, moisture, penetrating item material, and fire and smoke ratings of the penetrated construction.
   4. Manufacturer: 3M, GE, Flammadur, Hilti, Nelson, Rectorseal, or Thomas & Betts.

B. Expansion Seals:
   1. Waterproof, modular, mechanical expansion type consisting of synthetic rubber grommets or interlocking links shaped to continuously fill the annular space between the penetrating item and the opening. Sizing of links and sleeve shall be determined by the manufacturer.
   2. Manufacturer: Calpico Pipe Linx, Metraflex MetraSeal, or Thunderline Link Seal.

C. Seal Assemblies:
   1. Seal assemblies shall consist of a frame, compression mechanism, and insert modules. Assemblies shall be waterproof and shall be designed to allow easy addition or deletion of penetrating items.
   2. Seal assemblies for multicable penetrations of fire- and smoke-rated construction shall comply with the requirements of firestops as specified herein.
   3. Basis of Design: Nelson Multi-Plug.

2.4 HIGH TRAFFIC SLEEVES

A. Rated for walls and above grade floor slabs.

B. A self-contained firestop system that automatically adjusts to cable load.

C. UL classified for use in wall and floor systems rated for up to 3 hours.

D. Manufacturer: Hilti Speed-Sleeve or Specified Technologies EZ-Path.

2.5 UNDERGROUND DUCTS, MANHOLES, AND HANDHOLES

A. Underground ducts, manholes, and handholes shall be in accordance with 270543 - Underground Ducts and Raceways for Communications Systems.

PART 3 EXECUTION

3.1 GENERAL

A. Equipment, except portable equipment, shall be held in place. This shall include equipment, enclosures, components, and cables. Fastenings and supports shall support their loads with a safety factor of at least 3 unless otherwise specified herein.

B. Remove abandoned conduit, back boxes, and other raceways and dispose of them.

C. Patch, paint, and otherwise restore to original condition walls, floors, and ceilings cut, modified, or damaged in the process of implementing this Work.

3.2 PATHWAYS IN ACCORDANCE WITH DIVISION 26

A. General:
   1. Install raceways and boxes in accordance with 260533.13 - Conduit for Electrical Systems, 260533.16 - Boxes for Electrical Systems, and
   2. Install wiring or cables in raceways where wiring or cables are installed underground, in concrete, and concealed in walls or in inaccessible ceilings, unless otherwise specified herein.
   3. Install wiring or cables in raceways where wiring or cables are otherwise exposed, including open ceiling spaces.

B. J-Hooks:
   1. Install maximum 5' on center.
   2. Attach J-hooks to the structure as recommended by the manufacturer, except that J-hooks shall not be installed using drop wires or ceiling support wires. J-hooks shall not be connected to ceiling supports, utilities, or equipment.

3.3 SLEEVES

A. Provide where conduits pass through elevated floor slabs if conduits are not a part of the slab pour and for future cable or conduit risers.

B. Install in raised foundations at least 2" high.

C. Provide where cables pass through walls and elevated floor slabs.

D. Wall sleeves shall extend 4" from each side of the walls.

E. Openings through slabs for busway risers shall be finished with a 4" wide x 2" high curb around the opening.

F. Sleeves shall be secured in place. Provide insulating bushings on both sides of sleeves for cables.

G. Provide ground bushings on both sides of sleeves containing separate ground conductors.

3.4 PENETRATION SEALS

A. General:
   1. Install in accordance with the manufacturer's published instructions to achieve ratings and classifications specified herein. A copy of these instructions shall be maintained and available on site.

B. Firestops:
   1. Close and firestop abandoned penetrations and penetrations through fire- and smoke-rated construction. Materials used to seal these penetrations shall continue the construction’s fire and smoke resistance ratings uninterrupted and shall maintain an effective barrier against the spread of flame, smoke, water, and hot gases.
   2. Install after installation of raceways and cable tray.

C. Expansion Seals:
   1. Install to seal single conduit or cable penetrations of walls below grade.

D. Seal Assemblies:
   1. Install to seal the penetration of walls below grade by multiple cables in the same opening.
   2. Install to seal cable penetrations _____ and as indicated on the Drawings.

3.5 HIGH TRAFFIC SLEEVES

A. Provide where cables pass through walls or elevated floor slabs within voice and data communications rooms.

B. Provide where cable trays pass through rated walls or elevated floor slabs. Install 4 sleeves at each penetration, minimum.

C. Install associated rating information decal on both sides of sleeve. Sign and date the decal.

D. Install sleeve systems with flanges and fire-rated caulk as recommended by the manufacturer.

3.6 UNDERGROUND DUCTS, MANHOLES, AND HANDHOLES

A. Underground ducts, manholes, and handholes shall be in accordance with Section 270543 - Underground Ducts and Raceways for Communications Systems.

END OF SECTION

SECTION 280533 - SECURITY NETWORK COMMUNICATIONS EQUIPMENT

PART 1 GENERAL

1.1 SUMMARY DESCRIPTION

A. This Section covers local area networks (LAN) and similar equipment necessary to support the security systems specified under other sections of Division 28.

1.2 RELATED REQUIREMENTS:

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

B. 280500 - Common Work Results for Electronic Security Systems.

C. 280513 - Conductors and Cables for Electronic Security.

D. 280528 - Pathways for Electronic Security.

E. 280800 - Commissioning of Electronic Security.

F. 281000 - Access Control.

G. 283100 - Intrusion Detection.

1.3 REFERENCE STANDARDS:

A. EIA/ECA-310 - Cabinets, Racks, Panels, and Associated Equipment; 2005e.

B. IEEE 802.1Q - IEEE Standard for Local and Metropolitan Area Networks – Bridges and Bridged Networks; 2018.

C. IEEE 802.1X - IEEE Standard for Local and Metropolitan Area Networks--Port-Based Network Access Control; 2020.

D. IEEE 802.3 - IEEE Standard for Ethernet; 2022 (Corrigendum 2024).

E. IEEE 802.11 - IEEE Standard for Information Technology--Telecommunications and Information Exchange between Systems Local and Metropolitan Area Networks--Specific Requirements Part 11: Wireless LAN Medium Access Control (MAC) and Physical Layer (PHY) Specifications; 2024, with Amendment (2025).

F. TIA-607 - Telecommunications Bonding and Grounding (Earthing) for Customer Premises; 2024e.

1.4 SUBMITTALS

A. Action Submittals:
   1. Product Data:
      a. Provide product data sheets for equipment, materials, and cables in PDF format.
   2. Shop Drawings:
      a. Include site and floor plans indicating equipment locations. Plans shall include equipment identification that corresponds to the same label on the network diagram referenced below.
      b. Provide elevations of rack-mounted equipment, showing the location of all specified electronics and include enlarged, to scale plan (top), and front views.
      c. Network diagrams indicating the connections to the internet, workstations, servers, network video recorders (NVR), and cloud managed video recorders (CMVR) IP video cameras, and other IP-enabled security components shown on the Drawings. The diagrams shall indicate proposed connections of equipment, model numbers, and designations for cables and termination points.
      d. Provide a detailed loading schedule for each security network switch and patch panel.
   3. See Section 280500 - Common Work Results for Electronic Security Systems for additional requirements.

B. Informational Submittals:
   1. As required in Section 280500 - Common Work Results for Electronic Security Systems.
   2. Resumes of key personnel that documents the qualifications required. Include certificate of training or certifications.

C. Close-out Submittals:
   1. Functional Test Reports: Provide a spreadsheet with all security network devices and major components listed in the first column by device designator (e.g., camera number) with each test parameter listed by name (or code) in the remaining columns.
   2. Operations and Maintenance Documentation Package: As defined in Section 280500 - Common Work Results for Electronic Security Systems.
   3. Instruction of Operating Personnel:
      a. The Security Systems Performance Verification Supervisor shall schedule, coordinate, assemble and deliver the documentation of the training required by this section.
      b. Obtain receipt from the Owner acknowledging completion of each item of instruction.
   4. See Section 280500 - Common Work Results for Electronic Security Systems for additional requirements.

1.5 QUALITY ASSURANCE:

A. The video surveillance system contractor, the contractor’s supervisors, and technicians shall meet the qualifications as defined in Section 280500 - Common Work Results for Electronic Security Systems.

B. Installation of the Security LAN (S-LAN) shall be under the direct supervision of a person or persons having completed, as a minimum, the factory training recommended by the network switch manufacturer, the network switch manufacturer's highest available certification program, and have

direct field experience in the installation of local area networks for a minimum of 3 projects of similar scope and size within the past 5 years.

C. The installation company shall assign a project manager with a minimum of 5 years field experience in installation of LANs and professionally certified by the switch manufacturer (such as an APDS, if Avaya switches are provided, or as a CCNP, if Cisco switches are provided). The project manager shall be assigned for the duration of the project and shall not be replaced without written approval from the Owner.

D. In addition, the installation company shall have at the minimum 2 permanently employed persons with current manufacturer's network certification in their field office directly responsible for the installation and ongoing maintenance of the Project. The office shall be located within 100 miles of the project site.

E. The installation company shall be a currently listed as an authorized dealer or business partner by the manufacturer of the system and shall have been listed as such for a minimum of 3 years.

F. The security LAN contractor shall engage the manufacturer for onsite professional services.

PART 2 PRODUCTS

2.1 NETWORK SWITCHES:

A. Network Switches:
1. Physical, Electrical and Reliability:
   a. Mounting: 19" EIA rack for interior rack-mounted switches.
   b. Operating power: 120 V AC 60 Hz with redundant power supply.
   c. Mean time between failures: 150,000 hours minimum at 122º F.
2. Configuration:
   a. Ports as required to support the topology indicated on the Drawings, but no less than 4 RJ45 ports or 2 Gigabit SFP fiber ports per switch.
   b. Provide sufficient IEEE 802.3 compliant PoE to serve the PoE devices provided.
   c. Uplink media type: multimode or single-mode fiber.
3. Minimum Switch Capacities:
   a. Switching fabric: 20 Gbps.
   b. Forwarding rate (packets per second per box): 4.76 Mpps.
   c. MAC addresses supported: 4000.
4. Features:
   a. Auto-sensing (10/100/1000 Mbps) and auto-negotiation (full or half duplex and flow control).
   b. Port mirroring.
   c. Rate limiting on a per port basis.
   d. Link aggregation control protocol (LACP) between switches.
   e. Security:
      1) Port security requiring the port to validate the MAC address against a known list of MAC addresses.

2) Terminal access controller access control system (TACACS).
3) Remote authentication dial in user service (RADIUS) protocol as defined in IEEE 802.1X (AMD 802.1wck-2018).

f. Password protected with multiple user levels of access.
g. Web browser-based administration, secured with HTTPS and command line interface (CLI) via SSH.

5. Protocols Supported:
   a. Protocol support: IEEE 802.3, 100Base-TX, and 1000Base-T.
   b. Simple network management protocol (SNMP) with management information base (MIB) support, as well as support for SNMP v1, v2, and v3 commands.
   c. Remote network monitoring (RMON I) for history, statistics, alarm, and events.
   d. IGMP snooping (multicast filtering).
   e. Domain name service (DNS).
   f. Network time protocol (NTP).
   g. Dynamic host configuration protocol (DHCP).
   h. Fault recovery in less than 0.5 s via rapid spanning tree protocol (RSTP) as defined in IEEE 802.1D-2004 (R2011).
   i. Differentiated service (context-aware service).
   j. Quality of service (QoS) as defined in IEEE 802.1D-2004 (R2011).
   k. Virtual local area network (VLAN) trunking as defined in IEEE ISO IEC 8802.1Q-2019/AMD 7
6. Manufacturer: Allied Telesis, Avaya, Cisco, Dell, Dynics, Extreme, and HPE Aruba .

B. Managed Ethernet Fiber Aggregation Switches:
1. Physical, Electrical and Reliability:
   a. Mounting: 19" EIA rack for interior rack-mounted switches.
   b. Operating power: 100-240VAC (on the front) or 24/48VDC, 60 Hz.
2. Configuration:
   a. Connectors: quanitiy to support the topology indicated on the Drawings, with no less than two (2) 1G/10G SFP+ slots.
   b. Uplink media type: multimode or single-mode fiber.
3. Technology: Store-and-Forward switching architecture.
4. Features:
   a. Supports IPv6.
   b. Support Jumbo Frame up to 9K bytes.
   c. Authentication – RADIUS, TACACS+.
   d. IEEE 802.1X: RADIUS authentication, authorization and accounting, MD5 hash, guest VLAN, single/multiple host mode and single/multiple sessions.
   e. DHCP Relay, DHCP Snooping.
   f. L2/L3/L4 ACLs Support MAC, VLAN ID or IP, protocol, port, DSCP/IP precedence/TCP.UDP, Ether Type, ICMP, TCP flag.
   g. LLDP (Link Layer Discovery Protocol).
   h. IEEE 802.3az Energy Efficiency.
   i. IP Source Guard, Port Security.

j. Syslog.

5. IEEE 802.3 Standards Supported:
   a. IEEE 802.3
   b. IEEE 802.3u
   c. IEEE 802.3z
   d. IEEE 802.3ae
   e. IEEE 802.3x
   f. IEEE 802.3ad
   g. IEEE 802.1D
   h. IEEE 802.1w
   i. IEEE 802.1s
   j. IEEE 802.1Q
   k. IEEE 802.1p
   l. IEEE 802.1ad
   m. IEEE 802.1AB
   n. IEEE 802.1X
   o. IEEE 802.3az
6. Basis of Design: Lantronics SM12DP2XA-OZ.

C. Hardened Network Switches:
   1. Physical, Electrical and Reliability:
      a. Mounting: 19" EIA rack for interior rack-mounted switches.
      b. Operating power: 120 V AC 60 Hz with redundant power supply.
      c. Mean time between failures: 150,000 hours minimum at 185º F.
      d. Resiliency: switches mounted in exterior enclosures shall be IEEE 1613a-2011 compliant (environmentally hardened) to operate under extremes in temperature, vibration, and humidity.
   2. Configuration:
      a. Ports as required to support the configuration indicated on the Drawings, but no less than 4 RJ45 ports and 2 duplex Gigabit SFP fiber ports (2 send and 2 receive) per switch.
      b. Provide sufficient 25 W IEEE 802.3-2018/(AMD 2018) compliant PoE to serve the PoE devices provided.
      c. Uplink media type: multimode or single-mode fiber.
   3. Minimum Switch Capacities:
      a. Switching fabric: 1.6 Gbps.
      b. Forwarding rate (packets per second per box): 4.76 Mpps.
      c. VLANs per switch: 255.
   4. Features:
      a. Auto-sensing (10/100 Mbps) and auto-negotiation (full or half duplex and flow control).
      b. Port mirroring.
      c. Rate limiting on a per port basis.
      d. Port trunking/link aggregation control protocol (LACP) between switches.
      e. Security:

1) Port security requiring the port to validate the MAC address against a known list of MAC addresses.
2) Terminal access controller access control system (TACACS).
3) Remote authentication dial in user service (RADIUS) protocol as defined in IEEE 802.1X-2018 (AMD 802.1xck-2018).

f. Password protected with multiple user levels of access.
g. Web browser-based administration, secured with HTTPS and command line interface (CLI).

5. Protocols Supported:
a. Protocol support: IEEE 802.3-2018/(AMD 2018) 10Base-T, 100Base-TX, and 1000Base-T.
b. Simple network management protocol (SNMP) with management information base (MIB) support, as well as support for SNMP v1, v2, and v3 commands.
c. Remote network monitoring (RMON I) for history, statistics, alarm, and events.
d. IGMP snooping (multicast filtering).
e. Domain name service (DNS).
f. Simple network time protocol (SNTP).
g. Dynamic host configuration protocol (DHCP), and DHCP client.
h. Fault recovery in less than 0.5 s via rapid spanning tree protocol (RSTP) as defined in IEEE 802.1D-2004 (R2011).
i. Differentiated service (context-aware service).
j. Quality of service (QoS) as defined in IEEE 802.1D-2004 (R2011).
k. Virtual local area network (VLAN) trunking as defined in IEEE ISO IEC 8802.1Q-2019/(AMD 7)

6. Switch Administration:
a. Multicast routing by port.
b. Per port broadcast storm control.

7. Manufacturer: Comnet Environmentally Hardened Series, GarrettCom Magnum, N-TRON, or Transition Networks.

D. Self-Contained Hardened Switches in Outdoor Enclosures:
1. Physical, Electrical and Reliability:
a. Enclosure: NEMA 4/4X, IP66 rated.
b. Pole mount kit: accommodates 2”- 8” diameter or 5” square poles.
c. Battery Back-up: four 12VDC/7AH batteries and 2 rack unit rack mount battery enclosure to accommodates four 12VDC/7AH sealed lead acid or gel type batteries.
d. Power output: 120 W total power, 4 PoE+ IEEE 802.3 (30 W) ports or 2 Hi-PoE (60 W) ports.
e. Operating temperature: -40º F to 113º F (-40º C to 85º C).
f. Listings: UL60950-1-2007 (Information Technology Equipment) and UL60950-22-2017 (Information Technology Equipment to be installed Outdoors).

2. Configuration:
a. Ethernet ports: four 10/100/1000 ports (RJ45 connectivity), auto-crossover, half/full duplex, auto negotiation.

b. Fiber ports: two gigabit SFP ports.
c. Uplink media type: multimode or single-mode fiber.

3. Basis of Design: _____

2.2 PERIPHERAL EQUIPMENT:

A. Fire Wall:
1. Physical, Electrical and Reliability:
a. Mounting: 19" EIA/ECA-310 rack for interior rack-mounted switches.
b. Operating power: 120 V AC 60 Hz, with redundant power supply.
c. Mean time between failures: 150,000 hours minimum at 185º F.
d. Resiliency: switches mounted in exterior enclosures shall be IEEE 1613a-2011 compliant (environmentally hardened) to operate under extremes in temperature, vibration, and humidity.
2. Throughput:
a. UTM (full scan): 631 Mbps (measured using HTTP traffic with AV, IPS, and Application Control enabled. Does not account for all security services available on the appliance.
b. Firewall (IMIX): 1.32 Gbps.
c. VPN (IMIX): 416 Mbps.
d. HTTPS (IPS enabled, full scan) 344 Mbps.
e. Antivirus: 1.15 Gbps
f. IPS (full scan): 909 Mbps.
g. Firewall (UDP 1518): 4.7 Gbps.
h. VPN (UDP 1518): 1.4 Gbps.
3. Capacities:
a. Interfaces 10/100/1000: 8.
b. I/O interfaces: 1 Serial/2 USB.
c. Concurrent connections: 500,000.
d. Concurrent connections (proxy): 200,000.
e. New connections per second: 25,000.
f. VLANs: 75.
g. TDR Host Sensors included: 50.
4. VPN:
a. VPN Tunnels - Branch Office VPN: 60.
b. VPN Tunnels - Mobile VPN: 60.
c. Site to Site VPN: IKEv2, IPSec, Policy and Route Based Tunnels, TLS hub and spoke.
d. Remote Access VPN: IKEv2, IPSec, L2TP, TLS.
5. Security Features:
a. Firewall Stateful packet inspection, TLS decryption, proxy firewall.
b. Application proxies: HTTP, HTTPS, FTP, DNS, TCP/UDP, POP3S, SMTPS, IMAPS and Explicit Proxy.
c. Threat protection: DoS attacks, fragmented & malformed packets, blended threats.
d. Filtering options: Browser Safe Search, Google for Business.

6. Visibility:
    a. Logging and notifications: WatchGuard Cloud & Dimension, Syslog, SNMP v2/v3.
    b. Reporting: WatchGuard Cloud includes over 100 pre-defined reports, executive summary and visibility tools.
7. Certifications:
    a. Security: Pending: CC, FIPS 140-2.
    b. Safety: NRTL/CB.
    c. Network IPv6 Ready Gold (routing).
    d. Hazardous substance control: WEEE, RoHS, REACH.
8. Networking:
    a. SD-WAN: Multi-wan failover, dynamic path selection, jitter/loss/latency measurement.
    b. Dynamic Routing: RIP, OSPF, BGP.
    c. High Availability: Active/passive, active/active
    d. Quality of Service: IEEE 802.1Q, DSCP, IP Precedence.
    e. Traffic Management: By policy or application.
    f. IP address assignment: Static, DHCP (server, client, relay), PPPoE, DynDNS.
    g. NAT: Static, dynamic, 1:1, IPSec traversal, policy-based.
    h. Link aggregation: IEEE 802.3ad dynamic, static, active/backup.
9. Manufacturer: WatchGuard Firebox T80 with 3-yr Basic Security Suite or equal.

B. Wireless Network Access Points:
1. RF interface: IEEE 802.11 physical layer with proprietary MAC protocol or WPA2 standard compliant mode.
2. Frequencies: 2.40 GHz to 2.4835 GHz (ISM).
3. Support data rates for IEEE 802.11.
4. Protocols:
    a. Transmission control protocol/internet protocol (TCP/IP).
    b. User datagram protocol/internet protocol (UDP/IP).
    c. Real-time transmission protocol/internet protocol (RTP/IP).
    d. Internet protocol (IP) multicast.
    e. Domain name service (DNS).
    f. Dynamic host configuration protocol (DHCP), and DHCP client.
5. Security: SSL-based authentication and 128-bit AES encryption.
6. Manufacturer: Aerohive, Aruba, Avaya, Cisco, Extreme (Enterasys), or Meru.

C. Network Attached Storage:
1. Raw capacity: 24TB.
2. Minimum usable capacity: 18 TB.
3. Transfer rate: up to 300 MB/s.
4. Disk interface: 3.0 Gb Serial ATA II with NCQ and SMART.
5. RAID level: 6 + hot spare.

D. Network Attached Storage with Integrated Tape Drives:
1. Raw capacity: 9 TB.
2. Minimum usable capacity: 6 TB.
3. Integral tape drive capacity: 400 GB up to 800 GB.

4. Tape format: integrated LTO tape drive.
5. Transfer rate: up to 300 MB/s.
6. Disk interface: 3.0 Gb Serial ATA II with NCQ and SMART.
7. RAID level: 0 + hot spare.

E. Fiber Optic to Ethernet Media Converters:
1. Ethernet media converters shall be IEEE 802.3 compliant, designed to transmit and receive 10/100 Mbps data over multimode or singlemode optical fiber.
2. The Ethernet Media Converter shall Auto-Negotiate to a 10 Mbps or 100 Mbps Ethernet rate without any adjustments.
3. Mean Time Between Failure (MTBF) shall be 100,000 hours or more.
4. Full Duplex or Half Duplex Electrical Port/Full Duplex Optical Port.
5. Optical Power Budget: Multimode 10 dB, Singlemode 15 dB.
6. Connectors: Optical - SC, 1 or 2 Fibers, Electrical Signal – RJ45, and Electrical Power – Terminal Block.
7. Operating temperature shall be -40°F to 160°F or better.
8. Power Supply: DC Plug-in Power Supply, 90-264 VAC, 50/60 Hz.
9. Basis of Design: Comnet CNFE100(X) Series or equal.

F. Fiber Optic to Ethernet with POE+ Media Converters:
1. Wall mount, DIN Rail, or tabletop.
2. External AC/DC power supply included.
3. 2-port 10/100/1000 copper to fiber media conversion with IEEE 802.3at PoE+ on the copper port. Supports full 30 Watts of power to each twisted pair port.
4. 3-port with (1) RJ-45 PoE+ port and (2) open SFP slots such that the device can be configured as a 3-port switch or as a 2-port media converter with redundant fiber links. With redundant fiber enabled, supports a 50ms fail-over time.
5. 4-port with (2) RJ-45 PoE+ ports and (2) open SFP slots such that the device can be configured as a 4-port switch (with or without redundant fiber) or as two independent PoE+ media converters in one housing. With redundant fiber enabled, supports a 50ms fail-over time.
6. Shall support fixed LC connectors and open SFP.
7. SFP slots shall support 100Base-FX, 1000Base-X, or SGMII based (MSA compliant) SFP modules.
8. Supports Auto-Negotiation, Auto-MDI/MDIX, Active Link Pass Through (ALPT), and Remote Fault Detection
9. Jumbo frame support.
10. LEDs indicators for power status; per port link, duplex, and activity status; and PoE status.
11. Legacy PoE Detection.
12. Twisted pair ports support IEEE 802.3az Energy Efficient Ethernet for power saving.
13. Dip switch control of basic feature configuration.
14. RJ-45 serial port for Command Line Interface (CLI) of advanced port configuration (115200 baud).
15. Basis of Design: Transition Networks SGPAT Series or equal.

G. Network-Power Over Ethernet Extender and Midspan Power Injector:
1. The network-power over Ethernet (PoE) extender shall provide the capability to extend the maximum Ethernet cable length by 295', from the standard 90' to 590'.
2. The network-PoE extender shall be fitted in line with the cable and act as a repeater allowing network cables to be joined.

3. The network-PoE extender shall provide the capability to provide power over the Ethernet (PoE) to remote devices.
4. The network-PoE extender shall be powered from the network cable via PoE as an IEEE 802.3-2018(AMD 2018) class 0 device.
5. The network-PoE extender shall be fully transparent with no restriction on network traffic.
6. It shall be possible to connect multiple network-PoE extender and cable combinations in a daisy chain to form an extension of up to 2950'.
7. Network-PoE extenders shall comply with the universal IEEE 802.3-2018/(AMD 2018) PoE standard, and shall supply PoE to Altronix NetWay Spectrum Series Hardened POE Switches IEEE 802.3-2018/(AMD 2018) class 1 and 2 devices.
8. Network-PoE extenders shall provide the following features:
    a. Transmission rates: 100BaseTX, full duplex only with auto negotiation.
    b. Cable type: straight through or cross over (auto detected).
    c. Range (when used with a #24 AWG category 5, category 5e, or category 6 cable):
        1) Minimum range without midspan power injector; 2065' with no PoE, 1180' with PoE Class 1, and 885' with PoE Class 2.
        2) Minimum range with midspan power injector; 2950' with no PoE, 2065' with PoE Class 1, 1475' with PoE Class 2, and 885' with PoE Class 3.
    d. Device power (when used with a #24 AWG category 5, category 5e, or category 6 cable); 3.84 W for PoE Class 1, 6.49 W for PoE Class 2, and 12.95 W (using midspan power injector) for PoE Class 3.

PART 3 EXECUTION

3.1 NETWORK CONFIGURATION REQUIREMENTS:

A. A master list of IP addresses for both LAN and LAN user components shall be compiled for both network equipment and end user equipment. End user systems using DHCP are exempt from this requirement and shall be identified as DHCP systems.

B. The network shall be configured as indicated on the Drawings and in cooperation with the Owner's IT department. Configuration shall not be limited to the equipment provided but shall also include the existing switches and other equipment, as necessary.

C. Configuration Workshops:
1. Prior to installation, the on staff CCNE shall meet with the Owner's IT department in weekly workshops for a minimum of 2 sessions.
2. Workshops shall define the process of installation and configuration of the network components.
3. The CCNE shall configure and test the network expansion prior to installation.

D. Configure the VLANs, network IP addresses, Quality of Service (QoS), security settings, and other parameters per the Owner's requirements and as recommended by the manufacturer to support the system indicated on the Drawings.

3.2 INSTALLATION REQUIREMENTS:

A. Provide cable troughs for each side of network racks. Between 2 racks two 6" troughs are required.

B. Bond network enclosures, cabinets, service boxes, and framework to the building grounding system in accordance with TIA-607 and local codes.

3.3 CYBERSECURITY REQUIREMENTS:

A. Change all default passwords upon setup. Provide unique passwords for each device type. Provide passwords to Owner upon turnover of the system. Create strong passwords:
   1. Include numbers, symbols, uppercase and lowercase letters.
   2. Password shall be more than eight characters long.
   3. Avoid any password based on repetition, dictionary words, letter or number sequences, usernames, relative or pet names, or biographical information (birthday).

B. Two factor authentication.

C. Enable encryption, if not already enabled.

D. Where supported, configure the systems to provide alerts upon multiple failed login attempts.

E. Configure the system to prevent virtual private network (VPN) access.

F. Restrict access to open USB ports to prevent malicious agents or malware from being injected into the security network.

G. Configure the system to provide automated alert process if foreign devices (e.g., non-authorized devices like laptops, rogue APs, etc.) are attached to the security network.

H. Configure the system to provide automated alerts if unauthorized file deletions or modifications occur.

I. Configure the systems to provide automated checking of drivers and firmware to detect if the drivers and firmware are up to date.

J. Firewall Policy:
   1. No externally open ports to devices on the inside network, unless a specific use case is required to be met; then ports or mapping may be performed in a cyber-secure fashion (e.g., remote viewing of video is required from local NVR platform). A certificate would need to be procured from a Trusted Certificate provider and installed on the NVR to serve a secured interface prior to allowing an external mapping to the inside NVR interface.
   2. If multiple subnets are managed by the firewall providing segmentation between device types, (e.g., cameras and NVR subnet and an access control system subnet or other technology), communications should be restricted using least privilege methodologies so that inter-subnet device communications are restricted to only what is necessary, if necessary. Should there be no interaction required between devices on different subnets, then no communications should be allowed.
   3. Limit Internet access for inside devices to be allowed only if necessary (e.g., firmware and or software updates from manufacturer). Ideally, no security technology would be allowed access to the Internet at any time, only allowed times for specific reasons.

3.4 FIELD QUALITY CONTROL

A. Tests and Inspections:
   1. Connect a laptop directly to a network source (a modem or router) using an Ethernet cable. Open a Web browser to see if you can access the Internet. If you are successful, your modem or router is working properly.
   2. Connect one Ethernet cable from the modem or router to the WAN port on the Ethernet switch. Connect the other Ethernet cable from a laptop to the LAN 1 port on your Ethernet switch.
   3. Press the "Reset" button on the back of your modem or router to reboot the device. Plug the Ethernet switch's power adapter into a wall outlet once the modem or router has finished rebooting.
   4. Check for blinking green lights above the "WAN" and "LAN 1" ports on the Ethernet switch. A blinking green light represents an active connection. Open a Web browser on the laptop to confirm that the connection is active.
   5. Disconnect the Ethernet cable from "LAN 1" and plug it in to each of the remaining ports on the Ethernet switch. When testing each port, look for a blinking green light, and then test the connection by opening a Web browser on your laptop.

B. Tests and Inspection Reports:
   1. Security Network Communications Equipment Functional Report.

3.5 INSTRUCTION OF OPERATING PERSONNEL

A. Factory-trained technicians shall give operating and maintenance instructions on the security network equipment. The duration of each session for each system type shall be a minimum of hours _____.

B. Provide instruction of operating personnel as required in Section 280500 - Common Work Results for Electronic Security Systems.

END OF SECTION

SECTION 280800 - COMMISSIONING OF ELECTRONIC SECURITY

PART 1 GENERAL

1.1 SUMMARY DESCRIPTION

A. This Section covers security systems performance verification, as required to demonstrate that the equipment and systems of the following sections, are ready for safe and satisfactory operation.

B. Performance verification is an ongoing process and shall be performed throughout construction. Performance verification verifies that systems are operating in a manner consistent with the Construction Documents.

1.2 RELATED REQUIREMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

B. 280500 - Common Work Results for Electronic Security Systems.

C. 280513 - Conductors and Cables for Electronic Security

D. 281000 - Access Control.

E. 281353 - Security IP Network Compatible Intercom Systems.

F. 283100 - Intrusion Detection.

1.3 REFERENCE STANDARDS

A. ASHRAE Guideline 0.2 - Commissioning Process for Existing Systems and Assemblies; 2015.

B. ASHRAE Guideline 4 - Preparation of Operations and Maintenance Documentation for HVAC&R Systems; 2019.

1.4 QUALITY ASSURANCE

A. Provide a Security Systems Performance Verification Supervisor for the security systems. The Security Systems Performance Verification Supervisor shall have 10 years of experience in security systems contracting. The Security Systems Performance Verification Supervisor shall become familiar with the Owner's project requirements and the requirements of the performance verification process as defined in this Section. The Security Systems Performance Verification Supervisor shall coordinate and execute the required performance verification activities.

B. The Security Systems Performance Verification Supervisor shall review submittal data for conformance with the requirements of the Project, shall monitor compliance with the requirements specified herein for storage and protection of equipment during construction, shall oversee testing, and shall document that the scheduled and specified performance requirements of each system have been accomplished.

C. Refer to ASHRAE Guideline 0.2, Commissioning Process for Existing Systems and Assemblies, and ASHRAE Guideline 4, Preparation of Operating and Maintenance Documentation for HVAC&R System for the commissioning process and preparation of the O&M documents.

1.5 SUBMITTALS

A. CLOSEOUT SUBMITTALS
1. Operation and Maintenance Documentation Package - The Security Systems Performance Verification Supervisor shall compile and prepare documentation for equipment and systems covered in these Security Specifications and deliver this documentation for inclusion in the operation and maintenance manuals prior to the training of the Owner's personnel. The Architectshall receive a copy of the operation and maintenance manuals for review.

1.6 PERFORMANCE VERIFICATION

A. The Security Systems Performance Verification Supervisor shall be responsible for scheduling, supervising, coordinating, and executing the testing and performance verification activities as specified herein.

B. Security systems performance verification shall take place in three phases. Performance verification requirements for each phase are as follows:
1. Construction Phase:
a. During the construction phase of the Project, transmit a status update report upon request to the Architect (via e-mail). The status update report shall include digital photographs of areas where significant progress has been made. Digital photographs shall be minimum 1200 x 1600 pixels in resolution. Both the detail in the report and the detail in the photographs shall be sufficient for the Engineer to assess the progress made to date and respond appropriately to pay request. Periods of inactivity will require only a retransmission of the most recent form (via e-mail), updated to reflect the new date, and that "no significant progress has been made since the last status report was submitted". Status reports will not be requested more than once every 2 weeks.
b. Provide documentation of installed systems and equipment and develop functional testing procedures, prior to normal operation and maintenance manual submittals. This documentation shall include detailed manufacturer installation, operating, troubleshooting and maintenance procedures; full factory testing reports, if any; and full warranty information, including responsibilities of the Owner to keep the warranty in force. In addition, the installation, check-out materials that are actually shipped inside the equipment, and the actual field check-out sheet forms to be used by the factory or field technicians shall be submitted to the Architect.

c. Develop and submit to the Architect for review and comment, prior to system functional testing, a complete functional testing plan using manufacturer's testing procedures and functional testing checklists for the performance of the equipment to be verified.
d. Assist in clarifying the proposed operation and control of equipment in areas where the specifications, drawings or equipment documentation is not sufficient for writing detailed testing procedures.
e. Review the proposed functional test procedures to ensure feasibility, safety, and equipment protection. Obtain approval from the Architect for proposed functional test procedures.
f. Prepare a preliminary schedule for performance verification activities, including equipment testing and adjusting from start to completion, and update the schedule during the construction period, as appropriate. Notify the Architect immediately when performance verification activities not yet performed, or not yet scheduled, will delay construction.
g. Provide functional testing for equipment and execute the security systems related portions of the functional checklists for the verification of the performance of all the equipment during the testing process.
h. Perform and document functional tests results, providing a copy to the Architect.
i. Correct noncompliance items before beginning acceptance testing. Discrepancies and problems shall be remedied before acceptance testing.

2. Acceptance Phase:
   a. Place equipment and systems into operation and continue their operation during each working day of the acceptance testing and performance verification activities, as required.
   b. Provide skilled technicians to execute acceptance testing of each system. Technicians shall be available and present during the agreed upon scheduled acceptance tests and for sufficient duration to complete the necessary tests, adjustments and problem-solving.
   c. Perform acceptance testing for specified systems and equipment as directed by the Engineer and interpret the test data as necessary.
   d. Correct deficiencies (differences between specified and observed performance) as identified and interpreted by the Engineer and retest the equipment, as required to demonstrate proper operation and performance.
   e. Prepare operation and maintenance manuals as specified, including clarifying, and updating the original sequences of operation to as-built conditions.
   f. Maintain marked-up record drawings and produce final record drawings of project drawings and contractor-generated coordination drawings.
   g. Provide specified training of the Owner 's operating personnel.
   h. Coordinate with equipment manufacturers to determine specific requirements to maintain the validity of the warranty.
3. Warranty Period:
   a. Correct deficiencies and make necessary adjustments to operation and maintenance manuals, and as-built drawings system or equipment modifications made during the warranty period.

PART 2 PRODUCTS

2.1 TEST EQUIPMENT

A. Standard testing equipment required to perform the required testing shall be provided by the Contractor for the equipment or system being tested.

B. Test equipment shall be of the quality and accuracy required to test and/or measure system performance with the tolerances specified and shall have been calibrated within the last 12 months, or as specified herein. Equipment shall be calibrated according to the manufacturer's recommended intervals and when dropped or damaged. Calibration tags shall be affixed or certificates available on request. Accuracy of sensors shall be at least twice that of the instrumentation being tested.

PART 3 EXECUTION

3.1 SUBMITTALS

A. Submit additional documentation as required to support the performance verification process. This additional submittal documentation shall include, at a minimum, the proposed functional testing plan, and functional testing checklists.

3.2 FUNCTIONAL TESTING

A. General:
   1. Functional testing shall be performed as required to ensure that the equipment and systems are properly installed and ready for operation, so that acceptance testing may proceed without delays. Follow the approved functional testing procedures. Sampling strategies shall not be used for functional testing. The functional testing for equipment and subsystems of a given system shall be successfully completed and documented prior to acceptance testing of the system.
   2. Functional testing plan: develop the detailed functional testing plans for equipment and systems that are to be verified as specified herein. Review the proposed procedures and functional testing documentation to ensure that there is written documentation that each of the manufacturer-recommended procedures has been completed.
   3. The functional testing plan shall include the manufacturer's standard written check-out procedures copied from the installation manuals and manufacturer’s normally used field check-out sheets. The plan shall include checklists and procedures with specific boxes or lines for recording and documenting the tests recommended by the equipment manufacturer, and as specified herein. Each checklist shall include a summary statement with a signature block at the end of the plan.

3.3 ACCEPTANCE TESTING

A. Before obtaining permission from the Architect to schedule the acceptance test, provide written certification that each system has been calibrated, tested and is ready to begin the 14-day burn-in period and acceptance testing.

B. Conduct final acceptance test after a period of not less than 14 consecutive normal working days of trouble- free operation.

C. During this burn-in period, each system shall operate continuously for 24 hours per day. During the acceptance test, demonstrate the correct operation of features and capabilities specified herein.

D. The Owner reserves the right to witness the acceptance tests. Notify the Owner at least 10 days prior to the date scheduled for the tests.

3.4 RETESTING OF EQUIPMENT AND/OR SYSTEMS

A. Provide labor and materials required for retesting of any functional test found to be deficient.

B. Prior to retesting, submit required data indicating that the deficient items have been completed and/or corrected to the Architect for approval and rescheduling of the functional test. If during the retesting it becomes apparent that the deficient items have not been completed and/or corrected as indicated in the data provided by the Contractor, the retesting shall be stopped. Costs for the design team to further supervise the retesting of a functional test shall be the responsibility of the Contractor.

3.5 TESTING DOCUMENTATION, NONCONFORMANCE, AND APPROVALS

A. Functional Test Reports: For each subsystem, provide a spreadsheet with all devices listed in the first column by device designator (name/number) with each test parameter listed by name (or code) in the remaining columns.

B. Work to repair, replace, or otherwise resolve issues that result in a failed test until all devices pass all test parameters.

C. Upon the completion of Functional Testing, provide the Architect with the functional test reports. The Architect will then review the Contractor's functional testing reports and submit either a noncompliance report or available dates for the scheduling of the Acceptance Testing. Where items are found to be deficient during the acceptance testing, the Contractor shall correct items in a timely manner and notify the Architect that the items have been corrected. Resubmit an updated report and a statement of correction of each non-compliance item. When requirements are completed, the Architect will schedule follow-up acceptance testing or recommend acceptance of the electronic security systems.

END OF SECTION

SECTION 281000 - ACCESS CONTROL

GENERAL

1.1 SUMMARY DESCRIPTION

A. This Section covers access control and alarm monitoring systems (ACAMSs).

B. This Section covers wiring electric door hardware furnished and installed under Division 8.

C. The ACAMS shall consist of head-end servers, multiple workstations and a hierarchy of access controllers that communicate utilizing a TCP/IP based Ethernet network. The system shall be capable of routing individual alarms to select workstations based on event type and time of day.

1.2 RELATED REQUIREMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

B. 280500 - Common Work Results for Electronic Security Systems.

C. 280513 - Conductors and Cables for Electronic Security.

D. 280528 - Pathways for Electronic Security.

E. 280800 - Commissioning of Electronic Security.

F. 281353 - Security IP Network Compatible Intercom Systems.

G. 283100 - Intrusion Detection.

1.3 REFERENCE STANDARDS

A. BHMA A156.23 - Electromagnetic Locks; 2022.

B. BHMA A156.24 - Delayed Egress Locking Systems; 2022.

C. BHMA A156.25 - Electrified Locking Devices; 2023.

D. BHMA A156.31 - Electric Strikes and Frame Mounted Actuators; 2024.

E. FIPS 201-3 - Personal Identity Verification (PIV) of Federal Employees and Contractors; Current Edition.

F. ICC A117.1 - Accessible and Usable Buildings and Facilities; 2017.

I. NFPA 101-2018 - Life Safety Code; 2018.

J. UL 10C - Standard for Positive Pressure Fire Tests of Door Assemblies; Current Edition, Including All Revisions.

K. UL 294 - Access Control System Units; Current Edition, Including All Revisions.

L. UL 603 - Standard for Power Supplies for Use with Burglar-Alarm Systems; 18 February 2008.

M. UL 1034 - Standard for Safety Burglary-Resistant Electrical Locking Mechanisms; Current Edition, Including All Revisions.

N. UL 1076 - Proprietary Burglar Alarm Units and Systems; Current Edition, Including All Revisions.

1.4 SUBMITTALS

A. See Section 280500 - Common Work Results for Electronic Security Systems for additional requirements.

B. Action Submittals:
   1. Product Data:
      a. Provide product data sheets for equipment, materials, and cables in PDF format.
   2. Shop Drawings:
      a. Include floor plans indicating equipment locations. Plans shall include equipment identification and either direct references to wiring details for each specific installation and wiring condition or a schedule that references the same.
      b. Wiring diagrams shall indicate proposed connections of equipment, model numbers, and designations for cables and termination points.
      c. Provide elevations of console or rack-mounted equipment, showing the location of all specified electronics and include enlarged, to scale plan (top), and front views.
      d. Provide project specific manufacturer shop drawings of fabricated or modified units, if any.
      e. Provide riser diagrams indicating components of the system and proposed cabling between these components.
      f. Provide block diagrams indicating the proposed interface between the access control system and the video surveillance system. Provide a written description of the proposed sequence of operation to describe the operation of the interfaces.
      g. Provide block diagrams indicating the proposed interface between the access control system and the intercom system. Provide a written description of the proposed sequence of operation to describe the operation of the interfaces.

h. Provide detailed project specific mounting diagram for each type of device including raceway and back box requirements. These details shall be referenced on the floor plans or schedules.

i. Provide a detailed loading schedule for each access control system panel indicating card readers by Door Number, card reader modules, and input/outputs (I/O) modules identifying each device connected to the I/O modules.

C. Informational Submittals:
1. Resumes of key personnel that documents the qualifications required. Include certificate of training or certifications.
2. As required in Section 280500 - Common Work Results for Electronic Security Systems.

D. Close-out Submittals:
1. Functional Test Reports: Provide a spreadsheet with all access control system devices and major components listed in the first column by device designator (e.g., door number) with each test parameter listed by name (or code) in the remaining columns.
2. Operations and Maintenance Documentation Package: As required in Section 280500 - Common Work Results for Electronic Security Systems.
3. Instruction of Operating Personnel:
   a. The Security Systems Performance Verification Supervisor shall schedule, coordinate, assemble and deliver the documentation of the training required by this section.
   b. Obtain receipt from the Owner acknowledging completion of each item of instruction.
   c. See Section 280500 - Common Work Results for Electronic Security Systems for additional requirements.

1.5 QUALITY ASSURANCE

A. The access control system contractor, the contractor's supervisors, and technicians shall meet the qualifications as defined in Section 280500 - Common Work Results for Electronic Security Systems.

B. Qualifications of the Access Control System Contractor:
1. The access control system installation company shall have field office located within a 100-mile radius of the Project with a minimum of two permanently employed persons with current access control system certification directly responsible for the installation and ongoing maintenance of the project.
2. Installation of the access control system shall be provided by a person or persons having completed, as a minimum, the factory training recommended by the access control system manufacturer and have direct field experience in the installation of a minimum of 3 projects of similar scope and size within the past 5 years.
3. The access control system Project Manager or Project Supervisor shall have direct field experience in the installation of a minimum of 3 access control systems projects of similar scope and size within the past 5 years.
4. Programming and configuration of the access control system shall be provided onsite by a person or persons having completed the access control system manufacturer's highest available certification program and have direct field experience in the programming and configuration of a minimum of 3 projects of similar scope and size within the past 5 years.

5. The access control system installation company shall be currently listed as an authorized dealer or business partner by the manufacturer of the access control system and shall have been listed as such for a minimum of 3 years.

PRODUCTS

2.1 ACCESS CONTROL AND ALARM MONITORING SYSTEMS

A. General:
1. The access control System shall consist of products approved for use by the Federal Government under Federal Information Processing Standards FIPS 201-3 Evaluation Program (FIPS 201-3 Approved Products List - Physical Access Control System Components (idmanagement.gov) https://www.idmanagement.gov/fips201/). Before ordering system components, confirm that the components do not appear on the FIPS 201 Removed Product List (FIPS 201-3 Removed Product List (idmanagement.gov) https://www.idmanagement.gov/fips201/).
2. The system (hardware and software) shall support the quantity and types of devices specified herein and indicated on the Drawings, including software licenses for 1 user per workstation.
3. The ACAMS shall be modular in nature, allowing system capacities to be easily expanded without the replacement (or rendering obsolete or non-usable) any hardware in the system or requiring major changes to system operation. All defined system data as well as historical information shall be maintained.
4. Provide the quantity and type of software licenses required to support the readers, servers, and workstations at the levels of functionality specified herein, and as indicated on the Drawings.
5. Provide spare licenses and hardware to support 5% additional reader and I/O capacity.
6. Cybersecurity requirements for the access control system are specified in Section 280500 - Common Work Results for Electronic Security Systems.

2.2 APPLICATION SOFTWARE:

A. Manufacturer: Lenel S2 OnGuard (no substitutions)

B. General: The existing Lenel S2 server is located at the Long Hill Administration Building. New door controllers shall be configured, and be integrated with, the existing Lenel S2 system serving the school district.

2.3 SYSTEM HARDWARE:

A. Access control panels: each cabinet shall incorporate the following operational features:
1. Manufacturer: Lenel S2 Onguard.
2. Distributed intelligence architecture with each controller operating independently.
3. Database information shall be stored at the panel level. Decision making shall be performed at the field panel and upon loss of power the panel shall not revert to a degraded mode.
4. In the event of communications failure with the host, the controller shall provide complete control, operation, and supervision of monitored and controlled points. In the communications failure mode, the system shall store transactions in a first-in first-out buffer until the panel is brought back online at which time the data shall be uploaded to the server.

5. Field panels shall be flash ROM upgradeable.
6. Field panels shall support communications via RS-485, and TCP/IP.
7. Field panels shall hold a minimum of 50,000 cardholders in memory.
8. Field panels shall be mounted inside equipment enclosures with key lockable doors and tamper switches.
9. Communications lines to the server shall be supervised. In the event of failure, the system shall detect failure within 2 seconds and report the failure as an alarm condition.
10. Field panels shall report cabinet tamper, reader communications loss, AC power loss, and low battery.
11. The controller shall support the Security Industry Association's (SIA) Open Supervised Device Protocol (OSDP) compatible card readers or smart card readers.
12. The controller shall support Wiegand compatible card readers.
13. The controller shall support the Security Industry Association's (SIA) Open Supervised Device Protocol (OSDP) compatible card readers or smart card readers, as well as Wiegand compatible card readers.

2.4 ACCESS CONTROL PERIPHERAL EQUIPMENT

A. Card and RFID Readers:
   1. Prox Card Readers:
      a. 125 KHz technology.
      b. Color: as selected by the Owner.
      c. Manufacturer: Allegion AptiQ, Farpointe Pyramid, or HID.
   2. Smart Card Readers:
      a. Communication signals between the reader and the access control panel shall be encrypted and transmitted via RS-485 using the Security Industry Association's Open Supervised Device Protocol (SIA 2012 OSDP) .
      b. Standard readers: surface-mounted style, combination 125 KHz proximity and 13.56 MHz contactless smart card readers designed for mounting into a single-gang back box.
      c. Mullion readers: Card readers indicated to be mounted on mullions (whether single or dual technology) shall be designed for mounting onto window and door mullions.
      d. Reader firmware shall be flash upgradeable.
      e. Readers and cards shall conform to the Transportation Worker Identification Credential (TWIC) Program.
      f. RF data transmission between cards and readers shall be encrypted using a secure algorithm.
      g. Readers shall be potted, polycarbonate material, sealed to a NEMA 4X or IP65 rating.
      h. Readers shall provide the ability to change operational features in the field using a factory-programmed command card. Command card operational options shall include:
         1) Output configurations.
         2) LED and audio configuration.
         3) Keypad configurations.
      i. Card readers shall provide the following programmable audio-visual indication:
         1) An audio transducer shall provide various tone sequences to signify; access granted, access denied, power up, and diagnostics.

2) A high-intensity LED light bar shall provide clear visual status (red/green/amber) that is visible even in bright sunlight.
3) Contactless smart card read range shall be 2" to 3" using cards, 1" using key fobs, 1" using stickers (tags), 1" to 1.5" using smart + 125 kHz proximity cards, and 1" to 2" using MIFARE cards (card serial number only).

j. Manufacturer: Lenel S2.

2.5 DETECTION DEVICES

A. Magnetic Contacts:
1. For hinged doors:recessed switches for door head installation. Switches shall be magnetic, single-pole, double-throw type, providing dual circuit operation, designed for line supervision. Switches shall be tested and proven capable of initiating an alarm signal when the protected door is opened 2" on the latch side. Color of exposed portions of the door contacts (brown, grey, or white) shall be that which most closely matches the door frame color.
2. Switches shall be UL 634 Level 1 high security balanced magnetic switches.
3. Switches shall be UL 634 Level 2 high security balanced magnetic switches.
4. For overhead doors: extra heavy duty, aluminum bar stock construction, floor-mounted contact, single-pole, double-throw type, providing dual circuit operation, for use on roll-up doors and rolling gates. Contacts shall have 3' stainless steel armored cables.
5. Alarm contacts shall be designed for 12 V to 30 V DC, nonpolarized service.
6. Manufacturer: Amseco (a Potter Brand), Bosch, Honeywell, Magnasphere, Potter Electric Signal Company, or United Technologies Company (UTC) Fire & Security.

2.6 OTHER ACCESS CONTROL SYSTEM RELATED HARDWARE

A. Request-to-Exit Push Buttons:
1. Single-gang box mounting.
2. Normally open/normally closed, 1 A rated contacts.
3. Illuminated push button.
4. Tamperproof mounting screws.
5. Access and secure LEDs integral with the faceplate or the push button.
6. Coverplate finish: stainless steel.
7. Time delay module in compliance with NFPA 101-2018.
8. Manufacturer: Allegion, Assa Abloy, or Dortronics.

B. Emergency Door Release Pull Stations:
1. Single-gang box mounting.
2. Normally open/normally closed, 1 A rated contacts.
3. Tamperproof mounting screws.
4. Coverplate finish: stainless steel.
5. Manufacturer: Allegion, Assa Abloy, or Dortronics.

C. Egress Delay Controllers:
1. Comply with NFPA 101-2018.
2. Adjustable delay time from 1 s to 30 s.
3. Fire alarm system interface to allow instant lock release upon alarm initiation.

4. Auxiliary power output to drive keypads and local alarm devices.
5. Alarm output.
6. Alarm shunt input.
7. Battery back-up.
8. Manufacturer: Allegion, Assa Abloy, or Dortronics.

D. Request-to-Exit Motion Detectors:
1. Passive infrared type. Dual technology type, range-controlled radar (RCR) and active passive infrared (PIR).
2. Walk-test light.
3. Form C, double-pole double-throw output relay rated for 30 V (AC/DC), 0.5 A.
4. UL listed.
5. Service: 12 V to 24 V DC.
6. Color: White.
7. Basis of Design: Interlogix Aritech RCR-REX.
8. Manufacturer: Bosch DS160, Securitron XMS, or Interlogix Aritech RCR-REX.

2.7 POWER SUPPLY EQUIPMENT

A. Power Supplies:
1. Mounted in a NEMA 1 hinged enclosure with power indicator integral with door.
2. Rated at 1.2 times the current draw for devices served. For door locking hardwar with current draw under 0.75 amperes, coordinate with Division 8 for electrical power requirements.
3. Individually fused or PTC outputs to each device.
4. For lock power supplies provide input for connection to a UL listed fire alarm panel output, which upon initiation shall disconnect power to selectable lock outputs.
5. Power Supplies shall have UL listing marks for the intended categories:
   a. UL 294 Access Control Systems
   b. UL 603 ULBurglar Alarm Power Supplies
   c. UL 1076 Proprietary Burglar Alarm Systems
6. Power Supplies shall be Class 2 power limited with correct accessory boards.
7. System Health and Performance Monitoring:
   a. Total System Health: Faults, output draw, battery state and temperatures.
   b. Output Condition: Current draw, voltage level and output status.
   c. Battery Activity: Charging current, discharge level, time to service.
   d. Power History: AC outages, time stamped faults, and enclosure tampering
   e. Fire Alarm activation.
8. System Controls
   a. Independent output control for remote reset functions
   b. Scheduled or manual battery checks
9. Web based service functions:
   a. AC loss or trouble faults.
   b. Connected devices shall be able to be independently power cycled
   c. Live monitoring of status.
   d. Remote manual battery testing.
   e. Basis of Design: Insert Make and Model.

f. Manufacturer: Alarm-Saf, Allegion, Altronix, Assa Abloy/Securitron, or Life Safety Power.

2.8 MISCELLANEOUS EQUIPMENT

A. Door Hardware and Locking Devices:
1. Wiring of electric door hardware furnished and installed under Division 8.
2. Wiring of electric door hardware furnished and installed under this Section.
a. General:
1) Electrified locking devices shall comply with:
a) BHMA A156.25.
b) ICC A117.1.
c) NFPA 80.
d) NFPA 101-2018.
e) UL 1034.
f) Hardware on fire rated doors and frames as listed and classified by UL as suitable for the purpose specified and indicated.
2) Lock Voltage: 24V DC.
3) Manufacturer: Allegion, Assa Abloy or Dorma.
b. Electromagnetic Locks:
1) Electromagnetic locks shall meet BHMA A156.23.
2) Electromagnetic locks shall have been manufactured by an ISO 9001 certified manufacturer.
3) Locks shall hold against a minimum of 1500 lbf applied to the door.
4) Electromagnetic locks shall be equipped with an SPDT magnetic bond sensing device to monitor whether sufficient magnetic holding force exists to ensure adequate locking. The bond sensor shall be fully concealed within the electromagnet to resist tampering or damage.
5) Electromagnetic locks shall be equipped with a concealed adjustable time delay option to re-lock the door within one to 90 seconds.
6) Electromagnetic locks shall include mounting hardware compatible with the doors to which they are applied.
c. Electric Strikes:
1) Electric strikes shall meet BHMA A156.31.
2) Electric strikes shall be heavy duty, tamper resistant, fail secure, reversible type.
3) Electric strikes shall be constructed of stainless steel.
4) Mortise electric strikes shall have been tested to withstand a forcing strength of 3,000 lbf and a minimum of two million cycles.
5) Surface electric strikes shall have been tested to withstand a forcing strength of 1,900 lbf and a minimum of one million cycles.
6) Strikes shall be listed UL 10C as a fire door accessory.
7) Electric strikes shall have a five-year limited warranty.
d. Electric Locksets:

1) Electric locksets shall be heavy duty, mortise type locksets.
2) Electric locksets shall contain an integral request-to-exit switch.

e. Delay Egress Locks:
1) Delay egress locks shall meet BHMA A156.24.

f. Lock and Key-Lock Switches:
1) Switches shall be UL listed.
2) Locking mechanism shall be round-key type with 3 dual, 1 mushroom, and 3 plain pin tumblers, or shall have a pick resistance equal to a lock having a combination of 5 cylinder pins and 5-point 3-position side bars in the same lock.

g. Electric Hinges:
1) Provide electric hinges with standardized wire colors and concealed plug connectors to accommodate up to 12 wires.
2) Coordinate plug connectors so they plug directly into a wiring harness for connection to electric locking devices and power supplies.
3) Hinges shall be by original manufacturer.

h. Electric Power Transfers:
1) Ball-and-socket joint construction for cut and pinch protection for wiring.
2) Ten 24-gauge wires, up to 1 AMPS @ 24VDC, with a 16 AMPS maximum surge.

B. Local door alarm:
1. Features:
a. Local Warning Alarm.
b. Door Held Alarm.
c. Forced Door Alarm.
d. Supervised Door Contact Monitoring.
e. Remote Alarm Bypass.
f. Request to Exit.
g. Request to Enter.
h. Adjustable Time Delays.
i. Automatic Alarm Reset Delay.
j. Access and Secure LED's.
2. Power: 12 - 24 VAC/VDC @ 250 ma. max.
3. Inputs:
a. 1 Normally Closed fully supervised door input.
b. 3 Access Control inputs: Remote N/O alarm bypass, N/O or N/C request to exit shunt, and fail-safe or fail secure lock voltage monitoring (12 - 24 VAC/VDC).
4. Outputs:
a. 1 Normally Closed Entry Alarm Relay rated @ 0.5 A. Opens with forced door alarm or door held alarm after lock voltage shunt.
b. 1 Normally Closed Exit Alarm Relay rated @ 1/2 A. Opens with door held alarm after request to exit shunt.
5. Alarm sounder: 85 dB minimum. Pulsing tones indicate warning alarm, and constant tone indicates door violation alarm.
6. Green LED indicates access mode, Red indicates armed.

7. Time Delays:
   a. Access delay - adj. 0 - 60 sec. Shunts the alarm function for the duration of the delay.
   b. Warning delay - adj. 0 - 60 sec. Sets the duration of the warning alarm.
   c. Alarm automatic reset delay - adj. 0 - 60 sec. Sets the duration of an alarm if the automatic reset feature is enabled.
8. Field Configurable Options:
   a. Forced door alarm disable.
   b. N/O or N/C request to exit monitoring.
   c. Fail-safe or fail secure lock voltage monitoring.
   d. Alarm automatic reset disable.
9. Mortise cylinder mounting bracket with momentary 2 position switch with SPDT output.
10. Mounting 2 Gang, 2-½ inch deep electrical box.
11. Manufacturer: Detex, Dortoronics, DSI, or Kouba Systems.

EXECUTION

3.1 GENERAL

A. Configure field panel communications as indicated on the Drawings.

B. Programming Requirements, Development, and Deliverables:
   1. Produce fill-in-the-blank forms to the Owner to solicit user input for programming the system. The questionnaires shall identify each programming item that requires user input to configure the ACAMS along with recommendations for responses. These questionnaires shall be finalized in a series of meetings with the Owner's designated agent until such time that the questionnaires are completed, and the Owner has authorized the information to be inputted into the ACAMS.
   2. The questionnaires shall include three series
      a. The first shall be to the Owner's IT Department for network connectivity requirements.
      b. The second shall be devoted to controller, alarm input and door programming, or hardware related programming and shall include:
         1) Controller naming schemes.
         2) Door and alarm input naming.
         3) Door unlock time and relock time.
         4) Door held open time.
         5) Door unlock and relock schedules.
      c. The third shall be devoted to alarm responses and related interface programming with associated action and reaction requirements to include:
         1) Video surveillance system call-up and switching requirements.
         2) Security Communication System interface requirements.
         3) External alarm signaling requirements.
         4) Graphic map development and door and alarm display.
      d. The fourth shall be related to display of alarm messaging, map development and any requirements for alarm responses and reporting.

3. Upon completion, the programming questionnaires and associated programming database sheets shall be included in the operation and maintenance documentation.

C. Minimum Programming Requirements:
1. Program the alarm bypass or shunt time (the time period the door can remain open before an alarm event is created) for 30 seconds, unless directed otherwise by the Owner's representative.
2. Program the door relock time (the time period after which the door will relock unless opened) for 5 seconds.
3. Program alarm response fields, door names, and any other user-defined fields with terminology and descriptions provided by the Owner.
4. Program access rights, password protection, system integration interfaces, holidays, area control, inputs and outputs, schedules, and elevator control.

D. Graphics:
1. Develop graphic maps that detail the facility and display inputs and outputs dynamically.
2. Maps shall be nested according to the following levels:
   a. Global.
   b. Country.
   c. City.
   d. Overall campus.
   e. Building.
   f. Floors.
   g. Further subdivided in alarm device location.
3. Utilize AutoCAD architectural floor plans that show walls, doors, windows, room names, and room numbers.

E. Control Panel Cybersecurity Configuration Requirements:
1. The following are minimum requirements:
   a. Place the access control system components on a private network, in a secured enclosure, and with updated firmware with firmware matching the existing installation.
   b. Enable HTTPS.
   c. Remove default user login, create a unique user account with a strong password.
   d. Add authorized IP Addresses.
   e. Disable web service, unless specifically required for operation.
   f. Disable discovery and SNMP services, unless specifically required for operation.
   g. Disable unused USB and SD interfaces.
   h. Enable AES or TLS encryption.
   i. Provide additional configuration changes per manufacturer’s requirements.
2. Provide report manufacturer’s certification that cybersecurity requirements have been met.

F. System Integration and Interfaces:
1. Upon an alarm condition or event to include but not limited to, an access point, duress button or other alarm input, intercom call, emergency phone call, the ACAMS shall cause the video surveillance system to:
   a. Automatically call up the associated video camera image on the designated video surveillance monitor or multi-display monitor segment.

b. The video signal for the associated video camera shall be transmitted to the roving security officer's smartphone or tablet.
c. Where remotely positionable video cameras are associated with the alarm, the camera shall be panned and tilted, and the lens zoomed to provide an acceptable (Owner approved) view of the event scene.
d. Where remotely positionable video cameras are associated with the alarm, the video camera shall be automatically selected for local control via the video management systems command keyboard.
e. The recorded video signal for the associated video camera shall be tagged or linked to the event in the access control system database.
f. An alarm event message shall be transmitted to the associated workstations or consoles causing an audible and visual alarm signal.
g. Where a local door sounder is located adjacent to the door, the sounder alarm shall be activated until reset at the workstation or console.
h. A graphical representation of the alarm scene (site or floor plan) with icons representing the open door, video camera, and other local devices shall be displayed on the graphical user interface (GUI). Icons representing active devices shall change color to indicate their state change (inactive to active).
i. The system shall be programmed with at least one video camera call-up for each event where there are cameras covering the location of the device causing the event.

G. Cardholder Enrollment:
1. Provide fill-in-the-blank forms to the Owner requesting needed information.
2. Based on the information provided, enter sample cards for each card holder type/category into the system to be used as a template by the Owner.

3.2 MISCELLANEOUS EQUIPMENT

A. Fire/Life Safety Interface:
1. Locking devices controlling emergency exits connected to the building fire alarm system, if locked in the direction of egress, shall unlock upon initiation of an alarm signal at the building fire alarm control panel or upon loss of primary power to the building.
2. The use of battery or emergency power shall not be used to keep emergency exits locked in the direction of egress.

B. End-of-Line Supervision:
1. Provide end-of-line resistors to monitor 4-state supervision (cut-line, short-circuit, switch open, switch closed) at each intrusion detection input device.
2. Resistors shall be installed at the monitored device location, not in the control panel.
3. Provide pre-manufactured resistor packs, or devices with integral resistor networks.

C. Request-to-exit pushbuttons: mount flush, in single-gang box on the secured side of the door, not greater than 48" above the finished floor. Signage shall be integral to each button "Push to Exit", or "Exit". Wire such that one pole provides the request-to-exit signal to the access control system and the other pole breaks power to the lock until the time delay period expires.

D. Emergency door release pull stations: Mount in single-gang box on the secured side of the door, not greater than 48" above the finished floor. Signage shall be integral to each button "Emergency Door Release", Wire such that one pole provides the signal to the access control system to notify of the emergency door release being activated, and the other pole breaks power to the lock.

E. Egress delay controllers: configure (wire and program) such that those doors with card readers will immediately release upon use of a valid credential without generating a local or remote alarm signal. The doors shall also be configured to relock once the door closes. The local siren shall be silenced by the closing of the door. Wire to report an alarm upon delay egress sequence activation and a second alarm upon the door opening.

F. Electric hinges shall be installed at the middle hinge location, unless otherwise noted.

3.3 FIELD QUALITY CONTROL

A. Tests and Inspections:
   1. Program an access card to open all doors in the system. Program a second access card to open all doors in the system, but then classify the card as lost or stolen. Attempt to access each door using the valid card first, and the card classified as lost or stolen card second.
   2. For access-controlled doors, test the following parameters or functions:
      a. Valid card read of an authorized user unlocks the door.
   3. Valid card read of an authorized user shunts or bypasses door forced alarm.
      a. Valid card read of a card reported lost or stolen creates an unauthorized use of lost card event in the system.
      b. Door forced open (or unlocked with a key) without the use of a valid card creates a “door forced” event and displays event on security workstation with operator instructions.
      c. Door held open beyond the door alarm shunt time creates a “door propped” event and displays event on security workstation with operator instructions.
      d. Where a local door sounder is located adjacent to the door, the event activates the sounder alarm until reset at the workstation or console.
      e. On the GUI, the event causes icons representing active devices to change color to indicate their state change (inactive to active).
      f. Door forced or door prop event automatically calls up the associated video camera image(s) (if any) on the designated video surveillance monitor(s).
      g. The event causes the video signal for the associated video camera(s) (if any) to be transmitted to the roving security officer's smartphone or tablet.
      h. Where remotely positionable video cameras are associated with the alarm, the event causes the camera to be panned and tilted, and the lens zoomed to provide an acceptable (Owner approved) view of the event scene.
      i. Where remotely positionable video cameras are associated with the alarm, the event causes the video camera to be automatically selected for local control via the video management systems command keyboard.
      j. The event causes the recorded video signal for the associated video camera(s) (if any) to be tagged or linked to the event in the access control system database.

B. Test Reports:
   1. Print a report showing the activity of the valid card during the test period, as well as the alarm activity for the test period. Confirm that the report shows a valid access for each door in the system for the valid card, and that the card classified as lost or stolen generated an appropriate alarm or exception report for each door in the system. Present this report to the Architect.
   2. Access control system functional test reports.

3.4 INSTRUCTION OF OPERATING PERSONNEL

A. Factory-trained technicians shall give operating and maintenance instructions on the access control systems. The duration of each session for each system type shall be a minimum of quantity hours.

B. See Section 280500 - Common Work Results for Electronic Security Systems for additional requirements.

END OF SECTION

SECTION 281353 - SECURITY IP NETWORK COMPATIBLE INTERCOM SYSTEMS

PART 1 GENERAL

1.1 SUMMARY DESCRIPTION

A. This Section covers the security intercom systems. The security intercom shall be an IP-based audio and video intercom system shall be provided to support intercom communications from selected areas of the facility

B. Audio-Visual door intercom stations and master stations shall be integrated with the Milestone VMS.

1.2 RELATED SECTIONS

A. 280500 - Common Work Results for Electronic Security Systems.

B. 280513 - Conductors and Cables for Electronic Security.

C. 280528 - Pathways for Electronic Security

D. 280800 - Commissioning of Electronic Security.

E. 281000 - Access Control.

1.3 REFERENCE STANDARDS

A. IEEE 802.3 - IEEE Standard for Ethernet; 2022 (Corrigendum 2024).

1.4 QUALITY ASSURANCE

A. Installation of the security intercom systems shall be under the direct supervision of a person or persons having completed, as a minimum, the factory training recommended by the system manufacturer.

B. Manufacturer Qualifications: Manufacturers shall be companies specializing in manufacturing the type of products specified in this Section with minimum 3 years of documented experience.

C. Supplier qualifications: the supplier shall be a company authorized by the manufacturer and specializing in supplying products specified in this Section with minimum 3 years of documented experience.

D. Installer qualifications: the installer shall be a company specializing in installing the products specified in this Section with minimum 3 years of documented experience.

1.5 SUBMITTALS

A. See Section 280500 - Common Work Results for Electronic Security Systems for additional requirements.

B. Action Submittals:
   1. Product Data:
      a. Provide product data sheets for equipment, materials, and cables in PDF format.
   2. Shop Drawings:
      a. Include floor plans indicating equipment locations. Plans shall include equipment identification and either direct references to wiring details for each specific installation and wiring condition or a schedule that references the same.
      b. Wiring diagrams shall indicate proposed connections of equipment, model numbers, and designations for cables and termination points.
      c. Provide elevations of console or rack-mounted equipment, if any, showing the location of all specified electronics and include enlarged, to scale plan (top), and front views.
      d. Provide project specific manufacturer shop drawings of fabricated or modified units, if any.
      e. Provide riser diagrams indicating components of the system and proposed cabling between these components.
      f. Provide block diagrams indicating the proposed interface between the security IP network compatible intercom system and the access control system.
      g. Provide block diagrams indicating the proposed interface between the security IP network compatible intercom system and the video surveillance system.
      h. Provide a written description of the proposed sequence of operation to describe the operation of the interfaces.
      i. Provide detailed project specific mounting diagram for each type of device including raceway and back box requirements. These details shall be referenced on the floor plans or schedules.

C. Informational Submittals: As required in Section 280500 - Common Work Results for Electronic Security Systems.

D. Close-out Submittals:
   1. Functional Test Reports: Provide a spreadsheet with all security IP network compatible intercom system devices and major components listed in the first column by device designator (e.g., intercom station number) with each test parameter listed by name (or code) in the remaining columns.
   2. Operations and Maintenance Documentation Package: As required in Section 280500 - Common Work Results for Electronic Security Systems.
   3. Instruction of Operating Personnel:
      a. The Security Systems Performance Verification Supervisor shall schedule, coordinate, assemble and deliver the documentation of the training required by this section.
      b. Obtain receipt from the Owner acknowledging completion of each item of instruction.
      c. See Section 280500 - Common Work Results for Electronic Security Systems for additional requirements.

PART 2 PRODUCTS

2.1 GENERAL

A. The intercom system shall consist of IP-based audio-video master stations and substations as indicated on the Drawings.

B. The intercom system shall be provided with all hardware, software, and software licenses, to support the devices shown on the drawings and provide fully functional systems as required herein.

C. System wide function requirements include:
   1. The intercom system shall provide a minimum speaker frequency response of 200 Hz to 3400 Hz, loudness of 85 dB sound pressure level ±3 dB.
   2. The intercom system shall provide active or dynamic background noise suppression.

D. Integration:
   1. The intercom system shall support integration with the video surveillance system provided under Section 282000 - Video Surveillance to the level of functionality described herein.

E. Manufacturer: Axis (no substitutions)

2.2 MASTER STATIONS:

A. General:
   1. Master stations shall have the capability to selectively call any master station or remote station in the system.
   2. Master stations shall allow the operator to selectively release any door or open any gate in the system where communication is established.
   3. Calls to a master station shall cause a tone to sound and display the location of the call.
   4. Master stations shall be able to forward calls to another master station in the system.

B. Video Intercom Master Stations:
   1. Desktop style master station.
   2. Displays: minimum 3.5" color-LCD or TFT display for graphical menu navigation and display of video from selected station camera. Minimum display resolution shall be 320 x 240 pixels with 65,000 colors.
   3. Video Codec: H.264 or MJPEG.
   4. Integral jack for handset operation. Provide 1 handset per master station.
   5. Integral jack for headset operation. Provide 1 compatible headset per master station.
   6. Integral jack for connection of gooseneck microphone. Provide one compatible gooseneck microphone.
   7. Power supply: Powered from IEEE 802.3 POE IEEE 802.3af class 0.

2.3 SUBSTATIONS:

A. General:

1. Provide IoIP (Intercom over IP) substations that connect directly to IP networks with Static IP or DHCP.
2. Provide VoIP telephone system SIP compatible substations that connect to the existing VoIP telephone switch. The VoIP telephone switch will be provided by the Owner. provided under a separate contract. provided under Division 27.
3. Substations shall be tamper resistant, vandal resistant, and ADA Standards for Accessible Design-2010 compliant. Intercom substations located in outdoor or environmentally uncontrolled areas shall be weather resistant.

B. Video Intercom Substations:
1. Video Intercom substations shall be equipped with integral microphone, loudspeaker, integral camera, in-use LED, and push-to-call button, all housed in one-unit. Stations shall be flush mounted unless otherwise noted on the drawings.
2. Integral camera:
   a. Image sensors: 0.25" or larger progressive scan RGB CMOS.
   b. Lens: minimum 80º horizontal field-of-view.
   c. Light sensitivity: 0.5 fc (5 lux).
   d. Video compression: H.264 or MJPEG.
   e. ONVIF Profile S compliant.
   f. Camera shall be compatible with the video management system provided under Section 282000 - Video Surveillance ms.
3. Inputs: minimum 1 input.
4. Outputs: minimum 1 relay outputs rated for 30 V at 500 mA.
5. Operating temperature: -4º F to 140º F.
6. Relative humidity: up to 95% non-condensing.
7. Power supply: IEEE 802.3 POE IEEE 802.3af class 0.

PART 3 EXECUTION

3.1 GENERAL

A. Cables:
1. Size power conductors as required to ensure voltage drop does not exceed 10% of the source voltage of the load.
2. Data cables shall be as recommended by the manufacturer.

B. Programming:
1. Produce questionnaires to solicit user input for programming the system. The questionnaires shall identify each programming item that requires user input to configure the intercom system along with recommendations for responses. These questionnaires shall be finalized in a series of meetings with the Owner's designated agent until such time that the questionnaires are completed, and the Owner has authorized the information to be inputted into the intercom system.
2. Configure and program the system per the completed questionnaires. Program master station and substation names and any other user-defined fields with terminology and descriptions provided by the Owner.
3. Program access rights and password protection.

4. Upon completion, the programming questionnaires and associated programming database sheets shall be included in the operation and maintenance documentation.
5. Program and configure the ACAMS interface such that each security intercom call event shall result in the following actions:
    a. The intercom call shall be logged as an event in the ACAMS.
    b. Where an access-controlled door is associated with the intercom station, the door control command screen shall be selected and displayed on the security management system monitor, provided the officer with appropriate clearance is logged onto the workstation.
6. Program and configure the video surveillance system interface, such that each security intercom call event shall result in the following actions:
    a. The video signal for the associated video camera shall be switched to the first available event monitor of the associated workstation or console.
    b. Where remotely positionable video cameras are associated with the intercom, the camera shall be panned and tilted, and the lens zoomed to provide an acceptable (Owner approved) view of the intercom station.
    c. Where remotely positionable video cameras are associated with the intercom, the video camera shall be automatically selected for local control via the video surveillance system command keyboard.
    d. The associated video recording shall be tagged in the software to the intercom event and recorded on a NVR at a frame rate of 15 frames per second at the camera's highest available resolution for the duration of the event.
    e. The audio signal of the intercom selected shall be switched to the master intercom station in the same location.
    f. A graphical representation of the intercom location (site or floor plan) with icons representing the intercom, video camera, and any doors or other devices shall be displayed on the graphical user interface. Icons representing active devices shall change color to indicate their state change (inactive to active).

3.2 FIELD QUALITY CONTROL

A. Tests and Inspections:
    1. Provide a screenshot of the integral video monitor display of a live call during business hours and after dark. Test the following parameters or functions:
        a. Each intercom substation shall provide clear noise-free communications with each master station as specified herein and indicated on the Drawings.
        b. Each intercom substation call status LEDs shall operate as designed.
        c. Each intercom substation integral camera shall functions as designed.
        d. Each master station shall provide clear and noise-free communications with each remote station as specified herein and indicated on the Drawings.
        e. Each master intercom station call status LEDs shall operate as designed.
        f. Each master station shall provide clear and noise-free communications with every other master station as specified herein and indicated on the Drawings.

g. Initiation of an intercom call causes the recorded video signal for the associated video cameras to be tagged or linked to the event in the access control system database.

B. Test Reports:
1. Security IP Compatible Intercom System Functional Test Report.

3.3 INSTRUCTION OF OPERATING PERSONNEL

A. Factory-trained technicians shall give operating and maintenance instructions on the security IP network compatible intercom system and equipment. The duration of each session for each system type shall be a minimum of 1 hour.

B. See Section 280500 - Common Work Results for Electronic Security Systems for additional requirements.

END OF SECTION

SECTION 282000 - VIDEO SURVEILLANCE

PART 1 GENERAL

1.1 SUMMARY DESCRIPTION

A. This Section covers video surveillance systems.

B. The video surveillance system shall consist of IP video cameras, video servers and digital storage media, and security system workstations, all connected to a local area network.

1.2 RELATED REQUIREMENTS

A. 280500 - Common Work Results for Electronic Security Systems.

B. 280513 - Conductors and Cables for Electronic Security.

C. 280528 - Pathways for Electronic Security.

D. 280800 - Commissioning of Electronic Security.

E. 281000 - Access Control.

F. 281353 - Security IP Network Compatible Intercom Systems.

G. 283100 - Intrusion Detection.

1.3 REFERENCE STANDARDS

A. FIPS 140-2 - Security Requirements for Cryptographic Modules; Current Edition.

B. IEC 60529 - Degrees of Protection Provided by Enclosures (IP Code); 1989 (Corrigendum 2019).

C. IEC 62262 - Degrees of Protection Provided by Enclosures for Electrical Equipment Against External Mechanical Impacts (IK Code); 2002, with Amendment (2021).

D. IEEE 802.3 - IEEE Standard for Ethernet; 2022 (Corrigendum 2024).

E. NEMA 250 - Enclosures for Electrical Equipment; 2020.

1.4 SUBMITTALS

A. See Section 280500 - Common Work Results for Electronic Security Systems for additional requirements.

B. Action Submittals:
   1. Product Data:
      a. Provide product data sheets for equipment, materials, and cables in PDF format..
   2. Shop Drawings:
      a. Include site and floor plans indicating equipment locations. Plans shall include equipment identification and either direct references to wiring details for each specific installation and wiring condition or a schedule that references the same.
      b. Wiring diagrams shall indicate proposed connections of equipment, model numbers, and designations for cables and termination points.
      c. Provide elevations of console or rack-mounted equipment, showing the location of all specified electronics and include enlarged, to scale plan (top), and front views.
      d. Provide project specific manufacturer shop drawings of fabricated or modified units, if any.
      e. Provide riser diagrams indicating components of the system and proposed cabling between these components.
      f. Provide block diagrams indicating the proposed interface between the video surveillance system and the access control system.
      g. Provide block diagrams indicating the proposed interface between the video surveillance system and the intercom system.
      h. Provide a written description of the proposed sequence of operation to describe the operation of the interfaces.
      i. Provide detailed project specific mounting diagram for each type of device including raceway and back box requirements. These details shall be referenced on the floor plans or schedules.
      j. Provide a detailed loading schedule for each video surveillance network switch, patch panel, network video server recorder, and other head-end equipment identifying each device connected to it.

C. Informational Submittals:
   1. Resumes of key personnel that documents the qualifications required. Include certificate of training or certifications.
   2. As required in Section 280500 - Common Work Results for Electronic Security Systems.

D. Close-out Submittals:
   1. Functional Test Reports: Provide a spreadsheet with all video surveillance system devices and major components listed in the first column by device designator (e.g., camera number) with each test parameter listed by name (or code) in the remaining columns.
   2. Operations and Maintenance Documentation Package: As defined in Section 280500 - Common Work Results for Electronic Security Systems.
   3. Instruction of Operating Personnel:
      a. The Security Systems Performance Verification Supervisor shall schedule, coordinate, assemble and deliver the documentation of the training required by this section.
      b. Obtain receipt from the Owner acknowledging completion of each item of instruction.
      c. See Section 280500 - Common Work Results for Electronic Security Systems for additional requirements.

1.5 QUALITY ASSURANCE

A. The video surveillance system contractor, the contractor's supervisors, and technicians shall meet the qualifications as defined in Section 280500 - Common Work Results for Electronic Security Systems.

B. Qualifications of Contractor:
   1. The video surveillance system installation company shall have field office located within a 100-mile radius of the Project with a minimum of two permanently employed persons with current video management system certification directly responsible for the installation and ongoing maintenance of the project.
   2. Installation of the video surveillance system shall be provided by a person or persons having completed, as a minimum, the factory training recommended by the video management system manufacturer and have direct field experience in the installation of a minimum of 3 projects of similar scope and size within the past 5 years.
   3. The video surveillance system Project Manager or Project Supervisor shall have direct field experience in the installation of a minimum of 3 video surveillance systems projects of similar scope and size within the past 5 years.
   4. Programming and configuration of the video surveillance system shall be provided onsite by a person or persons having completed the video management system manufacturer's highest available certification program and have direct field experience in the programming and configuration of a minimum of 3 projects of similar scope and size within the past 5 years.
   5. The video surveillance system installation company shall be a currently listed as an authorized dealer or business partner by the manufacturer of the video management system and shall have been listed as such for a minimum of 3 years.

PART 2 PRODUCTS

2.1 GENERAL

A. Unless otherwise specified herein, quantities of equipment are indicated on the Drawings.

B. Provide compatible components. Provide IP cameras that are manufacturer certified compatible with the video management system software provided herein.

C. The video surveillance system shall be compatible with the access control and alarm monitoring system software provided under Section 281000 - Access Control.

D. Cybersecurity requirements for the video surveillance system are defined in Section 280500 - Common Work Results for Electronic Security Systems.

2.2 VIDEO CAMERAS AND ACCESSORIES

A. Video cameras shall have the following minimum features:
   1. Image sensor: progressive scan CCD or CMOS sensor, 0.33" or larger.
   2. Provide day/night (color/monochrome with IR filter removal) type cameras for outdoor areas.
   3. Digital processing with automatic white balance, automatic gain control, electronic shutter control, and backlight compensation.
   4. Event triggers: video motion detection (internal), active tampering alarm, and external input.

5. Event actions: pre- and post-alarm video buffering.
6. Dynamic range: minimum 65 dB., except camera types specified to have wide dynamic range shall have a minimum of 100 dB dynamic range.
7. Network interface: IEEE 802.3 Ethernet 100 BaseT.
8. Supported protocols: TCP/IP, UDP/IP, DHCP, HTTP, Multicast, PPPoE, RTP, and RTSP.
9. Security: SSL-based authentication.
10. FIPS140-2 compatibility with FIPS 140-2 compliant NVR.
11. ONVIF Profile S compliant (www.onvif.orgwww.onvif.org).
12. Compression: H.265, H.264 Baseline and Main Profile (MPEG-4 Part 10/AVC), and Motion JPEG, each stream independently selectable and capable of being transmitted to separate locations.
13. VBR (variable bitrate) or CBR (constant bitrate) encoding format selectable to correspond with various network conditions.
14. Audio: bidirectional audio with line input and line level output.
15. Lens: varifocal, remote focus and control, auto-iris control, IR corrected, and designed for camera's megapixel resolution.
16. Minimum illumination sensitivity requirements (50 IRE):
    a. Non-low-light cameras: using wide angle lens (3-9 mm); 0.4 lux (F1.2) in color mode, 0.03 lux (F1.2) in monochrome mode; using telephoto lens; 0.6 lux (F1.2) in color mode, 0.06 lux (F1.2) in monochrome mode.
    b. Low light cameras: minimum illumination: 0.04 lux (F1.2) in color mode; 0.008 fc (F1.2) in monochrome mode.
    c. For IR capable cameras: 0.0 lux (F1.2) when infrared illuminators are switched on.
17. Frame rate at maximum resolution: capable of 30 frames or images per second.
18. External I/O terminals: alarm input, alarm output.
19. Event triggers: video motion detection (internal), active tampering alarm, and external input.
20. Analytics integral to the camera (cameras and VMS shall be from the same manufacturer):
    a. Objects in Area: The event is triggered when the selected object type moves into the region of interest.
    b. Object Loitering: The event is triggered when the selected object type moves into the region of interest and then stays for an extended amount of time.
    c. Objects Crossing Beam: The event is triggered when the specified number of selected objects have crossed the directional beam that is configured over the camera’s field of view. The beam can be unidirectional or bidirectional.
    d. Object Appears or Enters Area: The event is triggered by each selected object that enters the region of interest. This event can be used to count objects.
    e. Object Not Present in Area: The event is triggered when no selected objects are present in the region of interest.
    f. Objects Enter Area: The event is triggered when the specified number of selected objects have entered the region of interest.
    g. Objects Leave Area: The event is triggered when the specified number of selected objects have left the region of interest.
    h. Object Stops in Area: The event is triggered when a selected object moves into a region of interest and then stops moving for the specified threshold time.

i. Direction Violated: The event is triggered when a selected object moves in the prohibited direction of travel.
j. Tamper Detection: The event is triggered when the scene unexpectedly changes.

21. Supported Classified Object Types:
    a. Object Types in Outdoor Mode: Vehicle, sub-types: Car, Truck, Bicycle, Motorcycle, Bus, and Person.
    b. Object Types in Indoor Mode: Person.
22. Where required on Drawings, provide built-in 850 nm LED infrared (IR) illuminator with 100' range for wide angle lens, and 200’ range for telephoto lens.
23. Integral memory card for edge storage, minimum capacity 32 GB.
24. Power: IEEE 802.3 8) or compliant PoE. Pan-tilt-zoom type cameras shall also be capable of operation via 24 V AC power.

B. Camera Enclosures and Mounting Hardware:
1. Style: Minidome, microdome, or bullet, as indicated on the Drawings.
2. Color: Color of non-transparent portions of the camera housing (normally black or white) shall be coordinated with the Architect. Transparent portion of dome or bullet shall be smoked glass or polycarbonate.
3. For cameras located in environmentally controlled areas (indoors) enclosures and mounting hardware shall have the following minimum features:
    a. Compatible with the camera and lens provided.
    b. Operating range from 14ºF to 100ºF
    c. IK10 rated for impact resistant.
    d. Enclosures and mounting hardware of the style and type indicated on the Drawings.
4. For each camera located in an environmentally uncontrolled area (outdoors), enclosures and appropriate mounting hardware shall have the following minimum features:
    a. Compatible with the camera and lens provided.
    b. Operating range from -22ºF to 140ºF.
    c. IEC 60529 IP66 or NEMA 250 4X rated enclosure.
    d. IEC 62262 IK10 rated for impact resistant.
    e. Sunshield where the video camera is exposed to direct sun.
    f. Enclosures and mounting hardware of the style and type indicated on the Drawings.

C. Manufacturer: Axis (no substitutions)

2.3 NETWORK VIDEO SURVEILLANCE SYSTEMS SOFTWARE

A. The NVMS shall be the latest enterprise version of the video management software.

B. The NVMS shall be scalable from one client, server, and camera to more than a thousand clients, servers, and cameras.

C. The NVMS shall consist of server software applications and client software applications.

D. The NVMS shall include a gateway software application that connects mobile devices to the NVMS.

E. The English language version of the NVMS shall be provided.

F. Compatibility Requirements:
1. The NVMS shall support recording and management of video and audio sources including:
   a. ONVIF compliant IP devices.
   b. Third-party IP devices, including Axis .

G. NVMS Architecture:
1. The NVMS shall support edge-based storage and processing of video and audio.
2. The NVMS shall require no proprietary recording hardware, no hardware multiplexer or time-division technology for video and audio recording or monitoring. The NVMS shall permit server and client software applications to be installed and run on either the same computer or on separate computers.
3. The NVMS shall support receiving digital input triggers and triggering digital outputs.

H. Security Requirements:
1. The NVMS shall digitally sign recorded video and audio using 256-bit encryption so video can be authenticated for evidentiary purposes.
2. The NVMS shall provide the ability to add privacy zones to a video source to block unwanted areas in the image field of view.
3. The NVMS shall authenticate users before granting access to the system.
   a. Basic access rights shall be defined individually for each user, and shall include; viewing live images, using PTZ controls, locking PTZ controls, triggering manual recording, triggering digital outputs, listening to microphones, broadcasting to speakers, viewing recorded images, exporting images, backing-up recorded images, managing user sessions, connecting and disconnecting cameras, viewing the system log, and accessing individual video and audio sources.
   b. Administration access rights shall be defined individually for each user, and shall also include the ability to configure or adjust camera general settings, camera network settings, camera image and display settings, camera compression and image rate, camera image dimension settings, camera motion detection settings, camera privacy zone settings, camera manual recording settings, camera digital input and output settings, camera microphone settings, camera speaker settings, general server settings, server schedule settings, server recording and bandwidth settings, server user and group settings, server alarm management settings, server scheduled backup settings, server rule engine settings, and server e-mail settings.
4. The NVMS shall provide the ability to import members of active directory groups as users in the NVMS. Changes made to members in the active directory shall be automatically synchronized with the NVMS.
5. The NVMS shall support using Windows credentials to authenticate users.

I. Event Logging Requirements:
1. The NVMS shall maintain an event log for critical server hardware and software events, device events, user events, and alarm events.
2. The NVMS shall have the capability to schedule and execute any of the following user notification actions in response to any of the events listed above:
   a. Start live streaming video.

b. Trigger an output.
c. Go to PTZ preset, run a PTZ pattern, set auxiliary, and clear auxiliary.
d. Trigger an alarm and acknowledge an alarm.
e. Provide a maintenance log and audit trail of all system errors and events.

J. The NVMS shall provide the following setup and administration capabilities:
1. The ability to discover all VMS server instances running on computers connected to the same network as the VMS client.
2. The ability to discover VMS server instances running on computers connected on a different network segment than the VMS client by using IP addresses or hostnames.
3. The ability to discover video and audio sources that are connected to the same network as the VMS server.
4. The ability to discover video and audio sources that are connected on a different network segment than the VMS server.
5. The ability to provide administration of all system connections from a single window.
6. The ability to detect video or audio signal loss and alert the system administrator.
7. The ability to rename all video and audio sources and NVRs.
8. The ability to schedule the monitoring of alarm inputs.
9. The ability to schedule backups of recorded video of associated events to a local folder or mapped network drive.
10. The ability to email users and system administrators when an event or system health error occurs.
11. The ability to schedule when e-mail notifications are sent.
12. The ability to include camera images in e-mail notifications.

K. The NVMS shall provide the following display and viewing capabilities:
1. The ability to save and restore the window layout.
2. The ability to control the system using a PC keyboard or joystick.
3. The ability to import and export client settings such as maps, views, and web pages.
4. The ability to display the following live video overlays: camera name, camera location, timestamp, record indicator, PTZ controls, motion activity, and license plate.
5. The ability of supporting an unlimited number of monitors for monitoring video and audio streams.
6. The ability to monitor live and recorded video and audio streams simultaneously on the same monitor.
7. The ability to view the same live or recorded video stream at different zoom levels.
8. The ability to view live or recorded video of 1 to 36 video streams simultaneously on a single monitor with the following standard layouts: full screen, 2 x 2, 3 x 3, 4 x 4, and 6 x 6.
9. The ability to switch from live to recorded video on demand for an instant replay of recently recorded video.
10. The ability to save views.
11. The ability to drag and drop a view from a tree of views into a window for live or recorded video and audio monitoring.
12. The ability to configure how the tree of video sources and views is displayed.
13. The ability to designate one or more regions in a window for displaying video directly linked to triggered alarms and rules.
14. The ability to save a link to a web page and view the web page in a window.
15. The ability to digital zoom and pan within live and recorded video streams.
16. The ability to playback (forward and reverse) recorded video and audio at variable speeds.

L. The NVMS shall provide the following recording and playback capabilities:
   1. The ability to playback recorded video and audio from selected video sources.
   2. The ability to record video and audio streams based on a recording schedule that can be defined individually for each video source. The schedule shall be created with the following parameters: recording mode (continuous, motion, alarms, digital inputs) and time and date settings (daily and weekly).
   3. The ability to manually trigger recording.
   4. Pre-event and post-event recording.
   5. Reference frame recording in the absence of events.
   6. Motion detection on each individual video source with adjustable sensitivity, threshold and detection zones.
   7. The ability to reduce the image rate of recorded video over time as a means of increasing record time. The image rate of non-event recorded video shall be able to be reduced to one half or one quarter of the original image rate. This setting can be configured separately for each video source.
   8. The ability to set a maximum recorded video retention time for each video source.

M. The NVMS shall provide the following general control capabilities:
   1. The ability to manually trigger digital output.
   2. The ability to change image quality and image rate parameters for a video source without affecting the settings on the other video sources.
   3. The ability to enable a secondary stream for live viewing.
   4. The ability to change the exposure, iris, IR filter, backlight compensation, gain, sharpening, saturation, focus, and white balance settings for a video source.
   5. The ability to rotate the image 90°, 180° or 270° for a video source.
   6. The ability to set a maximum recording duration for manually triggered recording for a video source.

N. The NVMS shall provide the following audio capabilities:
   1. The ability to change the input, output, gain and volume for an audio source.
   2. The ability for full-duplex two-way audio communication.
   3. The ability to link any independent audio source to any video source.

O. The NVMS shall provide the following alarm monitoring capabilities:
   1. The ability to prioritize alarms.
   2. The ability to assign alarms to users.
   3. The ability to acknowledge alarms.

P. The NVMS shall provide the following search and navigation capabilities:
   1. The ability to navigate recorded video and audio via calendar, timeline, or events.
   2. The ability to display a timeline of connected video sources and the corresponding motion and recording events.
   3. The ability to display a timeline of the entire time range down to one second of recorded video and audio.
   4. The ability to create bookmarks for recorded video and audio from multiple sources, displaying the bookmarks on the timeline, and searching for bookmarks based on various search criteria including bookmark name, notes, and linked camera names.

5. The ability to search through recorded video and audio based on various search criteria including time, date, video source, events, and image region, and have the results displayed as a series of thumbnail images.
6. The ability to search through recorded video based on point-of-sale transaction events.
7. The ability to search through recorded video based on license plates detected in the images of the video source.

Q. The system shall provide the following map support capabilities:
1. The ability to create a map that represents the physical location of cameras and other devices throughout the surveillance system. Maps shall be created from images stored in JPEG, BMP, PNG, or GIF image formats. Maps shall have the ability to contain links so as to create a hierarchy of interlinked maps.
2. The ability to create a map that has a link to a section of the entire image region.
3. The ability to drag and drop a video source from a map into a window for live or recorded video and audio monitoring.
4. The ability to highlight a camera on a map when an alarm linked to the camera is triggered.
5. The ability to highlight a linked map that contains a camera when an alarm linked to the camera is triggered.

R. The system shall provide the following exporting capabilities:
1. The ability to export recorded video in the following formats: native, MJPEG, and AVI.
2. The ability to export recorded audio in WAV or ASF format.
3. The ability to take a snapshot of a live or recorded image and export it from the system.
4. The ability to export a user selected series of images in JPEG bitmap, or other Windows format.
5. The ability to review video and audio that was exported in the native format.
6. The ability to include the camera properties and time zone in video exported in native format.
7. The ability to authenticate video that was exported in the native format to validate that it was not tampered with.
8. The ability to convert video that was exported in the native format to an industry standard format.

S. The NVMS shall provide the following NVR Management capabilities:
1. The ability to automatically log in to an NVR.
2. The ability to automatically log out of an NVR when the application is left idle.

T. Intercom System Integration Requirements:
1. The NVMS shall support integration with the intercom system provided herein.
2. Provide the license necessary for integration with the intercom system provided herein.

U. Manufacturer: Milestone Systems (no substitutions)

2.4 VIDEO ANALYTICS APPLICATION SOFTWARE

A. The applications software shall be designed for the automated detection of targeted behaviors based on fully scalable, rules-based video content analytics with the following minimum features:
1. The video analytics engine shall be able to distinguish between moving foreground objects and moving background objects. Examples of moving background objects include leaves and trees blowing in the wind, water fountains, or ocean waves.

2. The video analytics engine shall be able to adapt to changes in the environment automatically, such as lighting changes (clouds passing in front of the sun), weather, changes in the seasons, or the camera being aimed in a different direction without any manual adjustments. The video analytics engine shall be able to automatically adapt to lighting changes due to auto-iris adjustments, or changes from day mode to night mode in the camera, within 6 seconds or less without creating false alarms. The video analytics engine shall continue to accurately detect with low false alarm rates even in conditions of bad weather, such as snow, rain, hail, fog, as long as objects can be seen.
3. The video analytics engine shall include self-learning capabilities, so that it can automatically learn the scene environment in less than 2 minutes after being powered on, and then begin detecting immediately afterwards. The video analytics engine shall automatically learn highly dynamic backgrounds, such as water rippling, leaves blowing in the wind, water fountains and escalators.
4. The video analytics engine shall use pattern matching, rather than pixel differentiating techniques, to identify objects of interest.
5. The video analytics engine shall compensate for camera vibration.
6. The video analytics engine shall be able to track objects of interest accurately even when there is highly dynamic background motion in the scene. The video analytics engine shall not lose track of objects when they cross paths with other moving objects. The video analytics engine shall continue to track objects when they change from side views to front views, or vice versa.
7. Management and configuration of cameras shall be done through a GUI-based configuration. The video analytics engine shall send alerts to client workstations as well as the ability to push alerts to mobile devices.
8. The video analytics engine shall create and store a metadata record of all the objects it sees, so that video can quickly and easily be searched later by object’s appearance, or other rule violations determined later.

B. The video analytics engine shall include the licenses and analytics necessary to detect the following behaviors on the cameras indicated to have the behavior on the Drawings:
1. Movement-in-zone: detection of human or vehicular movement in sterile/secure zones where no movement is expected, with filters for direction of movement.
2. Directional line crossing: virtual line crossing (tripwire) for human and vehicular movement.
3. Crowd size detection: alarm shall be generated upon crowd size reaching a user-defined threshold.
4. Loitering: detection of person sojourning within a defined zone for a user-defined period of time.
5. Tailgating: detection of person or vehicle crossing entry/access-point line within a user-defined time interval after another person or vehicle. Integrated with access control systems.
6. Grouping: event generated upon number of persons in a defined zone exceeding exact threshold.
7. Moving water vessel: detection of water vessel movement, filtering out waves, sun reflections and typical waterscape phenomena.
8. Stopped vehicles: detection of vehicles stopped in one or more no-stopping zones beyond a configurable time threshold.
9. Object removal: detection of the removal of an object from a customer-defined region in a video camera's field of view. Event shall be reported whenever an object is moved from the region.
10. Asset protection: detection of the removal of up to 20 objects from a camera's field of view. Event shall be reported when an object is removed or hidden for more than the specified amount of time.
11. Two-man rule alerts: detection if less than 2 people are present at any time.

12. Fallen person (slip and fall): detection within seconds of transition from a person's vertical position to horizontal/angled position.
13. Road obstacles: detection of obstacles in an area of interest that remain stationary for more than the predefined amount of time, filtered for size of obstacle and duration.
14. Suspicious (abandoned) objects: detection of abandoned objects in an area of interest with filters for size and length of time object is present.
15. Object counting: directional counting of moving people and/or vehicles, with database storage of results and various statistics reports including overall daily traffic, traffic density hot spots, comparison between specific hours and days and more.
16. Stickiness: counts people that remain in a field of interest for more than the user-specified dwell time.
17. Video Search: Ability to quickly locate a specific person or vehicle of interest across an entire site using a sophisticated deep learning AI search engine.
18. Facial Recognition: Ability to detects matches from managed watchlists to alert operators of people of interest.
19. License Plate Recognition (LPR): Ability to capture accurate license plate information at a range of distances and speeds.

2.5 VIDEO SURVEILLANCE SYSTEM HARDWARE

A. Network Video Recorders (NVRs) or servers and video storage media:
   1. The video archival system shall include sufficient network video recorders (NVRs) or servers and video storage media to record or archive video from each camera as indicated on the drawings.
   2. NVRs or servers shall be configured for no more than 75% utilization of total recording and playback bandwidth or processing capacity supported.
   3. The NVMS shall not limit the storage capacity and shall allow for upgrades of recording capacity.
   4. The system shall provide redundancy and support camera failover to secondary server.
   5. Storage shall be provided in a RAID 6 configuration.
   6. The NVRs or servers shall be loaded with video management system software as described above, and sufficient site, server or NVR and camera licenses provided to support the configuration and cameras quantities indicated on the Drawings. The server/storage systems shall be connected via a virtual video surveillance system local area network (VLAN) to the IP based video cameras that are specified herein.
   7. Hardware Health Monitoring: The system shall monitor the health of the network switches, network video recorders, servers, hard drives, and power supplies and provide notifications as follows:
      a. The system shall monitor system issues, environmental characteristics and performance from a single screen, and provide high level status view of system, storage, network and cameras. Key components shall be monitored including:
         1) Processor (for performance and temperature).
         2) Memory.
         3) Cooling.
         4) Power Supply.
         5) Chassis.
      b. The system shall provide instant notification via email for the following:

1) Video loss when a camera becomes disconnected.
2) For critical issues with network video recorders.
3) Notification of drive failure and location within the system.
4) For potential performance impact on the recording server when issues are identified while monitoring network throughput.
5) Power supply failure.
6) Fan speed exceeds an alarm threshold.

8. NVRs or Servers System Minimum Requirements:
   a. Pre-configured with the video management system software, optimized and provisioned to use Federal Information Processing Standards FIPS 140-2 compliant cryptography for secure network video recording and video encryption. Video data encrypted at rest to FIPS 140-2 L2, secured with onboard TPM, via Windows BitLocker, OS drive encrypted to FIPS 140-2 L2, secured with TPM. Server 2016 STIG-compliant Windows OS.
   b. Pre-configured with the video management system NVR or server software and optimized for video surveillance.
   c. Operating system: latest 64-bit version of Windows Server compatible with the VMS .
   d. Processor: Dual Intel Xeon Series CPU recommended by the VMS manufacturer.
   e. System RAM: The NVMS manufacturer's recommended RAM to support the configuration provided.
   f. Network interface: two 1 Gbps (1000Base-T) RJ45 ports.
   g. Redundant power supply.
   h. RAID controller: storage shall be configured as RAID 5.
   i. Operating System Drives:
      1) Two M.2 Solid State Drives SSD, RAID 1.
   j. Video Storage Drives:
      1) Hot-Swappable, Enterprise Class Hard Drives
      2) Interface: SATA 6Gb/s or SAS 6Gb/s.
      3) Spin speed: 7200 rpm.
      4) RAID controller: storage shall be configured as RAID 6.
      5) Cache: 64 MB.
      6) Mean time between failures (MTBF): 1 million hours.
      7) Manufacturer: Dell or HP
   k. The NVMS shall be installed on hardware which meet or exceed the manufacturer's requirements as well as the requirements specified herein.

B. Security Workstation (with NVMS and ACS Clients) Minimum Requirements:
   1. Pre-configured with the access control and video management system client software and optimized for access control and video surveillance.
   2. Processors: The Intel processor recommended by the NVMS manufacturer for the client software.
   3. RAM: The NVMS manufacturer's recommended RAM to support the configuration provided.
   4. Graphics Card: Provide graphics card recommended by the NVMS manufacturer to support the quantity of monitors indicated on the Drawings.

5. Video Card or Graphics Processor:
   a. Support for full 4K video streaming.
   b. Support for four 4K monitors (2 DVI ports and 1 mini HDMI port).
6. Display interface: 2 HDMI ports, DP ports with HDMI adapters, or mDP with DP and HDMI adapters.
7. Monitors: Support for Two 4K (3840x2160 pixels) monitors. Provide 4K monitors, quantity and nominal sizes as shown on Drawings.
8. Operating System: The NVMS manufacturer's recommended version of Microsoft Windows for support of the NVMS client software.
9. OS Drive: 256GB Solid State Drive (SSD).
10. SATA II or SATA III controller as recommended by the manufacturer.
11. Internal storage: 1 TB hard drive, 7200 rpm SATA.
12. Optical drive: 16x DVD +/ R/W.
13. Network card: 10/100/1000Base-T.
14. Other components required for a complete and operational system, including optical mouse and keyboard.
15. Where the system manufacturer's recommendations exceed these requirements, workstations shall meet the video management system and access control system software manufacturers' recommendations, as defined in this section and in Section 281000 - Access Control 2.
16. Manufacturer: Dell or HP .

2.6 VIDEO MONITORS

A. General: monitors provided shall be designed for continuous operation.

B. Provide wall mounted flat panel monitors with the following minimum features:
   1. Commercial monitor designed for continuous operation (24 hours/day, 7 days/week, and 365 days/year).
   2. Screen Size: nominal diagonal measurement as indicated on the Drawings.
   3. Panel technology: 60 Hz direct-lit LED technology, 16:9 aspect ratio.
   4. Native resolution: 3840 x 2160 (4K or Ultra HD).
   5. Brightness: 350 cd/m2(350 nits).
   6. Contrast ratio: 4000:1.
   7. Viewing angle (horizontal/vertical): 178º/178º.
   8. Response time: 8 ms (gray to gray), or better.
   9. Computer/video input support: DVI-D and HDMI.
   10. Audio input: stereo mini jack.
   11. Audio output: stereo mini jack.
   12. Other: Built-in tuner and audio amplifier and speakers.
   13. Power requirements: 100 V to 240 V AC.
   14. Manufacturer: Mitsubishi, NEC, Samsung, Sharp, or Sony .

C. Provide desktop flat panel monitors with the following minimum features:
   1. Commercial monitor designed for continuous operation (24 hours/day, 7 days/week, and 365 days/year).
   2. Screen Size: nominal diagonal measurement as indicated on the drawings.
   3. Panel technology: direct-lit LED, 16:9 aspect ratio.
   4. Native resolution: 3840 x 2160 (4K or Ultra HD).

5. Brightness: 250 cd/m2.(250 nits).
6. Contrast ratio: 1000:1.
7. Viewing angle (horizontal/vertical): 178º/178º.
8. Response time: 8 ms (gray to gray).
9. Computer/video input support: DVI-D (24-pin digital DVI) and VGA (15-pin HD D-Sub (HD-15)).
10. Audio input: stereo mini jack.
11. Audio output: stereo mini jack.
12. Other: Built-in tuner and audio amplifier and speakers.
13. Power requirements: 100 V to 240 V AC.
14. Manufacturer: Acer, ASUS, Dell, HP, Samsung, or Viewsonic.

2.7 MISCELLANEOUS EQUIPMENT

A. Infrared Illuminators:
   1. Configuration: 1, 2, or 3 illuminators in a common mount.
   2. Construction:
      a. Each illuminator shall contain a matrix of surface mount infrared LEDs inside an environmentally sealed housing.
      b. External housing and hardware of aluminum, stainless steel, or alloy construction.
   3. IP66 rated enclosure with vandal-resistant polycarbonate lens.
   4. Wavelength: 850 nm semi-covert.
   5. Maximum power consumption: 100 W.
   6. Performance:
      a. Illumination distance: as indicated on the Drawings.
      b. Angle of coverage: as indicated on the Drawings.
   7. Manufacturer: Axton, Bosch, or Raytec .

B. Power supplies: 12/24 VDC, sized to accommodate video cameras and devices indicated on the Drawings with a 25% margin for future expansion, and shall have the following features:
   1. Compliance with UL 2044-2019
   2. 120 V AC input.
   3. One individually fused output per camera.
   4. Contained in a hinged and lockable NEMA 1 enclosure.
   5. Cabinet tamper switch.
   6. Battery back-up.
   7. Manufacturer: Alarm-Saf or Altronix .

PART 3 EXECUTION

3.1 GENERAL

A. Examine pathway elements intended for cables. Check raceways and other elements for compliance with space allocations, installation tolerance, hazards to camera installation, and other conditions affecting installation.

B. Examine roughing-in for LAN, WAN, and IP network before device installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

D. Provide programming for complete systems integration with the access control and alarm monitoring systems and the intercom systems as specified herein and in Section 281000 - Access Control.

E. Provide programming for complete systems integration with the access control and alarm monitoring systems and the intercom systems as specified herein and in 281353 - Security IP Network Compatible Intercom Systems.

F. Systems shall be installed by skilled craftsmen in a manner conforming to industry standards for the craft.

G. The NVMS shall provide the ability to import members of active directory groups as users in the NVMS. Changes made to members in the active directory shall be automatically synchronized with the NVMS.

H. The NVMS shall support using Windows credentials to authenticate users.

I. Occupancy Adjustments: When requested within 12 months of date of Architect's Final Certificate, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose. Tasks shall include, but are not limited to, the following:
   1. Check cable connections.
   2. Check proper operation of cameras and lenses. Verify operation of auto-iris lenses and adjust back-focus as needed.
   3. Adjust all preset positions; consult Owner's personnel.
   4. Recommend changes to cameras, lenses, and associated equipment to improve Owner's use of video surveillance system.
   5. Provide a written report of adjustments and recommendations.

3.2 WIRING

A. Wiring Method: Install cables in raceways unless otherwise indicated.
   1. Except raceways are not required in accessible indoor ceiling spaces and attics.
   2. Except raceways are not required in hollow gypsum board partitions.
   3. Conceal raceways and wiring except in unfinished spaces.

B. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Provide and use lacing bars and distribution spools.

C. Splices, Taps, and Terminations: For power and control wiring, use numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

D. Grounding: Provide independent-signal circuit grounding recommended in writing by manufacturer.

3.3 VIDEO CAMERAS AND ACCESSORIES

A. Install cameras and infrared illuminators level and plumb.

B. Install cameras with 84-inch minimum clear space below cameras and their mountings. Change type of mounting to achieve required clearance

C. Video cameras: connect camera video analytics alarm output to the access control system alarm input module as required for alarm event logging and response.

D. Pan-tilt drives: program presets as required for coverage of the detection devices, sensors, and alarm zones indicated on the Drawings.

E. Set pan unit and pan-and-tilt unit stops to suit final camera position and to obtain the field of view required for camera. Connect all controls and alarms and adjust.

F. Install power supplies and other auxiliary components at control stations unless otherwise indicated.

G. Install tamper switches on components indicated to receive tamper switches, arranged to detect unauthorized entry into system-component enclosures and mounted in self-protected, inconspicuous positions.

H. Identify system components, wiring, cabling, and terminals according to Section 270533 - Identification for Communications Systems.

3.4 NETWORK-BASED VIDEO SURVEILLANCE SYSTEMS

A. Configure network addresses, security settings, and other parameters per the Owner's requirements and as recommended by the manufacturer.

3.5 VIDEO MONITORS

A. Provide support structure where needed to support wall-mounted flat panel monitors.

B. Configure monitor settings as appropriate for the operation of the system as configured.

3.6 FIELD QUALITY CONTROL

A. Tests and Inspections:
   1. Provide a screen shot of each video camera taken during normal business hours and after dark. Place each screenshot on a PDF. Label each screen shot with the camera designator (name/number). Submit the document to the Architect for review and approval of the camera coverage area (aiming and lens setting).
   2. Test the following functions or parameters of the video management and storage systems:
      a. VMS is the specified edition/version.
      b. VMS servers meet the specifications.
      c. VMS workstations meet the specifications.

d. An alarm event causes the recorded video signal for the associated video camera to be tagged or linked to the event in the access control system database.
e. If available, a camera is associated with each access-controlled door, each intercom call, and each intrusion detection point.
f. The event automatically calls up the associated video camera images on the designated video surveillance monitors.
g. The video storage system is operational and recording the appropriate video camera at the initiation of each intrusion detection or duress alarm event, valid and invalid access card read, and the initiation of an intercom call.
h. Video from all cameras is retained for 30 days.
i. Video is recorded continuously at 1 frame per second.
j. Video is recorded on motion at 15 frames per second.
k. Loss of video generates an alert to system administrator.
l. The system emails users and system administrators when an event or system health error occurs.
m. Video analytics are functioning properly.

3. Test the following functions or parameters of the VSS cameras:
   a. Camera is correct type.
   b. Mounting is correct type.
   c. Camera coverage is approved by the Owner .
   d. Camera is auto-iris/auto-focus.
   e. Lens and dome are clean.
   f. Image quality is good.
   g. After dark IR illuminators switch on and provide sufficient lighting levels.
   h. Camera name, camera location, timestamp, record indicator, PTZ controls, and motion activity are displayed overlaid on the video.
   i. Assigned video analytics function properly.

B. Test Reports:
   1. Video management and storage systems functional test reports.
   2. Camera functional test reports.
   3. Point of Sale Camera functional test reports.
   4. LPR Camera functional test reports.

3.7 INSTRUCTION OF OPERATING PERSONNEL

A. Factory-trained technicians shall give operating and maintenance instructions on the video surveillance systems and equipment. The duration of each session for each system type shall be a minimum of 2 hours.

B. Additionally, provide instruction of operating personnel as required in Section 280500 - Common Work Results for Electronic Security Systems.

END OF SECTION

SECTION 283100 - INTRUSION DETECTION

PART 1 GENERAL

1.1 SUMMARY DESCRIPTION

A. This Section covers intrusion detection systems, including IDS panels, control keypads, detection devices, and communication devices.

1.2 RELATED REQUIREMENTS:

A. 280500 - Common Work Results for Electronic Security Systems.

B. 280513 - Conductors and Cables for Electronic Security.

C. 280528 - Pathways for Electronic Security.

D. 280800 - Commissioning of Electronic Security.

E. 281000 - Access Control.

1.3 REFERENCE STANDARDS

A. UL 365 - Police Station Connected Burglar Alarm Units and Systems; Current Edition, Including All Revisions.

B. UL 609 - Local Burglar Alarm Units and Systems; Current Edition, Including All Revisions.

C. UL 634 - Connectors and Switches for Use with Burglar-Alarm Systems; Current Edition, Including All Revisions.

D. UL 636 - Holdup Alarm Units and Systems; Current Edition, Including All Revisions.

E. UL 639 - Intrusion-Detection Units; Current Edition, Including All Revisions.

F. UL 1076 - Proprietary Burglar Alarm Units and Systems; Current Edition, Including All Revisions.

G. UL 1610 - Central-Station Burglar-Alarm Units; Current Edition, Including All Revisions.

1.4 SUBMITTALS

A. See Section 280500 - Common Work Results for Electronic Security Systemsfor additional requirements.

B. Action Submittals:

1. Product Data:
   a. Provide product data sheets for equipment, materials, and cables in PDF format.
2. Shop Drawings:
   a. Include floor plans indicating equipment locations. Plans shall include equipment identification and either direct references to wiring details for each specific installation and wiring condition or a schedule that references the same.
   b. Wiring diagrams shall indicate proposed connections of equipment, model numbers, and designations for cables and termination points.
   c. Provide elevations of console or rack-mounted equipment, showing the location of all specified electronics and include enlarged, to scale plan (top), and front views.
   d. Provide project specific manufacturer shop drawings of fabricated or modified units, if any.
   e. Provide riser diagrams indicating components of the system and proposed cabling between these components.
   f. Provide block diagrams indicating the proposed interface between the intrusion detection system and the access control system.
   g. Provide block diagrams indicating the proposed interface between the intrusion detection system and the video surveillance system.
   h. Provide a written description of the proposed sequence of operation to describe the operation of the interfaces.
   i. Provide detailed project specific mounting diagram for each type of device including raceway and back box requirements. These details shall be referenced on the floor plans or schedules.
   j. Provide a detailed loading schedule for each intrusion detection panel, identifying each device connected to it.

C. Informational Submittals: As required in Section 280500 - Common Work Results for Electronic Security Systems.

D. Close-out Submittals:
1. Functional Test Reports: Provide a spreadsheet with all intrusion detection system devices and major components listed in the first column by device designator (e.g., device number) with each test parameter listed by name (or code) in the remaining columns.
2. Operations and Maintenance Documentation Package: As defined in Section 280500, Common Work Results for Electronic Security.
3. Instruction of Operating Personnel:
   a. The Security Systems Performance Verification Supervisor shall schedule, coordinate, assemble and deliver the documentation of the training required by this section.
   b. Obtain receipt from the Owner acknowledging completion of each item of instruction.
   c. See Section 280500 - Common Work Results for Electronic Security Systemsfor additional requirements.

1.5 QUALITY ASSURANCE:

A. Installation of the intrusion detection system shall be under the direct supervision of a person or persons having completed the factory training recommended by the system manufacturer.

B. The installation company shall be a currently listed as an authorized dealer or business partner by the manufacturer of the system and shall have been listed as such for a minimum of 3 years.

PART 2 PRODUCTS

2.1 DETECTION DEVICES:

A. Magnetic Contacts:
1. For hinged doors:recessed switches for door head installation. Switches shall be magnetic, single-pole, double-throw type, providing dual circuit operation, designed for line supervision. Switches shall be tested and proven capable of initiating an alarm signal when the protected door is opened 2" on the latch side. Color of exposed portions of the door contacts (brown, grey, or white) shall be that which most closely matches the door frame color.
2. Switches shall be UL 634 Level 1 high security balanced magnetic switches.
3. Switches shall be UL 634 Level 2 high security balanced magnetic switches.
4. For overhead doors: extra heavy duty, aluminum bar stock construction, floor-mounted contact, single-pole, double-throw type, providing dual circuit operation, for use on roll-up doors and rolling gates. Contacts shall have 3' stainless steel armored cables.
5. Alarm contacts shall be designed for 12 V to 30 V DC, nonpolarized service.
6. Manufacturer: Amseco (a Potter Brand), Bosch, Honeywell, Magnasphere, Potter Electric Signal Company, or United Technologies Company (UTC) Fire & Security.

B. Duress Devices:
1. Push-for-Help Buttons:
   a. Designed for mounting under counter or desk.
   b. Latching call-placed indicator.
   c. UL 636 Holdup Alarm Units and Systems.
   d. Basis of Design: Honeywell 269R/270R Holdup Switch.
   e. Manufacturer: Ademco, Bosch, Honeywell, or Potter.

C. Glass Break Detectors:
1. Sensors shall use microprocessor-based digital signal processing to convert sound into mathematical sequences and perform analysis on signal variables to accurately identify the signal pattern of breaking glass.
2. Signal variables shall include flex/audio thresholds, ratios and durations, time coincidence, attack thresholds, and microphone overloads.
3. Detectors shall be configured with 2 microphones, 180º opposed, and time-of-arrival processing to eliminate glass break signals arriving from other than the protected area.
4. Detectors shall also provide the following minimum features:
   a. Form C (SPDT) alarm relay rated for 25 V DC, 125 mA maximum.
   b. Combination cover and wall tamper switch rated for 24 V DC, 25 mA maximum.
   c. LED indication for detection of sound events and alarm condition.
   d. Minimum range: 25'.
   e. Radio frequency interference (RFI) immunity from 10 MHz to 1000 MHz, up to 30 Vm.

f. Capable of detecting the breaking of single-pane plate, laminated, tempered, wired, and film-coated glass up to 0.25" thick.
g. Supervision circuitry with trouble output rated for 16 V DC, 20 mA maximum.
h. UL 639 Standard for Intrusion-Detection Units.

5. Manufacturer: Bosch, Honeywell, or United Technologies Company (UTC) Fire & Security.

D. Wall Mount Interior Motion Detectors:
1. Dual technology microwave and infrared motion type with the following minimum features:
a. Walk-test light.
b. Microwave noise adaptive processing to adjust for background disturbances.
c. Anti-masking.
d. Tamper alarm switch.
e. Digital fluorescent light interference filter.
f. RFI immunity: 27 MHz to 825 MHz.
g. White light immunity up to 650 fc.
h. Dual slope temperature compensation.
i. Form C output relay rated for 3 W.
j. UL 639 Standard for Intrusion-Detection Units.
k. Self-test: microwave supervision, end-to-end PIR, and temperature compensation.
l. Integrated end-of-line resistor.
m. FCC certified and UL listed.
n. Service: 10.5 V DC to 14 V DC.
o. Coverage Pattern: 40' x 40'.
2. Basis of Design: Blue Line Gen2 TriTech Motion Detectors.
3. Manufacturer: Bosch, Honeywell, Interlogix, or Visonic.

E. Wall Mount Interior Curtain Motion Detector with Curtain Pattern Coverage:
1. Dual technology microwave and infrared motion type with the following minimum features:
a. PIR Signal Processing: Motion analyzing of multiple thresholds and timing windows to analyze timing, amplitude, duration, and polarity of signals to make an alarm decision. The microprocessor shall analyze and compare sensor data to make alarm decisions.
b. Range Adaptive Radar: The microwave transceiver shall automatically adjusts its detection thresholds based on input from the PIR sensors. Integrating the target distance information from the PIR significantly reduces false alarms from the microwave Doppler radar.
c. Active White Light Supression: An internal light sensor shall measure the level of light intensity directed at the face of the detector. Sensor data fusion technology uses this information to eliminate false alarms from bright light sources.
d. Dynamic Temperature Compensation: The detector shall automatically adjusts PIR sensitivity to identify human intruders at critical temperatures. Dynamic temperature compensation detects human body heat accurately, avoids false alarms, and delivers consistent catch performance at all operating temperatures.
e. Tamper: Normally-closed (NC) contacts (with cover on) rated at 25 VDC, 125 mA maximum.

f. Trouble: Solid state relay normally-closed (NC) contacts.
g. Alarm: Solid state relay, normally-closed (NC) contacts, power supervised. 3 W, 125 mA, 25 DC, resistance < 10 Ω.
h. UL 639 Standard for Intrusion-Detection Units.
i. Coverage: curtain coverage 100' x 8.6'.
j. Basis of Design: Bosch Professional Series TriTech Curtain Motion Detector.
k. Manufacturer: Bosch, C&K Systems, Honeywell, or Visonic.

F. Ceiling Mount Interior Motion Detectors:
1. Dual technology microwave and infrared motion type with the following minimum features:
a. Signal Processing: Provide a detector that uses passive infrared and microwave Doppler radar technologies to provide an alarm condition when both fields of protection are simultaneously activated. Alarm signals must meet the signaling requirements of both technologies to activate an alarm.
b. Microwave Signal Processing: Adaptive processing to adjust to background disturbances. Designed to reduce false alarms while maintaining catch performance.
c. Self-test supervision systems: Two high output tri-color alarm LEDs visible from any angle, flash to indicate a trouble condition.
d. Height Range: 8 ft to 20 ft mounting height. Mounts directly to ceiling or to standard 3.5" rectangular electrical box.
e. Tamper alarm: Normally closed (with cover in place) tamper switch. Contacts rated at 28 VDC, 100 mA, 3W maximum.
f. RFI immunity: 26 MHz to 950 MHz at 50 V/m.
g. Alarm: Form C reed relay rated at 3.0 W, 100 mA at 28 VDC for resistive loads.
h. UL 639 Standard for Intrusion-Detection Units.
i. FCC compliant.
j. Voltage: 9 VDC to 15 VDC.
k. Current: 12 mA standby, 20mA in alarm. Max 24mA.
l. Coverage Pattern: Provides PIR and microwave, 46' diameter 360° panoramic coverage.
2. Basis of Design: Bosch DS9360 Motion Detector.
3. Manufacturer: Bosch, C&K Systems, Honeywell, or Visonic.

2.2 INTRUSION DETECTION SYSTEMS (IDS):

A. General:
1. Provide a microprocessor-based control/digital communicator that can provide intrusion, duress, and critical equipment monitoring. The system shall have a minimum of 48 individually addressable points that can transmit signals to a central station receiver. The system shall have the capability of controlling up to 16 outputs.
2. The system shall have arming stations with a touch pad through which users control security functions. Arming stations shall also have a minimum 16-character alphanumeric display. Displays shall show system status and give prompts to system operation. Arming stations shall display the status of 48 separate protection zones.

3. The system shall accommodate up to 4 microprocessor-based arming stations. All system operations shall be accomplished at any arming station.
4. UL 609 Standard for Local Burglar Alarm Units and Systems and UL 1076 Proprietary Burglar Alarm Units and Systems.

B. Initiation Circuits:
1. Protective inputs shall consist of points designated burglary and/or hold-up-duress and/or fire and/or supervisory. Each point shall be monitored by a protective circuit and shall accommodate normally opened and normally closed devices with end-of-line resistor supervision, or encrypted communication supervision.
2. Point programming: each of the points shall be programmable as to whether they are controlled versus 24 hours, interior versus perimeter, instant versus delayed, silent versus audible, and local or reporting. Additionally, each point shall be programmable to report to three separate telephone numbers.

C. Output Circuits:
1. Alarm power outputs: shall power audible alarms. Alarm circuits shall be supervised. There shall be 4 distinct audible patterns from which to select.
2. Additional relay outputs: capacity to expand to 16 additional relays. These relays shall be programmable to activate on alarms or other selected system events.

D. System Partitioning:
1. Point assignment: points shall be assignable to 1 of a minimum of 4 areas of protection.
2. Area arming: each area shall be separately armed and disarmed from any of the arming stations.

3. Keyswitch arming inputs: shall be programmable as either maintained or momentary contact.

E. Miscellaneous:
1. Programming: system functions shall be programmable at the system site or remotely via the use of the dial-up telephone network. Minimum programmable system passcode shall be used to prevent unauthorized remote programming attempts. Telephone access to the system shall be a ring counter or user-initiated access.
2. Printer interface: an optional printer interface to a parallel printer shall be available. The parallel printer shall record alarms and troubles by point, openings and closings by user code, and other system events.
3. Remote keypads: shall allow arming and disarming of the system, shunting of individual zones, and adjusting any delay periods.

F. Manufacturer: Bosch, Digital Monitoring Products (DMP), Tyco Digital Security Controls (DSC), or Honeywell.

2.3 INTRUSION DETECTION SYSTEM PERIPHERAL EQUIPMENT:

A. Digital communicators shall have the following minimum features:
1. Programmable delay before dialing.
2. Programmable dial attempts.
3. AC failure and AC restoral reporting.
4. Low battery and battery restoral reporting.

5. Listen-in capabilities (central station monitoring).

B. Cellular Alarm Transmission Back-up:
1. UL 365 Police Station Connected Burglar Alarm Units and Systems; and UL 1610 Central Station Burglar Alarm Units; Line Security Services compliant cellular alarm transmission back-up.
2. LTE Bands: AT&T: 2, 4, 5, and 17, Verizon: 4 and 13.v
3. Antenna Port: SMA, 50-Omh.
4. FCC part 15, 22, 24, 27 and 68 compliant.
5. Minimum transmit Power: 200 mW in all bands.
6. Full data reporting.
7. AES encryption.
8. Support for multiple alarm formats.
9. Automatic self-test and system trouble reporting outputs (5 or 60 minute, and daily).
10. Two programmable supervisory trip outputs
11. Alarm format support for SIA2, Contact ID, pulse (3x1, 4x2), modem IIe, & IIIa2, DMP.
12. Telephone line monitor built-in, with Standard Line Security.
13. Locking, metal enclosure.
14. Battery back-up.
15. Antenna, and cable.
16. Basis of design: TELGUARD AMETEK TG-7 or equal.

2.4 MISCELLANEOUS EQUIPMENT:

A. Local door alarm management system: audible range shall be minimum 85 dBA at 3', 12 V DC to 24 V DC. Sirens shall have an integral keyswitch and mount in a double-gang junction box. Sirens shall be keyed alike.
1. Manufacturer: Ademco, Detex, or Kouba Systems.

B. Exterior sirens: audible range shall be minimum 115 dBA at 3', 12 V DC to 24 V DC. Sirens shall have waterproof construction or be mounted in a weather resistant enclosure.

PART 3 EXECUTION

3.1 GENERAL:

A. Programming:
1. Program alarm response fields, door names, and any other user-defined fields with terminology and descriptions provided by the Owner.
2. Program access rights, password protection, video surveillance system interface, holidays, area control, inputs and outputs, and schedules.

B. Graphics:
1. Develop graphic maps that detail the facility and display inputs and outputs dynamically.
2. Utilize AutoCAD 2016 architectural floor plans that show walls, doors, windows, room names, and room numbers.

C. System Integration and Interfaces:

1. Interface with the video surveillance system: the IDS shall interface with the video surveillance system to cause automatic camera call-up utilizing ASCII text string commands. Upon an alarm condition at but not limited to, an access point, vehicle post, duress button or other alarm input, the IDS shall cause the video surveillance system to automatically call up the associated video camera image. The system shall be programmed with at least one video camera call-up per access control point.
2. Interface with the Insert Text here.

D. Programming Requirements and Deliverables:
1. Produce questionnaires to solicit user input for programming the system. The questionnaires shall identify each programming item that requires user input to configure the ACAMS along with recommendations for responses. These questionnaires shall be finalized in a series of meetings with the Owner's designated agent until such time that the questionnaires are completed, and the Owner has authorized the information to be inputted into the ACAMS.
2. The questionnaires shall include three series. The first shall be devoted to alarm input related programming. The second shall be devoted to interface programming and associated action and reaction requirements including the video surveillance system call-up and switching requirements. The third shall be related to display of alarm messaging, mapping and any requirements for alarm responses and reporting.
3. Upon completion, the programming questionnaires and associated programming database sheets shall be included in the operation and maintenance documentation.

E. Each alarm event shall result in the following actions:
1. The video signal for the associated video camera shall be switched to the first available event monitor of the associated workstation or console.
2. The video signal for the associated video camera shall be transmitted to the roving security officer's smartphone or tablet.
3. Where remotely positionable video cameras are associated with the alarm, the camera shall be panned and tilted, and the lens zoomed to provide an acceptable (Owner approved) view of the alarm scene.
4. Where remotely positionable video cameras are associated with the alarm, the video camera shall be automatically selected for local control via the video management systems command keyboard.
5. The archived or recorded video signal for the associated video camera shall be tagged or linked to the alarm event in the access control system database.
6. A supervised and coded alarm signal shall be transmitted to the associated workstations or consoles causing an audible and visual alarm signal.
7. Where a local door sounder is located adjacent to the door, the sounder alarm shall be activated until reset at the workstation or console.
8. A graphical representation of the alarm scene (site or floor plan) with icons representing the open door, video camera, and other local devices shall be displayed on the graphical user interface (GUI). Icons representing active devices shall change color to indicate their state change (inactive to active).

3.2 CELLULAR ALARM TRANSMISSION BACK-UP:

A. Submit cost and terms of cellular service contract to the Owner prior to installation. Owner reserves the right to seek independent cellular service provider with no penalty.

B. Make connections and verify proper operation with the alarm monitoring service provider.

3.3 ALARM MONITORING SERVICE:

A. Provide 1 year of alarm monitoring service with a UL listed central station. Include fees associated with connection, subscription, and termination so that no other costs shall be incurred if the service is terminated at the end of the year.

3.4 FIELD QUALITY CONTROL

A. Tests and Inspections:
   1. One at a time breach each device in each zone that makes up the intrusion detection system. Where the intrusion detection system is designed to detect multiple types of breaches, test each zone or device using each type of breach that is practical without damaging the system or system components. Provide a Honeywell Model FG701 glass break simulator for testing glass break detectors. For each intrusion point, test the following parameters or functions:
      a. Event is logged and displayed on the keypad/controller and the security workstation with operator instructions.
      b. The event automatically calls up the associated video camera images on the designated video surveillance monitors.
      c. The event causes the video signal for the associated video cameras to be transmitted to the roving security officer's smartphone or tablet.
      d. Where remotely positionable video cameras are associated with the alarm, the event causes the camera to be panned and tilted, and the lens zoomed to provide an acceptable (Owner approved) view of the event scene.
      e. Where remotely positionable video cameras are associated with the alarm, the event causes the video camera to be automatically selected for local control via the video management systems command keyboard.
      f. The event causes the recorded video signal for the associated video cameras to be tagged or linked to the event in the access control system database.
      g. Where a local door sounder is located adjacent to the door, the event activates the sounder alarm until reset at the workstation or console.
      h. On the GUI, the event causes icons representing active devices to change color to indicate their state change (inactive to active).

B. Test Reports:
   1. Print a report showing the alarm activity for the test period. Confirm that the report shows an alarm or exception appropriate for the zone and breach for each intrusion detection or duress alarm zone or device in the system. Present this report to the Architect.

3.5 INSTRUCTION OF OPERATING PERSONNEL

A. Factory-trained technicians shall give operating and maintenance instructions on the intrusion detection system equipment. The duration of each session for each system type shall be a minimum of 2 hours.

B. See Section 280500 - Common Work Results for Electronic Security Systems for additional requirements.

END OF SECTION

SECTION 285129 - EMERGENCY RESPONDER COMMUNICATION ENHANCEMENT SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. Description: This section includes labor, material, and equipment to furnish, install and test a complete and operating In-Building Emergency Responder Communication Enhancement System for the purpose of amplifying and distributing throughout the entire building. The radio signals and frequency bands shall be those in use by the Emergency Responders serving this facility. Signal strength levels and coverage in 90% of all areas each floor and 99% of critical areas in accordance with the Fire Code shall be provided.

B. This specification is a performance-based specification. Final and complete design and layout will be provided by the bidder and submitted as part of the shop drawing process

1.3 REFERENCES

A. Abbreviations and Acronyms:
   1. AHJ: Authority Having Jurisdiction.
   2. BDA: Bi-directional amplifier.
   3. DAQ: Delivered Audio Quality.
   4. EMRES: Emergency Responder Radio Enhancement System.
   5. FCC: Federal Communications Commission.
   6. RF: Radio Frequency.

1.4 COORDINATION

A. Coordinate system scope and layout requirements, attachment methods, and envelope penetrations with architectural and MEP roof plans, elevations, and sections.

B. Coordinate installation of roof curbs, equipment supports, and roof penetrations with Division 07 Section "Roof Accessories."

1.5 QUALITY ASSURANCE

A. Manufacturer Qualifications:
   1. Five continuous years, minimum, design and manufacture of the systems specified.

2. Manufacturing facilities certified to ISO 9001 International Quality Standard with third-party certification verifying quality assurance in design/development, production, installation, and service.
3. Maintain, within 100 miles of Project site, a service center capable of providing training, parts, maintenance, emergency repairs to equipment, and response times less than eight hours.
4.
5. Employ trained staff that are available 24/7 to provide scheduling support and assist with reporting needs.

B. Installer Qualifications:
1. Manufacturer's authorized representative who is trained and certified by the manufacturer for installation and testing of the specified product.
2. Minimum of five years successful installation experience with Projects of similar size and complexity.
3. Upon request, be able to provide a minimum of three reference accounts at which similar work, both in scope and complexity, have been completed by The Contractor within the last three years.
4. Project Personnel Requirements: Installer must have the following certified full-time employees on staff and assigned to the project:
a. Designer of system and lead installation personnel shall hold a valid FCC issued general radio operators license and certification of in-building system training issued by a nationally recognized organization, school or a certificate issued by the manufacturer of the equipment being installed.

1.6 WARRANTIES

A. Manufacturer Warranty: Manufacturer agrees to repair or replace specified product, and all of its components that fail in materials or workmanship within 12 months from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency acceptable to authorities having jurisdiction and marked for intended use.

B. All equipment shall have required FCC approvals.

2.2 SYSTEM PERFORMANCE REQUIREMENTS

A. Delegated Design Criteria:

1. Coordinate with the AHJ to ascertain operating frequencies in use. Include local fire, police, EMS, Sheriff and any state, city or county first responder frequencies as required by the AHJ.
2. Provide equipment compatible with the existing state, county and local Fire/Police communications system utilized by the Public Safety and Emergency Responder agencies.
3. Fully coordinate with all agencies involved and any state, federal or county agencies required and fully comply with requirements of such agencies.
4. Provide an FCC certified and compliant system.
5. Signal strength for the installed system shall be considered to have acceptable coverage when signal strength measurements in 90% of all areas on each floor and 99% in all critical areas as determined by the AHJ of the building meet a minimum signal strength into (downlink) the building of -95dBm and a minimum signal strength out (uplink) of the building of -100dBm when received by the agency's radio system when transmitted from within the building.
6. Provide an antenna distribution system installed to provide in-building amplification for all in use bandwidths tuned to the frequencies utilized. Provide building mounted "donor" antennas for all frequencies. The antennas will feed into a BDA (bi-directional amplifier), one for each band, which will distribute the boosted signal throughout the facility with a distributed antenna system utilizing point source fixed antennas, or other proposed solution by designer.
7. The system will be designed and installed per the requirements of NFPA, Building Code, Fire Code, and FCC.
8. Optional methods of achieving conformance to the code and distributing the signal throughout the building may be submitted.

2.3 MANUFACTURERS

A. Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Alpha Refuge
   2. Rath
   3. Talk-a-phone

B. Source Limitations: Obtain components through one source who assumes responsibility of system component compatibility.

2.4 SYSTEM COMPONENTS

A. Bi-Directional Amplifier:
   1. BDAs shall incorporate appropriate RF filters, firmware/software upgradeable band migration, output level control, degrade performance capabilities, and incremental adjustable gain. BDA gain shall be determined by this contractor and sufficient to increase signal to meet or exceed Code levels throughout the building.
   2. BDAs shall be class A channelized amplifiers. Full spectrum or Class B amplifiers shall not be used.

B. Donor Antenna:
   1. The "donor" antenna signal level shall provide as much head end gain off system as possible but shall be a minimum of 9dB – 15dB above the source under all operating conditions.
   2. Antenna Masts: Wind rated per AASHTO Wind Charts with an additional 10 mph rating and a 1.3 gust factor. Contractor to provide all required supports, mounting hardware, and anchoring required for components per manufacturer's requirements. Coordinate materials with Roofing Manufacturer/Contractor if roof mounted and maintain roof warranty.

C. Power Supply:
   1. Power supplies for amplifiers and head end equipment shall be served from two independent reliable sources if available. Emergency 120V Generator power (if available) shall be obtained from a local emergency panel.
   2. Amplifiers shall be located as determined by designer or as shown on drawings. It is preferable to be as centrally located as possible and if room permits, in the Main Technology Closet or Electrical Room.
   3.
   4. Each BDA shall be served by a dedicated 20A branch circuit and breaker with a handle lock on device. The secondary power source shall be a dedicated battery, capable of operating the in-building radio system for at least 12 hours at 100% operation capacity.
   5. Battery system shall be self/automatic charging system and contained in an enclosure. All signal booster and battery components shall be contained in a NEMA 4 or 4 X type enclosures per NFPA requirements. All enclosures shall be red in color.

D. All signal boosters shall have FCC certification prior to installation. All signal boosters shall be compatible with both analog and digital communications simultaneously at the time of installation. The AHJ shall provide the maximum acceptable propagation delay standard. Contractor shall coordinate with the AHJ.

E. System Monitoring
   1. Provide monitoring of system integrity in accordance with NFPA requirements. Provide monitor modules for each BDA and battery cabinet enclosure, quantity as required.
   2. Extend addressable fire alarm loop or if zoned system, provide zone modules and zone wiring to these monitor modules and mount the modules near the BDA enclosures.
   3. System and Signal Booster Supervisory Signals shall include the following:
   4. Donor Antenna Malfunction
   5. Signal Components Failure
   6. Active RF Emitting Device Failure
   7. Power Supply Supervisory Signals shall include the following for each signal booster:
   8. Loss of Normal AC Power
   9. Failure of Battery Charger
   10. Low-Battery Capacity, Alarming at 70 percent of battery capacity
   11. Integrity of communications link between fire alarm system and ERCES.

F. Annunciator:
   1. Provide a dedicated annunciator located next to the BDA enclosures to annunciate the status of all signal booster locations. The monitoring panel shall provide visual and labeled indication of the following for each signal booster:
   2. Normal AC Power
   3. Signal booster trouble

4. Loss of normal AC power

G. Cabling:
1. Coaxial cable bandwidth shall be as required for frequencies used. Verify that any stopbands built into the cable do not block the frequencies used.
2. Unless specified or approved by the Engineer, radiating coaxial cable shall not be used.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas for compliance with manufacturer's installation requirements. Confirm installation tolerances and other conditions affecting performance.

B. Examine substrates and conditions for compliance with requirements for opening configurations, penetrating items, substrates, and other conditions affecting performance of the Work.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Wiring Methods: Install all cabling in metal conduit, minimum 3/4-inch, in accordance with Section 260533, "Raceways and Boxes for Electrical Systems" and manufacturer's recommendations. Conceal raceway, except in unfinished spaces.
1. Riser runs shall be routed in 2 hour rated shafts.
2. Horizontal runs shall meet NFPA requirements for Survivability level 1 or 2 as required by code based on building construction and systems.

B. Antennas and cabling shall be kept a minimum of 24" from any high voltage cabling/raceways/bus duct or other EMI producing sources. Coordinate routing with field conditions and other trades.

C. Survey facility for any other RF producing components such as mobile radio or base stations and maintain proper separation of antennas so as to not cause interference. Perform adjustments to power output or antenna locations as required to mitigate interference. Coordinate with Owner.

D. Utilize cable manufacturers stripping and crimping tools.

E. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

F. Where a tightening torque is indicated as a numeric value on equipment or in installation instructions provided by the manufacturer, use a calibrated torque tool to achieve that indicated torque value, unless the equipment manufacturer has provided installation instructions for an alternative method of achieving the required torque.

3.3 GROUNDING AND BONDING

A. Comply with requirements in Section 260526 “Grounding and Bonding for Electrical Systems”.
   1. Ground cable shields and equipment per manufacturer’s requirements.
   2. Provide grounding blocks and surge protection for exterior coaxial cabling.
   3. Ground antenna mast in accordance with NEC and manufacturer’s requirements..

3.4 IDENTIFICATION

A. Comply with requirements in Section 260553 “Identification for Electrical Systems”.
   1. Identify all interior antennas to coincide with schematic diagram inside BDA.
   2. Identify all exterior RF Antenna cables outside and inside at their point of entry.
   3. Permanently affix schematics of the system within the main BDA enclosure.
   4. Affix FCC information as to the license holder, call letters, frequencies in use and other pertinent information on the exterior of the BDA.

3.5 FIELD QUALITY CONTROL

A. Perform the following tests and inspections with the assistance of a factory-authorized service representative.

B. Provide written 7-day advance notice of any testing to allow The Engineer and Owner’s Representative the option to witness the tests.

C. Visual and Mechanical Inspections
   1. Inspect connectors for correct pin depth and torque, weatherproofing and damage from minimum bending radius, crushed or deformed cable.
   2. Document and label donor antenna(s) physical location(s), cable type and cable length.
   3. Ensure all cables are securely captivated with an approved clamp or strap and that the outer jacket has not been compromised from over tightening.
   4. Verify all interior antennas have an identifying number visible from the traffic path location.
   5. Check NEMA Box enclosure and filters for proper ventilation.
   6. Confirm/Verify that the antenna(s) BDA(s) and applicable AC/DC power source are installed to R56 standards and working clearances.

D. Electrical Tests
   1. Confirm proper antenna orientation via signal strength test. Coordinate with system municipality the closest and/or strongest tower/signal source to orientate to.
   2. Sweep donor antenna(s) using a calibrated FTDR for Return Loss and Distance to Fault.
   3. Measure and record donor antenna grounding hardware and ground resistance for adherence to manufacturer or R56 specifications utilizing a megger documenting reading(s) and exact location(s).
   4. Measure and record received signal strength of all applicable frequencies at input.
   5. Verify BDA amplified power output with spectrum analyzer in both directions from RF in/out.
   6. Test amplifiers for proper gain output and signal level.

7. Check spectral purity of amplified signal for harmonics, spurs, and distortion in both directions.
8. Perform an over the air sweep test for excessive harmonic content, spurs, and distortion.
9. Sweep entire cable plant of each frequency band utilizing a FTDR for Return Loss and Distance to Fault from BDA out to building.
10.
11. Cabling and connectors shall be tested with a FTDR Meter for continuity and signal levels for RF power. Testing shall be for input and output paths.
12. Check and log AC input voltages and document circuit number, breaker, and physical location for both the BDA and AC/DC supply.
13. Test battery output under load for 1 hour for proper output. Test charging circuitry for proper performance.

E. Acceptance Tests
   1. The radio frequencies used by the ER shall be tested to ensure two-way coverage on each floor of the building to ensure the following:
      a. Measurements in 95 percent of all areas on each floor of the building shall meet the following signal strengths:
         1) Minimum signal strength into the building shall be -95 dBm.
         2) Minimum signal strength out of the building shall be -95 dBm.
      b. Critical areas such as fire command centers, fire pump rooms, exit stairs, exit passageways, elevator lobbies, standpipe cabinets, sprinkler sectional valve locations, and other areas deemed critical by the AHJ, shall be provided with 99 percent floor area radio coverage.
   2. RF Signal Strength Testing
      a. The signal strength test shall be conducted using a calibrated (within last 12 months) spectrum analyzer utilizing antennas similar in use by the emergency responders.
      b. Where signal strength out of the building cannot be efficiently measured, a DAQ Test shall be conducted using a calibrated portable radio of the latest brand and model used by the agency talking through the agency's radio communications system.
      c. Each floor of the building shall be divided into a grid of 20 approximately equal test areas.
      d. A test location approximately in the center of each test area shall be selected for the test, with the radio enabled to verify two-way communications to and from the outside of the building through the public agency's radio communications system. Once the test location has been selected, that location shall represent the entire test area. Failure in the selected test location shall be considered failure of that test area. Additional test locations shall not be permitted.
      e. Measurements shall be made with the antenna held in a vertical position at three (3) to four (4) feet above the floor to simulate portable radios worn on the belt or turnout coat pocket.
      f. A maximum of one (1) (or 5 percent) of nonadjacent test areas shall be allowed to fail the test per floor.
      g. In the event that two or more (or > 5 percent) of the test areas fail the test, in order to be more statistically accurate, the floor shall be permitted to be divided into 40 equal test areas. Failure of more than two (or 5 percent) nonadjacent test areas shall result in failure of the test. If the building fails the 40 area test, the building shall be deemed in non-conformance to Code. The facility shall be equipped with an in-

building RF amplification antenna system to meet a 90 percent coverage requirement per floor and retested.

h. The gain values of all amplifiers shall be measured, and the test measurement results shall be kept on file with the building Owner so that the measurements can be verified during annual tests.

3. Voice Signal Quality Testing
   a. For quality purposes, DAQ readings shall be taken at the same time as the above RF signal strength measurements. The DAQ scale is as follows:
      1) DAQ 1: Unusable. Speech present but not understandable.
      2) DAQ 2: Speech understandable with considerable effort. Requires frequent repetition due to noise or distortion.
      3) DAQ 3: Speech understandable with slight effort. Requires occasional repetition due to noise or distortion.
      4) DAQ 3.4: Speech understandable without repetition. Some noise or distortion present.
      5) DAQ 4: Speech easily understandable; little noise or distortion.
      6) DAQ 4.5: Speech easily understandable; rare noise or distortion.
      7) DAQ 5: Perfect; no distortion or noise discernible
   b. A DAQ level of 3 or better throughout the building shall be deemed acceptable and passing. Areas not achieving this level shall be deemed as failing.
4. Test Fire Alarm Supervisory and Trouble Signals in accordance with NFPA 72 and project fire alarm specifications. Verify proper annunciation.

F. Test and Inspection Reports: Prepare a written report to certify compliance with test parameters and record the following:
   1. Test procedures used.
   2. Date, time, and weather conditions during testing.
   3. Results that comply with requirements.
   4. Results that do not comply with requirements and corrective action taken to achieve compliance with requirements.
   5. Prepare information in a format required by the AHJ.

G. Products will be considered defective if they do not pass tests and inspections. Remove and replace malfunctioning units and retest as specified above.

3.6 ADJUSTING

A. Occupancy Adjustments: When requested within 12 months of date of Completion, provide on-site assistance in adjusting antennas to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

3.7 DEMONSTRATION

A. Provide 4 hours of system training and maintenance instruction to Owner’s personnel. Record training and submit DVD with O&M.

END OF SECTION

SECTION 310800 - EARTHWORK

PART 1 - GENERAL

1.1 DESCRIPTION

A. General: Perform earthwork in accordance with the Contract Documents.

B. Work Included: Work of this Section includes all labor, materials, equipment, and services necessary to complete the excavation, foundations, subgrade preparation, filling and grading as shown on the Drawings and specified herein including, but not limited to the following:

1. Removal and replacement beneath the building pad, foundations, utilities, and hardscape features as detailed in the project geotechnical report.

2. All earth excavation to the bottom of foundations, walls, pits, slabs, manholes, etc. as required and indicated on the Contract Drawings, or to a lower elevation to achieve required bearing capacity, as directed by the Owner's Geotechnical Engineer.

3. Excavation, filling and rough grading of site area at adjacent structures and roadways as required and within the Contract Limit Line.

4. Excavation, filling, grading and compacting to required elevations for all floors, slabs on grade, and structural slabs.

5. Excavation, filling, grading and compacting to required elevations for appurtenances and site work.

6. Filling and compacting of soil below foundation slab-on-grades, behind below grade walls, and beneath structural slabs.

7. Legal disposing off the site, of surplus excavated materials unsuitable for filling or backfilling.

8. Pumping and dewatering as required for work of this section and for foundation work.

9. Subgrade preparation for foundations.

10. Protection and monitoring of adjacent structures, structures to remain, utilities, and pavements.

11. Other labor and materials as may be reasonably inferred to be required to make the work under this Section complete.

C. The contractor shall coordinate all earthwork activities with the specialty ground improvement contractors such that all slab, foundation, utilities, and hardscape features bear on natural/competent material, are improved with ground improvement elements, or are addressed through a removal and replacement program. See geotechnical report.

D. The contractor shall coordinate all work with the specialty ground improvement contractor in the vicinity of utilities to remain. See geotechnical report.

1.2 RELATED SECTIONS

A. Ground Improvement

B. Concrete

C. Rock Excavating

D. Construction Drawings and Documents

1.3 HIGH PERFORMANCE BUILDING REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.4 REFERENCES

A. General: All work and materials under this section shall conform to the latest revision of the following standard specifications, where not otherwise required by the Contract Documents.

American Society for Testing and Materials (ASTM) – latest edition.

1. C 136 Test for Sieve Analysis of Fine and Coarse Aggregates.

2. D 422 Method for Particle Size Analysis of Soils.

3. D 1140 Test for Amount of Material in Soils Finer than No. 200 (75 mm) Sieve.

4. D 1556 Test for Density and Unit Weight of Soil in Place by the Sand-Cone Method.

5. D 1557 Test for Laboratory Compaction Characteristics of Soil Using Modified Effort (56,000 ft-lbf/ft3) (Modified Proctor).

6. D 2216 Laboratory Determination of Moisture content of Soil and Rock Mass.

7. D 2487 Classification of Soils for Engineering Purposes (Unified Soil Classification System).

8. D 6938 Tests Methods for In-Place Density and Water Content of Soil and Soil- Aggregate in Place by Nuclear Methods (Shallow Depth).

9. D 4253 Test Method of Maximum Index Density and Unit Weight of Soils Using a Vibratory Table.

10. D 4254 Test Methods for Minimum Index Density and Unit Weight of Soils and Calculations of Relative Density.

11. D 4318 Test for Plastic Limit, Liquid Limit, and Plasticity Index of Soils.

12. D 1883 Test Method for California Bearing ratio (CBR) of Laboratory Compacted Soils.

B. American Association of State Highway and Transportation Officials (AASHTO) – Latest edition.

1. T 88 Mechanical Analysis of Soils.

C. All work shall comply with the requirements of the 2018 Connecticut State Building Code (IBC 2015), and the requirements and regulations of any other Federal, State, or Local ordinances having jurisdiction.

D. All work and materials under this section shall conform to the following references:

1. Geotechnical Engineering Study, prepared by Langan (revised 11 November 2020).

E. Limits of Ground Improvement Work

1. See geotechnical report.

2. See structural and landscape plans.

3. See ground improvement specification.

F. Connecticut Department of Energy & Environmental Protection's General Permit for Contaminated Soil and/or Sediment Management (Staging and Transfer).

G. Connecticut DOT Form 819.

1.5 SUBMITTALS

A. Within ten days after award of the contract, the Contractor shall submit a schedule detailing the sequence, and time of completion of all phases of work under this section.

B. At least two weeks in advance of imported fill use, the Contractor shall submit the following laboratory test data and a 25-pound soil sample to the Owner's Geotechnical Engineer for review and approval:

1. Contractor to submit test reports on borrow material as follows:

a. Moisture and Density (modified proctor) Relationship: ASTM D1557.

b. Mechanical Analysis: AASHTO T-88.

c. Moisture content in accordance with ASTM D 2216.

d. Relative Density: ASTM D4254.

e. California Bearing Ratio (CBR): ASTM D1883, if utilized as subgrade material beneath paved areas.

f. Plasticity Index: ASTM 4318.

g. Test for Sieve Analysis of Fine and Coarse Aggregates: C 136.

2. Include data for all samples indicating the exact location and methods of transportation and placement of all materials.

3. Submit documentation for each of the imported material certifying them as "Clean Fill" in accordance with Part 2, Section 2.1, Article A of this specification and in accordance with Specification 02 6113.

C. The contractor shall submit the name of each material supplier and specific type and source of each material. Any change in source or soil type throughout the job requires approval of the Builder and the Owner's Consultants.

D. Samples: Submit a 12 inch by 12 inch sample of geosynthetic filter fabric.

E. Temporary Excavation Support Shop Drawings:

1. Submit detailed shop drawings and calculations, to be reviewed by the Owner's Geotechnical Engineer, of earthwork procedures and sequences including temporary excavation support systems, if required.

2. The temporary excavation support system drawings shall bear the signature and seal of a Professional Engineer registered in the State of Connecticut.

F. Dewatering: The contractor shall prepare dewatering shop drawings. The dewatering plan shall be designed by the contractor's engineer.

G. Pre-Construction Conditions Survey: The Contractor will perform a pre-construction conditions survey of all immediate offsite adjacent structures and surrounding critical site features, the results of which will be made available to the Owner and Design Team upon completion of the survey (include digital copies of photographs). The survey shall consist of photographic and video documentation and shall include a plan detailing the limits of the work and any observed damage.

H. Monitoring: Submit a plan showing location of proposed vertical and horizontal control points. Submit survey readings of the control points within 24 hours of the survey. Plan and survey readings shall be signed and sealed by a Land Surveyor registered in the State of Connecticut.

I. Certification for Examination of Site and Records: Before proceeding with the Work, submit certification in an acceptable form, signed by the Contractor, stating that careful examination has been made of the site, existing structures, records of utility lines, test boring records, test pit records, and subsurface exploration reports by the Owner's Geotechnical Engineer, the Drawings, and all other Contract Documents.

J. Submit approvals and permits to the General Contractor a minimum of 15 days prior to commencement of construction.

1.6 ENVIRONMENTAL CONSIDERATIONS

A. Install erosion control measures in the sequence shown of the plans or as directed by the Architect or regulatory agencies to protect adjacent properties and water resources from erosion and sediment damage.

B. Any off-site soil disposal requirement shall be performed in accordance with all applicable Local, State, and Federal regulations governing soil movement and disposal.

C. Dust and Erosion Control:

1. The Contractor shall take all necessary measures and provide equipment and/or materials to minimize dust from rising and blowing across the site and also to control surface water throughout the operation so that it does not run onto paved ways without being filtered. In addition, the Contractor shall control all dust created by construction operation and movement of construction vehicles, both on site and on paved ways. Comply with the 2002 Connecticut Sediment and Erosion Control Guidelines.

1.7 PROJECT CONDITIONS

A. The Contractor, by careful examination, shall inform himself as to the nature and location of the work; the conformation of the ground, the nature of the subsurface conditions; the location of the groundwater table; the character, quality and quantity of the materials to be encountered; the character of the equipment and facilities needed preliminary to and during the execution of the work; the conditions of adjacent structures and utilities and all other matters which can in any way effect the work.

B. The Contractor shall be held to have visited the site and to have familiarized himself with the existing conditions of adjoining utilities and structures.

C. The Contractor shall make his own deductions of the subsurface conditions which may affect the methods or cost of construction of the work hereunder, and he agrees that he will make no claims for damages or compensations, except as are provided under the agreement, should he find conditions during the progress of the work different from those as calculated and/or anticipated by him. Additional borings and other exploratory operations may be performed by Contractor, at the Contractor's option and following the Owner's approval. No change in the Contract Sum will be authorized for such additional exploration undertaken by the Contractor.

D. The Contractor shall investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to, ingress and egress of the site of the work. The Contractor shall conform to all University, City and State, and Federal regulations concerning the transportation of materials to and from and at the job site and shall secure in advance such permits as may be required.

1.8 PRE-CONSTRUCTION CONDITION SURVEY

A. The Contractor shall perform a pre-construction conditions survey of the structures and critical site features immediately adjacent to the work area, prior to the start of work and shall include the results of this survey with their shop drawings submittal to the Owner and Design Team before commencement of said work.

1.9 PROTECTION

A. Protection of Adjacent Structures, Utilities and Pavements

1. Prior to commencement of any work, consult the records for existing utilities, and note all conditions and limitations, which might affect the work required under this section.

2. The Contractor shall become acquainted with the existence and location of all surface and subsurface structures and utilities within the project area. Contractor shall not damage any of those that are to remain and shall leave them accessible.

3. The work shall be executed so that no damage or injury will occur to existing public and adjoining or adjacent structures, streets, paving, sewers, gas, water, electric or any other pipes. Should any damage or injury caused by the contractor, or anyone in Contractor's employ, or by the work under this Contract occur, the Contractor shall, at his own expense, make good such damage and assume all responsibility for such injury.

4. Provide barricades and warning lights, barriers, etc., to prevent accidents, to avoid all necessary hazards and protect the public, the work, and property at all times, including Saturdays, Sundays, and holidays.

5. The above shall also include the protection of all existing utilities to remain in use within and adjacent to the area affected by the work of this project.

6. Monuments, bench marks and other reference features on streets bounding this project, shall be protected. Should these be disturbed in any manner, the Contractor shall have them replaced at own expense.

7. Excavation work shall be restricted to hours indicated in the Contract Documents.

8. The Contractor's surveyor shall install control points on the adjacent structures and pavement for vertical and horizontal monitoring (to the nearest 0.005 ft.). Control points shall be monitored weekly during excavation and foundation construction work.

B. Protection of Excavation Bottoms

1. Facilities and materials needed to prevent earth at bottom of excavation from becoming frozen or unsuitable to receive the foundations shall be furnished.

2. The excavation shall not be carried to final grades during freezing weather without providing complete protection against freezing of the subgrades as specified hereinafter. Complete protection against freezing shall also be provided if freezing weather sets in after completion of the excavation to final subgrade. This protection shall include adequate heating and coverage of the area to maintain temperatures above freezing until foundations have been concreted and backfilled.

3. Where excavations have been brought to the bottom elevations called for on the drawings, and the bottom of these excavations become unsuitable in the opinion of the Owner's Geotechnical Engineer because of inadequate protection by the Contractor, these excavations shall be carried to lower depths sufficient to provide stable bearing as determined by the Owner's Geotechnical Engineer.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Imported Material: Imported fill should consist of a relatively well-graded mixture of sand and gravel. Suitable imported fill should be free of organics, clay, excessive silt, other deleterious or compressible materials, cinders, frozen material, trash, masonry, rubble, and other deleterious materials. In addition, any approved imported fill should be free of all hazardous substances. Grain-size distribution and modified Proctor compaction tests (ASTM D1557) should be made on representative samples of the imported fill proposed.

B. Imported clean fill shall be "Clean Fill" as defined in the Solid Waste Regulations found at Section 22a-209-1 of the Regulations of Connecticut State Agencies: "Clean fill" means (1) natural soil (2) rock, brick, ceramics, concrete, and asphalt paving fragments which are virtually inert and pose neither a pollution threat to ground or surface waters nor a fire hazard and (3) polluted soil as defined in subdivision (45) of subsection (a) of section 22a-133k-1 of the Regulations of Connecticut State Agencies which soil has been treated to reduce the concentration of pollutants to levels which do not exceed the applicable pollutant mobility criteria and direct exposure criteria established in sections 22a-133k-1 through 22a-133k-3 of the Regulations of Connecticut State Agencies and which soil is reused in accordance with R.C.S.A. subdivision (3) of subsection (h) of section 22a-133k-2 of such regulations. Documentation, including, but not limited to laboratory analytical reports and source location, shall be provided for review and approval by owner or owner's Licensed Environmental Professional prior to the importation of clean fill materials.

C. 3/4-Inch Crushed Stone: Crushed stone shall be a quarry product or washed gravel stone obtained from offsite sources for use as detailed on the drawings. Crushed stone shall consist of durable crushed rock or gravel stone essentially free of silt, clay, loam or other deleterious materials and shall conform to the following graduation requirements for the nominal size indicated.

SQUARE MESH SIEVES	PERCENT FINER BY WEIGHT
Pass 1 Inch	100
Pass 3/4 Inch	90 – 100
Pass 1/2 Inch	20 – 55
Pass 3/8 Inch	0 – 15
Pass No. 4	0 – 5

D. Surface Aggregate Course: Naturally or artificially graded non-plastic mixture of durable, sound coarse and fine aggregate and obtained from offsite sources. Mixture to be free of debris, waste, frozen materials, and organics, and shall be well graded within the following limits (processed stone, no gravel) and conforming to the requirements of CT DOT 817 M.02.06 Grading C:

SQUARE MESH SIEVES	PERCENT FINER BY WEIGHT
Pass 1.5 Inch	100
Pass 3/4 Inch	45-80
Pass 1/4 Inch	25-60
Pass No. 10	15-45
Pass No. 40	5-25

Pass No. 100	0-10
Pass No. 200	0-5

E. Base: Naturally or artificially graded non-plastic mixture of durable, sound coarse and fine aggregate and obtained from offsite sources. Mixture to be free of debris, waste, frozen materials, and organics, and shall be well graded within the following limits (processed stone, no gravel):

SQUARE MESH SIEVES	PERCENT FINER BY WEIGHT
Pass 2-1/2 Inch	100
Pass 2 Inch	95 - 100
Pass 3/4 Inch	50 - 75
Pass 1/4 Inch	25 - 45
Pass No. 40	5 - 20
Pass No. 100	2 - 12

F. Subbase: Subbase material for use as pavement subbase course and other uses as detailed shall be obtained from offsite sources. Base shall consist of a non-plastic mixture of durable, sound coarse and fine aggregate with no more than 15 percent by weight of recycled bituminous concrete and shall be well graded within the following limits:

SQUARE MESH SIEVES	PERCENT FINER BY WEIGHT
Pass 3-1/2 Inch	100
Pass 1-1/2 Inch	55 - 100

Pass 1/4 Inch	25 - 60
Pass No. 10	15 - 45
Pass No. 40	5 - 25
Pass No. 100	0 - 10
Pass No. 200	0 - 5

G. Bedding Material:

1. Type "A" Bedding: Well-graded gravels and gravel sand mixtures free of debris, waste, frozen materials, and organics within the following limits:

SQUARE MESH SIEVES	PERCENT FINER BY WEIGHT
Pass 1-1/2 Inch	100
Pass No. 4	10 - 50
Pass No. 200	0 - 5

2. Type "B" Bedding: Sand or sandy soil free of debris, waste, frozen materials, and organics within the following limits:

SQUARE MESH SIEVES	PERCENT FINER BY WEIGHT
Pass 3/8 Inch	100
Pass No. 4	100 - 95
Pass No. 200	0 - 10

H. Granular Fill (Also Termed Structural Fill): Granular fill shall be obtained from offsite borrow sources for use as fill and backfill below and interior to building areas except where other materials are specified or detailed, and as details on the drawings. Granular fill shall consist of non-plastic naturally or artificially graded mixture of sound coarse and fine aggregates free of debris, waste, frozen materials and organics and conforming to the following gradation:

SQUARE MESH SIEVES	PERCENT FINER BY WEIGHT
Pass 3-1/2 Inch	100
Pass 1-1/2 Inch	55 – 100
Pass 1/4 Inch	25 – 60
Pass No. 10	15 – 45
Pass No. 40	5 – 25
Pass No. 100	0 – 10
Pass No. 200	0 – 5

I. General Fill: Clean, sound mixture of satisfactory soils free of debris, waste, frozen materials and organics with 3-inch maximum size aggregate and not more than 12 percent passing the No. 200 sieve.

J. Flowable / Excavatable Fill: Mixture of cement, GranCem, sand, water and admixtures to produce a flowable / excavatable fill with a compressive strength at 28 days of 100 psi to 150 psi.Crushed Stone/Crushed Gravel/Drainage Aggregate: Free draining natural clean, crushed durable stone free of deleterious materials and conforming to the gradation requirements commercially known as ¾-inch clean crushed durable stone (AASHTO No. 57 or approved alternative). Recycled concrete aggregate shall not be acceptable.

K. Processed Aggregate: Coarse and fine aggregates mixed to conform to the gradation requirements of M.05.01 material as defined on Connecticut DOT Form 817.

L. The use of recycled concrete aggregate (RCA) is not permitted as a drainage backfill material against structures.

M. Filter Fabric: Mirafi 140N manufactured by TC Mirafi or approved equivalent woven geotextile filter fabric where specified.

N. The use of mole rock is not permitted.

PART 3 - EXECUTION

3.1 CODES, PERMITS AND REGULATIONS

A. Comply with all applicable laws, rules, and ordinances and regulations of the Federal Government, Connecticut, and other jurisdictions.

B. Obtain and pay for all permits and licenses required to execute and complete the work.

C. In case of conflict between regulations and specifications, the Contractor shall comply with the most stringent applicable codes, regulations or specifications.

3.2 PUMPING AND DEWATERING

A. Provide adequate pumps, or other equipment, appurtenances, power, drains, materials and labor necessary to excavation continuously dry during excavation, foundation construction, and backfilling and at such other times as the progress of the work may demand or as necessary to insure safety to the structure shall be provided.

B. All pumping both inside and outside the areas of the building shall be performed, continued and maintained as required for the completion of all work, including the work of the mechanical trades, throughout the period of the contract.

C. Contractor shall manage runoff to limit impact on construction.

D. The dewatering system or systems shall be installed and operated in such a manner as to avoid the movement of fines or loss of ground from below the bearing level and shall not influence the stability of surrounding areas. The facilities needed to eliminate loss of ground shall be included.

E. The Contractor shall not use any portion of the building foundation units or any part thereof as a sump for drainage resulting from pumping in any other area. The Contractor shall not conduct water to privately owned properties.

F. Any pumped groundwater which will require off-site disposal shall comply with all Local, State, and Federal Environmental Regulations.

3.3 EXCAVATION

A. Removal and Replacement

1. The existing fill and peat material within the limits of the proposed building are not suitable for foundation or slab support in their current state. In areas where the depths of unsuitable material, as documented in the geotechnical report referenced herein, are relatively shallow, the contractor may elect to perform a removal and replacement program in lieu of ground improvement (outlined in the ground improvement specification).

2. In areas of the removal and replacement program, the Contractor shall removal all unsuitable material to the top of natural stratified sand and gravel, weathered rock, or bedrock material within the footprint in this area and beyond (i.e. exterior edge) a horizontal distance equal to the depth of the over-excavation below the proposed footing elevation. The contractor shall minimize disturbance of the natural material using appropriate techniques (i.e., flat plate welded across bucket of backhoe). Contractor shall backfill accordingly to proposed grades with structural fill as defined herein.

3. Contractor shall coordinate all removal/replacement work with the specialty contractor installing ground improvement elements and with the architectural, structural, and site drawings.

4. The base or bottom of the excavation shall be as-built and overlain upon the foundation (within the building) or site plan (throughout the site). The contractor's licensed professional surveyor shall provide this information to the Geotechnical and Structural Engineer.

5. In lieu of structural fill, the contractor may use drainage fill (stone) to assist with backfilling operations in proximity to the dewatered level of the groundwater. Drainage fill shall be placed in maximum 12-inch thick lifts and compacted with appropriate equipment to achieve densification. A properly designed geosynthetic filter fabric (Mirafi 140N or equivalent) shall be placed on the top and sides of the drainage fill to serve as a means of preventing migration of overlying soil fill into the drainage fill layer.

6. The contractor shall proofroll the bottom of the excavation prior to placement of structural fill or drainage stone or excavate in a manner so as to obtain a firm and unyielding condition of the surface of the sand and gravel with excavation techniques which minimize disturbance. The excavation subgrade shall be observed and approved by the Owner's Geotechnical Engineer prior to the placement of any structural fill or drainage fill material. The excavation shall be maintained in a dewatered condition such that observation of the surface of the excavation and subsequent backfilling can be accomplished in a relatively dry condition. Should soft or yielding conditions be observed, the contractor shall remove and replace this material with approved suitable compacted material. If alternative drainage fill material is to be utilized by the contractor based on particular circumstances, the proposed material shall be submitted to the Owner's Geotechnical Engineer for review and approval.

B. General

1. Excavation work shall include removal and disposal of all materials encountered regardless of the nature of the materials and shall be understood to include but not limited to rock, boulders, earth, hardpan, fill, structures, utilities, pavements, curbs, piping and debris, and others. Re-use of existing fill material shall only be permitted if the material meets the requirements for structural fill.

2. All excavation shall extend to the dimensions and elevations required for the installation of the work described herein and as indicated on the Drawings. Excavation shall be made to a depth that will allow installation of full depth of concrete slabs, and sub-base as shown on the Drawings and within a 1 inch tolerance. Excavation lines shall provide sufficient clearance for the proper execution of all concrete work, including allowances for form work, shoring and inspection.

3. Materials that in the opinion of the Owner's Geotechnical Engineer are not suitable for fill and any surplus earth shall be removed from the site and legally disposed off-site.

4. Existing utility lines to be retained that are shown on the drawings or the locations of which are made known to the Contractor prior to excavation operations, shall be protected from damage during excavation and backfilling, and if damaged, shall be repaired by the Contractor, at own expense.

C. Excavation for Foundations

1. Foundation subgrades shall be inspected and approved by the Owner’s Geotechnical Engineer before proceeding with the construction of foundations. Bottoms of footings shall be founded on the natural sand and gravel material, structural fill or fill improved via rammed aggregate piers or controlled modulus columns having net allowable uniform bearing pressures as specified in the Structural Drawings and as approved by the Owner’s Geotechnical Engineer.

2. Subgrade of foundations shall be level and free of loose soil, debris, standing water and frost prior to acceptance for placing concrete. A Geotechnical Engineer shall inspect and approve the foundation subgrade to verify that the subgrade material is adequate to provide the recommended allowable bearing pressure.

3. Unauthorized Excavation: When suitable bearing material is encountered at subgrade elevations shown on Drawings and excavation is made to greater depth, the foundations and foundation walls shall be extended to the lower elevation with concrete of the same strength used for the foundations, at no additional cost to the Owner.

D. Subgrade Preparation

1. Natural undisturbed material shall be graded and compacted to attain a uniform surface. These areas shall be determined by the Owner’s Geotechnical Engineer.

2. Prior to constructing foundations, slabs, utilities, utility structures, fields, and paved/hardscape areas, the subgrade shall be proofrolled in the presence of the Owner’s Geotechnical Engineer for the following conditions:

a. Subgrades shall be proofrolled with a minimum of six passes of a 10-ton roller. For all other subgrades, proofrolling shall be accomplished with a minimum of six passes of a 5-ton walk-behind vibratory roller.

b. Foundation elements shall not be placed until the subgrade is approved by the Owner's Geotechnical Engineer. All structural fill footing subgrades shall be tested to confirm the top lift of the footing subgrade is compacted to the project specified requirement for structural fill material.

c. Soft Areas during Compaction: If any areas show pumping, noticeable weaving, or which are otherwise unsatisfactory, undercut material to competent material within the limits and extent suggested by the Owner's Geotechnical Engineer. These areas shall be replaced with either concrete of the same strength used for the foundation or structural fill, compacted to 95% of maximum dry density by ASTM D1557. The appropriate water content at the time of compaction should be plus or minus 2 percentage points of optimum moisture content as determined by the laboratory compaction test aforementioned, unless otherwise directed by the Engineer of Record. If structural fill is utilized, the excavation shall be oversized to include the zone of influence (1H:1V) beneath and beyond the footing and footing level.

d. Subgrades should be excavated level and if any cobbles or boulders are encountered at the footing subgrade level such that a relatively level subgrade is not achieved, the cobbles or boulders should be removed and replaced with compacted structural fill or compacted crushed stone.

e. Consideration should be given to protecting the natural sand and gravel subgrades after excavation utilizing either clean, crushed, durable, compacted ¾ inch stone, or a mud mat.

E. Excavation for General Grading:

1. Excavations made below the elevations shown or specified, unless authorized by Change Order, shall be filled and compacted as hereinafter specified, at no additional cost.

F. Trench Excavation:

1. Unless otherwise shown or specified, make trenches for piping and utilities not less than 16 inches or more than 24 inches wider than the outside width of the piping or utilities. Accurately grade bottoms of trenches with bell holes scooped out to provide uniform bearing and support of pipe and utilities on undisturbed soil throughout its entire length, except where other means of supporting pipe are indicated.

2. Trenches for underground conduit and piping, where necessary, shall be excavated to the required depth and bell holes shall be provided where necessary to insure uniform bearing. Trench excavation lines shall provide sufficient clearance for the proper execution of underground mechanical work.

3. Trenches shall be by open cut from the surface. No tunneling will be allowed except by consent of the Owner's Geotechnical Engineer. Irregularities at bottom of trench, or where excavation is below required depth, shall be refilled to required grade with compacted granular fill.

4. Pipe trenches shall be excavated and minimum cover shall be provided to required depths as per the Connecticut State Building Code. Excavated materials adjacent to trench as directed shall be neatly banked.

5. Where trenches are in wet or soft ground that in the opinion of the Owner's Geotechnical Engineer is unsuitable for supporting the piping, concrete cradles or approved equivalent shall be installed.

6. Where necessary, the sides of trenches and excavations shall be supported by adequate sheeting and bracing and conform with applicable OSHA regulations to insure proper construction and safety of the workers. The Contractor will be held responsible for the sufficiency of sheeting and bracing and for all damages to property or injury to persons resulting from improper quality, strength, placing, maintaining and removing of same.

7. Prior to utility installation, soil subgrades in the utility trenches should be proofrolled as specified herein. Pipe bedding should be placed and compacted in accordance with the pipe manufacturer's requirements or as indicated in the Drawings, whichever is more stringent.

8. Immediately after piping has been installed, tested, inspected, and accepted, piping shall be filled around with special care to solidly fill voids without causing injury to piping. Up to two feet above the pipe's crown, the utility excavation shall be backfilled using structural fill placed in 4-inch thick loose lifts. For the remainder of trench backfill, the excavation shall be backfilled using structural fill placed in 12-inch thick loose lifts. Each layer shall be compacted before placing the next layer. Backfill shall be in such a manner so as to prevent future settlement.

3.4 FILLING AND COMPACTING

A. General

1. Do not commence filling and backfilling operations until construction below finish grade has been approved, underground utilities and mechanical items inspected and tested, forms removed, waterproofing or damproofing and other improvements installed, trash and debris removed, and temporary and permanent bracing installed.

2. Do not commence backfilling, filling and grading until existing subgrade has been compacted to 95% of the material's maximum dry density as determined by the Modified Proctor Compaction Test (ASTM D1557).

3. Fill all excavations, backfill against all walls, and do all filling and grading necessary to bring the surfaces to the level required.

4. No fill material shall be placed on areas where free water is standing, or frozen subsoil area, or on surface which have not been approved for fill placement by the Owner's Geotechnical Engineer.

5. Do not backfill against concrete elements until the concrete has obtained its specified compressive strength.

6. Perform backfilling around foundation walls when the first floor provides sufficient bracing to withstand the backfill pressure. All other fill, backfill, and rolling to approximately finished grades shall then be completed.

7. Take particular care when rolling over areas where trenches or other excavations have been made and backfilled.

8. Grade bottoms of pavements and area way bottoms toward sediment pits or catch basins to maintain uniform thickness of the slabs.

B. Grading

1. Prior to placing fill or backfill in any area, grading is to be performed as required to provide for drainage. Ditching or filling around the area will be performed to intercept or divert all surface water. Within the area the ground which fill is to be placed will be graded so as to provide for unobstructed drainage from every point to a sump or other disposal point.

2. On completion of grading as specified above, closely examine to determine whether excessive wetness, springs, or other seepage of water can be observed at any point. If such conditions exist, positive drainage in suitable form, such as french drains or tilling, must be provided before placement of fill is undertaken.

C. Placement and Compaction of Controlled Fill and Backfill

1. Placement

a. Begin fill and backfilling in the lowest section of the area. Spread material evenly by mechanical equipment or by manual means above the approved compacted subgrade in lifts not exceeding 10 to 12 inches for material compacted by heavy machinery and 4 inches for material compacted by hand tamping. Build layers as horizontally as practical to prevent thickness of lift from exceeding that specified but provide with sufficient longitudinal and transverse slope to provide for runoff of surface water from every point.

b. Moisture Control: The moisture-density curve for the fill use shall be supplied to the Contractor as a guide in controlling moisture to achieve the required degree of compaction. If, in the opinion of the Owner's Geotechnical Engineer, fill material becomes too wet for the required compaction, the fill shall be dried by a method approved by the Owner's Geotechnical Engineer prior to commencing or continuing compaction operations. Likewise, if, in the opinion of the Owner's Geotechnical Engineer, the fill material becomes too dry for the required compaction, the fill shall be moistened by a method approved by the Owner's Geotechnical Engineer prior to commencing or continuing compaction operations. The water content at the time of compaction should be within 2% points of the optimum water content.

2. Compaction: Compact each lift to 95% of the maximum dry laboratory density by ASTM D1557. The degree of compaction shall be checked by the Owner's Geotechnical Engineer and each successive lift shall not be placed or compacted until the previous lift is inspected and approved by the Owner's Geotechnical Engineer. Compact the fill and backfill to elevations and limits shown on Drawings and is subject to final inspection and approval by the Owner's Geotechnical Engineer.

3. Drainage During Fill Operation: At all times, maintain and operate proper and adequate surface and subsurface drainage to the satisfaction of the Owner's Geotechnical Engineer in order to keep the construction site dry and in such condition that placement and compaction of fill may proceed unhindered by saturation of the area.

4. Frost: Do not place fill materials when either the fill materials or the previous lift (or subgrade) on which it is placed is frozen. In the event that any fill which has already been placed on the surface shall become frozen, it shall be scarified and re-compacted, or removed, to the approval of the Owner's Geotechnical Engineer before the next lift is placed. Remove or re-compact any soft spots resulting from frost to the satisfaction of the Engineer before new fill is placed.

3.5 MAINTENANCE

A. Protection of Graded Areas: Protect newly graded areas from traffic and erosion. Keep free of trash and debris.

B. Repair and re-establish grades in settled, eroded, and rutted areas to specified tolerances.

C. Reconditioning Compacted Areas: Where completed compacted areas are disturbed by subsequent construction operations or adverse weather, scarify surface, reshape, and compact to required density prior to further construction.

D. Settling: Where settling is measurable or observable at excavated areas, remove surface (pavement, lawn, or other finish), add backfill material, compact, and replace surface treatment. Restore appearance, quality, and condition of surface or finish to match adjacent work, and eliminate evidence of restoration to greatest extent possible.

3.6 QUALITY CONTROL AND INSPECTION

A. The Owner will employ, at his own expense, a Geotechnical Engineer to review all laboratory test results and submitted reports specified in this Section.

B. The Owner's Geotechnical Engineer will interpret the tests, state in each report whether or not the test specimens and results comply with all requirements of the Contract Documents and note any deviations.

C. The Owner's Geotechnical Engineer will identify when and where samples are to be obtained. Contractor shall collect samples and forward them to the Owner's Testing Laboratory for testing. Testing Laboratory will submit the following laboratory test reports to the Owner's Geotechnical Engineer:

1. Laboratory results conducted on each type of borrow and fill material:

   a. Gradation Analysis ASTM D422.

   b. Atterberg limits ASTM D 4318.

   c. Modified Moisture-density curve determination ASTM D1557.

2. Owner's Geotechnical Engineer will determine the conformance of materials to be used for fills.

D. Field Inspection:

1. Foundation Subgrades: Foundation subgrades shall be inspected by Owner's Geotechnical Engineer to verify the design bearing capacities. The bottom of excavation prior to placement of structural fill shall be observed and approved by the Owner's Geotechnical Engineer prior to placement of structural fill. No foundation shall be constructed unless the Owner's Geotechnical Engineer approves the subgrade.

2. Proofrolling: Proofrolling where required shall be inspected by Owner's Geotechnical Engineer.

3. Paved Area and Building Slab Subgrades: Owner's Geotechnical Engineer shall inspect subgrades for paved areas and building slabs. No pavement or slab shall be constructed unless the subgrade approved by the Owner's Geotechnical Engineer.

4. Backfilling and Compaction: Backfilling and compaction below paved areas, building slabs, behind the foundation walls, and any other backfilling and compaction work shall be inspected by the Owner's Geotechnical Engineer. No fill shall be placed unless the previous lift is approved by the Owner's Geotechnical Engineer. Owner's Geotechnical Engineer will take field density tests of the subgrade for every 2,500 sq- ft. but not less than 3 tests in each compacted fill layer. All footing subgrades within structural fill shall have field density tests. Perform field density tests in accordance with ASTM D6938.

E. Contractor shall cooperate with the Owner's Geotechnical Engineer in the performance of the required tests.

3.7 DISPOSAL OF EXCAVATED MATERIALS

A. Legally dispose the excavated material to an off-site disposal facility, in accordance with all Local, State, and Federal Environmental regulations.

3.8 ERRORS IN DEPTH

B. In the event that any part of the excavation is carried, through error, beyond the depth and the dimensions indicated on the drawings of called for in the specifications, then the Contractor, at his own expense, shall furnish and install gravel or stone with which to fill to the required level, in all locations except beneath footings and piers. At these locations, Contractor shall be required to fill to level of bottom footing with concrete mixed in the proportion of the foundations bearing on them. Where established bottoms as shown on drawings have not been maintained or have been disturbed by operations under this contract, they shall be cleaned out and filled with concrete mixed in the proportion of the footings bearing upon them, without additional cost to the Owner.

PART 4 - ALLOWANCES & UNIT RATES

4.1 ALLOWANCES & UNIT RATES

A. See Division 1 for required allowances and unit rates.

END OF SECTION

\\langan.com\data\NHV\data6\140202601\Project Data\Specifications\310800 - Earthwork.docx

THIS PAGE IS LEFT INTENTIONALLY BLANK

SECTION 311100 – CLEARING AND GRUBBING

PART 1 GENERAL

1.1 SECTIONS AND DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. The applicable provisions of the Connecticut Edition of the International Building Code, latest edition or as enforced by the local agency.

C. Architectural and Structural Plans and Specifications where the architectural and structural requirements are more stringent than the requirements outlined herein.

D. Section 02 01 00 – Protection of Existing Utilities

E. Section 31 25 00 – Soil Erosion and Sediment Control

F. Section 31 08 00 – Earthwork

G. Section 02 61 13 - Handling, Transport, Disposal of Excavated Soil

1.2 SCOPE OF WORK

A. Clearing Site of debris, grass, trees, and other plant life in preparation for Site or building earthwork.

B. Protection of existing structures, trees, or vegetation indicated in contract documents to remain.

C. Removal of existing sidewalks, drives, curbs, etc.

D. Removal of asphalt pavement and athletic courts where indicated on contract documents and as specified herein.

E. Stripping topsoil, if necessary, from areas that are to be incorporated into limits of project.

F. Disposal of cleared, grubbed, and stripped materials in accordance with all applicable codes and ordinances.

1.3 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.4 REFERENCE STANDARDS

The Connecticut Department of Energy & Environmental Protection's (CTDEEP) Guidelines for Soil Erosion and Sediment Control, latest edition.

1.5 ENVIRONMENTAL REQUIREMENTS

A. Construct temporary erosion control systems to protect adjacent properties and water resources from erosion and sedimentation.

B. Owner will obtain the Stormwater and Dewatering Wastewaters from Construction Activities permit for stormwater discharges associated with construction activities from the CTDEEP. Contractor shall conform to the requirements therein.

C. Contractor shall be totally responsible for conducting soil erosion and sediment control and the storm water management practices in accordance with all applicable permits and for enforcement action taken or imposed by federal or state agencies, including cost of fines, construction delays, and remedial actions resulting from contractor's failure to comply with all provisions of the applicable permits.

1.6 PROJECT CONDITIONS

A. Contractor to provide a thorough inspection of the site prior to bidding and accept the site as is.

B. Variations to conditions or discrepancy in actual or described as proposed conditions as they apply to site preparation operations are to be brought to the attention of the Owner prior to commencement of sitework.

PART 2 - PRODUCTS

2.1 MATERIALS

Off-site materials shall be transported to project using well maintained and operating vehicles. Once on site, transporting vehicles shall stay on designated haul roads and shall at no time endanger improvements by rutting, overloading, or pumping.

PART 3 - EXECUTION

3.1 PREPARATION

Verify existing plant life that is to remain and any clearing limits are clearly tagged, identified, and fenced in such manner as to insure their safety throughout construction operations.

3.2 PROTECTION

A. Locate and identify existing utilities that are to remain and protect from damage.

B. Protect trees, plant growth, and features not designated for removal.

C. Conduct operations with minimum interference to public or private accesses and facilities. Maintain ingress and egress at all times and clean or sweep roadways daily as required by the governing authority. Dust control shall be provided with sprinkling systems or equipment provided by contractor.

D. Protect benchmarks, property corners, and other survey monuments from damage or displacement. If marker needs to be removed it shall be referenced by a licensed land surveyor and replaced, as necessary, by same at contractor’s cost.

E. Provide traffic control as required, in accordance with the U.S. Department of Transportation's "Manual on Uniform Traffic Control Devices”, Connecticut Department of Transportation and local requirements.

3.3 CLEARING, GRUBBING AND STRIPPING

A. The Contractor shall clear areas required for execution of work.

B. Unless otherwise indicated on Construction Drawings, the contractor shall remove trees, shrubs, grass, other vegetation, improvements, or obstructions interfering with installation of new construction. Removal includes digging out stumps and roots. Depressions caused by clearing and grubbing operations are to be filled to subgrade elevation to avoid collecting water to form ponds. Satisfactory fill material shall be placed in accordance with Section 31 00 00.

C. Remove grass, trees, plant life, stumps, and other construction debris from site to dump site that is suitable for handling such material according to state laws and regulations.

D. The Contractor shall strip all asphalt within the building footprint area and 10 ft beyond, and from any other areas to receive new fill. Removed asphalt can be milled by the Contractor and asphalt millings can be reused as subbase material beneath new pavements. Asphalt to be used as recycled material shall be milled to form a well-graded material having a maximum particle size of 2 inches. The Contractor shall provide dust control measures during any milling process. Excess asphalt materials shall be properly disposed of in accordance with all applicable codes and ordinances.

3.4 TOPSOIL EXCAVATION

A. Satisfactory topsoil is reasonably free of subsoil, clay lumps, stones, weeds, roots, and other objectionable material.

B. Cut heavy growths of grass from areas before stripping and remove cuttings with remainder of cleared vegetative material.

C. Strip topsoil from areas that are to be filled, excavated, landscaped, or re-graded to such depth that it prevents intermingling with underlying subsoil or questionable material.

D. Stockpile topsoil in storage piles in areas acceptable to the Owner. Construct storage piles to freely drain surface water. Cover storage piles in compliance with the erosion and sedimentation control specifications to prevent windblown dust and waterborne erosion. Dispose of unsuitable topsoil as specified for waste material, unless otherwise specified by Owner. Excess topsoil shall be removed from site by Contractor unless specifically noted otherwise on Construction Drawings.

E. Stockpiled topsoil shall be reused as general fill in landscaped areas as permitted by Owner’s geotechnical engineer and as specified in specifications.

END OF SECTION

SECTION 312316 – EXCAVATION, BACKFILL AND SUBGRADE PREPARATION FOR PAVEMENT

PART 1 - GENERAL

1.1 RELATED SECTIONS AND DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 320000 – General Requirements

C. Section 312500 – Soil Erosion and Sediment Control

D. Section 310000 – Earthwork

E. Section 321216 – Asphaltic Concrete Paving

F. Section 321313 – Portland Cement Concrete Paving

G. Section 321613 – Curbs and Sidewalks

H. Contract Drawings and Documents

I. Geotechnical Engineering Investigation by Langan Engineering

1.2 SCOPE OF WORK

A. Excavation and backfilling to line, grade and configuration as shown in the Contract Documents and as described in these specifications for proposed asphaltic concrete, porous asphaltic concrete and Portland cement concrete pavement

B. Removal of unsuitable material beneath proposed paved areas.

C. Compacting fill materials in acceptable manner as specified herein.

1.3 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest

extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.4 REFERENCE STANDARDS

A. American Society for Testing and Materials (ASTM) - latest edition

1. D 422 Method for Particle Size Analysis of Soils
2. D 1557 Test for Moisture-Density Relations of Soils Using 10-lb (4.5 Kg) Hammer and 18-inch (457 mm) Drop (Modified Proctor)
3. D 2216 Laboratory Determination of Moisture content of Soil
4. D 2487 Classification of Soils for Engineering Purposes
5. D 2922 Tests for Density of Soil and Soil- Aggregate in Place by Nuclear Methods (Shallow Depth)
6. D 3017 Test for Moisture Content of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth)
7. D 4318 Test for Plastic Limit, Liquid Limit, and Plasticity Index of Soils

B. American Association of State Highway and Transportation Officials (AASHTO) - latest edition
T 88 Mechanical Analysis of Soils

C. All applicable OSHA Regulations

D. Geotechnical Engineering Study, prepared by Langan CT, Inc. dated 03 January 2020

1.5 QUALITY ASSURANCE

A. An Engineer, familiar with the requirements of the Subsurface Investigation and Contract Documents, selected and paid by the Owner (herein referenced to as “Owner’s Engineer”), may be retained to perform construction testing on filling operations and subgrade preparation as specified in section 31 00 00 and described herein. This inspection will not relieve the Contractor from his responsibility to complete the work in accordance with the plans and specifications.

1.6 SUBMITTALS

A. Submit gradation and certification of aggregate material that is to be used for review at least one week prior to use on-site.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Fill material from on-site as specified in Section 310000 of these Specifications and approved by the Owner's Engineer.

B. Fill material from off-site as specified in Section 310000 of these specifications and approved by the Owner's Engineer.

2.2 EQUIPMENT

A. Off-site materials shall be transported to project using well maintained and operating vehicles. Once on-site, transporting vehicles shall at no time endanger improvements by rutting, overloading, or pumping.

B. Excavation is to be performed using capable, well maintained equipment and methods acceptable to the Owner and the Contract Document requirements and schedule.

C. Compaction shall be performed using a 5-ton static drum weight, vibratory, smooth drum roller or as specified in the Geotechnical Report.

D. Smaller compaction equipment, together with thinner lifts may be required at areas of limited access or maneuverability. In such a case, the compaction equipment shall be a double drum walk-behind roller and shall be subject to the Owner's Engineer approval.

PART 3 - EXECUTION

3.1 PREPARATION

A. Identify lines, elevations, and grades necessary to construct pavements, curb, sidewalk, and roadways as shown on Contract Documents.

B. Protect benchmarks, property corners, and other survey monuments from damage or displacement. If marker needs to be removed it shall be referenced by licensed land surveyor and replaced, as necessary, by same.

C. Locate and identify site utilities that have previously been installed and protect from damage.

D. Locate and identify existing utilities that are to remain and protect from damage.

E. Overexcavate and properly prepare areas of subgrade that are not capable of supporting proposed systems. These areas shall be stabilized by using aggregate material placed and compacted as specified.

3.2 EXCAVATION

A. Excavate roadways and pavement areas to line and grade as shown on the Contract Documents.

B. Areas of existing curb islands, sidewalks and existing pavement failure shall be excavated to competent soil to the satisfaction of the Owner's Engineer. Excavation of soft soils will be required in both fill and overlay areas to the satisfaction of the Owner's Engineer.

C. Perform excavation using capable, well maintained equipment and methods acceptable to Owner and local governing agencies.

D. Where existing grades are above proposed subgrade elevation, excavate materials in the pavement areas to the subgrade elevations necessary based on the finished pavement lines and grades as shown in the Contract Documents being careful not to overexcavate beyond the elevations needed. Replacement of fill in areas overexcavated by the Contractor without approval of the Owner's Engineer shall be replaced as compacted fill in accordance with these Specifications at no additional cost to the Owner.

E. Excavated on-site soils that meet the requirements of Section 31 00 00 of these Specifications and approved by the Owner's Engineer may be used as fill on-site.

F. Excavated on-site soils that are unsuitable for fill may be used in landscaped areas if approved by the Owner's Engineer. Otherwise this material shall be legally disposed of off-site at no additional cost to the Owner.

G. Unsuitable material, such as wood and any other deleterious materials determined to be unsuitable by the Owner's Engineer for use as on-site fill shall be legally disposed of off-site at no additional cost to the Owner.

3.3 SUBGRADE PREPARATION

A. Existing grades below areas of proposed pavement shall be leveled prior to fill placement or paving. The Contractor shall remove existing trees, roots, stumps, organic wetland soils, and top soil in these areas prior to placement of any fill and legally dispose of this material off-site at no additional cost to Owner.

B. The Contractor shall drain any standing or puddled water in low lying areas.

C. All existing grades below areas of proposed pavement shall be proofrolled and compacted with a minimum of 6 overlapping passes using the vibratory drum roller specified in part 2.02 of this Section prior to placement of pavement subbase. Existing areas which exhibit "pumping" or "rutting" under the action of the roller shall be removed and replaced with suitable fill material as specified in Section 310000 of these Specifications, or as directed by the Owner's Engineer.

D. Excavated on-site soils that are unsuitable for pavement subgrade below paved areas may be used in landscaped areas if approved by the Owner's Engineer. Otherwise this material shall be legally disposed of off-site at no additional cost to the Owner.

E. Unsuitable material, such as wood and any other deleterious materials determined to be unsuitable by the Owner's Engineer for use as on-site fill shall be legally disposed of off-site at no additional cost to the Owner.

3.4 SUBGRADE FILL PLACEMENT AND COMPACTION

A. Fill material shall not be placed in areas of standing water, in areas of frozen or thawing ground, or in areas that have not been approved by the Owner's Engineer.

B. Fill materials shall not be placed during unfavorable weather conditions. When work is interrupted by heavy rains, fill operations shall not be resumed until all saturated surficial soils are returned to a satisfactory moisture content as determined by the Owner's Engineer.

C. Maintain optimum moisture content of fill materials as specified herein to attain required compaction density.

D. Materials shall be tested in accordance with Section 310000.

E. If compaction requirements are not complied with at any time during construction process, remove and recompact deficient areas until proper compaction is obtained at no additional expense to Owner.

F. Fill lift surfaces shall be made smooth and free from ruts or indentations at the end of any work day when significant precipitation is forecast to prevent saturation of surficial fill material. Fill surfaces shall be graded to drain and sealed with a smooth drum roller at the completion of each work day.

G. Subgrade fill in paved areas shall be placed in uniform loose lifts and compacted in accordance with the Specifications.

H. Wet, saturated material shall be removed and replaced or scarified and air dried as necessary to achieve the field densities specified in this Section. Drying may be assisted by discing, harrowing, or pulverizing until moisture content is reduced.

I. Prior to paving, the subgrade shall be proofrolled with a minimum of 6 overlapping passes using a 5-ton static drum weight vibratory roller.

J. Remove areas of finished subgrade found to have insufficient compaction density of depth necessary and replace with suitable compacted fill as approved by the Owner or Owner's Engineer. Surface of subgrade after compaction shall be hard, uniform, smooth, stable, and true to grade and cross-section.

3.5 MAINTENANCE OF APPROVED SUBGRADE SURFACES

A. Finished subgrades shall be verified to ensure proper elevation and conditions for construction above subgrade.

B. Protect subgrade and binder course from excessive wheel loading during construction including concrete trucks, dump trucks, and other construction equipment.

C. Remove areas of finished subgrade found to have insufficient compaction density to depth necessary and replace in manner that will comply with compaction requirements by use of material that has been approved by the Owner's Engineer. Surface of subgrade after compaction shall be hard, uniform, smooth, stable, and true to grade and cross-section.

3.6 FINISH GRADING

A. Finish grading shall be in accordance with Section 310000.

3.7 QUALITY CONTROL

A. Compaction tests shall be performed by the Owner's Engineer as specified in Section 310000 together with the following for areas of proposed pavement:
In cut areas, not less than one compaction test for every 15,000 square feet.
In fill areas, one test for every 15,000 square feet for each lift.

B. Prior to paving, the finished subgrades shall be verified by the Contractor to ensure proper elevation and conditions for construction above subgrade.

C. Tolerances of 0.10 feet will be permitted. Any deviation from the design grades shall not result in changes in drainage areas or ponding. The Contractor shall provide engineering and field staking necessary for verification of lines, grades, and elevations.

END OF SECTION

SECTION 312319 - DEWATERING

PART 1 – GENERAL

1.1 RELATED SECTIONS AND DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Comply with water disposal requirements of authorities having jurisdiction.

C. General Permit for Stormwater from Construction Activities

D. Section 31 08 00 – Earthwork

E. Section 31 23 33 – Trench Excavation and Backfill for Utilities

F. Geotechnical Engineering Study prepared by Langan

1.2 SCOPE OF WORK

A. Construction dewatering.

B. Erosion and Sediment Control

1.3 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.4 PERFORMANCE CRITERIA

Design, provide, test, operate, monitor, and maintain a dewatering system of sufficient scope, size, and capacity to control ground-water flow into excavations and permit construction to proceed on dry, stable subgrade.

PART 2 - PRODUCTS

2.1 PRODUCTS

All pumps, hoses, electricity, erosion control measures needed.

PART 3 - EXECUTION

3.1 PREPARATION

A. Protect structures, utilities, sidewalks, pavements, and other facilities from damage caused by settlement, lateral movement, undermining, washout, and other hazards created by earthwork operations.

B. Prevent surface water and subsurface or ground water from entering excavations, from ponding on prepared subgrades, and from flooding surrounding area.

C. Protect subgrade and foundation soils from softening and damage by rain or water accumulation.

D. Install dewatering system to ensure minimum interference with roads, streets, walks, and other adjacent occupied and used facilities.

E. Accomplish dewatering without damaging existing buildings adjacent to excavation.

3.2 DEWATERING

A. Install dewatering system using wells, well points, or similar methods complete with pump equipment, standby power and pumps, filter material gradation, valves, appurtenances, water disposal, and surface-water controls.

B. Before excavation below ground-water level, place system into operation to lower water to specified levels and then operate it continuously until drains, sewers, and structures have been constructed and fill materials have been placed, or until dewatering is no longer required.

C. Dispose of water removed from excavations in a manner to avoid endangering public health, property, and portions of work under construction or completed. Dispose of water in a manner to avoid inconvenience to others. Provide sumps, sedimentation tanks, and other flow-control devices as required by authorities having jurisdiction.

D. Promptly repair damages to adjacent facilities caused by dewatering operations.

END OF SECTION

SECTION 312333 – TRENCH EXCAVATION AND BACKFILL FOR UTILITIES

PART 1 - GENERAL

1.1 RELATED SECTIONS AND DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 310000 – Earthwork

C. Section 312319 – Dewatering

D. Section 331116 – Site Water

E. Section 333000 – Site Sanitary Sewers

F. Section 334100 – Storm Sewer Systems

G. Section 337100 – Utilities

H. Construction Documents and Drawings

I. Local Utility Company Requirements

J. Geotechnical Engineering Study, prepared by Langan

1.2 SCOPE OF WORK

A. Excavating trenches for the installation of utilities.

B. Backfilling trench with bedding material as specified and finish filling trenches with suitable material to proposed subgrade.

C. Compacting subgrade, bedding, and backfill materials in an acceptable manner.

D. Compliance with all environmental and health and safety regulations.

1.3 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a

construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.4 REFERENCE STANDARDS

A. American Society for Testing and Materials (ASTM) Latest Edition

1. D 422 Method for Particle Size Analysis
2. D 698 Test of Moisture Density Relations of Soils - Standard Proctor Method
3. D 1557 Test for Moisture-Density Relations of Soils Using 10-lb. (4.5 Kg)
4. Hammer and 18-inch (457 mm) Drop (Modified Proctor)
5. D 2216 Laboratory Determination of Moisture Content of Soil
6. D 2487 Classification of Soils for Engineering Purposes
7. D 2922 Tests for Density of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth)
8. D 3017 Test for Moisture Content of Soil and Soil-Aggregate in Place by Nuclear Methods (Shallow Depth)
9. D 4318 Test for Plastic Limit, Liquid Limit, & Plasticity Index of Soils

B. American Association of State Highway and Transportation Officials (AASHTO) latest edition

1. T 88 Mechanical Analysis of Soils

1.5 QUALITY ASSURANCE

A. A Geotechnical Engineer, selected and paid by owner, may be retained to perform construction inspection and testing on backfilling operations. This inspection will not relieve the Contractor from his responsibility to complete the work in accordance with the plans and specifications.

1.6 SUBMITTALS

A. The Contractor shall contact all utility companies and identify any requirements. Contractor shall provide written confirmation of the status of all utility construction to the Owner at the time of the preconstruction conference or no later than 30 days following the project possession date.

B. Submit gradation and origin for each type of offsite fill and/or bedding material that is to be used in backfilling.

1.7 PROJECT RECORD DOCUMENTS

A. Accurately record actual locations of all subsurface utilities, structures and obstructions encountered.

B. Accurately record any as-built variation from the construction plans and specifications. The Contractor shall provide as-built drawings within 30 days of project completion.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Bedding Material: AASHTO No. 67 processed sand and gravel free from debris, clay lumps, organic, or other deleterious material, and complying with following gradation requirements:

1. U. S. Sieve: Size Percent Passing (by weight)

a. 1 Inch: 100
b. 3/4 Inch: 90-100
c. 3/8 Inch: 20-55
d. No. 4: 0-10
e. No. 8: 0-5

B. Backfill material as approved by the owner and/or the Geotechnical Engineer and utility provider.

PART 3 - EXECUTION

3.1 PREPARATION

A. Set all lines, elevations, and grades for utility and drainage system work and maintain for the duration of work. Provide careful maintenance of benchmarks, property corners, monuments, or other reference points.

B. Protect and maintain in operating condition, existing utilities encountered during utility installation. Repair any damage to surface or subsurface improvements shown on Drawings.

C. Verify location, size, elevation, and other pertinent data required to make connections between existing utilities and drainage systems, and proposed construction indicated on Drawings. Coordinate all building utility connection locations and elevations with architectural plans. Contractor shall comply with all local codes and regulations.

D. Install dewatering systems that will be required to construct the proposed utilities to the design elevations and using the methods described herein. Water pumped out of excavations shall be disposed of on-site, and will not be discharged directly to the city storm drainage system.

E. Over-excavate and properly prepare areas of subgrade that are not capable of supporting the proposed systems. These areas are to be stabilized by using acceptable backfill materials and/or additional bedding material placed and compacted as specified to the satisfaction of the Geotechnical Engineer.

3.2 EXCAVATION

A. Contact local utility companies before excavation begins. Dig trenches at proper width and depth for laying pipe, conduit, or cable and in accordance with utility company requirements. Cut trench banks for safety and remove stones as necessary to avoid point-bearing.

B. All trench excavation side walls shall be sloped, shored, sheeted, braced or otherwise supported by means of sufficient strength to protect the workmen within them in accordance with the applicable rules and regulations established for construction by the Department of Labor, Occupational Safety and Health Administration (OSHA), and by local ordinances. Lateral travel distance to an exit ladder or steps shall not be greater than 25 feet in trenches 4 feet or deeper.

C. Trench width requirements below the top of the pipe shall not be less than 12 inches nor more than 24 inches wider than the outside surface of any pipe or conduit that is to be installed. All other trench width requirements for pipe, conduit, or cable shall be the minimum practical width that will allow for proper compaction of trench backfill and satisfy safety and utility company regulations.

D. Accurately grade trench bottom to an elevation 6 inches below the pipe, as per bedding details in construction drawings. Provide uniform bearing and support for each section of pipe on bedding material at every point along the entire length, except where necessary to excavate for bell holes, pipe joints, or other required connections. Dig bell holes and depressions for joints after trench bottom has been graded. Dig no deeper, longer, or wider than needed to make the joint connection properly.

E. During excavation, stockpile excavated material suitable for backfilling in an orderly manner far enough from the trench to avoid overloading, slides, or cave-ins.

F. Remove excavated materials from the site which are not suitable for backfill.

G. Any abandoned structures, utilities or debris discovered during excavation shall be removed and disposed of.

H. Utility alignments have been designed to avoid expected obstructions wherever possible. If unanticipated significant obstructions are encountered during utility installation work immediately notify the Owner and Engineer.

I. Prevent surface water from flowing into trenches or other excavations by temporary grading or other methods, as required. Remove accumulated water in trenches or other excavations by pumping or other acceptable methods.

J. Utility installation shall meet the following minimum pipe installation depths, or applicable codes and ordinances, measured from finished grade or the paved surface.

1. Water Mains: 54-inch minimum to top of pipe barrel, or as required by the local utility company, whichever is deeper.
2. Sanitary Sewer: Elevations, and grades as indicated on Drawings.
3. Storm Sewer: Elevations, and grades as shown on Drawings.
4. Electrical Conduits: 30-inch minimum to top of secondary service conduits, 36" minimum to the top of primary service conduits, or as required by NEC 300-5, NEC 710-36 codes, or the local utility company requirements, whichever is deeper.

5. Telephone Conduits: 18-inch minimum to top of conduit, or as required by the local utility company, whichever is deeper.
6. Gas Mains and Service: 30-inch minimum to top of pipe, or as required by the local utility company, whichever is deeper.

3.3 LATERALS

A. All utilities intended to connect to services within any building will be extended to within 5 feet of the exterior face of building in the direction and elevation to connect at those geometrical locations indicated or inferred on the drawings. All utility ends will be plugged and marked by a 2" x 4" piece of wood extending from the utility invert to 4 feet above final grade.

3.4 PIPE BEDDING

A. Accurately cut trenches for pipe or conduit to designated line and grade 6 inches below the bottom of the pipe, to width as specified previously. Compact trench bottoms a minimum of 95% of the maximum dry density as determined by ASTM D1557, Modified Proctor Test.

B. Over-excavate wet or unstable soil, if encountered, from trench bottom as necessary to provide a suitable base for continuous and uniform bedding.

C. Place bedding material and compact in 6 inch loose lifts to obtain at least 95% of the maximum dry density. Accurately shape bedding material to conform to lower portion of pipe barrel. After pipe installation, place and compact bedding material as specified above in maximum 6 inch loose layers to the springline of the pipe.

3.5 BACKFILLING

A. After pipe or conduit has been installed, bedded and tested as necessary, backfill trench to finish grade in 8 inch thick loose lifts of approved fill soils, compacting and testing each lift as specified above.

B. Systematically backfill to allow maximum time for natural settlement. Do not backfill over porous, wet, frozen or spongy subgrade surfaces. Should these conditions exist, the areas should be removed, replaced and recompacted.

3.6 COMPACTION

A. Exercise proper caution when compacting immediately over top of pipes or conduits.

B. Maintain optimum moisture content of fill materials to attain required compaction density.

END OF SECTION

SECTION 312500 – SOIL EROSION AND SEDIMENT CONTROL

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 310000 - Earthwork

C. Contract Drawings and Documents

D. CT DEEP General Permit for Stormwater Discharge from Construction Activities

1.2 SCOPE OF WORK

A. Temporary and permanent soil erosion control systems.

1.3 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.4 REFERENCE STANDARDS

A. The Connecticut Department of Energy & Environmental Protection's (CTDEEP) Guidelines for Soil Erosion and Sediment Control, latest edition

1.5 QUALITY ASSURANCE

A. The Contractor shall carefully adhere to the construction sequence that is shown on the Contract Drawings.

B. The Contractor shall follow Soil Erosion and Sediment Control Notes that are shown on the Contract Drawings.

C. The Contractor shall make frequent inspection of temporary soil erosion controls and maintain them in working order until permanent soil erosion controls are established.

1.06 ENVIRONMENTAL REQUIREMENTS

A. The Contractor shall protect adjacent properties and water resources from soil erosion and sediment damage throughout construction.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Quick-growing grasses such as wheat, rye or oats in accordance with Contract Drawings.

B. Fencing for siltation control as specified on the Contract Drawings.

C. Fibrous blankets by North American Green SC150BN, biodegradable, or approved Equal.

D. Temporary mulches such as loose hay, straw, netting, wood, cellulose or agricultural silage.

E. Filter fabric as specified on the Contract Drawings, or approved equal.

F. Haybales free from invasive species

PART 3 - EXECUTION

3.1 PREPARATION

A. Review site conditions and sediment control plans.

B. Review the soil erosion and sediment control plans as they apply to current conditions. Any proposed deviation from the plans must be submitted to the Owner’s Engineer in writing 72 hours prior to commencing that work.

3.2 SOIL EROSION CONTROL AND SLOPE PROTECTION IMPLEMENTATION

A. Place soil erosion control systems in accordance with the Contract Documents prior to any earthwork construction.

B. Limit the surface area of erodible earth material exposed by clearing and grubbing, excavation, borrow and embankment operations by following the construction phasing on the Soil Erosion and Sediment Control Plan.

C. The Contractor will be required to incorporate all permanent soil erosion control features into the project at the earliest practical time to minimize the need for temporary controls. Cut slopes shall be permanently seeded and mulched as the excavation proceeds to the extent considered desirable and practical. Equip catch basins with filter fabric inlet protection immediately upon construction.

D. The temporary soil erosion control systems installed by the Contractor shall be maintained as directed by the Owner's Engineer to control siltation at all times during the life of the contract. The Contractor must respond to any maintenance or additional work ordered by the Owner's Engineer within a 48 hour period.

E. Slopes that erode easily shall be temporarily seeded as the work progresses with quick growing grass grains of wheat, rye or oats unless otherwise specified in the Landscape Specifications. In areas where seeding is ineffective, as determined by the Owner's Engineer or other governing authorities, the Contractor shall provide fibrous netting as shown on Contract Drawings at no additional cost to the Owner.

F. All soil erosion control measures shall be maintained until all permanent improvements to the site are complete unless otherwise directed by the Owner's Engineer.

END OF SECTION

SECTION 320000 – GENERAL SITE REQUIREMENTS

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SCOPE OF WORK

A. The work generally includes, but is not limited to, the following:

1. Soil Erosion and Sediment Control Measures
2. Earthwork
3. Placement of Compacted Fill
4. Removal of Cut
5. Rough Grading of Grass Areas
6. Construction of Storm Drainage System
7. Construction of Sanitary Sewer System
8. Construction of Site Water System
9. Construction of On-Site Utilities
10. Construction of Curbs
11. Construction of Site Walks
12. Paving of Parking Areas and Roadways
13. Paving of Playground Areas
14. Traffic Striping and Signage
15. Fine Grading of Grass Areas
16. Landscaping
17. Site Lighting

B. Associated work items as described in the Contract Drawings and Documents and all construction methods and procedures necessary for the performance of the work.

C. The Site Contractor shall provide adequate personnel, facilities, material, and equipment to complete the work shown on the Contract Drawings and Documents and as specified herein and in accordance with the requirements of the town within the agreed upon schedule. When these specifications are at variance, the more restrictive requirements shall apply. The Contractor shall employ a qualified supervisor to provide adequate and efficient coordination of the Work and to adhere to all requirements set forth in this specification and general construction practices within the State of Connecticut and those required by the town. The Supervisor shall be present on the site on a continuous full-time basis and have authority to act on behalf of the Contractor.

D. The Contractor shall obtain and pay for the construction of all related site work. The Contractor shall pay for all other fees and services, give notice, file necessary drawings, and obtain permits and certificates of approval required in connection with the related work of their contracts, comply with laws, ordinances, rules and regulations of departments having jurisdiction over this work.

E. Additional Owner and Engineer time for repeat inspections of punch list items after the initial inspections will be charged to the Contractor in the form of a deductive change order.

1.3 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.4 CONTRACTOR TO ACCEPT SITE CONDITIONS AND CONTRACT DOCUMENTS

A. The Contractor shall accept the site as is. The Contractor shall make and shall be deemed to have made a thorough site inspection in order to field check existing site conditions, correlate conditions with the drawings and resolve any possible construction conflicts with the Owner and Owner's Engineer prior to commencement of work. This includes a topographic survey of any areas the Contractor requires additional topographic information, and subsurface utility investigations. Any conditions that differ from the existing conditions shown on the drawings that are not brought to the attention of the Owner and Owner's Engineer prior to the start of work shall not be considered grounds for a change order.

B. The work to be performed is as shown on the Contract Drawings. Attempts have been made to note all specific items on the drawings. The contractor is responsible for means and methods of construction; as such, these plans may not completely represent all specific site details of installation required for sitework construction. Contractor is responsible to provide all improvements required to achieve construction depicted on these plans. Incidental items not included in the Contract Documents shall be constructed in accordance with standard engineering or architectural requirements. It shall be the Contractor's responsibility to repair or replace any existing facilities (utilities, streets, sidewalks, etc.) damaged by him during the work. Such repairs or replacement shall be done at the Contractor's own expense to the satisfaction of the Owner.

C. The Contractor shall provide written requests for information to the Owner and Owner's Engineer prior to the construction of any specific sitework item if any sitework item depicted on the plans warrants additional engineering information required for construction and is not related to means and methods of construction. The Contractor shall be responsible for sitework items installed differently than intended as depicted on the plans in the absence of submitting and receiving reviews and/or direction on written requests for information from the Owner or Owner's Engineer.

D. It is specifically noted that information related to elevations and proposed utilities (such as roadway grades, invert elevations, rim elevations, grate elevations, building finished floor elevations, etc.) may be found in more than one location on the contract documents. Contractor shall specifically review all plans, profiles and any information/data tables for consistency prior to construction. Any inconsistencies or discrepancies that are found shall immediately be brought to the attention of the Owner's Engineer in writing requesting clarification prior to construction.

E. Contractor is specifically noted that there are additional notes, specifications and requirements contained on sheets throughout the plan set and available references to specifications from applicable governing authorities and industry standards. It is the contractor's responsibility to obtain, review and adhere to all applicable requirements.

F. Contractor's acceptance of the project contract specifically binds the contractor to the requirements noted above and contained in this entire document.

G. Contractor is specifically noted that the project is subject to the conditions and requirements of the following permits:

1. Permit: Wetlands Permit
   Agency: Town of Trumbull Inland Wetlands and Watercourses Commission
   Permit No.: TBD
2. Permit: General Permit for the Discharge of Stormwater and Dewatering Wastewaters from Construction Activities
   Agency: CTDEEP – Water Discharge
   Permit No.: TBD
3. Permit: Certificate
   Agency: OSTA
   Permit No.: TBD

1.5 INDEMNIFICATION

A. The Contractor shall indemnify and save harmless the Owner, and its respective agents, officers, employees and Owner's Engineer (herein collectively called the "indemnities") from and against any and all liability, loss, damages, interest, judgments and liens growing out of, and any and all costs and expenses (including, but not limited to, counsel fees and disbursements) arising out of, or incurred in connection with, any and all claims, demands, suits, actions, or proceedings which may be made or brought against any of the indemnities for or in relation to any violation of this Contract, the laws, statutes, ordinances, rules, regulations, executive orders and agreements herein provided or any injuries, including death at any time resulting therefrom, sustained by any person or persons, or on account of any damage to property, arising out of or in consequence of the performance of or the failure to perform the contract, whether or not such injuries to persons or damage to property are due

or claimed to be due to any negligence of the Contractor or its employees, agents, subcontractors or materialmen, the indemnities or any other person.

1.6 WARRANTIES

A. The Contractor shall correct defective work at the Contractor's expense which appears within one year's time from acceptance of work. Failure of Contractor to correct such defects within a reasonable time after being notified to do so shall permit the Owner to cause such defects to be corrected and charge the Contractor the cost of corrections.

B. The Contractor shall submit to the Owner and Owner’s Engineer all material warranties supplied by manufacturers.

1.7 GENERAL QUALITY ASSURANCE

A. References and Standards: The Contractor shall comply with all rules, regulations, laws and ordinances of all Authorities having jurisdiction. All labor, materials, equipment, and services necessary to make the work comply with such requirements shall be provided without additional cost. All Standards shall be the latest edition and revisions.

B. The Contractor shall deliver material to the site, in the approved Manufacturer's original and unopened containers and packaging, bearing labels as to type of material, brand name and manufacturer's name. Delivered materials shall be identical to approved samples. Certifications for materials shall be included with the shipment.

C. The Contractor shall store material under cover (if appropriate) in a clean, dry, above-ground location, and remove materials which are damaged or otherwise not suitable for installation from the job site and replace with acceptable materials.

1.8 SECURITY

A. Protect work, existing premises and Owner's operations from theft, vandalism, and unauthorized entry.

B. Initiate and maintain security program as described herein throughout construction period until Owner acceptance precludes the need for Contractor security.

C. Restrict entrance of persons and vehicles into project site. Allow entrance only to authorized persons with proper identification. Maintain log of workers and visitors, make available to Owner on request.

D. Maintain a list of authorized persons; submit copy to Owner on request.

1.9 SAFETY PROVISIONS:

A. Site safety is entirely the responsibility of the Contractor. The Contractor is hereby made aware that the Owner's Engineer does not have the authority to stop the work on the grounds of unsafe work practices.

B. The Contractor shall give all notices and comply with all laws, ordinances, rules and regulations as required by all authorities having jurisdiction bearing on the conduct of the Work as specified.

C. If any of the Contractor's work is performed contrary to such laws, ordinances, rules and regulations, and/or without the required notices, he shall bear all cost arising therefrom.

D. The Contractor shall also give prior written notice to all concerned utility companies, agencies, authorities, owners, etc., at least forty-eight (48) hours in advance of commencing any work on this Contract.

E. Maintenance materials, including extra materials, spare parts, tools, and software.

1.10 SUBMITTALS:

A. General:
1. The Contractor shall submit to the Owner's Engineer and to Town Officials and/or the Town Engineer, where required, sufficient documentation from the manufacturers that all material and products used by the Contractor meet the required specifications. Such documentation shall be submitted and reviewed prior to the delivery of the material.
2. This documentation shall include shop drawings, vendor drawings, manufacturer's specifications and catalog cuts. The shop drawings shall include plans, elevations, sections and details of the work showing in detail the methods of installation and all data and assumptions considered in the design.
3. The Owner's Engineer will review appropriate documentation for general compliance to the specifications prior to delivery. The Owner's Engineer's review will be made on a timely basis.
4. The review of the Owner's Engineer or failure to review shall not be construed as permitting any departure from Contract requirements, or as relieving the Contractor of responsibility for any errors, including details, dimensions or materials. If submittals show variations from Contract requirements, the Owner's Engineer may review such variations, subject to a proper adjustment in the Contract. If the Contractor fails to describe such variations, he shall not be relieved of the responsibility for executing work in accordance with the Contract Documents even though such submittals identifying other variations have been reviewed. It is specifically noted that variations from items depicted on the plan require the review and approval of the Town Engineer.
5. All submittals required by specifications shall be submitted, unless otherwise stated herein, as follows:

    a. Specifications – One electronic or three paper copies of material specifications shall be submitted to the Owner's Engineer unless agreed that less copies will be sufficient.
    b. Shop Drawings – One electronic or three paper copies shall be submitted to the Owner's Engineer.

6. The work shall not begin until all required submittals for each segment of work have been reviewed.

1.11 PROJECT COORDINATION

A. Cooperate with the Owner when necessary in allocation of mobilization areas of the site for field offices and sheds, for access, traffic and parking facilities.

B. Comply with Owner procedures for intraproject communications; submittals, reports and records, schedules, coordination drawings, and recommendations and resolution of ambiguities and conflicts.

C. Comply with instructions of the Town and the Owner for use of temporary utilities and construction facilities.

D. Submit preliminary progress schedule and coordinate with project construction schedule. After review, revise and resubmit schedule to comply with revised project schedule. During progress of work revise and resubmit as directed.

E. Provide information required by Owner and Owner’s Engineer for preparation of coordination drawings.

F. Notify Owner and Owner’s Engineer when work is considered ready for substantial completion. Accompany Owner’s Engineer on preliminary inspection to determine items to be listed for completion or correction in Contractor's Notice of Substantial Completion and punchlist.

1.12 PROGRESS SCHEDULE

G. The Contractor shall submit a detailed schedule for approval by the Owner before beginning work and shall adhere to the approved schedule. The schedule, which shall list all major and minor construction tasks, shall be based on the requirements set forth by the Owner and Construction Manager and shall be in accordance with the construction phasing plans. All work shall be done in a continuous manner unless otherwise directed by the Owner and Construction Manager and shall be completed at a satisfactory rate of progress. If in the opinion of the Owner, or his/her representative, work is not being done at a satisfactory rate of progress, the Owner may order the Contractor to increase his work force to insure completion of the project on schedule.

1.13 PERMIT APPLICATIONS AND COMPLIANCE

A. The Contractor shall carefully plan and coordinate his work so as to comply with all criteria, conditions and the intent of all project permits.

1.14 ENVIRONMENTAL PROTECTION

A. It is the Contractor's responsibility to assure himself that all applicable Federal, State and local laws, concerning pollution and environmental protection are being complied with by his personnel and subcontractors.

B. When Contractor is in, or it is anticipated that any part of the work may become in non-compliance with applicable Federal, State, and local laws or regulations, the Owner may issue an order stopping all or part of the work until satisfactory corrective actions have been taken, or may order supplemental actions to be taken to stay in, or come into, compliance. No part of the time lost due to any such stop order shall be made subject of a claim for extensions of time, or for extra compensation or damages by the Contractor.

C. In particular, the Contractor shall not allow the discharge of concrete, mortar, grout, gasoline, diesel, or the washing from vessels containing these materials, or other construction materials, into public areas, onto adjacent properties or the sewage or stormwater conveyance systems.

D. Contractor shall provide and maintain all facilities necessary for pollution control under this Contract as long as construction operations continue.

1.15 CONTRACTOR'S REPRESENTATIVES

A. The Contractor shall provide and maintain a capable and experienced field person to oversee all contract operations. The Contractor shall submit references for his proposed representative to, and obtain approval from, the Owner and/or Owner’s Engineer prior to the start of construction. The representative shall be on-site during all operating hours of the project.

B. As appropriate, the Contractor or his subcontractors shall provide qualified supervisory personnel for specialist aspects of the work, such as concrete, landscaping, and site furnishings.

1.16 JOB OFFICE

A. General:

1. The Contractor shall provide and maintain a suitable site trailer for the use of his supervising personnel at a location agreed upon by the Owner and/or Owner’s Engineer.
2. The offices shall be equipped with appropriate facilities, including, telephone, internet, water, heat, air conditioning, and electricity. The cost for maintaining the office facilities and the trailer shall be paid for by the Contractor for the duration of the project. The contractor shall arrange for weekly office trailer cleaning.
3. The Contractor shall provide and maintain in a neat and sanitary condition such temporary sanitary conveniences and accommodations for the use of his employees and Owner’s Representative as may be necessary to comply with the requirements and regulations of the Department of Health and other governing agencies having legal jurisdiction.
4. The Contractor shall provide all security necessary and be entirely responsible for protection of equipment and materials supplied and used in conjunction with his work.
5. The office shall be maintained throughout the course of construction and shall be removed upon final acceptance of the Contract work.

1.17 SITE ACCESS

A. General
   1. The Contractor shall construct any construction access ways shown on the Drawings or as required prior to the execution of his work. The contractor shall be required to maintain all necessary access and parking areas, haul roads, ramps and any other temporary facilities required by the Owner to insure safe and satisfactory operation of the facility and completion of the work in accordance with the schedule. Cleanliness of off-site streets (both private and public) shall be maintained by the Contractor throughout construction. All public roadways shall be kept free of debris and sediment that result from the subject work. The contractor will provide daily sweeping if required by the Town.
   2. The Contractor shall coordinate construction fencing with the Owner.

1.18 EXISTING CONDITIONS, UTILITIES AND STRUCTURES

A. Prior to the beginning of any grading work, the Contractor shall make sufficient checks on the topographic conditions and subsurface utilities to satisfy himself that the existing information as shown on the topographic survey and contract documents are adequate for construction. Should any discrepancies be found, they shall be reported to the Owner's Engineer immediately. Claims for extras due to discrepancies in the existing conditions will not be reviewed if the Owner's Engineer and Owner are not notified immediately (within 24 hours of beginning of site work).

B. Verify Locations: Locations of existing underground utilities and structures as shown on the Contract Documents are approximate and may not necessarily be complete. These locations must be verified by the Contractor prior to construction. It is specifically noted that the contractor may require the use of a utility location service in the event the Contractor deems it necessary to perform this verification.

C. Prior to construction of the sanitary, water, gas, electric, telephone, cable and storm sewer systems, the Contractor shall conduct test pits at all proposed utility crossings with existing underground utilities and/or storm pipes. Elevations of existing utilities shall be accurately recorded and submitted to the Owner's Engineer for verification of the proposed design. Any necessary adjustments to the proposed design will be made by the Owner's Engineer in a timely manner.

D. The Contractor is specifically made aware that the exact depth and location of the off-site water and gas mains are unknown. The Contractor shall perform test pits prior to installation of the new laterals where shown on the plans to verify the depth and location of existing connection points.

E. Avoid Damage: The Contractor shall exercise care to avoid damage to all existing structures, poles, utilities, pipes, etc. which are scheduled to remain. In locations where the excavation is carried beneath or adjacent to such facilities, the Contractor shall adequately support such structures, utilities or pipes as necessary to remain in operation and maintain their original position. The Contractor shall be responsible for any damage caused to any utilities by this work, and shall repair any damage without charge to the Owner.

F. The Contractor shall provide written requests for information to the Owner and Owner's Engineer prior to the construction of any specific item if any specific item depicted on the plans warrants additional information required for construction and is not related to means and method of construction. The Contractor shall be responsible for specific sitework items installed differently than intended as depicted on the plans in the absence of submitting and addressing written requests for information.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Use materials appropriate to the work, and meeting with the Owner’s Engineer's approval.

PART 3 - EXECUTION

3.1 GENERAL

A. Execute general measures as appropriate, and meeting with the Owner’s Engineer's approval.

END OF SECTION

SECTION 321216 – ASPHALTIC CONCRETE PAVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 312316 - Excavation, Backfill, and Subgrade Preparation for Pavement

C. Section 321613 - Curbs and Sidewalks

D. Section 321723 - Pavement Markings

E. Connecticut Department of Transportation Standard Specifications, latest edition.

F. Contract Drawings and Documents

1.2 SCOPE OF WORK

A. Preparation and placement of asphaltic concrete binder course.

B. Preparation and placement of asphaltic concrete surface course.

1.3 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

5. T 245 Marshall Mix Design

E. Connecticut Department of Transportation Standard Specifications, latest edition.

F. Municipal Standards

1.5 QUALITY ASSURANCE

A. At the discretion of the Owner, an Engineer, selected and paid by Owner (herein referenced to as “Owner’s Engineer”, may be retained to perform construction testing of in-place asphaltic concrete courses for compliance with requirements for thickness, compaction, and surface smoothness. Asphaltic surface and base courses shall be randomly cored at minimum rate of 1 core per 20,000 sq. ft of paving. However, no less than 3 cores in light duty areas and 3 cores in heavy duty areas shall be obtained. Coring holes shall be immediately filled with full-depth asphaltic concrete. Asphaltic concrete pavement samples shall be tested for conformance with mix design.

B. Establish and maintain required lines and elevations.

C. In-place compacted thickness shall not be less than thickness specified on Contract Documents. Areas of deficient paving thickness shall receive tack coat and minimum 1-in. overlay; or shall be removed and replaced to proper thickness, at discretion of Owner; until specified thickness of course is met or exceeded at no additional expense to Owner.

D. Testing shall be performed on finished surface of each asphalt concrete course for smoothness, using 10-ft straightedge applied parallel with, and at right angles to centerline of paved area. Results of tests shall be made available to Owner upon request. Surfaces will not be acceptable if the following 10-ft straightedge tolerances for smoothness are exceeded:

1. Base Course Surface: 1/4-inch
2. Wearing Course Surface: 3/16-inch

E. Check surface areas at intervals necessary to eliminate ponding areas. Remove and replace unacceptable paving as directed by Owner.

F. Field density test for in-place materials shall be performed by examination of field cores in accordance with one of following standards:

1. Bulk specific gravity of paraffin-coated specimens: ASTM D 1188.
2. Bulk specific gravity using saturated surface-dry specimens: ASTM D 2726.

G. Rate of testing shall be 1 core per 20,000 sq. ft of pavement, with minimum of 3 cores. Cores shall be cut from areas representative of project. Areas of insufficient compaction shall be delineated, removed, and replaced in compliance with Specifications at no additional expense to Owner.

1.6 SUBMITTALS

A. Design Mix: Before any asphaltic concrete paving is constructed, submit actual design mix to the Owner's Engineer for review and/or approval. Design mix shall be CTDOT approved. Submittal shall include the type/name of the mix, sources of coarse aggregate, fine aggregate, mineral filler and PG binder, gradation analysis for aggregate used within final mixes and final aggregate mix blend, grade of asphalt cement used, voids in mineral aggregate (VMA), voids filled with asphalt (VFA), air void percent and effective asphalt content (percent). Mix design over three (3) years old will not be accepted by the Owner's Engineer.

B. Material Certificates: Submit materials certificate to the Owner's Engineer which is signed by material producer and Contractor, certifying that materials comply with, or exceed, the requirements herein.

C. Testing Results: Results of concrete, steel and paving tests performed by Contractor's testing laboratory shall be submitted to Owner's Engineer in a timely manner.

D. The results of tests for the day of installation shall be submitted to the Field Engineer with the first truck delivery each day of asphalt placement.

1.7 PROJECT CONDITIONS

A. Weather Limitations:

1. Apply tack coats when ambient temperature is above 40 degrees Fahrenheit, and when temperature has been above 35 degrees Fahrenheit for 12 hours immediately prior to application. Do not apply when base is wet, contains excess moisture, or during rain.

2. Construct asphaltic concrete paving when atmospheric temperature is above 40 degrees Fahrenheit.

B. Maintain access for vehicular and pedestrian traffic as required for other construction activities. Utilize temporary striping, flagmen, barricades, warning signs, and warning lights as required.

PART 2 - PRODUCTS

2.1 MATERIALS

A. All materials shall conform to the applicable sections of the CTDOT Standard Specifications except as modified herein.

B. Aggregate Base Course: Crushed aggregate base course shall conform to the CTDOT Standard Specifications, Material M.05.01 processed aggregate base with no more than 8% passing the No. 200 sieve.

C. Asphalt Binder: AASHTO M 332, Performance Grade 64E-22.

D. Aggregate for Bituminous Concrete Surface Course: HMA S0.375, shall meet the requirements of Table M.04.02-3 for Traffic Level 2 per Section M.04 of the CTDOT Standard Specifications.

E. Aggregate for Bituminous Concrete Binder Course: HMA S0.5, shall meet the requirements of Table M.04.02-3 for Traffic Level 2 per Section M.04 of the CTDOT Standard Specifications.

F. Tack Coat: Emulsified asphalt; AASHTO M 140 or AASHTO M 208, SS-1h, CSS-1, or CSS-1h, diluted with 1 part water to 1 part emulsified asphalt.

G. Bituminous Concrete Surface Course: HMA S0.5, shall meet the requirements of Tables M.04.02-2, M.04.02-4 and M.04.02-5 for Traffic Level 2 per Section M.04 of the CTDOT Standard Specifications.

H. Bituminous Concrete Binder Course: HMA S0.5, shall meet the requirements of Tables M.04.02-2, M.04.02-4 and M.04.02-5 for Traffic Level 2 per Section M.04 of the CTDOT Standard Specifications.

I. Joint Sealant: ASTM D6690, Type 2, hot-applied, single-component, polymer-modified bituminous sealant.

J. Air voids: 4 +/- ½%

K. The use of reclaimed asphalt pavement (RAP) in new bituminous pavement will not be permitted.

L. Asphalt plants shall conform to the requirements of AASHTO M156 including plant inspections.

2.2 EQUIPMENT

A. Maintain equipment in satisfactory operating condition and correct breakdowns in manner that will not delay or be detrimental to progress of paving operations.

PART 3 - EXECUTION

3.1 PREPARATION

A. Proof roll prepared base material surface to check for unstable areas. Paving work shall begin only after unsuitable areas have been corrected and are ready to receive paving.

B. Remove loose material from compacted base material surface immediately before applying prime coat.

3.2 APPLICATIONS

C. Tack Coat:

1. Apply to contact surfaces of previously constructed asphaltic concrete base courses or Portland cement concrete and surfaces abutting or projecting into asphaltic concrete or into asphaltic concrete pavement.
2. Apply tack coat to asphaltic concrete base course. Apply emulsified asphalt tack coat between each lift or layer of full depth asphaltic concrete bases and on surface of bases where asphaltic concrete paving will be constructed.
3. Apply emulsified asphalt tack coat in accordance with Connecticut Department of Transportation Standard Specifications.
4. Apply at minimum rate of 0.05 gal per sq. yd of surface.
5. Allow to dry until at proper condition to receive paving.

3.3 ASPHALTIC CONCRETE PLACEMENT

A. Place asphaltic concrete mixture on completed compacted subgrade surface, spread, and strike off. Do not place bituminous concrete pavement upon a wet surface. Ambient air temperature shall be at least 40 degrees F and rising. Delivery and mat temperature of the bituminous concrete mixes during paving operations shall be between 275 and 325 degrees F.

B. Whenever possible, pavement shall be spread by finishing machine; however, inaccessible or irregular areas may be placed by hand methods. Hot mixture shall be spread uniformly to required depth with hot shovels and rakes. After spreading, hot mixture shall be carefully smoothed to remove segregated course aggregate and rake marks. Rakes and lutes used for hand spreading shall be type designed for use on asphalt mixtures. Loads shall not be dumped faster that they can be properly spread. Workers shall not stand on loose mixture while spreading.

C. Paving Machine Placement: Apply successive lifts of asphaltic concrete in transverse directions with surface course placed parallel to flow of traffic. Place in typical strips not less than 10-ft wide.

D. Joints: Make joints between old and new pavements, or between successive days and work in manner that will provide continuous bond between adjoining work. Construction joints shall have same texture, density, and smoothness as other sections of asphaltic concrete course. Clean contact surfaces of joints and apply tack coat.

3.4 ROLLING AND COMPACTION

A. Mixture, after being spread, shall be thoroughly compacted by rolling as soon as it will bear the weight of rollers without undue displacement. Number, weight, types of rollers, and sequences of rolling operations shall be such that required density and surface are consistently attained while mixture is in workable condition.

B. The bituminous concrete pavement shall have a minimum thickness as specified on the Contract Documents and should be compacted to a minimum of 96% of the maximum unit weight as determined by the Marshall Mix Design Procedures in accordance with ASTM D-1559.

C. Compact mixture with hot hand tampers or vibrating plate compactors in areas inaccessible to rollers.

D. Breakdown Rolling: Accomplish breakdown or initial rolling immediately following rolling of joints and outside edge. Check surface after breakdown rolling and repair displaced areas by loosening and filling with hot material.

E. Second Rolling: Follow breakdown rolling as soon as possible, while mixture is hot. Continue second rolling until mixture has been thoroughly compacted.

F. Finish Rolling: Perform finish rolling while mixture is still warm enough for removal of roller marks. Continue rolling until roller marks are eliminated and course has attained maximum density.

G. Patching: Remove and replace paving areas mixed with foreign materials and defective areas. Cut out such areas and fill with fresh, hot asphaltic concrete. Compact by rolling to maximum surface density and smoothness.

H. Protection: After final rolling, do not permit vehicular traffic on pavement until it has cooled and hardened. Erect barricades to protect paving from traffic until mixture has cooled enough not to become marked.

I. Scheduling: After complete placement of the base course the contractor may be required to remobilize for the placement of the top course. This schedule requirement will be based on the building progress, and fully at the discretion of the Owner’s Engineer.

END OF SECTION

SECTION 321313 – PORTLAND CEMENT CONCRETE PAVING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 310000 - Earthwork

C. Section 312316 - Excavation, Backfill, and Subgrade Preparation for Pavement

D. Connecticut Department of Transportation Standard Specifications, latest edition.

E. Contract Drawings and Documents

1.2 SCOPE OF WORK

A. Preparation and placement of Portland cement concrete sidewalk, pad areas, and other concrete areas identified on Contract Documents

1.3 REFERENCE STANDARDS

A. American Concrete Institute (ACI) latest edition
   1. 301 Specifications for Structural Concrete for Buildings
   2. 304R Guide for Measuring Mixing, Transporting and Placing Concrete
   3. 308 Standard Practice for Curing Concrete

B. American Society for Testing and Materials (ASTM) latest edition
   1. A 185 Steel Welded Wire Fabric, Plain for Concrete Reinforcement
   2. C497 Steel Welded Wire Fabric, Deformed, for Concrete Reinforcement
   3. A615 Deformed and Plain Billet-Steel for Concrete Reinforcement
   4. C33 Concrete Aggregates
   5. C 94 Ready-Mixed Concrete
   6. C 150 Portland Cement
   7. C 260 Air-Entraining Admixtures for Concrete
   8. D 309 Liquid Membrane-Forming Compounds for Curing Concrete
   9. C494 Chemical Admixtures for Concrete
   10. C1751 Performed Expansion Joint Fillers for Concrete Paving and Structural Construction (Nonextruding and Resilient Bituminous Types)
   11. FS TT C 800 - Curing Compound, Concrete, for New and Existing Surfaces.

C. Connecticut Department of Transportation Standard Specification, latest edition.

1.4 QUALITY ASSURANCE

A. The Contractor shall pay for the services of a test laboratory, approved by the Engineer, for concrete inspection. The test laboratory shall have at least one Professional Engineer on staff and shall submit proof that any concrete inspectors used on the project shall have successfully completed the ACI course in Concrete Inspection within the past year.

B. Establish and maintain required lines and elevations.

C. Check surface areas at intervals necessary to eliminate ponding areas. Remove and replace unacceptable work as directed by Owner's Engineer.

D. Sweep concrete pavement and wash free of stains, discolorations, dirt, and other foreign material just prior to final inspection.

E. Protect concrete from damage until acceptance of work. Exclude traffic from pavement for at least 14 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of material.

1.5 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.6 SUBMITTALS

A. Submit materials certificate to the Owner's Engineer, which is signed by materials producer and Contractor, certifying that materials comply with, or exceed, requirements specified herein.

B. The Contractor shall retain an independent testing agency to perform the required tests. The Contractor shall provide any necessary assistance to the testing agency and provide the testing agency with the intended construction schedule at least one week prior to the start of construction.

C. Submit concrete mix design to the Owner's Engineer for review at least 14 days prior to use.

D. Testing results of concrete, steel and paving tests performed by Contractor's testing laboratory shall be submitted to Owner's Engineer in a timely manner.

1.7 PROJECT CONDITIONS

A. Maintain access for vehicular and pedestrian traffic as required for other construction activities. Utilize temporary striping, flagmen, barricades, warning signs, and warning lights as required.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Forms: Steel, wood, or other suitable material of size and strength to resist movement during concrete placement and to retain horizontal and vertical alignment until removal. Use straight forms, free of distortion and defects. Use flexible spring steel forms or laminated boards to form radius bends as required. Forms shall be of depth equal to depth of curbing or sidewalk, and so designed as to permit secure fastening together at tops. Coat forms with nonstaining type of coating that will not discolor or deface surface of concrete.

B. Welded Wire Mesh: Welded plain cold-drawn steel wire fabric, ASTM A 185.

C. Reinforcing Bars: Deformed steel bars, ASTM A 615, Grade 60.

D. Concrete materials: Comply with applicable requirements for concrete materials, admixtures, bonding materials, curing materials and others as required. Concrete shall have a minimum 28-day compressive strength of 4000 psi.

E. Joint Sealers: Resilient premolded bituminous impregnated fiberboard units complying with ASTM D 1751 FS HH-F-341, Type II, Class A.

F. Welded wire fabric as indicated on Contract Documents.

2.2 MIX DESIGN AND TESTING

A. Concrete mix design and testing shall comply with requirements of ACI.

B. Design mix to produce normal weight concrete consisting of Portland cement, aggregate, water reducing admixture, air entraining admixture, and water to produce following properties:
   1. Compressive Strength: 4,500 psi, minimum at 28 days, unless otherwise indicated on Contract Documents.
   2. Slump Range: 4-inches +/- 1-inch at time of placement
   3. Air Entrainment: 5 to 7 percent

PART 3 - EXECUTION

3.1 PREPARATION

A. Proof-roll prepared base material surface to check for unstable areas. Paving work shall begin only after unsuitable areas have been corrected and are ready to receive paving. Compaction testing for the base material shall be completed prior to the placement of the paving.

B. Remove loose material from compacted base material surface to produce firm, smooth surface immediately before placing concrete.

3.2 INSTALLATION

A. Form Construction
   1. Set forms to require grades and lines, rigidly braced and secured.
   2. Install sufficient quantity of forms to allow continuance of work and so that forms remain in place minimum of 24 hours after concrete placement.
   3. Check completed formwork for grade and alignment to following tolerances:
      a. Top of forms not more than 1/8-inch in 10-ft
      b. Vertical face on longitudinal axis, not more than
      c. 1/4-inch in 10 ft
   4. Clean forms after each use and coat with form release agent as often as required to ensure separation from concrete without damage.
   5. Install 6-inch x 6-inch welded wire fabric as indicated on Contract Documents. Support wire on metal wire chairs to ensure that wire stays mid-depth of sidewalk section during concrete pour.

B. Reinforcement: Locate, place and support reinforcement in accordance with Contract Documents and ACI.

3.3 CONCRETE PLACEMENT

A. Place concrete in accordance with requirements of Connecticut Department of Transportation Standard Specifications and ACI requirements.

B. Do not place concrete until base material and forms have been checked for line and grade. Moisten base material if required to provide uniform dampened condition at time concrete is placed. Concrete shall not be placed around manholes or other structures until they are at required finish elevation and alignment.

C. Deposit and spread concrete in continuous operation between transverse joints, as far as possible. If interrupted for more than 1/2 hour, place construction joint. Automatic machine may be used for curb and gutter placement at Contractor’s option. Machine placement must produce curbs and gutters to required cross-section, lines, grades, finish and jointing as specified for formed concrete. If results are not acceptable, replace with formed concrete as specified.

D. Concrete placement in poor weather conditions shall be subject to limitation of ACI.

E. Joint Construction: Construct expansion, weakened-plane control or contraction, and construction joints straight with face perpendicular to concrete surface. Construct traverse joints perpendicular to centerline, unless otherwise detailed.
   1. Weakened-Plane Control or Contraction Joints: Provide joints per the drawings. Construct control joints for depth equal to at least 1/4 concrete thickness, as follows:
   2. Form tooled joints in fresh concrete by grooving top with recommended tool and finishing edge with jointer.
   3. Form sawed joints using powered saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut joints into hardened concrete as soon as surface will not be torn, abraded, or otherwise damaged by cutting action.
   4. Construction Joints: Place concrete joints at end of placements and at locations where placement operations are stopped for period of more than 1/2 hour, except where such placements terminate at expansion joints. Construct joints using standard metal keyway-section forms.
   5. Expansion Joints: Locate expansion joints per the drawings. Provide premolded joint filler for expansion joints abutting concrete curbs, catch basins, manholes, inlets, structures, sidewalks, and other fixed objects.

F. Joint Fillers: Extend joint fillers full width and depth of joint, and not less than 1/2-inch or more than 1-inch below finished surface where joint sealer is indicated. Furnish joint fillers in one-piece lengths for full width being placed, wherever possible. Where more than one length is required, lace or clip joint filler sections together.

3.4 CONCRETING FINISHING

A. After striking off and consolidating concrete, smooth surface by screening and floating. Adjust floating to compact surface and produce uniform texture. After floating, test surface for trueness with 10-ft straightedge. Distribute concrete as required to remove surface irregularities, and refloat repaired areas to provide continuous smooth finish.

B. Work edges of sidewalks, gutters, back top edge of curb, and formed joints with edging tool, rounding edge to 1/2-inch radius. After completion of floating and trowelling, when excess moisture or surface sheen has disappeared, complete surface finishing, as follows:

C. Paving: provide course, nonslip finish by scoring surface with stiff-bristled broom perpendicular to flow of traffic.

D. Curbs and sidewalks: Broom finish by drawing fine haired broom across surface perpendicular to line of traffic. Repeat operation as necessary to produce a fine line texture.

E. After form removal, clean ends of joints and point up minor honeycombed areas. Remove and replace areas or sections with major defects, as directed by Owner’s Engineer.

F. Protect and cure finished concrete paving using acceptable moist curing methods, more particularly described in "water curing" section of ACI 308.

3.5 BACKFILL

A. After the concrete has set sufficiently, the spaces in front and back of the curb or sidewalk shall be refilled to the required elevation with suitable material in accordance with Section 310000, which shall be compacted until firm and solid and neatly graded.

3.6 CLEANING AND ADJUSTING

A. Sweep concrete pavement and wash free of stains, discolorations, dirt, and other foreign material just prior to final inspection.

B. Protect concrete from damage until acceptance of work. Exclude traffic from pavement for at least 14 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of materials.

END OF SECTION

SECTION 321613 – CONCRETE CURB AND SIDEWALKS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 310000 - Earthwork.

C. Section 312316 - Excavation, Backfill and Subgrade Preparation for Pavement.

D. Section 321313 - Portland Cement Concrete Paving

   9. C494 Chemical Admixtures for Concrete
   10. C1751 Performed Expansion Joint Fillers for Concrete Paving and Structural Construction (Nonextruding and Resilient Bituminous Types)
   11. FS TT C 800 - Curing Compound, Concrete, for New and Existing Surfaces.

C. Connecticut Department of Transportation Standard Specifications, latest edition.

D. Town of Enfield Standard Requirements

1.4 QUALITY ASSURANCE

A. The Contractor shall warrant that concrete curb and base is 4,500 psi unless otherwise noted on the Construction Documents.

B. Establish and maintain required lines and elevations.

C. Check surface areas at intervals necessary to eliminate ponding areas. Remove and replace unacceptable work as directed by Owner.

D. Sweep concrete pavement and wash free of stains, discolorations, dirt, and other foreign material just prior to final inspection.

E. Protect concrete from damage until acceptance of work. Exclude traffic from pavement for at least 30 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of material.

1.5 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.6 SUBMITTALS

A. Submit concrete mix design to the Owner's Engineer for review at least 14 days prior to use.

1.7 PROJECT CONDITIONS

A. Contractor shall maintain access for vehicular and pedestrian traffic as required for other construction activities. Utilize temporary striping, flagmen, barricades, warning signs, and warning lights as required.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Forms: Steel, wood, or other suitable material of size and strength to resist movement during concrete placement and to retain horizontal and vertical alignment until removal. Use straight forms, free of distortion and defects. Use flexible spring steel forms or laminated boards to form radius bends as required. The forms shall be of a depth equal to the depth of curbing or sidewalk, and so designed as to permit secure fastening together at the tops. Coat forms with non-staining type coating that will not discolor or deface surface of concrete.

B. Concrete Materials: Comply with requirements of Connecticut Department of Transportation Standard Specifications and applicable Section 321613 for concrete materials, admixtures, bonding materials, curing materials and others as required. Concrete shall have a minimum 28-day compressive strength of 4,500 psi.

C. Joint Fillers: Resilient pre-molded bituminous impregnated fiberboard units complying with AASHTO M 213.

D. Welded wire fabric as indicated on Contract Documents.

2.2 MIX DESIGN AND TESTING

A. Concrete mix design and testing shall comply with requirements of ACI.

B. Design mix to produce normal weight concrete consisting of Portland cement, aggregate, water-reducing admixture, air-entraining admixture, and water to produce the following properties:
   1. Compressive Strength: 4,500 psi, minimum at 28 days, unless otherwise indicated on the Contract Drawings.
   2. Slump Range: 3-inches +/- 1-inch at time of placement
   3. Air Entrainment: 5 to 7 percent

PART 3 - EXECUTION

3.1 PREPARATION

A. Proof-roll prepared base material surface to check for unstable areas. The paving work shall begin after any unsuitable areas have been corrected and are ready to receive paving. Compaction testing for the base material shall be completed prior to the placement of the paving.

B. Surface Preparation: Remove loose material from compacted base material surface to produce a firm, smooth surface immediately before placing concrete.

3.2 INSTALLATION

A. Form Construction
   1. Set forms to required grades and lines, rigidly braced and secured.
   2. Install sufficient quantity of forms to allow continuance of work and so that forms remain in place a minimum of 24 hours after concrete placement.
   3. Check completed formwork for grade and alignment to following tolerances:
   4. Top of forms not more than 1/8-inch in 10-ft.
   5. Vertical face on longitude axis, not more than 1/4-inch in 10-ft.
   6. Clean forms after each use, and coat with form release agent as often as required to ensure separation from concrete without damage.
   7. Install 6-inch x 6-inch welded wire fabric as indicated on Contract Documents. Support wire on metal wire chairs to ensure that wire stays mid-depth of sidewalk section during concrete pour.

B. Concrete Placement
   1. Comply with applicable requirements of ACI and Architectural Specifications.
   2. Do not place concrete until base material and forms have been checked for line and grade. Moisten base material if required to provide uniform dampened condition at time concrete is placed. Concrete shall not be placed around manholes or other structures until they are at the required finish elevation and alignment.
   3. Place concrete using methods which prevent segregation of mix. Consolidate concrete along face of forms and adjacent to transverse joints with internal vibrator. Keep vibrator away from joint assemblies, reinforcement, or side forms. Consolidate with care to prevent dislocation of dowels, and joint devices.
   4. Deposit and spread concrete in continuous operation between transverse joints, as far as possible. If interrupted for more than 2 hours, place construction joint. Automatic machine may be used for curb and gutter placement at Contractor's option. Machine placement must produce curbs and gutters to required cross section, lines, grades, finish, and jointing as specified for formed concrete. If results are not acceptable, replace with formed concrete as specified.
   5. Concrete placement shall be conducted in accordance with related ACI recommended procedures.

C. Joint Construction
   1. Transverse Expansion Joints: Transverse expansion joint in sidewalk shall have the filler cut to the exact cross section of the sidewalk. The joints shall be similar to the type of expansion joint used in the adjacent pavement. Joint spacing as specified on the plans.
   2. Joint Fillers: Extend joint fillers full-width and depth of joint, and not less than 1-inch or more than 2-inches below finished surface where joint sealer is indicated. Furnish joint fillers in one-piece lengths for full width being placed, wherever possible. Where more than one length is required, lace or clip joint filler sections together.
   3. Joint Sealants: All joints shall be sealed with approved exterior pavement joint sealants and shall be installed per manufacturer's recommendations.

D. Concrete Finishing
   1. After striking off and consolidating concrete, smooth surface by screening and floating. Adjust floating to compact surface and produce uniform texture. After floating, test surface for trueness with 10-ft straightedge. Distribute concrete as required to remove surface irregularities, and refloat repaired areas to provide continuous smooth finish.
   2. Work edges of sidewalks, back top edge of integral curb, and formed joints with an edging took, and round to 2-inch radius. Eliminate tool marks on concrete surface. After completion of floating and troweling when excess moisture or surface sheen has disappeared, complete surface finishing as follows:
   3. Inclined Slab Surfaces: Provide coarse, non-slip finish by scoring surface with stiff-bristled broom perpendicular to line of traffic.
   4. Curbs, gutters, and sidewalks: Broom Finish by drawing fine-hair broom across surface perpendicular to line of traffic. Repeat operation as necessary to produce a fine line texture.

E. Do not remove forms for 24 hours after concrete has been placed. After form removal, clean ends of joints and point up any minor honeycombed areas. Remove and replace areas or sections with major defects, as directed.

F. Protect and cure finished concrete paving using acceptable moist-curing methods, more particularly described in the “water-curing” section of ACI 308-81.

3.3 BACKFILL

A. After the concrete has set sufficiently, the spaces in front and back of the curb and gutter or sidewalk shall be refilled to the required elevation with suitable material in accordance with Section 31 00 00, which shall be compacted until firm and solid and neatly graded.

3.4 CLEANING AND ADJUSTING

A. Sweep concrete pavement and wash free of stains, discolorations, dirt, and other foreign material just prior to final inspection.

B. Protect concrete from damage until acceptance of work. Exclude traffic from pavement for at least 14 days after placement. When construction traffic is permitted, maintain pavement as clean as possible by removing surface stains and spillage of materials.

END OF SECTION

TRUMBULL HILLCREST MIDDLE SCHOOL

SECTION 321723 – PAVEMENT MARKINGS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Contract Drawings and Documents

1.2 SCOPE OF WORK

A. Preparation and application of painted pavement markings.

1.3 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.4 REFERENCE STANDARDS

A. Connecticut Department of Transportation Standard Specifications, latest edition.

B. Manual on Uniform Traffic Control Devices, latest edition.

1.5 PROJECT CONDITIONS

A. Maintain access for vehicular and pedestrian traffic as required for other construction activities. Utilize flagmen, barricades, warning signs, and warning lights as required.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Paint shall be non bleeding, quick drying, alkyd petroleum base paint suitable for traffic bearing surface and shall be mixed in accordance with manufacturer's instructions before application.

B. Provide ready-mixed one component waterborne traffic line paint. Materials shall be Sherwin-Williams “Setfast” paint or approved equal.
   1. Colors:
   2. Yellow: TM2161
   3. White: TM2160
   4. Blue: TM2133
   5. Black: TM2135

C. Preformed pavement markings shall be Stamark Intersection Grade Tape Series A420 as manufactured by 3M Traffic Control Materials Division, or approved equal.
   1.

PART 3 - EXECUTION

3.1 PREPARATION

A. Sweep and clean surface to eliminate loose material and dust.

B. Where existing pavement markings are indicated on Contract Documents to be removed or would interfere with adhesion of new paint, motorized abrasive device shall be used to remove markings. Equipment employed shall not damage existing paving or create surface hazardous to vehicle or pedestrian traffic. Within public rights-of-way, method of marking removal shall be approved by appropriate governing authority.

3.2 APPLICATION

A. Apply two (2) coats of paint, without addition of thinner, with maximum of 100 sq. ft per gal. Apply the first coat less than 5 days after the placing of bituminous pavement. Apply the second coat just prior to school opening. Apply with mechanical equipment to produce uniform straight edges. At sidewalk curbs and crosswalks, use straightedge to ensure uniform, clean, and straight stripe.

B. Install preformed pavement markings according to manufacturers recommended procedures for the specified material.

C. Following items shall be painted with colors noted below:
   1. Pedestrian Crosswalks: White
   2. Light Pole Bases, and Bollards: Yellow, or as specified in Contract Drawings.
   3. On-Site Sign Bases: Black, or as specified in Contract Drawings.
   4. Fire Lanes: as shown on Contract Documents.

5. Lane Striping where separating traffic moving in opposite directions: Yellow
6. Lane Striping where separating traffic moving in the same direction: White
7. Handicap Symbols: Blue or per local code and as shown on Contract Documents.
8. Parking Stall Striping: White, or as shown on Contract Documents.

D. The Minimum Required total Dry Film Thickness (DFT): The DFT shall be the minimum required dry film thickness as measured in mils. or as required by sections 2.1 of this specification as well as part of the referenced standard in section 1.2 of the same.

E. System Coverage Requirements:
1. 1st Coat - 3.0 mils DFT
2. 2nd Coat - 6.0 mils DFT

F. Exterior Paint Systems: Provide the following paint systems as indicated:
1. Parking stall, division and limit lines shall be 4" in width, true and straight. Color: White – DFT 6.0 mils.
2. Stop legends shall be as detailed on Drawing. Color: White - DFT 6.0 mils.
3. Wheelchair legends shall be as detailed on Drawing. Color: Blue. Parking stall striping shall be Blue at Handicapped stalls only - DFT 6.0 mils.
4. Diagonal striping Handicapped. Color: Blue - DFT 6.0 mils.
5. Diagonal striping Loading Zone. Color: White - DFT 6.0 mils.
6. Directional signage shall be as detailed on Drawing. Color: White - DFT 6.0 mils.
7. Centerline striping shall be 4" in width as detailed on Drawings. Color: White - DFT 6.0 mils.

END OF SECTION

SECTION 323100 – CHAINLINK FENCES AND GATES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 321313 – Portland Cement Concrete

C. Construction Documents

D. Manufacturer’s technical data and installation requirements

1.2 SCOPE OF WORK

A. Provide chain link fence, framework, fabric, and accessories.

B. Excavation for post bases: concrete foundation for posts and center drop for gates.

C. Manual gates and related hardware.

D. Manufacturer’s technical data and installation requirements

1.3 REFERENCE STANDARDS

A. ASTM A116 Zinc-coated (Galvanized) Steel Woven Wire fence Fabric.

B. ASTM A120 Pipe, Steel, Black and Hot-Dipped Zinc Coated (Galvanized) Welded and seamless, for Ordinary Uses.

C. ASTM A121 Zinc-Coated (Galvanized) Steel Barbed Wire.

D. ANSI/ASTM A123 Zinc (Hot Dip Galvanized) Coatings on iron and steel products.

E. ASTM A153 Zinc Coating (Hot-Dip) on Iron and Steel Hardware.

F. ASTM A392 Zinc Coated Steel Chain-Link Fence Fabric.

G. ANSI A428 Weight of Coating on Aluminum-Coated Iron or Steel Articles.

H. ASTM A446 Steel Sheet, Zinc-Coated (Galvanized) by the Hot-Dip Process, Structural (Physical) Quality.

I. ASTM A491 Aluminum-Coated Steel Chain Link Fence fabric.

J. ASTM A569 Steel, Carbon (0.15 Maximum Percent), Hot-Rolled Sheet and Strip Commercial Quality.

K. ASTM A585 Aluminum Coated Steel Barbed Wire.

L. ASTM C94 Ready-mixed Concrete.

M. ASTM F567 Installation of Chain-Link Fence.

N. ASTM F573 Residential Zinc-Coated Steel Chain Link fence fabric.

O. ASTM F668 Poly (Vinyl Chloride) (PVC) Coated Steel Chain Link Fence Fabric.

P. ASTM F669 Strength Requirements of Metal Posts and Rails for Industrial Chain Link Fence.

Q. ASTM F1083 Pipe, Steel, Hot-Dipped Zinc-Coated.

R. Chain Link Fence Manufacturers Institute (CLFMI)-Product Manual.

1.4 QUALITY ASSURANCE

A. Perform work in accordance with Manufacturer's instructions.

B. Perform work in accordance with ASTM F567.

1.5 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.6 SUBMITTALS

A. Submittals for review - the following submittals are intended for review and acceptability.
   1. Section 320000 General Requirements for submittals.
   2. Product Data: Provide data on fabric, posts, accessories, fittings and hardware.
   3. Shop Drawings: Indicate plan layout, spacing of components, post foundation dimensions, hardware anchorage, and schedule of components.
   4. Samples: Submit one sample of fence fabric, 12 inch X 12 inches in size Illustrating construction and finish.

B. Submittals for Information
   1. Manufacturer’s Installation Instructions: Indicate installation requirements, post foundation anchor bolt, templates, and any other data required.

C. Submittals for Closeout
   1. Data: Provide Warranties and Bonds.
   2. Project Record Documents: Accurately record actual locations of property perimeter posts relative to property lines and easements.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Fabric and boards:
   1. No. 9 ga. finished size galvanized steel wires, 2 inch mesh, with top salvage knuckled and bottom selvage twisted and barbed.
   2. Furnish one-piece fabric widths for fencing.
   3. Attached Wire Mesh shall be coated with Black PVC or approved equal.

B. End, Corner, and Pull Posts: Galvanized steel, minimum sizes and weights as follows:
   1. Up to 6'-0" fabric Height: 2.375" OD pipe, 3.65 lbs./1 in.ft., or 3.5"x 3.5" roll-formed sections, 4.85 lbs./1 in.ft.
   2. Over 6'-0" Fabric Height: 2.875" OD pipe, 5.79 lbs./1 in.ft., or 3.5"x 3.5" roll-formed sections, 4.85 lbs./1 in.ft.

C. Line Posts: Galvanized steel, minimum sizes and weights as follows:
   1. Up to 6'-0"Fabric Height: 1.90"OD steel pipe, 2.70 lbs./1 in.ft. Or 1.875'x 1.625" C-sections, 2.28 lbs./1 in.ft.
   2. 6'-0" to 8'-0"Fabric Height: 2.375"OD steel pipe, 3.65 lbs./1 in.ft. or 2.25" x 1.875" H-sections, 2.64 lbs./1 in.ft.
   3. Over 8'-0"Fabric Height: 2.875"OD steel pipe, 5.79 lbs./1 in.ft. or 2.25"x 1.875" H-sections, 3.26 lbs./1 in.ft.

D. Gate Posts: Galvanized steel, posts for supporting single gate leaf, or one leaf of double gate insulation, for nominal gate with as follows:
   1. Up to 6'-0": 3.5"x 3.5"roll-formed section, 4.85 lbs./1 in.ft. or 2.875 OD pipe, 5.79 lbs./1 in.ft.
   2. Over 6'-0" to 13'-0": 4.000"OD pipe, 9.11 lbs./1 in.ft.

E. Top Rails: Rails: 1.66"OD pipe, 2.27 lbs./ft. or 1.625" x 1.25" roll-formed sections, 1.35 lbs./ft.; galvanized steel, manufacturer's longest lengths.

F. Couplings: Expansion type, approximately 6" long, for each joint.

G. Attaching Devices: Provide means for attaching top rail securely to each gate corner, pull and end post.

H. Sleeves: Galvanized steel pipe not less than 6" long and with inside diameter not less than ½"greater than outside diameter of pipe. Provide steep plate closure welded to bottom of sleeve of width and length not less than 1"greater than outside diameter of sleeve.

I. Tension Wire: 7 gage galvanized steel, coated coil spring wire, located at bottom of fabric.

J. Wire Ties: 11 ga. galvanized steel

K. Post Brace Assembly: Manufacturer's standard adjustable brace at end of gate posts and at both sides of corner and pull posts, with horizontal brace located at mid-height of fabric. Use same material as top rail for brace, and truss to line posts with 0.375" diameter rod and adjustable tightener.

L. Post tops: Galvanized steel, weather-tight closure cap for each tubular post. Furnish caps with openings to permit passage of top rail.

M. Stretcher Bars: Galvanized steel, one piece lengths equal to full height of fabric, with minimum cross-section of 3/16"x 3/4". Provide one stretch bar for each gate and end post, and two for each corner and pull post.

N. Stretch Bar Bands: Manufacturer's standard.

O. Gate Cross-bracing: 3/8"diameter galvanized steel adjustable length truss rods.

P. Portland Cement: ASTM C 150.

Q. Aggregates: ASTM C 33.

R. Water: Potable.

S. Non-shrink, Non-metallic Grout: Premixed, factory-packaged, noncorrosive, non-staining, nongaseous, exterior grout complying with CE CRD-C621.

T. Swinging Gate Hardware:
1. Hinges: Size and material to suit gate size, non-lift-off type, offset to permit 180 degree gate opening. Provide a pair of 1-1/2"hinges for each leaf over 6"-0"nominal height.
2. Latch: Forked type or plunger-bar type to permit operation from either side of gate, with padlock eye as integral part of latch.

U. Double Gate Hardware: Provide gate stops for double gates, consisting of mushroom type of flush plate with anchors set in concrete, to engage center drop rod or plunger bar. Include locking device and padlock eye as integral part of latch, using one padlock for locking both gate leaves.

PART 3 - EXECUTION

3.1 GATE FABRICATION

A. Fabricate swing gate perimeter frames of 1.90"OD pipe, galvanized steel. Provide horizontal and vertical members to ensure proper gate operation and for attachment of fabric, hardware, and accessories. Space frame members a maximum of 8'-0"apart.

B. Assemble gate frames by welding or special fittings and rivets for rigid connections. Install same fabric as for fence with stretcher bars at vertical edges. Install diagonal cross-bracing on gates as required to ensure rigid frame without sag or twist. Bars may be used at top and bottom edges. Attach stretchers to gate frame at 15 inches on center maximum.

C. Attach hardware to provide security against removal or breakage.

3.2 FINISH

A. Fabric Finish: Galvanized, ASTM A 392, Class I, with not less than 1.2 oz zinc/sq.ft. of surface.

B. Framing: Galvanized steel, ASTM A 120 or A 123, with not less than 1.8 oz. zinc/sq.ft. of surface.

C. Hardware and Accessories: Galvanized, ASTM A 153 with zinc weights in accordance with Table 1.

3.3 CONCRETE MIXING

A. Mix materials to obtain concrete with a minimum 28-day compressive strength of 2,500 psi; 1" maximum size aggregate, maximum 3"slump, and 2-4% entrained air.

3.4 INSTALLATION

A. Comply with recommended procedures and instructions of fencing manufacturer. Provide secure, aligned installation with line posts spaced at 10 feet- 0 inches on center maximum.

B. Grade Set Posts: Drill of hand excavate using post hole digger in firm or compacted soil.

C. Excavate hole for each post to minimum diameter recommended by fence manufacturer but not less than four times largest cross-section of post. Excavate hole depths approximately 3" lower than post bottom with bottom of posts set not less than 36" below finish grade surface.

D. Center and align posts in holes 3" above bottom of excavation.

E. Place concrete around posts; vibrate or tamp for consolidation. Check each post for vertical and top alignment. Hold in position during placement and finishing operations. Extend concrete footing 2" above grade. Crown footing to shed water.

F. Top Rails: Run rail continuously, bending to form radius for curve runs. Provide expansion couplings as recommended by manufacturer.

G. Center Rails: Provide center rails where indicated. Install in one piece between posts and flush with post on fabric side, using special offset fittings where necessary.

H. Brace Assemblies: Install braces so posts are plumb when diagonal rod is under proper tension.

I. Tension Wire: Install tension wires through post cap loops before stretching fabric and tie to each post cap with not less than 6 ga. galvanized wire. Fasten fabric to tension wire using 11 ga. galvanized steel hog rings spaced 24 inches on center.

J. Fabric: Leave approximately 2" between finish grade and bottom salvage. Pull fabric taut and tie to posts, rails, and tension wires. Install fabric on security side of fence, and anchor to framework so that fabric remains in tension after pulling force is released.

K. Stretcher Bars: Secure at end, corner, pull, and gate posts by threading through or clamping to fabric at 4 inches on center, and secure to posts with metal bands spaced at 15 inches on center.

L. Tie Wires:
   1. Use U-shaped wire, conforming with diameter of pipe to which attached, clasping pipe and fabric firmly when ends twisted at least two full turns. Bend ends of wire to minimize hazard to persons or clothing.
   2. Tie fabric to line posts with wire ties spaced 12 inches on center. Tie fabric to rails and braces with wire ties spaced 24 inches on center. Tie fabric to tension wires with hog rings spaced 24 inches on center.
   3. Manufacturer’s standard procedure will be accepted if of equal strength and durability.

M. Fasteners: Install nuts for tension bands and hardware bolts on side of fence opposite fabric side. Peen ends of bolts or score treads to prevent removal of nuts.

N. Gates: Install gates plumb, level, and secure for full opening without interference. Install ground-set items in concrete for anchorage. Adjust hardware for smooth operation and lubrication.

END OF SECTION

SECTION 329000 - PLANTING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this section.

B. B. Section 31 2310 – Earthwork

C. C. Section 32 9100 – Planting Soils

D. D. Section 32 9200 – Turf and Grasses

E. E. Section 32 9353 – Landscape Maintenance

1.2 SUMMARY

A. This Section includes the following:
1. Tree, shrub, groundcover, perennial and bulb installation.
2. Fertilizing, mulching, trimming, guying, wrapping and edging.
3. Maintenance of installed plant material.
4. Warranty.
5. Tree staking

1.3 REFERENCES

A. American Joint Committee on Horticultural Nomenclature Publication: Standardized Plant Names.

B. ANSI Z60.1 - American Standard for Nursery Stock.

C. FS 0-F-241 - Fertilizers, Mixed, Commercial.

1.4 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent.

Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.5 SUBMITTALS

A. General: Submit each item in this Article according to the Conditions of the Contract and Division 1 Specification Sections.

B. B. Submit complete list of plant material nursery sources within four weeks of notice to proceed and prior to digging of plants. List is to include names of individuals to contact, phone numbers, addresses and latest possible date for completion of tagging.

C. C. Contractor to cover cost of Landscape Architect's plant tagging.

D. D. Submit waterproof tags prior to tagging trip. Tags to contain following information:
1. Contractor's name.
2. Plant genus, species and cultivar/variety.
3. Plant common name.
4. Name of nursery.
5. Size of plant.
6. Quantity of plant (i.e. 2 of 10)

E. Submit proposed planting schedule, indicating dates for each type of landscape work during normal seasons for such work in area of site. Correlate with specified maintenance periods to provide maintenance from date of substantial completion. Once accepted, revise dates only as approved in writing, after documentation of reasons of delay.

F. Submit schedule of arrival of "specimen plant material".

G. Submit instructions for continuing Owner maintenance. Include pruning and trimming methods and types, application frequency and recommended coverage of fertilizer; and water requirements for year-round care of installed plants. Document is to be in bound 8 ½" x 11" format. Submit prior to expiration of required maintenance period(s).

H. Submit for approval a proposed maintenance procedure and schedule of the storage of plant materials. Trees, shrubs, groundcover and perennials stored on and off site shall be maintained by watering, fertilizing, mulching, and spraying for infestation and disease to maintain these plants in a healthy condition. Plants stored off site shall be available for inspection by the Landscape Architect.

I. Samples of each of the following:
1. 5 lb (2 kg) of mulch for each type required for the Project, in labeled plastic bags.
2. Edging materials and accessories to verify color selected.

J. Qualification data for firms and persons specified in the "Quality Assurance" Article to demonstrate their capabilities and experience. Include lists of completed projects with project names and addresses, names and addresses of Landscape Architects and Owners, and other information specified.

1.6 QUALITY ASSURANCE

A. Prior to being approved, the successful bidder will be required to submit to the Landscape Architect a statement of qualifications listing the names of contact references for at least three jobs of similar scope that have been completed in the last five years. Attention is called to the fact that the installation will not be awarded to a firm that does not possess the required technical expertise and construction organization.

B. Allow Landscape Architect option of traveling to nursery to select trees from available stock. (See 1.4 C)

C. Allow for receipt of stamped nursery source list, to tag trees. (See 1.4 B)

D. Trees dug prior to tagging by Landscape Architect are subject to rejection.

E. Landscape Architect will confirm the trees satisfy the requirements of ANSI Z60.1 and all special conditions stated in project manual and drawings.

F. Measure trees and shrubs according to ANSI Z60.1 with branches and trunks or canes in their normal position. Do not prune to obtain required sizes. Take caliper measurements 6 inches (150mm) above ground for trees up to 4-inch (100-mm) caliper size, and 12 inches (300-mm) above ground for larger sizes. Measure main body of tree or shrub for height and spread; do not measure branches or roots tip-to-tip.

G. Unacceptable trees will not be tagged and a different Grower will be selected by Contractor at no expense to Owner. A second tagging trip will then be scheduled.

H. Decision by Landscape Architect to forego tagging trip does not release Contractor from responsibility of obtaining plant material which meets standards and conditions stated in project manual and drawings.

I. Minimum three years experience installing plant material of this type required of Installer.

J. Minimum five years' experience specializing in growing and cultivating the specified material is required by of Grower.

1.7 REGULATORY REQUIRMENTS

A. Comply with regulatory requirements for fertilizer and herbicide composition.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Plant material is to be COVERED with tarpaulin during transport.

B. Deliver soil conditioners and fertilizer in unopened waterproof bags showing weight, chemical analysis, and name of manufacturer. Keep materials in dry storage away from contaminants.

C. Provide freshly dug trees and shrubs. Do not prune prior to delivery unless otherwise approved by Landscape Architect. Do not bend or bind tie trees or shrubs in such a manner as to damage bark, break branches, or destroy natural shape. Do not drop balled and burlapped stock during delivery. Protect plants until planted to prevent damage to root balls or desiccation of leaves.

D. Deliver trees and shrubs after preparations for planting have been completed and plant immediately. If planting is delayed more than six hours after delivery, set trees and shrubs in shade, protect from weather and mechanical damage, and keep roots moist by covering with mulch, burlap or other acceptable means of retaining moisture.

E. Provide water to staged material as required to keep root balls moist.

F. Do not remove container-grown stock from containers until planting time.

1.9 ENVIRONMENTAL REQUIREMENTS

A. Do not install plant life when ambient temperatures may drop below 30 degrees F or above 90 degrees F.

B. Do not install plants when wind velocity exceeds 30 mph.

C. Planting shall be done when the ground is not frozen, snow covered, or in an otherwise unsuitable condition for planting.

D. Conduct planting operations during recommended planting seasons. Preferable planting season is March 15 to May 30 and October 15 to December 1, inclusive.

E. At the Subcontractor's option and full responsibility, planting operations may be conducted under unseasonable conditions without additional compensation.

1.10 JOB CONDITIONS

A. Locate above grade and underground utilities and perform Work in manner which will avoid damage. Hand excavate, as required.

B. Maintain grade stakes set by others until removal is mutually agreed upon by concerned parties.

C. Notify Landscape Architect, before proceeding, when conditions detrimental to plant growth are encountered, such as rubble fill or adverse drainage conditions.

D. Install plants after final grades are established and prior to establishment of lawns, unless otherwise approved by Landscape Architect. If planting occurs in undisturbed lawn areas or after lawn work, protect lawn areas and promptly repair damage to lawns resulting from planting operations.PROJECT CONDITIONS

1.11 SEQUENCING AND SCHEDULING

A. Coordinate the Work of this Section with installation of underground utilities, sodding and remainder of Work associated with this Project.

B. Proceed with and complete landscape work as rapidly as portions of site become available, working within seasonal limitations.

1.12 MAINTENANCE

A. Contractor shall maintain plant material until completion of 18-month guarantee period and Final Acceptance of work, as described in Part 3 of this Section

1.13 GUARANTEE

A. Plants shall be guaranteed for a period of 18-months after the date of Acceptance by the Owner.
   1. When the work is accepted in parts, the guarantee periods shall extend from each of the partial acceptances to the terminal date of the last guarantee period. Thus, all guarantee periods terminate at one time.

B. Plants shall be healthy, free of pests and disease, and in flourishing condition at the end of the guarantee period. Plants shall be free of dead and dying branches and branch tips, and shall bear foliage of normal density, size and color.

C. Replace dead plants and all plants not in vigorous, thriving condition, as determined by the Architect during and at the end of the guarantee period, without cost to the Owner as soon as weather conditions permit and within the specified planting window.
   1. Replacements shall closely match adjacent specimens of the same species. Replacements shall be subject to all requirements stated in this Specification.
   2. Make all necessary repairs due to plant replacements. Such repairs shall be done at no extra cost to the Owner.
   3. The guarantee of all replacement plants shall extend for an additional 18-month period from the date of their acceptance after replacement. In the event that a replacement plant is not acceptable during or at the end of the said extended guarantee period, the Owner may elect one more replacement or credit for each item.

D. At the end of the guarantee period, and no less than five days prior to final inspection, staking and guying materials, and tree wrap and ties shall be removed from the site.

1.14 FINAL INSPECTION AND FINAL ACCEPTANCE

A. At the end of the 18-month guarantee period, the Architect will, upon written notice offend of guarantee period inspect the work for Final Acceptance. Requests shall be received at least ten calendar days before the anticipated date for Final Inspection.

B. Upon completion and reinspection of full repairs or replacements necessary in the judgment of the Architect at that time, the Architect will recommend to the Owner that Final Acceptance of the Work of this Section be given.

PART 2 - PRODUCTS

2.1 TREES, SHRUBS, GROUND COVER AND BEDDING PLANTS

A. Plant material to be nursery grown stock conforming to ANSI Z60.1.

B. Publication for Standardized Plant Names will govern nomenclature issues.

C. Plans will supersede planting material schedule where a discrepancy in quantity occurs.

D. Provide plant material which is well branched and formed, sound, vigorous, healthy, and free from disease, sun-scald, windburn, abrasion, and harmful insects, eggs, larvae and such defects as knots sun scald, injuries, abrasions and disfigurement, and shall have healthy, normal, and unbroken root systems.

E. Provide symmetrically developed plant material, of uniform habit with straight boles and free from objectionable disfigurements. Tree leader shoots shall not be cut or broken.

F. Where formal arrangements or consecutive order of trees or shrubs are shown, select stock for uniform height and spread, and label with number to assure symmetry in planting.

G. Provide vigorous ground covers and vines with number and length of runners and clump size specified and proper age for the grade of plants specified. Use only vines and ground cover plants well established in removable containers, integral containers, or formed homogeneous soil sections.

H. Plants shall have been grown in the same or colder climatic zone of this project.

I. Provide plants according to measurements indicated. Measure sizes before pruning and with branches in normal position. Plants larger in size than specified may be used as approved.

J. Spray plants, budding into leaf or having soft growth, with an anti-desiccant at the nursery or collecting field before digging.

2.2 PLANTING AMENDMENT MATERIALS

A. Shrub and Tree Fertilizer: Tightly compressed, slow release planting tablets. Provide 50% of Nitrogen as water insoluble. The following or equal is acceptable:
   1. AGRIFORM Planting Tablets by:

      The Scott's Company

      1-800-492-8255

B. Ground Cover Fertilizer: FS-0-F-241, Type 1, Class 1 with fifty percent of the elements derived from organic sources. Use fertilizer with N.P.K. ratio of 1:2:1 for Ground Cover Beds and 2:1:1 for Bedding Plant Beds.

C. Topsoil: Topsoil for backfill shall be as specified in Section 329100 - Landscape Grading.

D. Compost: Well-composted, stable, and weed-free organic matter, pH range of 5.5 to 8; moisture content 35 to 55 percent by weight; 100 percent passing through 1-inch sieve; soluble salt content of 5 to 10 decisiemens/m; not exceeding 0.5 percent inert contaminants and free of substances toxic to plantings; and as follows:

E. Organic Matter Content: 50 to 60 percent of dry weight.

F. Water: Clean, fresh and free of substances or matter which could inhibit vigorous growth of plants.

G. Herbicide: Comply with all applicable State and Federal Laws.

H. Pesticide: Comply with all applicable State and Federal Laws.

2.3 MULCH MATERIALS

A. Mulching Material: Double shredded, composted hardwood bark mulch free of growth or germination inhibiting ingredients.

B. Mineral Mulch: Hard durable stone, washed free of loam, sand, clay and other foreign substances, of following type, size range and color:
   1. Type: Rounded, natural tan/beige color.
      a. Size Range: 1"-2"

2.4 MISCELLANEOUS MATERIALS

A. Filter Fabric: Filter fabric shall be Trevira 1115, or equal approved by Landscape Architect. Trevira is manufactured by Hoechst Fibers Industries, P.O. Box 5887, Spartanburg, SC 29304 (1-800-845-7597 or 1-800-579-5479).

B. Anti-Desiccant: Emulsion type, film-forming agent, designed to permit transpiration but retard excessive loss of moisture from plants. Deliver in manufacturer's fully identified containers and mix

in accordance with manufacturer's instructions.Setting Blocks: Elastomeric material with a Shore, Type A durometer hardness of 85, plus or minus 5.

C. Erosion Control Blanket: The following products or approved equal are acceptable:
   1. S75 as manufactured by North American Green for 3:1 slopes.
   2. C125 as manufactured by North American Green for 2:1 slopes or steeper.

D. Aluminum Edging: Edging shall be 3/16" x 4" aluminum painted black . Edging shall be installed according to manufacturer's instructions.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify site is ready to accept Work of this section

B. Test drainage of plant beds and pits by filling with water twice in succession. Notify Landscape Architect of conditions permitting the retention of water in planting beds for more than twenty-four (24) hours.

C. Prior to the excavation of planting pits, or placing tree stakes, the Contractor shall ascertain the location of utility lines, electric cables and conduits, so that proper precautions may be taken not to disturb or damage subsurface improvements. Should obstructions be found, the Contractor shall promptly notify the Landscape Architect.

D. Beginning of installation means acceptance of existing conditions.

3.2 PREPARATION OF PLANT PITS AND BEDS

A. Plant Pits: Dig to produce vertical sides and flat, undisturbed bottoms. Scarify glazed side surfaces of pits. Size plant pits as shown on drawings.

B. Shrub masses, hedges, groundcover and perennial beds shall be entirely excavated edge to edge and backfilled with specified backfill mixture; they shall not be treated as individual planting pits.

C. Remove all sticks, stones, roots and other objectionable materials during tilling operations larger than one inch in diameter.

D. Damage to paving, sidewalks or other materials shall be removed and replaced at the Contractor's expense and to the satisfaction of the Landscape Architect.

3.3 LAYOUT

A. Stake tree and shrub locations with 3/4" x 2" x 18" wood stakes driven into the soil at center points of plants. Paint tops of stakes representing tree locations a color different from the stakes locating shrubs. Contractor may stake continuous uninterrupted straight runs of shrubs at each end. Outline ground cover beds.

B. Mark all underground utilities.

C. Notify Owner's Representative, in writing, of portions of plant material which have been staked. Allow one week for Landscape Architect to review and adjust stake locations.

D. Plants which are planted prior to contractor receiving Landscape Architect's approval of staking and bed outlines are subject to being relocated at no cost to Owner.

3.4 PLANTING

A. Setting Plants: Handle balled and burlapped and container-grown plants by ball or container. Set plants and hold in plumb position until sufficient soil has been firmly placed around roots or ball. Set plants in relation to surrounding grade so that they are even with depth at which they were grown in nursery, collecting field, or container.

B. Place fertilizer prior to backfilling and in accordance with the manufacturer's recommendations. Ground cover plants may be planted after mulch is in place. Take care to avoid contaminating mulch with planting soil.

C. Backfill excavations for balled and burlapped stock with planting soil mixture to approximately half the depth of the ball and then tamp and water. Carefully remove, open or fold back burlap and tying materials. Completely remove plastic wrap before the placement of backfill. Finish backfilling and tamp. Form earth saucers around isolated plants of size ample enough to hold at least 2-1/2 gallons for shrubs or 5 gallons for trees. Do not use planting stock if ball is cracked or broken before or during planting operation.

D. Bulbs shall be planted in the locations and at the spacing indicated on the Drawings. Plant bulbs at the depths and orientation recommended by the Supplier. Do not remove the leaves until after they have lost their green color. Remove leaves by cutting.

3.5 FERTILIZATION, WATERING, EDGING, AND MULCHING

A. Trees, Shrubs and perennials: Fertilize according to manufacturer's recommendations.

B. Ground Cover Beds: Topdress beds with .12 lbs of actual phosphoric acid per cubic yard of Planting Bed Mix.

C. Watering: Provide uniform coverage which will not cause erosion or damage to the finished surface. Water sufficiently to penetrate the planting bed to a depth of 4 inches.

D. Uniformly edge beds or individual plants using a sharp tool to provide a clear cut division line between the planted area and the adjacent lawn. Refer to drawings for bed shape. Provide plant pits circular in shape for individual pits.

E. Mulch within 24 hours after planting. Spread to uniform thickness of 3 inches.

3.6 PRUNING AND REPAIR

A. Plants shall be neatly pruned and or clipped to preserve the natural character of the plants (with exception to clipped shrub hedges); in a manner appropriate to the particular requirements of each plant and to the satisfaction of the Landscape Architect. Unless otherwise directed by Landscape Architect, do not cut tree leaders; remove only injured or dead branches.

B. Remove broken or badly bruised branches with a clean cut. All pruning shall be done with sharp tools in accordance with instructions of the Owner. Accidental damage to trees occurring during the course of planting operations which is not so great as to necessitate removal of a branch or replacement of a plant shall promptly be treated as required in accordance with recognized horticultural practices.

3.7 CLEANING

A. Keep worksite in clean and orderly condition as Work progresses. Leave worksite "broom clean" at end of Work.

3.8 MAINTENANCE

A. See Section 329353 Landscape Maintenance

END OF SECTION

SECTION 329100 – PLANTING SOILS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. The Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this section.

B. Section 31 0800 – Earthwork

C. Section 32 9000 – Planting

D. Section 32 9200 – Lawns and Grasses

1.2 RELATED SECTIONS

A. Testing off-site borrow soil, existing topsoil and amendment materials for approved use in planting soil mixes. Verification testing of on-site sub-soils.

B. Furnishing material from approved off-site source(s) as a base component for planting soil mixes and furnishing other soil amendment materials.

C. Amending, preparing, and mixing planting soils for plant areas.

D. Placing, spreading, and fine grading pre-mixed planting soil material of the type(s) indicated for plant areas.

E. Protecting all plant mix installations with snow fencing, filter fabric, or other approved means, over the surface area plant bed installations, until substantial completion.

F. Protection of finished paving, light poles utility or other finished work by means of wooden protection boards, or other approved means, over the area of construction concurrent with any and all construction operations.

1.3 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this

Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.4 SUBMITTALS

A. Refer to and comply with General Requirements, for procedures and additional submittal criteria.

B. Product Data: Submit technical descriptive data for each manufactured or packaged product of this Section. Include manufacturer's product testing and analysis and installation instructions for manufactured or processed items and materials.

C. Locations: Submit locations of material sources. Submit location of mixing sites.

D. Certificates:
1. Submit certified analysis for each soil treatment, amendment, and fertilizer material specified and as used. Include guaranteed analysis and weight for packaged materials.

E. Test Reports: Submit written reports of each sample tested. Each report shall include the following as a minimum and such other information required specific to material tested:
1. Date issued.
2. Project Title and names of Contractor and supplier.
3. Testing laboratory name, address and telephone number, and name(s), as applicable, of each field and laboratory inspector.
4. Date, place, and time of sampling or test, with record of temperature and weather conditions.
5. Location of material source.
6. Type of test.
7. Results of tests including identification of deviations from acceptable ranges. Identify any toxic substance(s) harmful to plant growth or life.

F. Statement(s) of Qualifications: Submit within 45 days of notice to proceed to confirm qualifications as specified in Article 1.04, herein.

G. Schedule and Protection Plan: Submit a detailed plan for scheduling and sequencing of all contract work and for protection of soil mixes and other completed work including coordination with contractors requiring access through the site. Indicate with schedules and plans the utilization of soil mix and subsoil protection measures (filter fabric and snow fencing) over the surface area of plant bed installations, until substantial completion. Indicate with schedules and plans the utilization of finished work protection measures (wooden protection boards or other approved methods) over the work area of construction operations concurrent with all construction operations until substantial completion.

1.5 QUALITY ASSURANCE

A. Qualifications:
   1. Installation and maintenance foreman on the job shall be competent English-speaking supervisor(s), experienced in landscape installation and maintenance. Perform work with personnel totally familiar with planting soil preparation and planting installations under the supervision of a foreman experienced with landscape work.
   2. Agricultural Chemist: Experienced person or persons employed by public or private soils testing laboratory, qualified and capable of performing tests, making soil recommendations, and issuing reports as specified. Testing Laboratory and Agricultural Chemist shall be as approved by the Owner's Identified Agent.

B. References:
   1. Association of Official Agricultural Chemists.
   2. American Society for Testing and Materials (ASTM) using test criteria as specified or required by other references.

C. Pre-installation Conferences: Person(s) responsible for soil preparation and mixes of this Section shall attend Pre-installation Conference(s) to coordinate with work of other sections.

D. Inspections and Testing
   1. Soil, compost, and other material testing required in this Section or additionally required by Owner's Representative shall be furnished and paid for by Contractor.
   2. Contractor is to test installed soil in-place after installation to confirm material is as submitted. One sample should be taken per every 250sf of installed area.
   3. Owner's Identified Agent reserves the right to take and analyze at any time such additional samples of materials as deemed necessary for verification of conformance to specification requirements. Contractor shall furnish samples for this purpose upon request and shall perform testing as requested.
   4. If at any time, test results indicate that any soil delivered to the site does not comply with these specifications, the contractor shall immediately remove the non-compliant soils from site at the contractor's expense.

1.6 REQUIREMENTS

A. Comply with all rules, regulations, laws and ordinances of local, state, and federal authorities having jurisdiction. Provide labor, materials, equipment and services necessary to make work comply with such requirements without additional cost to Owner.

B. Procure and pay for permits and licenses required for work of this section. Comply with the requirement of any Remedial Action Work Plan that may apply to the project.

1.7 SITE CONDITIONS

A. Acquaintance with Existing Site Conditions
   1. Through study of all Contract Documents and by careful examination of the site, become informed as to the nature and location of the Work, the nature of surface and subsurface soil conditions, the character, quality and quantity of the materials to be encountered, the character of equipment and facilities needed preliminary to and during the prosecution of the Work, the general and local conditions, and all other matters which can in any way affect the Work.
   2. Investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to, ingress and egress of this work site. Conform to all governmental regulations in regard to the transportation of materials to, from, and at the job site, and secure in advance such permits as may be necessary.
   3. Should the Contractor, in the course of Work, find any discrepancies between Contract Drawings and physical conditions or any omissions or errors in Drawings, or in layout as furnished by the Owner, it will be Contractor's duty to inform the Owner's Identified Agent immediately in writing for clarification. Work done after such discovery, unless authorized by the Owner's Identified Agent, shall be done at the Contractor's risk.
   4. Contractor shall be familiar with any Remedial Action Work Plan for the project and be experienced in working on sites with historic fill.

B. Environmental Requirements:
   1. Perform both off-site mixing and on-site soil work only during suitable weather conditions. Do not disc, rototill, or work soil when frozen, excessively wet, or in otherwise unsatisfactory condition.
   2. Soil mixes shall not be handled, hauled, or placed during rain or wet weather or when wet near or above field capacity.

C. Sequencing and Scheduling: Adjust, relate together, and otherwise coordinate work of this Section with work of Project and all other Sections of Project Specifications.

1.8 PRODUCT DELIVERY, STORAGE AND HANDLING

A. Product Data: Packaged Materials: Deliver packaged materials to the location where soils are to be mixed, in unopened bags or containers, each bearing the name, guarantee, and trademark of the producer, material composition, manufacturers' certified analysis, and the weight of the materials Retain packages for the Construction Manager or Owner's Representative.

B. Soil or amendment materials stored on site temporarily in stockpiles prior to placement shall be protected from intrusion of contaminants and erosion. All temporary storage means and methods shall be approved by Owner's Representative.

C. After mixing, soil materials shall be covered with a tarpaulin until time of actual use.

PART 2 - PRODUCTS

2.1 PLANT MIX MATERIALS

A. All soil material to be imported to the site shall be tested every 500 CY to ensure soils meet applicable remediation standards for clean soils. Proof of compliance shall be provided by contractor prior to delivery of soils to site.

B. General:
   1. All plant mix materials shall fulfill the requirements for new plant mixes as specified.
   2. Samples of blended plant mixes shall be submitted by the Contractor for testing and analysis to the approved testing laboratory. Include verification testing of on-site sub-soils. Comply with specific material requirements specified.
      a. As necessary to conform to the requirements of these specifications, make any and all soil mix amendments, retest and resubmit reports indicating results until approved.
   3. Owner's Representative may request additional testing by Contractor for confirmation of mix quality at any time until completion.

C. Base Component Material
   1. Base Component Material shall be a sandy loam. Base Component Materials shall not be site salvaged unless approved by Owner's Identified Agent and CT DEEP.
   2. Before base component material is used for mixing with amendments, handle and pile Base Component Material in the following manner:
      a. Homogenize to make a uniform mix, free of subsoil lenses and other irregularities.
      b. Aerate the base material to make a friable planting medium.
      c. Separate out and remove all clay lumps, stones, stocks, roots, and other debris.

D. Organic Matter
   1. Leaf Mold: Shredded leaf litter, composted for a minimum of one year (12 months) and confirming to the following characteristics:
      a. The leaf mold must be free of debris such as plastic fragments, glass, and metal fragments.
      b. The leaf mold must be free of stones larger than 1/2", large branches, and large roots.
      c. Woodchips over 1" in length or diameter should be removed by screening.

2.2 SOIL AMENDMENT MATERIAL

A. Ground Limestone: Ground Limestone as a soil amendment material will only be used pending results of analysis.
   1. Provide a Ground Agricultural Limestone with a minimum of 88% of calcium and magnesium carbonates.
   2. Ground Limestone material shall have a total 100% passing the 10 mesh sieve, minimum of 90% passing the 20 mesh sieve, and a minimum of 60% passing the 100 mesh sieve.

2.3 HERBICIDES

A. Herbicides: May be required for use if there is seed germination after sub-grade placement and prior to 2planting mix installation or after subsequent plant mix installation. Under no circumstances are materials to be applied without specific instruction from the Owner's Identified Agent.
   1. Herbicides shall be approved before use for type and rate of application by the Owner's Identified Agent and by local and state agencies with jurisdiction.
   2. Post emergent herbicide shall be Roundup, as manufactured by Monsanto Agricultural Products Company, C3NJ, St. Louis, MO 63166, or an approved equal.

2.4 PLANTING SOIL MIXES

A. General: Adequate quantities of mixed planting soil materials shall be provided, to supplement topsoil stockpiled from site, to attain, after compaction and natural settlement, all design finish grades. Verify quantities for placement as specified in Planting and Turf and Grasses specifications and to suit conditions.

B. Uniformly mix ingredients as specified (Base Component Material, leaf mold, and other ingredients deemed to be necessary as a result of testing) by wind rowing/tilling on an approved hard surface area. Organic matter shall be maintained moist, not wet, during mixing.

C. Testing of Plant Mixes:
   1. Perform initial soil mix tests to confirm compliance with specifications. In conjunction with the requirements of the specifications, these test results, when approved, will establish the standard to which all other test results must conform.
   2. Follow-up Testing: Have one (1) composite sample tested prior to delivery and upon arrival to the site from each 500 c.y. of material or as required by Owner's Representative intended for use in each type of lawn and plant mix to include the following:
      a. Soil Texture / Physical Analysis: Use the hydrometer method and classify the soil.
      b. Nutrient Analysis:
         1) Have nutrient levels (nitrate, nitrogen, phosphate, potassium, magnesium, calcium, ammonium, iron, and manganese) tested, and request testing laboratory recommendations for additional fertilizer requirements at both lawn and all plant areas if nutrient levels are below average.
         2) Nutrient deficiencies in soils of plant areas shall be corrected at time of installation.
         3) Nutrient deficiencies in soils of lawn areas shall be corrected both at time of lawn installations and during maintenance period as specified.
      c. Test organic matter, pH, soluble salts, and percolation.

D. Soil Mix Types: Provide the following planting soil mix at the locations indicated. Percentages of components, unless otherwise noted, will be established upon completion of test results of the various mixes. The controlling factor will be the percent (%) organic matter as specified for each mix. Note that percent (%) by volume of components will be, in large part, determined by the leaf mold. Specifically the bulk density reading of the leaf mold will directly impact the organic matter readings which have been specified for each mix.
   1. Topsoil / Horticultural Soil Mix shall be used for planting areas on natural subsoils.

a. Test results must be submitted for per-cent (%) retained as well as for per-cent (%) passing for all sieve sizes. Failure to include any of the aforementioned criteria will be cause for rejection of the test report.
b. Soil Texture/ Physical Analysis (Sandy Loam)
    1) Sand – 50-70%
    2) Silt – 20-30%
    3) Clay – 10-20%
    4) Gravel content should not exceed 3% and soil should be free of glass, plastic and other foreign materials
c. Chemical Analysis:
    1) Organic matter: 6.0 to 10.0%
    2) Soil reaction (pH): 6.0 to 7.0
    3) Soluble salt content (conductivity): The soluble salts measurement (Electric Conductivity) should not exceed 0.5 mmhos/cm measured as a 1: 5 dilute.
d. Heavy metal content not to exceed the following amounts:

2.

Element	Acetate Extract	HCL Extract
Iron	0.5 ppm	3.1 ppm
Manganese	0.5 ppm	15.4 ppm
Molybdenum	0.4 ppm	0.8 ppm
Zinc	0.2 ppm	4.4 ppm
Aluminum	0.2 ppm	1.2 ppm
Boron	1.1 ppm	1.7 ppm
Copper	None	0.01 ppm
Lead	01 ppm	0.4 ppm
Selenium	None	0.4 ppm
Mercury	None	None
Chromium	None	None
Cadmium	None	0.02 ppm
Nickel	None	0.04 ppm
Cobalt	None	0.05 ppm

None = none detected = below detection limits of 0.01 ppm.

3.

4.

a. Percolation: 60% passing in 2 minutes, 40% retained. Soil should be saturated prior to conducting test.
b. Other Amendments as required by test results and as approved.
c. All imported topsoil must meet pollution standards for residential areas.

5. Bioretention Soil Mix
    a. Bioretention soil mix is to be used in all detention basins and rain gardens.
    b. Mix to consist of 60% coarse sand, 40% submitted Topsoil/Horticultural Soil Mix
    c. Topsoil/Horticultural Soil Mix: Refer to specifications listed in section above
    d. Coarse Sand
        1) Particle Size Analysis

Sieve	Percent passing
3/8 inch (9.5 mm)	100
No 4 (4.75 mm)	95-100
No 8 (2.36 mm)	80-100
No 16 (1.18 mm)	50-85

No 30 (.60 mm) 25-60
No 50 (.30 mm) 10-30
No 100 (.15 mm) 2-10
No 200 (0.75 mm 2-5

2) Chemical Analysis

pH: lower than 7.0

Toxic substance analysis

1)

e.

f. Final Bioretention Mix

1) Particle Size Analysis

a) Sand – 80-85%
b) Silt – 8-15%
c) Clay – 2-8%

2) Chemical Analysis

a) pH – 5.5-6.5
b) Soluble salts: less than 2 mmho/cm

3) Contractor to submit toxic substance analysis and material drainage rate in addition to information listed above. Drainage rate of material to exceed 1 inch/hour

E. Stockpiling and Plant Mixes

1. General: Stockpiling and Plant Mixes utilized for planting soil on-site, off-site and at source should be restricted to no more than the needs of what can be used in a 24-hr. period. Stockpiles should be no more than 6 feet in height to prevent anaerobic conditions within the pile(s). Stockpiles shall be sheltered from weather to prevent excessive water absorption and blowing by winds as approved by Owner's Representative.

2.5 VERIFICATIONS

A. Prior to construction and soil placement operations at planting areas, ascertain the location of all electric cables, conduits, underdrainage systems and utility lines.

B. Take proper precautions so as not to disturb or damage sub-surface elements. Contractor failing to take these precautions shall be responsible for making requisite repairs to damaged utilities at Contractor's own expense.

C. Verify that required underground utilities are available, in proper location, and ready for use. Coordinate with other trades.

D. Verify that all work requiring access through or adjacent to areas where plant mixes are to be placed has been completed and no further access will be required. In the event that access will be required, this must be coordinated with the Owner's Representative.

2.6 PREPARATION OF SUBGRADE

A. Prior to depositing and spreading clean fill, sand and/or plant mix soils, the Contractor shall furnish and install grade stakes on a 10 foot grid in open areas and sufficiently spaced in other areas to insure correct line and grade of subgrade and finished grade.
   1. Verify as constructed or existing subgrade elevations and do whatever additional grading is necessary to bring the subgrade to a true, smooth, slope parallel to the finish grade at all areas to receive planting soil for lawns.
   2. Clean up subgrade and dispose of all debris and garbage prior to inspection.
   3. Scarify compacted subgrades to permit drainage through soil layers. Scarification to occur minimum 6" in planting beds, 12" in rain garden or infiltration basins.

B. Remove all vegetation on subgrade or wherever additional soil is to be added to meet grade.

C. Any soils polluted by gasoline, oil, plaster, construction debris, unacceptable soils, or other substances which would render subgrade unsuitable for a proper lawn or plant growth, shall be removed from the premises whether or not such pollution occurs or exists prior to or during the Contract period. In the event that such material is placed, this material shall be removed and replaced with approved material. All remedial operations associated with soil mixes and controlled fill shall be reviewed and approved by the Owner's Representative responsible for remediation, when applicable.

2.7 PLACING PLANTING SOIL

A. Remove all large clods, lumps, brush, roots, stumps, litter, and other foreign material and stones one-half inch (1/2") in diameter or larger. Dispose of removed material legally off-site.

B. Do not place a muddy or wet soil mix.

C. Place and spread planting soil mix of the type specified over approved subgrade to a depth sufficiently greater than the depth required for planting areas so that after natural settlement, misting and/or light rolling, as previously approved by Owner's Identified Agent, the completed work will conform to the lines, grades, and elevations shown or otherwise indicated.

D. Topsoil/ Planting Soil Mix shall be placed at the following minimum depths, or as otherwise directed by the plans in all areas over natural subsoils.
   1. Lawn Areas – 6" minimum
   2. Planting Beds – 18" minimum
   3. Tree Pits – 36" minimum

E. Grading Tolerances: Lawn and Planting areas shall be fine graded within ±1/10 (0.10) feet of grades indicated on drawings. Maintain all "flat" areas and slopes to allow free flow of surface drainage without ponding.
   1.

END OF SECTION

SECTION 329200 – LAWNS AND GRASSES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 32 9000 – Planting

C. Section 32 9100 – Planting Soils

1.2 SCOPE OF WORK

A. Provide lawns, meadow mixes, and sod (if selected by owner) in accordance with the contract documents.

B. Provide stakes and rope for protection of seed during establishment.

1.3 REFERENCES

A. Hortus III - 1976 Edition, Bailey Horatorium, Cornell University.

B. Technical Association of the Pulp and Paper Industry for Wood Cellulose.

C. Contract Drawings and Documents

1.4 EXAMINATION OF SITE AND DOCUMENTS

A. By submitting a bid the Contractor affirms that he has carefully examined the site and all conditions affecting work under this Section. No claim for additional costs will be allowed because of lack of full knowledge of existing conditions.

B. Plans, specifications, surveys, measurements, other documents and dimensions under which the work is to be performed are believed to be correct; but the Contractor shall have examined them for himself during the Bidding period, as no additional compensation will be made for errors for inaccuracies that may be found therein.

1.5 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.6 SUBMITTALS TO LANDSCAPE ARCHITECT

A. Watering or irrigation plan and schedule, including source of water and methods for encouraging drought tolerance, prior to installation.

B. Maintenance plan through final acceptance, prior to installation.

C. Biweekly reports monitoring performance and corrective actions, after installation.

D. Product Data: Manufacturer's current catalog cuts and specifications of the following:
   1. Fertilizer
   2. Mulch

E. Certificates:
   1. Certificates of inspection as required by law for transportation of each shipment of seed along with invoice.
   2. Seed mix certificate including fertilizer and rate of application.
   3. Sod mix certificate (if selected by owner).
   4. Product certificates for soil amendments and fertilizer, from manufacturer.

1.7 FIELD QUALITY CONTROL

A. Tests: Samples of materials may be taken and tested for conformity to Specifications at any time.

B. Rejected Materials: Remove rejected materials immediately from the site at contractor's expense. Pay cost of testing of materials not meeting Specifications.

1.8 DELIVERY, STORAGE AND HANDLING

A. Seed:
   1. Delivery: Furnish standard seed in unopened manufacturer's standard containers bearing quantity, analysis and name of manufacturer
   2. Storage: Store seed with protection from weather, rodents or other conditions, which would damage or impair the effectiveness of the product.

B. Sod (if selected by owner):
   1. Harvest, deliver, store, and handle sod according to requirements in "Specifications for Turfgrass Sod Materials" and "Specifications for Turfgrass Sod Transplanting and Installation" in TPI's "Guideline Specifications to Turfgrass Sodding." Deliver sod in time for planting within 24 hours of harvesting. Protect sod from breakage and drying.

C. Mulch:
   1. Labeling: Each package of the cellulose fiber shall be marked by the manufacturer to show the air dry weight content.
   2. Storage: Store seed with protection from weather, rodents or other conditions, which would damage or impair the effectiveness of the product.

1.9 PROJECT/SITE CONDITIONS

A. Existing Conditions: For protection of existing plants to remain, refer to Spec Section 32 90 00 – Planting

1.10 SEQUENCING AND SCHEDULING

A. Period of Application of Hydroseeding:
   1. Within fourteen (14) calendar days after the completion of finish grading in any area.

B. Scheduling:
   1. Hydroseeding: Perform on a section-by-section basis, upon approval of Landscape Architect, and immediately after finish grading and irrigation installation except for seasonal Limitations.
      a. Season: Plant in Fall or Spring.
         1) Allow sufficient time for full germination and 2 mowings before preliminary acceptance.
   2. Embankment and Slopes: Complete in a continuous manner.
   3. Acceptable Planting Window:
      a. Place grass seed or sod only at seasonal times within appropriate temperature range and wind conditions for plant development as approved by Landscape Architect:
      b. Acceptable Seeding Seasons/Times:
         1) Spring: April 1st - June 15th
         2) Fall: September 1st - October 15th

c. Seeding or sodding at any time other than within the above seasons shall be allowed only when the Contractor submits a written request for permission to do so and permission is granted in writing by the Owner. Newly seeded or sodded areas, if installed out of season, must be continuously watered according to best recommended and Landscape Architect approved practice. Contractor shall be responsible for providing an acceptable stand of grass as specified.

1.11 WARRANTY

A. The 90 day maintenance period begins with the Landscape Architects certification of substantial completion. The warranty period begins after the final acceptance of the maintenance period. The final acceptance occurs upon satisfactory completion of all work, included in the 90 day maintenance period, but exclusive of replacement of materials under the Warranty Period.

B. Time Period: Warrant that meadows shall be in a healthy and flourishing condition of active growth 18-months from date. Lawn to be in a healthy and flourishing condition of active growth 90-days from growth.

C. Appearance During Warranty: Lawns and sod shall be free of dead or dying patches, and all areas shall show foliage of a normal density, size and color.

D. Delays: Delays caused by the Contractor in completing planting operations, which extend the planting into more than one planting season, shall extend the Warranty Period correspondingly.

E. Coverage: Warrant growth and coverage of hydroseeded planting to the effect that a minimum of 95% shall be covered with specified planting after one growing season with no bare spots.

F. Exceptions: Contractor shall not be held responsible for failures due to neglect by owner, vandalism, etc., during Warranty Period. Report such conditions in writing.

PART 2 - PRODUCTS

2.1 MANUFACTURERS/GROWERS

A. Hydro Mulch and Soil Stabilizer: Obtain mulch and soil stabilizer from a certified source within proximity of the project site.

B. Turfgrass Sod: Certified complying with "Specifications for Turfgrass Sod Materials" in TPI's "Guideline Specifications to Turfgrass Sodding." Furnish viable sod of uniform density, color, and texture, strongly rooted, and capable of vigorous growth and development when planted.

C. Fertilizer:
1. Regular Type: Nitrogen content derived from organic sources; bearing manufacturer's statement of analysis. Minimum requirements: 12% nitrogen, 4% phosphoric acid, 8% potash.
2. Slow-release Type: 50% of nitrogen is in slow-release form. Content derived from organic or inorganic sources; bearing manufacturer's statement of analysis. Minimum requirements: 12% nitrogen, 4% phosphoric acid, 8% potash.

3. Commercial Mixed Type: Nitrogen content derived from organic or inorganic sources, bearing manufacturer's statement of analysis. Minimum requirements: 10% nitrogen, 10% phosphoric acid, 10% potash.

D. Lime: Ground limestone containing not less than 85% carbonates; 50% passing 100 mesh sieve and 90% passing 20 mesh sieve.

E. Seed: Shall be of a mix as specified on the plans furnished in un-opened containers and providing percentage of seed varieties and inert matter. All non-turf seeds shall be purchased and applied at a Pure Live Seed (PLS) rate as indicated on the plans. This may require the contractor to purchase/apply seed at a high rate as measured by bulk weight.

F. Straw Bales: Clean bales of straw of hay, wheat, rye, oats or barley.

G. Hydromulch: Wood cellulose fiber containing no germination inhibiting or growth inhibiting agents. Characteristics shall be as follows:
1. Percent moisture content: 9.0% (+3.0%)
2. Percent organic matter: 99.2% (+0.8).
3. Percent ash content: 0.8% (+0.2%).
4. pH: 4.8 (+0.5).
5. Water Holding Capacity: 1150 grams water/100 grams fiber, minimum.

H. Mulch: Clean, seed free straw of hay, wheat, rye, oats or barley.

I. Staking Pegs: 3/4" diameter by 8" long softwood.

J. Water: Clean, potable.

2.2 ACCESSORIES

A. Mulch: Shall be Product: "Silva Fiber", "X-100 Spra-mulch", or "Conwed".
1. Composition: Green-colored, fibrous, 100% virgin wood fibre mulch containing no growth or germination-inhibiting factors.
2. Weight: Weight specifications of this material from suppliers, and for all applications, shall refer only to air dry weight of the fiber material. Absolute air dry weight is based on the normal standards for wood cellulose and is considered equivalent to 10% moisture.
3. Dispersion in Slurry: Mulch shall be manufactured in such manner that after addition to and agitation in slurry tanks with fertilizer, seed, water and other approved additives, fibers in the material will become uniformly suspended to form a homogeneous slurry.
4. Absorption Capacity: When hydraulically sprayed on the ground, the material will form a blotter-like groundcover impregnated uniformly with seed, which will allow absorption of moisture and allow rainfall to percolate to the underlying soil.

2.3 HYDROSEED EQUIPMENT (if required)

A. Type: Commercial type hydro-seeder for the application of slurry. Equipment shall have a built-in agitation system with an operating capacity sufficient to agitate, suspend and homogeneously mix slurry.

B. Distribution Lines: Large enough to prevent stoppage and to provide even distribution of the slurry over the ground.

C. Pump Capacity: 150 psi at the nozzle.

D. Slurry-Tank: Minimum capacity of 1,000 gallons and shall be mounted on a traveling unit which will place the slurry tank and spray nozzles within sufficient proximity to the areas to be seeded.

2.4 MIXES

A. Hydroseeding Mix per (1,000 Sq. Ft.)
   1. Lawn Areas:
      a. 30 lbs. - Mulch
      b. 7 lbs. - Lawn Seed
      c. 10 lbs. - Fertilizer

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions:
   1. Stones, Weeds, Debris: Verify that all areas to receive hydroseeding are clear of stones larger than 1/2 in. diameter, weeds, debris and other extraneous materials.
   2. Grades: Verify that grades are within 1 in. plus or minus of the required finished grades. Verify that fertilization have been installed in another section. Report all variations in writing.

3.2 PREPARATION

A. Soil Moisture:
   1. Excessive Moisture: Do not commence work of this section when soil moisture content is so great that excessive compaction will occur, nor when it is so dry that dust will form in air or that clods will not break readily.
   2. Inadequate Moisture: Apply water, as necessary, to bring soil moisture content to an acceptable level.

3.3 SEEDING

A. Unless indicated otherwise, all "lawn" areas shall be seeded or sodded.

B. Provide soil preparation, seeding, sodding, weeding, watering, and otherwise all labor and materials necessary to secure the establishment of acceptable turf and meadows.

C. After planting soil has been placed, grading is complete, surface soils have been allowed to settle a minimum fourteen (14) days, remedial work is complete, and soil amendments have been applied as specified in this Section, water the planting soil seed bed twelve to twenty-four (12-24) hours prior to seed or sod installation to a depth making the planting soil evenly moist but not overly moist or slippery.

D. Water all seeded areas immediately following seed installation so that the seed bed surface is thoroughly soaked. Cut and maintain established grass in accordance with the requirements specified herein. Perform maintenance on completed areas as installation continues in other areas.

E. Seeding shall not be performed in windy weather.

F. Seeding shall be done in two (2) directions at right angles to each other.

G. Lawn areas shall be seeded by sowing evenly with an approved mechanical seeder at the rate indicated on the Construction Drawings. Culti-packer or approved similar equipment may be used to cover the seed and to form the seed bed in one operation. In areas inaccessible to culti-packer, the seeded ground shall be lightly raked with flexible rakes and rolled with a water ballast roller. After rolling, seeded areas are to be tightly mulched with wheat straw.

H. If the project completion date prohibits in-season planting, the Contractor shall prepare himself for out-of- season seeding so that all lawns shall be completed and ready for acceptance at time of project completion, without additional cost to the Owner. Lawn maintenance shall be the same as for other planting.

I. Lawns shall be maintained by the Contractor for at least 60 days after seeding, or as long as is necessary to establish a uniform stand of the specified grasses, or until substantial completion of the project or until acceptance of lawns, whichever is later.

J. In the event that lawn operations are completed too late in the Fall for adequate germination and/or growth, maintenance shall continue into the following growing season or until a uniform stand of the specified grasses has been established.

K. Water seeded areas twice the first week to a minimum depth of six inches (6") with a fine spray and once per week thereafter as necessary to supplement natural rain to the equivalent of one-inch (1") or to a six inch (6") depth.

L. The surface layer of soil for seeded areas must be kept moist during the germination period. After first cutting, water as specified above.

M. Make weekly inspections to determine the moisture content of the soil and adjust the watering schedule established by the irrigation system installer to fit conditions.

N. After grass growth has started, all areas or parts of areas, which fail to show a uniform stand of grass for any reason whatsoever shall be reseeded in accordance with the plans, and as specified herein. Such areas and parts of areas shall be reseeded repeatedly until all areas are covered with a satisfactory growth of grass at no additional cost to the Owner.

O. Watering shall be done in such a manner and as frequently as is deemed necessary by the Landscape Architect to assure continued growth of healthy grass. All areas of the site shall be watered in such a way as to prevent erosion due to excessive quantities applied over small areas and to avoid damage to the finished surface due to the watering equipment.

P. Water for the execution and maintenance of this work shall be provided by the Owner at no expense to the Contractor. The Contractor shall, however, furnish his own portable tanks, pumps, hose, pipe, connections, nozzles, and any other equipment required to transport the water from the available outlets and apply it to the seeded areas in an approved manner.

Q. Mowing of the seeded areas shall be initiated when the grass has attained a height of two and one-half to three inches (1-1/2" to 2"). Grass height shall be maintained between two and two and one-half inches (2" to 2-1/2") at subsequent cuttings depending on the time of year. Not more than one third (1/3) of the grass leaf shall be removed at any cutting and cutting shall not occur closer than ten (10) days apart.

R. When the amount of grass is heavy, it shall be removed to prevent destruction of the underlying turf. If weeds or other undesirable vegetation threaten to smother the planted species, such vegetation shall be mowed or, in the case of rank growths, shall be uprooted, raked and removed from the area by methods approved by the Landscape Architect.

S. Protect seeded area against trespassing while the grass is germinating. Furnish and install fences, signs, barriers or any other necessary temporary protective devices. Damage resulting from trespass, erosion, washout settlement or other causes shall be repaired by the Contractor at his expense.

T. Remove all fences, signs, barriers or other temporary protective devices after final acceptance.

3.4 HYDROSEEDING

A. Roughen surface to break-up large clods and surface crust, to scarify and remove irregularities that will hold water.

B. Mix specified seed, fertilizer and fiber mulch in water using clean, washed equipment specifically designed for hydroseed application. Continue mixing until uniformly blended into a homogenous slurry suitable for hydraulic application.

C. Apply slurry uniformly to all areas to be seeded in a two-step process.

D. Apply first slurry uniformly at a minimum rate of 500 lbs/acre dry weight but no less than a rate required to obtain the recommended seed-sowing rate of the seed mix supplier.

E. Apply second slurry cover coat of fiber mulch at rate of 1000 lbs/acre.

3.5 SODDING

A. Lay sod within 24 hours of harvesting. Do not lay sod if dormant or if ground is frozen or muddy.

B. Lay sod to form a solid mass with tightly fitted joints. Butt ends and sides of sod; do not stretch or overlap. Stagger sod strips or pads to offset joints in adjacent courses. Avoid damage to subgrade or sod during installation. Tamp and roll lightly to ensure contact with subgrade, eliminate air pockets, and form a smooth surface. Work sifted soil or fine sand into minor cracks between pieces of sod; remove excess to avoid smothering sod and adjacent grass.

C. Lay sod across angle of slopes exceeding 1:3.

D. Retain subparagraph below if required. Steel staple anchors are commonly used.

E. Anchor sod on slopes exceeding 1:6 with wood pegs spaced as recommended by sod manufacturer but not less than 2 anchors per sod strip to prevent slippage.

F. Saturate sod with fine water spray within two hours of planting. During first week after planting, water daily or more frequently as necessary to maintain moist soil to a minimum depth of 1-1/2 inches below sod.

3.6 SEEDING MEADOW AREAS

A. Do not use wet seed or seed which is moldy or otherwise damaged, in transit or storage.

B. Sow seed using a spreader, seeding machine or hydroseeder. Do not seed when wind velocity exceeds 5 mi. per hr. Distribute seed evenly over entire area by sowing equal quantity in 2 directions at right angles to each other. Under no circumstances shall wildflower seeds be mixed with to nurse crop seeds or warm season grass seed in the same spreader or mechanical seeder. Variations in seed size, shape a weight will contribute to uneven application and undesirable results.

C. If spreader is utilized for wildflower seeding, mix sufficient quantity of slightly moist sand with seed to ensure even application of seed. After seeding, rake seed lightly into top 1/8” of soil, roll lightly, and water with a fine spray.

D. If cultipacker or seed drill is used to apply seeds, equipment should be set to install seed at a maximum of ¼” depth followed by firming of the soil to maximize seed/soil contact.

E. Sow not less than the quantity of seed specified or scheduled. If utilizing spreader or seeding machine, protect seeded area against erosion by spreading straw type mulch after completion of seeding operation. If seeds are applied using a hydroseeder, 5-10% of the mulching fiber should be applied with the seeds, the balance should be applied separately a second step for optimal seedling germination. Spread uniformly to form a continuous blanket not less than 1½” thick, loose measurement over seeded areas.
   1. If wind is a problem, then anchor mulch by spraying with tactifier at the rate of 10 to 13 gallons per 1000 sq. ft. Take precautions to prevent damage or staining of construction or other plantings adjacent to mulched areas.
   2. If a hydroseeder is employed to apply seed, the proper procedures should be followed to minimize the amount of time that seed is circulated through pumps and paddles prior to application. Over circulation may damage the seed.

F. For areas to be seeded before 26 April
   1. Areas to be seeded/planted are to be shallow tilled to a depth of 6” to remove existing turf type grasses and weeds, to expose dormant weed seeds and to remove large stones over 1½” in any dimension and sticks, roots, rubbish and other extraneous matter. Limit preparation to areas, which will be planted after preparation. Hand cultivation only will be permitted within the canopy areas of existing trees.
   2. Soil amendments, as determined by soil tests, are to be spread and incorporated into topsoil to a minimum depth of 6”.
   3. Fine grade lawn and wildflower areas to smooth, even surface with loose, uniformly fine texture. Roll, rake and drag meadow areas, remove ridges and fill depressions, as required to meet finish grades.
   4. Moisten prepared meadow planting areas to settle soil and amendments. Do not create a muddy soil condition.
   5. Approximately two weeks following initial tilling, areas to be seeded/planted are to be treated with a non-selective, glyphosate based herbicide to kill any newly germinated grasses and weeds.

G. For areas to be seeded after 26 April
   1. Following the first flush of spring growth on existing turf areas, areas to be seeded/planted are to be mowed to a height of 4” with all debris raked off and disposed of off-site. Areas to be seeded/planted are then to be sprayed with a non-selective glyphosate based herbicide to kill all grasses and forbs.
   2. Approximately four weeks after initial spraying, Contractor is to inspect sprayed areas with Architect to determine success of vegetation removal. Follow up spot treatments may be required and shall be applied at that time. Soil amendments, as determined by soil tests, are to be applied to areas to be seeded/planted.

H. Preparation of Unchanged Grades: Where lawns or meadows are to be planted in areas that have not been altered or disturbed by excavating, grading, or stripping operations, prepare soil for lawn planting as follows: Till to a depth of not less than 6”; apply soil amendments and initial fertilizers as specified; remove high areas and fill in depressions; till soil to a homogenous mixture of fine texture, free of lumps, clods, stones, roots, and other extraneous matter. Hand cultivation only will be permitted within the canopy of areas of existing trees.
   1. Note: Some limited tree protection areas may require removal of mulch, debris, stumps, herbaceous material, etc. before lawn can he installed.
   2. Prior to preparation of unchanged areas, herbicidally treat or physically remove existing grass, vegetation and turf. Dispose of such material properly outside Owner’s property; do not turn over into soil being prepared for lawns.

3.7 MAINTENANCE OF MEADOW AREAS

A. General Maintenance Requirements:
   1. Maintenance work shall include but not be limited to watering; remedial work such as repair of eroded areas, reseeding, and keeping the area clean. All other work as deemed by the Contractor required in support of his guarantee, or as may be pointed out to the Contractor by the Landscape Architect during the guarantee period shall be provided.

B. In early spring before growth begins, mow to a height of 4 to 6 inches and leave the residue on the ground as a reservoir of viable seed.
   1. Refer to plans for additional maintenance notes.
   2. For grassy annual weed control, apply post-emergent herbicides such as “Acclaim” or approved equal, as per manufacturer’s recommendations and with written approval of Landscape Architect. Apply twice during first growing season.
   3. Selectively apply broadleaf weed control spot spray as required with a broadleaf selective herbicide as recommended by manufacturer twice during first growing season.
   4. Apply overseed to wildflower areas original wildflower seed mix at 50% original rate.

3.8 CLEANING

A. Hydroseed Overspray: Immediately after application, thoroughly wash off any plant materials, planting areas, or paved areas not intended to receive slurry mix.
   1. Erosion: Immediately restore eroded areas. Keep all adjacent paved surfaces cleaned of dirt, mud or stains and organic debris.

END OF SECTION

SECTION 329353 – LANDSCAPE MAINTENANCE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 1 Specification Sections, apply to this section.

B. Section 32 9000 – Planting

C. Section 32 9200 – Lawns and Grasses

1.2 SUMMARY

A. Provide labor, materials, equipment, services and transportation to complete work.
   1. Plant and turf maintenance including pruning, watering, drainage, irrigation, fertilizing, weed and pest control, adjusting tree guys, and mulching two times per year during 18-month warranty period.
   2. Guaranty and replacement of unacceptable plants.
   3. Fall Leaf Cleanup in fall every two weeks prior to acceptance
   4. Providing Owner with Maintenance Manual.

1.3 REFERENCES

A. Comply with applicable requirements of:
   1. State of Connecticut Department of Transportation (ConnDOT) Standard Specifications for Roads, Bridges and Incidental Construction, Latest addition
   2. American Association of Nurserymen, American Standards for Nursery Stock, (ANSI Z60.1), latest edition, published by the American Association of Nurserymen, 1250 I Street, N.W., Suite 500 Washington, D.C. 20005.

1.4 DEFINITIONS

A. Maintenance: consists of keeping turf , woody, perennial and annual plants in healthy growing condition including watering, weeding, cultivating, remulching twice during 18-month warranty period, removal and replacement of dead plant material, resetting plants to proper grades or upright positions and maintaining saucer.

1.5 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.6 SUBMITTALS

A. Submittals: in accordance with Section 013300 – Submittal Procedures

B. Materials List: provide list of materials to be used in maintenance; materials shall be the same as approved in related sections:
   1. Fertilizers, soil amendments, testing see Section 329113 – Planting Soils.
   2. Plant materials, mulch, and related materials, see Section 329000 - Planting.

C. Pest and Disease Treatment
   1. Submit plan for pest and disease treatment; identify proposed materials and methods.
   2. Explain why a problem does or may exist.

D. Maintenance Manual
   1. Provide a maintenance manual to Owner describing operations for on-going upkeep of the installed plants. The manual shall address itself to specified types and uses of plants installed, and provide information for care of both newly installed plants and long-term maintenance.
   2. Provide specific information on the following items:
      a. Watering: Watering season; diagnosis of watering need; frequency of watering; amount; time of day; methods and equipment; equipment maintenance.
      b. Fertilization: Fertilizing seasons; analysis for fertilizer selection; application rates and methods; preparation and conditions; application times; application equipment; post-application operations and care; precautions for fertilizer use.
      c. Liming: Liming season; analysis for liming; application rate; method and equipment for application.
      d. Pruning: Pruning goals and purposes; methods and techniques (relate to species); equipment; season; cleanup and disposal; precautions.
      e. Mulching of beds: Depths of mulch; refreshment and replacement of mulch.

f. Miscellaneous plant maintenance: Weeding and weed control; pest and disease control; leaf and litter removal (required every two weeks during the fall if maintenance period is not complete before fall clean-up); bed edging; professional assistance for plant care; and plant replacement as necessary.

3. Include a month-by-month calendar of maintenance procedures, indicating operations listed above.
4. Include a developed Record Keeping document to be completed by the maintenance staff and submitted weekly to the Owner's Representative during active maintenance period.
5. Submit a copy of maintenance manual to Owner's Representative for approval. Submit prior to planting completion. Owner's Representative may request revisions to manual to meet intent of project design.
6. Submit three copies of manual to Owner at acceptance meeting for planting work. Acceptance shall not be granted until manual has been submitted and approved.

1.7 QUALITY ASSURANCE

A. Qualifications: contractor shall have minimum five years' experience in landscape maintenance.

B. Regulatory Requirements
1. Secure permits, licenses, and pay fees including traffic control.
2. Comply with laws, regulations, and quarantines for agricultural and horticultural products.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Packing and Shipping: deliver materials in unopened containers bearing the manufacturer's name. Transport materials without damage. Protect finishes from abrasion, dirt, oils, grease, and chemicals. Pack materials to protect from weather.

B. Acceptance at Site: verify in writing that delivered materials conform to specifications and approved submittals.

C. Storage and Protection:
1. The owner will not provide areas of storage for the maintenance contractor.
2. Store materials in dry place, on pallets, off the ground; protect from sun.
3. Protect materials from theft, damage, weather, dirt, oils, grease, and construction.

1.9 PROJECT/SITE CONDITIONS

A. Environmental Requirements: do not work soils when dry, wet, or frozen.
1. Field Test
a. Form soil in palm of hand, if soil retains shape and crumbles upon touching, the soil may be worked.
b. If soil will not retain shape it is too dry and should not be worked.
c. If soil retains shape and will not crumble, it is too wet and should not be worked.

B. Planting Seasons: see Section 329000 – Planting

1.10 COMPLETION

A. Upon completion of planting, request Owner's Representative's review to determine if work is substantially complete. If work is complete, Owner's Representative will issue a Letter of Substantial Completion that establishes the effective date of the start of the 18-Month Maintenance Period for plantings and turf.
   1. If work is not substantially complete, Owner's Representative will make a list of outstanding work to be done on a timely schedule agreed upon by Contractor and Owner's Representative.
   2. Contractor shall notify Owner's Representative when outstanding work is accomplished and ready for review. When outstanding work is complete, in the judgment of Owner's Representative, a Letter of Substantial Completion will be issued.

1.11 PRELIMINARY ACCEPTANCE

A. After the Letter of Substantial Completeness the work will be reviewed for completeness and of Preliminary Acceptance

B. Plantings and turf shall be in thriving and vigorous condition at the time of review for Preliminary Acceptance. If plantings and turf are acceptable, Owner's Representative will issue a Letter of Preliminary Acceptance establishing the effective date of the 18-Month Guaranty Period.
   1. If plantings are not thriving, in the judgment of Owner's Representative, remedial actions by Contractor will be required to repair or replace plantings.
   2. Remedial work shall be done immediately and in accordance with related work of other sections.
   3. At the conclusion of remedial work, Owner's Representative will review work and extend the Guaranty Period to incorporate new plantings.

1.12 FINAL ACCEPTANCE

A. After the 18-month Maintenance and Guaranty Period, plantings and turf will be reviewed.

B. Plantings and turf shall be in thriving and vigorous condition at the time of review for Final Acceptance. If plantings and turf are acceptable, Owner's Representative will issue a Letter of Final Acceptance.
   1. If plantings and turf are not thriving, in the judgment of Owner's Representative, remedial actions by Contractor will be required to replace plantings.
   2. Remedial work shall be done immediately and in accordance with related work of other sections.
   3. At the conclusion of remedial work, Owner's Representative will review work and extend the Maintenance and Guaranty Period until plantings are deemed acceptable.

PART 2 - MATERIALS

2.1 MATERIALS

A. Materials utilized during the maintenance period shall be the same specified in the work of the related sections:
   1. Fertilizers, soil amendments, testing, see Section 329113 – Planting Soils.
   2. Seed, sod and related materials, see Section 329200 – Turf and Grasses
   3. Plants, mulch, and related materials, see Section 329300 - Planting.

2.2 BIOLOGICAL, HORTICULTURAL, HERBICIDAL AND OTHER PEST CONTROL

A. Material Specification: shall be by a licensed pest control operator, with authority to purchase, utilize, and specify agricultural chemicals and agricultural products.

B. Use the least hazardous, least intrusive materials and methods.

2.3 EQUIPMENT

A. Vehicles: in good working order so oil and grease does not stain pavements and poison plantings. Signs identifying the vehicles shall be clearly displayed.

B. Machinery: in good working order so oil and grease does not stain pavements and poison plantings.

2.4 WATER

A. Water: Furnished by Contractor, suitable for irrigation and free from ingredients harmful to plant life.

B. Hoses and other watering equipment to be furnished by Contractor.

2.5

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verification of Conditions: in the event field conditions are not as shown on Drawings and outlined in the Specifications, notify Owner’s Representative in writing.

3.2 PREPARATION

A. Protection:
   1. Agricultural Chemicals: protect site improvements from contact with agricultural chemicals, soil amendments, and fertilizers.

3.3 PRUNING

A. Pruning: prune with approval of Owner's Representative.
   1. Remove dead branches, rubbing branches, and branches growing towards plant center.

3.4 DRAINAGE

A. Observe drainage in plant pits with hand soil augur.

B. Verify plant pits are draining; plant pits not draining shall be identified on the plan and brought to the attention of Owner's Representative.

3.5 PLANTS

A. Maintain plants in vigorous condition throughout the Maintenance and Guaranty Periods.

B. Replace plants that are missing, dead, not true to name or size as specified, or not in satisfactory growth, as determined by Owner's Representative. Replace plants found unacceptable within one month or in first month of next growing season, whichever comes first.

C. Plants must show a minimum of 75% healthy head with obvious growth since planting. Signs of disease, injury, or damage shall have been successfully treated or plant shall be rejected as determined by Owner's Representative.

D. Replacements plants shall be same kind and size as specified in plant list. Furnish and plant. Cost of replacement borne by Contractor except where it can be shown loss resulted from vandalism, fire, theft, or other causes beyond Contractor's control. Restore areas damaged or disturbed by replacement operations to their original condition.

3.6 WATERING

A. Water at a rate of one inch of water every five to seven days. Apply water such that it penetrates the soil to a depth of 6".

B. Trees require a minimum of ten gallons each and shrubs a minimum of five gallons each per week.

C. If spring or fall months experience below average rainfall, periodic watering could be extended as part of this contract and at no additional charge as requested by Owner's Representative.

D. If natural rainfall provides water to meet watering requirements, weekly watering could be reduced but only at the request of Owner's Representative.

3.7 BASINS

A. Keep foot tamped and shaped earth dikes around plantings.

3.8 MULCH

A. Maintain mulch at 2" depth in planting areas with the exception of at stems and trunks of plants where mulch to be placed to a 0" depth and increasing to a depth of 2" at edge of rootballs and beyond.

B. Mulching is required two times per year during maintenance period, remove existing mulch as needed to maintain maximum 2" cover.

C. Maintain finish grades around plantings, at pavement edges, and at irrigation fixtures.

3.9 TREATMENT OF PEST AND DISEASES

A. Spray for both insect pests and diseases during maintenance period with notification and permission of Owner's Representative. Apply herbicides, insecticides and fungicides as prescribed by their manufacturer and in accordance with State laws. Contractor shall possess from the State of Connecticut the proper registrations and permits for application of materials or have applications made by approved, qualified firm holding registrations and permits. Furnish copies of permits in connection with materials to Owner's Representative. Spraying to be considered only after full consideration has been given to alternative pest control strategies. The least toxic approach to pest control shall be used.

3.10 ADJUSTING

A. Re-set settled plants to proper grade and position.

B. Restore planting saucer and adjacent material.

3.11 CLEANING

A. Clean up, remove and dispose off-site excess planting mixture, soil and debris generated under work of this section.

B. Wash and sweep clean site improvements and building surfaces. Clean spills and oversprays immediately.

C. Repair damage caused by maintenance operations.

3.12 PROTECTION

A. Protect work of this section until Final Acceptance.

B. Protect planted areas and soils from compaction by construction traffic and from contamination by construction materials.

END OF SECTION

TRUMBULL HILLCREST MIDDLE SCHOOL

SECTION 329400 - ARBORICULTURE

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specifications, apply to this section.

B. Section 024113 – Site Demolition

C. Section 311100 – Clearing and Grubbing

D. Section 310000 - Earthwork

E. Section 312333 – Trench Excavation for Utilities

F. Section 334100 – Storm Sewer

G. Section 329200 – Lawns and Grasses

H. Section 329300 – Landscape Planting

1.2 SCOPE OF WORK

A. This Work Included: Provide labor and materials as indication on Drawings and specified to implement basic arboricultural activities for existing trees, as well as construction observation of activities within the Tree Preservation Areas. Scope to include but not limited to
   1. Pruning
   2. Shade Tree Inventories
   3. Diagnosis and Treatment Recommendations
   4. Pre Planting Site Analysis, Plant Recommendations
   5. Root Pruning
   6. Integrated Pest Management
   7. Monitor Excavation & Construction within Tree Preservation Area (Section 02200-Earthwork).
   8. Disposal and Cleanup

B. Coordinate Work with that of other trades affecting or affected by Work of this Section and cooperate to assure the steady progress of Work.

1.3 REFERENCE STANDARDS

A. National Arborist Association (N.A.A.) Standards

B. American Society of Consulting Arborists

C. American National Standard for Tree Care Operations
   1. ANSI Z133.1 – 1994
   2. ANSI A300 – 1995

D. American Nurseryman Association Standards

1.4 QUALITY ASSURANCE

A. Arboriculture: comply with all applicable standards of the National Arborist Association (NAA) for pruning, guying, fertilizing and installation of lightning protection systems. Arborist shall have current certification by the International Society of Arboriculture (ISA).
   1. All arboricultural work under this section shall be performed by personnel totally familiar with arboricultural work and under the supervision of an experienced foreman and ISA certified arborist.
   2. Pruning shall be performed by tree workers who, through a minimum of five years related training and on-the-job experience, are familiar with the techniques and hazards of this work.

B. Analysis and testing of materials required under these specifications shall be in accordance with the current methods of the Association of Official Agricultural Chemists (AOCA) and ASTM.

C. Equipment and Safety
   1. Equipment shall be modern and well maintained. Adhere to all applicable state and federal regulations. Contractor shall be responsible for damage to property resulting from equipment, including fluid leakage or damage resulting from equipment failure. Report incidents of this type immediately to Owner's representative.
   2. Safety shall be a primary concern while working on the Site. Contractor shall have an established safety program and adhere to NAA, OSHA and ANSI standards applicable to the tree care industry, including electrical and utility requirements as well as personal equipment and safe work procedures.

D. Pesticide Applications
   1. Certified Pesticide Applicator shall be responsible for supervision of all applications of fertilizer or pesticides on the site.
   2. Pesticides shall be applied in strict compliance with label instructions and all applicable federal, state and local requirements. Material Safety Data sheets shall be available for pesticides in the Contractor's possession while on the site.

E. Arrange a pre-construction meeting between the Landscape Architect, General Contractor and Arboriculture Subcontractor. Such meeting shall seek to review the proposed arboriculture procedures, schedule, consideration of substitutions, and general review of specifications. Note that pruning, fertilization, vertical mulching and mulching activities should be performed prior to the start of construction activities, to improve the vigor of the existing trees to be preserved and to help mitigate the effects of construction stress.

1.5 DEFINITIONS

A. Diameter shall be defined as diameter at breast height (dbh) which is the average tree diameter at 4.5 feet from the ground on the uphill side of the tree.

B. Caliper shall be defined as the diameter of the trunk at 6” above the soil for trees up to 4” in caliper and as the diameter of the trunk at 12” above the soil for trees up to 12” caliper.

C. Root zone shall be defined as 1 (one) foot of radius around trunk for every inch of trunk diameter (at 4.5 feet above the ground level on the uphill side of the tree).

D. Tree Preservation Area shall be defined as all areas outside the limits of construction which contain trees and all areas within the limits of construction which are designated as tree preservation areas on the plans and/or in the field by fencing and signs.

1.6 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project’s environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.7 SUBMITTALS

A. General: Make submittals in accordance with the provisions and procedures of these documents. Render submittals and receive approval prior to delivery or installation. Approval by the Landscape Architect of submitted product data, samples, test reports, and certificates, or material inspected at source of supply, does not constitute final acceptance.

B. Product Data: Submit producers/manufacturers specifications, quality control, product data, and test reports for the following: Include instructions for handling, storage, installation and protection.
1. All Pesticides, Insecticides, Herbicides, and other chemicals

C. Arboricultural Program: Submit detailed program of Arboriculture work and proposed schedule at the pre-construction meeting.

D. Arborist Qualifications
   1. Include evidence of experience, including project list.
   2. Verification of membership in the National Arborist Association (NAA).

1.8 COORDINATION

A. The work of this Section shall be coordinated with that of other trades affecting, or affected by, this work, as necessary to assure the steady progress of all work of the Contract.

1.9 PERMITS AND CODES

A. All work shall comply with applicable codes, ordinances, rules, regulations, and laws of all local, municipal, and state authorities having jurisdiction. All work necessary to make site preparation comply with such requirements shall be provided without additional cost to Owner.

B. Procure and pay for all permits and licenses required for work under this Section.

1.10 REGULATORY REQUIREMENTS

A. Comply with all rules, regulations, laws and ordinances of local, state and federal authorities having jurisdiction. Provide labor materials, equipment and services necessary to make Work comply with such requirements without additional cost to Owner.

B. Investigate the conditions of public thoroughfares and roads as to availability, clearances, loads, limits, restrictions, and other limitations affecting transportation to and ingress and egress at the site. Conform to all governmental regulations regarding the transportation of materials and secure, in advance, any necessary permits.

C. Procure and pay for permits and licenses required for Work.

1.11 DELIVERY, STORAGE AND HANDLING

A. Packaged Materials: Deliver packaged materials in clearly marked containers showing net weight, guaranteed analysis and name of manufacturer. Specified requirements for packaged materials apply to bulk shipments. Protect materials from deterioration during delivery and during storage at site.

1.12 PROJECT CONDITIONS

A. Existing Conditions
   1. Carefully examine the site before submitting a bid. Be informed as to the nature and location of the Work, general and local conditions including climate, adjacent properties and utilities, conformation of the ground, the nature of subsurface conditions, the character of equipment

and facilities needed prior to and during execution of the Work. Be aware of and comply with restrictions regarding subsurface utilities and subterranean structures, including excavation and loading parameters.

2. Should the Contractor, in the course of Work, find any discrepancies between Drawings and physical conditions or any omissions or errors in Drawings, or in layout as furnished by the Landscape Architect, it will be his duty to inform the Landscape Architect immediately in writing for clarification. Work done after such discovery unless authorized by the Landscape Architect, shall be done at the Contractor's risk.

B. Environmental Conditions – Arboriculture

1. Pruning: Pruning shall occur, no later than April 1st, prior to the leafing out of the trees. Pruning shall only occur when weather conditions are favorable; pruning shall not occur when branches are wet with snow or rain or when covered by ice.
2. Fertilization: Spring fertilization shall occur in early spring, before bud break. When leaves have fully expanded, fertilizing can continue until early July Fall fertilization shall occur after October 1st or after the first hard freeze, whichever comes first, when all possibility of top growth in past and before the moisture in the soil freezes casing root activity. Avoid fertilizing between July and September 1.
3. Pest control: Avoid use of herbicides within planting bed. Avoid use of fertilizer/herbicide combinations within the dripline of trees in plant beds.

PART 2 - PRODUCTS

2.1 SOIL AMENDMENT MATERIAL

A. Sand: Natural, medium to coarse grained in texture, free from decomposed organic matter like roots, sticks, leaves, paper and of any other undesirable trash-like glass, plastic or metal fragments, that could interfere with soil drainage and planting operations. Sand shall be salt-free.

B. Ground Limestone: Natural dolomitic limestone containing a minimum of 88% of calcium and magnesium carbonates. Total of 100% passing the 10 mesh sieve; minimum of 90% passing the 20 mesh sieve; minimum of 60% passing the 100 mesh sieve.

C. Water: Potable, clean, fresh and free from harmful materials. Water shall be furnished by the Owner. All hoses and other irrigation equipment required for the Work shall be furnished by the Contractor.

2.2 FERTILIZERS

A. General: As specified below, all fertilizer shall conform to applicable state fertilizer laws. It shall be uniform in composition, free-flowing, and shall be delivered to the site in the original, unopened containers, each bearing the manufacturer's guaranteed analysis. Any fertilizer which is unsuitable for use will be rejected.

B. Fertilizer: To be determined based on testing.

2.3 MULCH

A. Mulch shall be double shredded hardwood bark.

2.4 PESTICIDES

A. Biological control for trees and shrubs: Bacillus thuringensis, predatory mites, parasitic nematodes, parasitic insects, predatory insects, or other approved biological agents.

B. Miticide for trees: chinomethionate or dicofol.

C. Miticide for trees: chinomethionate or dicofol.

D. Superior oil for trees: horticultural grade, highly refined potassium salts or fatty acids.

E. Insecticides for trees: acephate, cyfluthrin, fluvalinate, chlorpyrifos, bendiocarb, or dimethoate.

PART 3 - EXECUTION

3.1 GENERAL

A. Basic arboriculture shall include all activities as noted in drawings, and shall include other arboriculture activities as described herein. Note that pruning, fertilization, vertical mulching and mulching activities should be performed prior to the start of construction activities, to improve the vigor of the existing trees to be preserved and to help mitigate the effects of construction stress.

B. The Arborist shall monitor excavations and construction within the Tree Preservation Area, including: being on site during all excavations within the Tree Preservation Area to ensure that hand or approved mechanical excavations does not damage existing root systems, and to perform compensatory pruning. The construction that would occur within the Tree Preservation Area would include but not be limited to removal of existing pavements, pavements, and utility trenching.

3.2 PRUNING

A. Pruning – General: Pruning shall conform to ANSI A300 – 2017 standards as specified. Stripping of interior growth on trees is not acceptable. Interior growth may be selectively thinned when appropriate to type of prune. Thinning in general shall be accomplished from the tips of branches by removing diseased, crossing, and/or conflicting branch structure. Target pruning shall be the preferred method of branch removal. Equipment shall be sharp and well maintained. Proper equipment shall be used for all pruning procedures (i.e., handsaw, chainsaw, polesaw, or pole pruner). Employees pruning trees shall have adequate training as to the proper methods and procedures for tree pruning. Refer to ANSI A300 standards for other pruning requirements.
   1. On trees known or suspected of being diseased, tools are to be disinfected with methyl alcohol at 70% (denatured wood alcohol diluted appropriately with water) or Clorox solution after each cut and between trees where there is known to be a danger of transmitting the diseased on tools.

2. The presence of any structural weakness, disease conditions, decayed trunk or branches, split crotches or branches, should be reported in writing to the Architect and Owner, and corrective measures recommended.

B. All Trees shall receive a crown cleaning to remove all dead, weak, and conflicting branches 1 (one) inch and larger at the point of attachment. Trees with root zone affected by construction shall receive a slight reduction in the meristematic regions at the branch tips in the crown.

3.3 ROOT PRUNING

A. Root pruning shall be performed in conjunction with Tree Preservation Fencing. Root pruning shall be performed as indicated on Drawings or as required, including: trenching for utilities, excavations for foundations, or wherever grades will be changed within the root zone of the tree to be preserved. Root pruning shall be to the depth of excavation or 24 inches, whichever is less. A trencher or vibratory plow shall be used to prune roots. Roots over 2" in diameter shall have a clean cut made on the surface of the root which is still attached to the tree. This cut shall be made with a hand saw or chain saw as soon as larger root is severed. Where fill is to be placed, root pruning shall be to the depth of top soil.

B. The Arborist must verify exact layout with General Contractor, to ensure root pruning in appropriate location.

C. When root pruning in conjunction with excavation and installation of utilities, the Arborist shall endeavor to work around and preserve the existing tree roots. Make all effort to preserve roots greater than 2" in diameter.

3.4 FERTILIZATION

A. Position Trees shall receive a liquid fertilization. Fertilizer shall be applied at a rate of 1.5 pounds of nitrogen per 1,000 square feet of root zone treated. A root stimulant shall be added for trees with root loss or disturbance or otherwise affected by construction. Fertilizer shall be injected using a soil probe at a depth of six inches. Fertilizer shall be applied in three foot grid pattern evenly distributed throughout the root zone.

3.5 INTEGRATED PEST MANAGEMENT (IPM)

A. Arborist shall provide an IPM technician and equipment to make necessary treatments. Technician shall be trained and licensed to apply necessary controls, and the control methods shall be reviewed and approved by the Arborist.

B. Work shall be completed in accordance with the town of Enfield landscaping standards.

C. IPM technician shall monitor and treat any pests which may inhibit the health or survival of the trees to be preserved. Technician shall make ten monitoring / treatment visits per year. Arborist shall submit a Site Monitoring/Treatment Report following each visit, which describes the pests observed

and treatments which were applied, and shall report on other issues observed on Site which may affect survival or the trees.

D. Watering shall be included in IPM program. Water shall be applied to trees during Site Monitoring / Treatment Visits, whenever soil moisture is below 40% of field capacity.

3.6 TREE WOUND CARE

A. Tree wounds shall be treated according to standard practices, by a professional arborist. Wounds shall not be covered with dressings.

3.7 DISPOSAL AND CLEAN UP

A. All refuse and debris from these operations shall be legally disposed of off-site. Material shall be removed or neatly stored at the end of each day's work. Dumping on the site shall not be permitted. Burning of material on the site shall not be permitted.

B. Maintain the site in an orderly condition during the progress of Work. Con tenuously and promptly remove excess and waste materials; keep lawn areas, walks and roads clear. Store materials and equipment where directed. Immediately remove rejected materials from the property. Promptly remove equipment, surplus material, and debris and trash resulting from operations under this Contract upon completion and prior to initial acceptance of Work. Lave the site in a neat, orderly condition, "broom clean".

C. All materials generated by construction activities during this phase of work shall be completely removed at the end of this phase and the site shall be left in a safe and clean conditions.

END OF SECTION

SECTION 331116 – SITE WATER

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 312333 –Trench Excavation and Backfill for Utilities

C. Town of Trumbull and Aquarion Water Company Standards and Regulations

1.2 SCOPE OF WORK

A. Work under this Section shall consist of providing all labor, plant facilities, materials, and equipment necessary and required to install all proposed water facilities in accordance with the Contract Documents. This Work shall include but not be limited to:
   1. Installation of water mains consisting of pipes, valves, thrust blocks, meter pits, hydrants, storage tanks, and all necessary and required accessory items and operations.

B. Coordination of the connection of building domestic and fire service lines to the on-site water mains with the Building Contractor.

C. Sterilization and testing of new water facilities.

1.3 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.4 SUBMITTALS

A. Product Data: Provide manufacturer's certificate for castings, pipe and accessories to certify that products meet or exceed specified requirements.

B. Shop drawings of hydrants, valves, and valve boxes.

C. Shop drawings of storage tanks including plan layout, access hatches, vent, refill, suction, overflow, and pipe connection locations between tanks. Provide anti-buoyancy calculations. Provide product data on seals, sealants, and couplers and access hatches.

PART 2 - PRODUCTS

2.1 MATERIALS

A. Ductile Iron Pipe: AWWA C151-91. Thickness Class 52 or better. Push-on joint complying with AWWA C110-90 or C153, rubber gaskets. Cement mortar lining complying with AWWA C104-90 for pipe and fittings minimum 1/16” thick. Note this type of pipe is most preferred and must be used for all lines 4” in diameter or greater.

B. Copper Tube: ASTM B88-61, soft annealed temper with bituminous coating, cast copper alloy flared joint fittings, ANSI B16.26, Type K for domestic service under four (where required by local authorities in lieu of ductile iron or as shown on the Drawings).

C. Control Valves:
1. General: Provide valves and flow control devices as indicated.
2. Minimum Working Pressure: 200 psi unless otherwise indicated, or required.
3. Valves shall open left.
4. Gate Valves: Standard shut off valves with maximum working pressure cast into body, outside screw and yoke type complying with AWWA C500.
5. Check Valves: Gravity operated, regular type, iron bodied, bronze fitted with metal to metal rubber faced checks, complying with AWWA C506.
6. Butterfly Valves: Rubber seated, equipped with gear or traveling nut actuator to minimize water hammer, complying with AWWA C504.

D. Valve Boxes: Minimum 5-1/4” diameter cast iron, slide type. Covers shall be non-locking and have the word WATER in the casting.

E. Accessories:
1. General: Provide anchorages for tees, plugs, caps, and bends. After installation, apply a full coat of asphalt or other acceptable corrosion retarding material to surfaces of rods and clamps.
2. Clamps, Straps and Washers: Steel, ANSI/ASTM A506.
3. Rods: Steel, ANSI/ASTM A575.
4. Rod Couplings: Malleable iron, ANSI/ASTM A197.
5. Bolts: Steel, ANSI/ASTM A307.
6. Cast Iron Washers: ANSI/ASTM A126, Class A.
7. Trust Blocks: 2,500 psi concrete. Use at all changes in directions and elsewhere as necessary.

8. Fittings: Fitting should be short body, cast iron or ductile iron, and should conform and be installed per applicable AWWA C110/A21.10-82 or C153/A21.53-84.
9. Water Service Identification: Blue metallic tape reading 'WATER LINE BURIED

F. Joints:
1. Restrained: 1700 series by EBAA Iron or field lock gaskets
2. Retaining Glands: 'Megalug' with a minimum working pressure of 250 psi, or approved equal

G. Hydrants:
1. Per drawings and local utility Specifications.
2. 3-way hydrant with a 5-1/4" valve and mechanical joint connections in accordance with AWWA C502, open left, as manufactured by Mueller or approved equal.

H. Concrete Valve Seats: Concrete for valve seats shall have a minimum compressive strength of 3,000 psi in 28 days.

I. Concrete Storage Tanks:
1. Tank: precast concrete conforming to ACI-350 standards, steel support saddles, taps for accessories, threaded connections, access manhole.
2. The structures shall be constructed to the lengths, widths and heights as shown on the contract drawings. The chambers shall be designed to adequately and safely support all live and dead loads to which the structure will be subjected, and to withstand all conditions which may be encountered.
3. Design calculations to be prepared by a State of Connecticut licensed professional engineer. Engineer shall verify that the structures have been designed to withstand the burial depth, submergence due to high groundwater (assumed at the ground surface), and the dead and live loads (H20 wheel load) anticipated for the station. The station structures shall have adequate wall, floor and roof thickness and steel reinforcement sufficient for the depth of burial shown on the drawings.
4. Design calculations for uplift forces shall contain a 1.15 minimum factor of safety. When required for counter-flotation, as determined by the buoyancy calculations, the structures shall be designed with an anti-flotation collar (factory casted or field installed) to satisfactorily withstand up-lift pressures exerted on the chambers.
5. The concrete used for the structural components shall attain a minimum, 28-day compressive strength of 5,000 PSI
6. Each pre-cast tank shall be provided with minimal joints to insure a watertight seal. Vertical joints are not allowed and, if required, horizontal joints are to be located above the wet storage volume of the tank. When modules are set in the field, utilize a vulcanized butyl rubber compound sealant conforming to AASHTO M- 198 (latest revision). Sealant shall be "Conseal CS-102" as manufactured by Concrete Sealant or equal. All surfaces of the pre-cast structure shall be smooth, even and free from roughness, irregularities and other defects, and shall be suitable for the application. All joints shall be both internally and externally sealed in the field with 12" wide woven elastomeric wrap.
7. Structures shall be completely watertight with 0% leakage. The manufacturer shall warranty the tanks for a period of five (5) years. In the event a tank should leak the contractor and manufacturer shall repair the chamber at no cost to the Owner. Structures utilizing vertical joints regardless of sealing techniques are NOT ALLOWED.
8. All storage tanks shall be equipped with a suitably protected screened overflow. Overflow pipes shall discharge to a site catch basin and be provided with a rubber flapper valve.

9. All storage tanks shall be equipped with a suitable protected and screened vent. Vents shall terminate in an inverted “J” manner. Overflows shall not be used as vents. Vents shall be located above the overflow level of the tank such that during an overflow condition there would be no water overflowing through the vent.
10. Vents and overflows shall be equipped with a minimum 24-mesh noncorrodible screen.
11. Tanks shall be equipped with a filler pipe to allow for water to be trucked in case of emergencies. The filler pipe shall be capped and locked.
12. All access hatches and manholes shall be locked. Hatches shall be aluminum construction, gasketed, lockable, with spring assist opening.
13. Tanks shall be cast with PVC couplers sized to accept pipe connections. Penetrations of piping through the tank shall be made with mechanical Link-Seals within cast-in-place HDPE or PVC sleeves. Link seals shall be rated for direct burial and for the system which they serve. Tanks shall be cast with pvc couplers sized to accept pipe connections.

J. Liquid Chlorine: In conformance with AWWA standards

K. Hypochlorite: In conformance with AWWA standards.

PART 3 - EXECUTION

3.1 GENERAL

A. The Contractor shall install all water pipe in the locations as shown on the Drawings and/or as approved by the Owner's Representative. Pipe shall be of the type and sizes specified and shall be laid accurately to line and grade. Structures shall be accurately located and properly oriented. Installation should conform with applicable AWWA Standards for the installation of water mains.

B. The tank manufacturer shall be present for tank installation. In addition, the tank manufacturer shall provide a site inspection and certification report indicating that the tank is installed, leveled, and sealed appropriately.

C. The fire marshal’s office shall be present at time of tank installation and will be responsible for directing above grade pipe connections in the field.

3.2 EXCAVATION AND BACKFILL

A. The provisions of Section 312333 entitled "Trench Excavation and Backfill for Utilities" shall govern all work under this Section.

B. The bottom of the trench shall provide a minimum of 4-1/2’ of cover over the crown of the pipe. Stones are not permitted at the bottom of the trench or in contact with the pipe in any location.

C. Sand bedding shall be installed to line and grade as shown on the Contract Drawings. Bedding shall provide continuous and uniform support along the entire length of the pipe.

D. Backfill shall be in accordance with Section 312333, entitled “ Trench Excavation and Backfill for Utilities”

E. Metallic tape reading ‘WATER LINE BURIED BELOW’ shall be placed in trench along entire length of water line.

F. The trench shall be kept free of water throughout pipe installation in accordance with Section 312319, entitled “Dewatering”

G. Contractor shall plug open ends of pipe overnight with an inflatable rubber plug, or approved equal.

3.3 STORAGE AND HANDLING PIPE

A. All pipes shall be protected against impact, shock and free fall, and only equipment of sufficient capacity and proper design shall be used in the handling of the pipe. Storage of pipe on the job shall be in accordance with the pipe manufacturer's recommendations, subject to the approval of the Owner's Representative.

3.4 DAMAGE TO PIPE

A. Pipe which is defective from any cause, including damage caused by handling, and determined by the Owner's Representative as unrepairable, shall be unacceptable for installation and shall be replaced at no cost to the Owner as directed by the Owner's Representative.

B. Pipe that is damaged or disturbed through any cause prior to acceptance of the Work shall be repaired, realigned or replaced as directed by the Owner's Representative, at the Contractor's expense.

3.5 PIPE INSTALLATION

A. The installation of water pipe shall conform to the requirements of AWWA standards and shall be laid to required lines and grades.

B. Laying Pipe - Each length of pipe shall be laid with firm, full and even bearing throughout its entire length, in a trench prepared and maintained in accordance with Section 312333 entitled "Trench Excavation and Backfill for Utilities”. All pipe shall have sufficient cover above the top of the pipe, and must be laid in separate trenches at least ten feet from the sewer pipe. Crossing of other facilities must have 12 inch minimum clearance (18 inches minimum clearance from sanitary).

C. Every length of pipe shall be inspected and cleaned of all dirt and debris before being laid. The interior of the pipe and the jointing seal shall be free from sand, dirt and trash before installing in the line. No pipe is to be trimmed or chipped to fit.

D. No length of pipe shall be laid until the preceding lengths of pipe have been thoroughly embedded in place, so as to prevent movement or disturbance of the pipe.

E. Full Length of Pipe - Full lengths of pipe are to be used whenever possible to minimize the amount of cutting and splicing in the field.

F. Bedding and Backfilling - The type of materials to be used in bedding and backfilling and the method of placement shall conform to the requirements of Section 312333 entitled "Trench Excavation and Backfill for Site Utilities", Section 3.2 above, and as shown on the Details on the Drawings.

G. Protection During Construction - The Contractor shall protect the installation at all times during construction, and movement of construction equipment, vehicles and loads over and adjacent to any pipe shall be performed at the Contractor's risk.

H. At all times when pipe laying is not in progress, all open ends of pipes shall be closed by temporary watertight plugs. If water is in the trench when work is resumed, the plug shall not be removed until the trench has been pumped dry and all danger of water entering the pipe has passed.

3.6 PIPE JOINTS

A. All joints are to be made water-tight and shall be tested in accordance with the requirements of the Water Company.

B. Pipe shall be jointed in strict accordance with the pipe manufacturer's instruction. Jointing of all pipe shall be done entirely in the trench.

C. At all tees, bends, dead ends and hydrant, joint restraint shall be provided on the first two joints on either side of the fitting.

D. Install retaining glands at all mechanical joint locations per manufacturer’s installation method.

3.7 THRUST BLOCKS

A. Thrust blocks shall be constructed at all bends by placing a minimum of one-third cubic yard of concrete for each fitting at the undisturbed side of excavation. The thrust block construction shall be adequate to sustain the imposed load. Placement of thrust blocks shall conform to the details and schedule of the Drawings.

3.8 CONNECTION TO EXISTING FACILITIES

A. General - The Contractor shall make all required connections of the proposed water lines into existing water facilities, where and as shown on the Drawings and/or as approved by the Owner's Representative. Connections shall be performed by a Contractor approved by the local utility company. The Contractor shall perform any investigation measures including, but not limited to, exploratory test pits to confirm the point of tie-in and avoidance of other utilities. All investigation measures should be performed a minimum of two weeks prior to the start of water main installation work. Notify engineer of any conflicts. The Contractor shall be responsible for relocating utilities in conflict.

B. Compliance with Requirements of Owner of Facility - Connections into existing water facilities shall be performed in accordance with the requirements of the Owner of the facility. The Contractor shall be required to comply with all such requirements, including securing of all required permits, and paying the costs thereof. The cost of making the connections in accordance with the requirements of the owner of the existing facility shall be included in the Contract Sum.

3.9 SERVICE LINES

A. General - The Contractor shall terminate the water laterals five feet from the building. Work shall include making the service line connections into the on-site water mains, furnishing and installing all service line pipe from the on-site water main systems to points located five feet outside of the proposed building lines and properly sealing the ends with watertight plugs. Service line extensions from these points into the building will be performed by the Building Contractor.

B. Coordination with Building Contractor - The Contractor shall be required to coordinate his work with the work of the Building Contractor to determine the exact location and elevation of the point of entry into the building. If the Building Contractor has installed his portion of the water service line, work under this Contract shall also include final connection of the water service line five feet outside the building line to the building service line at no additional cost to the Owner. The Contractor shall review the latest architectural/ mechanical plans to verify the location of the service laterals.

C. Connection into On-Site Water System - Water service line connections to the pipe of the on-site water mains shall be made with proper fittings supplied by the pipe manufacturer and as shown on the Drawings in a manner satisfactory to the Owner's Representative.

D. Connection into Off-Site Water System - Water service line connections to the pipe of the off-site water mains shall be made with proper fittings supplied by the pipe manufacturer and as shown on the Drawings in a manner satisfactory to the local authorities.

3.10 STERILIZING

A. All new water lines shall be flushed, sterilized and inspected prior to being put into service and the final connection(s) made to the existing system. Contractor shall sterilize lines in accordance with AWWA C601 or the local utility requirements, whichever is more restrictive.

B. The contractor is responsible for properly disposing of any chlorinated water in accordance with all State and Federal regulations. Any required permits for this work is also the responsibility of the contractor.

3.11 TESTING

A. General: The Contractor shall coordinate and perform all required testing in connection with water line installation. Hydrostatic and leakage tests shall be performed in accordance with the latest edition of AWWA C600 or the local utility requirements, whichever is more restrictive.

B. Scheduling of pressure and leakage tests shall be coordinated with the local water company and performed in the presence of local water company personnel.

C. Contractor shall furnish all necessary items to complete the required tests. Items include, but are not limited to:

Temporary plugs or caps
Pumps
Water meter
Pressure guage

D. Pipes proposed to be encased in concrete shall be tested prior to placing of the concrete.

3.12 FINAL INSPECTION

A. Upon completion of the Work and before final acceptance by the Owner, the entire water system may be subjected to a final inspection in the presence of the Site Engineer and/or Owner's Representative at the Owner's discretion. The Work shall not be considered as complete until all requirements for line, grade, cleanliness, leakage tests and workmanship have been met.

END OF SECTION

SECTION 333000 – SITE SANITARY SEWERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 310000 – Earthwork

C. Section 312333 –Trench Excavation and Backfill for Site Utilities

D. Town of Trumbull WPCA Standards and Regulations

1.2 SCOPE OF WORK

A. This Work under this section of the specifications shall consist of providing all labor, plant facilities, materials and equipment necessary to install all of the sanitary sewer facilities. This work shall include but not be limited to:
   1. Installation of sanitary sewers consisting of manholes, pipe, cleanouts, laterals, wye connections, pump stations, septic tanks, leaching fields, and all necessary and required accessory items and operations as shown on the Details and Drawings.
   2. Connection to existing sanitary sewer facilities.

B. All necessary coordination with governing sewerage authority including local sewerage authority and local health department and/or Connecticut Department of Energy and Environmental Protection.

C. Testing of sanitary sewer system.

D. Abandonment and removal of existing sanitary sewer pipes and manholes.

1.3 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.4 SUBMITTALS

A. Product Data: Provide manufacturer's certificate for castings, pipe and accessories to certify that products meet or exceed specified requirements.

B. Submit shop drawings of the precast structures to the Owner’s Engineer for review prior to fabrication. Shop drawings shall include dimensions, reinforcing, joint treatment, invert elevations and invert locations.

C. Submit shop drawings of structure tops including frames and covers.

D. Anti-buoyancy calculations for septic tank, if necessary

PART 2 - PRODUCTS

2.1 MATERIALS

A. The Contractor shall install materials based on this specification or per local specifications, whichever is more restrictive.

B. Polyvinyl Chloride (PVC) Pipe: ASTM D3034-93 for pipe and fittings, minimum wall thickness of SCH-40 or SDR-35 as indicated on drawings. Provide minimum three feet of pipe cover in pavement areas.

C. Precast Concrete Manholes: AASHTO M199-93/ASTM C478-90b, rated for H20 loading, with concrete strength of 4,000 psi.

D. Manhole Frames and Covers: Gray iron casting, AASHTO M105-93/ASTM A48, Class 30B. Pattern number as specified by the local authority or approved equal. All openings to comply to OSHA confined space access diameter. The word sewer is to be on the cover or as specified by the local sewage authority.

E. Manhole Steps: Aluminum alloy 6016T6 steps, manufactured by Alco or approved equal.

F. Cleanouts: Iron body type with extra heavy bronze plugs. Cover shall consist of Neenah Foundary Company Pattern No. R-1914 with locking cover, or approved equal.

G. Pipe joint: Rubber compression gaskets meeting ASTM D 3212.

H. Precast Concrete Grease Trap: Type and location as shown on the drawings

PART 3 - EXECUTION

3.1 GENERAL

A. The Contractor shall install all sanitary sewer structures and pipe in the locations as shown on the Drawings and/or as approved by the Owner's Representative. Pipe shall be of the type and sizes specified and shall be laid accurately to line and grade. Structures shall be accurately located and properly oriented.

3.2 EXCAVATION AND BACKFILL

A. The provisions of Section 312333 entitled “Trench Excavation and Backfill for Utilities” shall govern all Work under this Section.

3.3 STORAGE AND HANDLING OF PIPE

A. All pipe shall be protected against impact, shock and free fall, and only equipment of sufficient capacity and proper design shall be used in the handling of the pipe. Storage of pipe on the job shall be in accordance with the pipe manufacturer's recommendations, subject to the approval of the Owner's Representative.

3.4 DAMAGE TO PIPE

A. Pipe which is defective from any cause, including damage caused by handling, and determined by the Owner's Representative as unrepairable, shall be unacceptable for installation and shall be replaced at no cost to the Owner as directed by the Owner's Representative. Damaged pipe shall be immediately marked with white paint and separated from usable pipe on site.

B. Pipe that is damaged or disturbed through any cause prior to acceptance of the Work shall be repaired, realigned or replaced as directed by the Owner's Representative, at the Contractor's expense.

3.5 PIPE INSTALLATION

A. Laying Pipe - Each length of pipe shall be laid with firm, full and even bearing throughout its entire length, in a trench prepared and maintained in accordance with Section 312333 entitled “Trench Excavation and Backfill for Utilities”. Pipe will be laid with bells upgrade.

B. Every length of pipe shall be inspected and cleaned of all dirt and debris before being laid. The interior of the pipe and the jointing seal shall be free from sand, dirt and trash before installing in the line. Extreme care must be taken to keep the bells of the pipe free from dirt and rocks so that joints may be properly assembled without over stressing the bells. No pipe is to be trimmed or chipped to fit.

C. No length of pipe shall be laid until the preceding lengths of pipe have been thoroughly embedded in place, so as to prevent movement or disturbance of the pipe.

D. Full Lengths of Pipe - Only full lengths of pipe are to be used in the installation except that partial lengths of pipe may be used at the entrance to structures where necessary to obtain a proper connection to the structure.

E. Pipe Entrances to Structures - All pipe entering structures shall be cut flush with the inside face of the structure, and the cut ends of the pipe surface of the structure shall be properly rounded and finished so that there will be no protrusion, ragged edges or imperfections that will impede the flow of water or affect the hydraulic characteristics of the installation.

F. Bedding and Backfilling - The type of materials to be used in bedding and backfilling and the method of placement shall conform to the requirements Section 312333 entitled “Trench Excavation and Backfill for Utilities” and as shown on the Details of the Drawings.

G. Protection During Construction - The Contractor shall protect the installation at all times during construction, and movement of construction equipment, vehicles and loads over and adjacent to any pipe shall be performed at the Contractor's risk.

H. At all times when pipe laying is not in progress, all open ends of pipes shall be closed by temporary water tight plugs. If water is in the trench when work is resumed, the plug shall not be removed until the trench has been pumped dry and all danger of water entering the pipe has passed.

I. Tolerance - Pipe shall be laid accurately to the line and grade as shown on the Drawings and/or as approved by the Owner's Representative. Allowable tolerances shall be 1/4 inch in grade and 1/2 inch in line in any section of pipe between manholes. No adverse grades shall be allowed. Deviations from these tolerances shall be grounds for rejection of the line of pipe by the Owner's Representative. Any line which has been rejected shall be rebuilt to the correct line and grade by the Contractor at his own expense.

J. Do not lay the sanitary sewer line closer than ten feet horizontally or 1.5 feet vertically to a water main or service line. Where sanitary sewer lines pass above water lines, encase the sewer in six inches of concrete for a distance of ten feet on each side of the crossing or substitute rubber-gasketed pressure pipe for the pipe being used for the same distance if approved by the appropriate sewerage authority.

3.6 PIPE JOINTS

A. All joints are to be made watertight in accordance with the requirements specified herein.

B. Pipe shall be jointed in strict accordance with the pipe manufacturer's instructions. Jointing of all pipe shall be done entirely in the trench.

C. Where sanitary sewer lines pass below water lines, lay pipe so that no joint in the sewer line will be closer than 3 feet horizontally to the water line.

D. Where sanitary sewer lines pass less than 18 inches below the water line, provide concrete encasement. The length of encasement is to be increased to the nearest joint beyond the specified horizontal offset distance.

E. Make joints between ductile-iron pipe and other types of pipe with standard manufactured ductile-iron adapters and fittings or as directed by the local sewerage authority. Install ductile-iron piping and fittings in accordance with the recommendations of the pipe manufacturer.

3.7 MANHOLES AND OTHER PRECAST STRUCTURES

A. General Requirements - All manholes shall be built in accordance with the Details and in the locations shown on the Drawings and as specified herein.

B. Structures shall be constructed of precast concrete. Precast structures will require Shop Drawing approval by the Owner's Representative and/or the Site Engineer.

C. No concrete shall be poured when the temperature is below 40 degrees Fahrenheit, or when indications are for lower temperatures within 24 hours, unless protection of concrete is approved by the Owner's Representative.

D. Manholes are to be constructed as soon as the pipe-laying reaches the location of the manhole. Should the Contractor continue his pipe-laying without making provision for completion of the manhole, the Owner's Representative shall have the authority to stop the pipe-laying operations until the manhole is completed.

E. Any manhole which is mislocated or oriented improperly shall be removed and rebuilt in its proper location, alignment and orientation at the Contractor's expense.

F. Foundations - All foundations shall rest on firm ground of uniform bearing.

G. Inverts - Smooth concrete invert channels shall be constructed in all manholes to insure a smooth flow of water through the structure.

H. The invert channels shall be carried up to the elevations shown on the Drawings and/or as approved by the Owner's Representative. Channels shall slope smoothly and evenly from the entrance pipe to the outlet pipe.

I. Frames, Covers and Gratings - Frames, covers and/or grating for manholes shall be of the type and size indicated on the Drawings or as required by the local authority. Frames shall be well bedded in mortar and shall be set accurately to the correct alignment and grade.

J. Ladder Rungs - Ladder rungs shall be installed in all manholes, spaced 12 inches on center vertically and staggered. Rungs shall be set securely in place during the construction of the masonry wall.

K. Precast Manhole - Precast manholes shall be installed only after Shop Drawings have been approved. Any manholes required by the appropriate utility shall be fabricated, bedded, located and backfilled in accordance with said utility requirements and recommendations.

L. The top grade of the precast concrete corbel section shall be set sufficiently below finished grade to permit a maximum of four and a minimum of two courses of eight inch brick to be used as risers to adjust the grade of casting. Manhole frames shall be set on a grout pad as specified herein above.

M. Bitumastic coating - The entire exterior surface of all manholes shall be coated with two coats of an approved bitumastic material to produce a dry film thickness of 0.07 inches (7 mils) per coat.

3.8 INTERFACE WITH EXISTING FACILITIES

A. Requirements: The Contractor shall make all required connections of the proposed sanitary sewer facilities into existing sanitary sewer facilities, where and as shown on the Contract Documents and/or as approved by the Owner's Engineer.

B. Compliance with Facility Owner Requirements: Connections made into existing sanitary sewer facilities shall be performed in accordance with the requirements of the Owner of the facility. The Contractor will be required to comply with all such requirements, including securing of all required permits, and paying the costs thereof. The cost of making the connections in accordance with the requirements of the Owner of the existing facility shall be included in the Contract Sum.

3.9 MODIFICATIONS OF EXISTING STRUCTURES

A. General: The Contractor shall alter, reconstruct and/or convert existing structures where and as shown on the Contract Documents, and/or as approved by the Owner's Engineer. In general, alterations shall be performed with the same type of material used in the original construction unless otherwise indicated on the Contract Documents of approved by the Owner's Engineer.

B. Damage to Existing Installations: The Contractor shall exercise extreme care during such alteration, reconstruction and/or conversions so as not to damage any portions of the structure and/or pipe shown to remain. Any Such damage shall be repaired by the Contractor at his own expense and to the satisfaction of the Owner's Engineer and Owner of the damaged structure.

C. All existing sanitary sewer manhole covers, rims, and structures to remain shall be adjusted to proposed grade.

3.10 SERVICE LINES

A. General - The Contractor shall terminate sanitary laterals five feet from the building.

B. Coordination with Building Contractor - The Contractor will be required to coordinate his work with the work of the Building Contractor to determine the exact location and elevation of the point of entry into the building. If the Building Contractor has installed his portion of the sanitary sewer service line, work under this contract shall also include final connection of the sanitary sewer service line five feet outside the building line to the building service line at no additional cost to the Owner. The Contractor shall consult the latest architectural/mechanical drawings to confirm lateral locations.

3.11 INSPECTION AND TESTING

A. General - The Contractor shall test the completed sewers, including manholes and laterals for leakage by low-pressure air test, infiltration and exfiltration tests as specified herein and any other testing required by the local sewer authority. The Contractor shall furnish all necessary equipment, materials

and labor for performing the tests as specified. The Contractor shall notify the Owner's Representative and the sewage authority at least 48 hours prior to the start of testing. Sections of pipe tested for infiltration and exfiltration prior to completion of the project shall be subject to additional leakage tests, if warranted in the opinion of the Owner's Representative, and/or the sewage authority prior to acceptance of the project.

B. Infiltration and Exfiltration Testing - The test length intervals for either type of leakage test shall be approved by the Owner's Representative and the sewage authority, but in no event shall they exceed 1000 feet. In the case of sewers laid on steep grades, the length of line to be tested by exfiltration at any one time may be limited by the maximum allowable internal pressure on the pipe and joints at the lower end of the line.

C. The test period, wherein the measurements are taken shall not be less than four hours in either type of test.

D. Leakage Requirements - The total leakage of any section tested shall not exceed the rate of 50 gallons per day per mile per inch of nominal pipe diameter. For purposes of determining the maximum allowable leakage, manholes shall be considered as sections of 48 inch diameter pipe, five feet long, and the equivalent leakage allowance shall be 2.25 gallons per manhole per 24 hours. Depending on field conditions, the following test for leakage shall be employed:
   1. Infiltration Test - The test may be used only when groundwater levels are at least four feet above the highest point of the crown of the sewer being tested and after the trench has been backfilled and compacted. The groundwater leakage into the pipe will be measured near the lower end of the section of sewer under test.
   2. Exfiltration Test - This test consists of filling the pipe with water to provide a head of at least five feet above the top of the pipe or five feet above groundwater, whichever is higher, at the highest point of the pipe line under test, and measuring the loss of water from the line by the amount which must be added to maintain the original level. In this test, the line must remain filled with water for at lest 24 hours prior to the taking of measurements. Exfiltration shall be measured by the drop of water level in a closed-end standpipe or in one of the sewer manholes available for convenient measuring.When a standpipe and plug arrangement is used in the upper manhole of a line under test, there must be some positive method of releasing entrapped air in the sewer prior to taking measurements.

E. Low Pressure Air Testing - The sewer mains and/or laterals shall be tested for leakage by the use of low-pressure air as specified hereinafter or by the local sewage authority and as approved by the Owner's Representative. The test length shall not exceed one interval of pipe between two manholes. Air test procedures may be dangerous and the Contractor shall take all necessary precautions to prevent blowouts.

F. The proper procedure for air testing of sanitary sewers shall be as described in ASTM C-828, latest edition, entitled "Recommended Practice for Low-Pressure Air Test of Vitrified Clay Pipe Lines (4-12 inches)". Although the title specifies vitrified clay pipe, the same procedure maybe used for any other pipe material.

G. It is important that test plugs be properly installed to prevent blowouts. It is also important to maintain pressure relief devices to prevent system over pressurization.

H. Correction of Defective Work - If leakage exceeds the specified amount, the Contractor shall, at his own expense, make the necessary repairs or replacements required to permanently reduce the leakage to within the specified limit, and the tests shall be repeated until the leakage requirement is met.

I. Any defects found in the system are to be repaired at the expense of the Contractor so as to conform strictly to the Specifications and to the satisfaction of the Owner's Representative. All repairs shown necessary by the tests are to be made, broken or cracked pipe replaced, all deposits removed, and sanitary sewer left true to line and grade and entirely clean, free from lumps of cement, protruding gaskets, bulkheads, etc., and ready for use before final acceptance by the Owner.

J. Compliance with Agency Requirements - In the event of conflict between the leakage test requirements specified herein with the leakage test requirements of agencies having jurisdiction over all or any portion of the sanitary sewers installed under this Contract, the more restrictive requirements shall govern.

3.12 CLEANING AND REPAIR

A. The Contractor will be required to clean the entire sanitary sewer system of all debris and obstructions. This shall include, but not be limited to removal of all formwork from structures, concrete and mortar droppings, construction debris and dirt. The system shall be thoroughly flushed clean and the Contractor shall furnish all necessary hose, pumps, pipe and other equipment that may be required for this purpose. No debris shall be flushed into existing sanitary sewers or streams; all debris shall be removed from the system.

B. After the system has been cleaned, the Contractor shall thoroughly inspect the system and all repairs shown to be necessary shall be promptly performed by the Contractor.

C. All work of cleaning and repair as specified herein shall be performed at the Contractor's expense and to the complete satisfaction of the Owner's Representative.

3.13 FINAL INSPECTION

A. Upon completion of the Work and before final acceptance by the Owner, the entire sanitary sewer system shall be subjected to a final inspection in the presence of the Site Engineer and/or Owner's Representative and local sewerage authority. The Work shall not be considered as complete until all requirements for line, grade, cleanliness, leakage tests and workmanship have been met.

END OF SECTION

SECTION 334100 – STORM SEWER SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 320000 - General Requirements

C. Section 020100 - Protection of Existing Utilities

D. Section 310000 - Earthwork

E. Section 312333 - Trench Excavation and Backfill for Utilities

F. Section 312500 - Soil Erosion and Sediment Control

G. Section 333100 Sanitary Sewerage System

H. Section 321313 - Portland Cement Concrete Paving

I. Local governing authority and code requirements.

J. All necessary construction permits.

K. Contract Documents

L. Town of Trumbull standard requirements

1.2 SCOPE OF WORK

A. Work under this section shall consist of providing all labor, plant facilities, materials, tools, equipment, shop drawings and supervision necessary and required to install all of the storm drainage facilities as specified in accordance with the Contract Documents. This work shall include but not be limited to:

1. Installation of the drainage system consisting of manholes, catch basins, pipes, yard drains, cleanouts, flared end sections, stormwater management units, water quality units and all necessary and required accessory items and operations.
2. Connections to existing drainage facilities.

1.3 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.4 REFERENCE STANDARDS

A. American Society for Testing and Materials (ASTM) latest edition.
1. A706 Type 1R
2. C14 Concrete Sewer, Storm Drain, and Culvert Pipe.
3. C55 Concrete Building Brick.
4. C76 Reinforced Concrete Culvert, Storm Drain, and Sewer Pipe.
5. C443 Joints for Circular Concrete Sewer and Culvert Pipe, Using Rubber Gaskets.
6. C478 Precast Reinforced Concrete Manhole Sections.
7. C923 Resilient Connectors between Reinforced Concrete Manhole Structures and Pipes.
8. D1557 Test Methods for Moisture Density Relations of Soils and Soil Aggregate Mixtures Using 10 lb (4.54 Kg) Rammer and 18 inch (457 mm) Drop.
9. D2922 Test Methods for Density of Soil and Soil Aggregate in Place by Nuclear Methods (Shallow Depth).
10. D3017 Test Methods for Moisture Content of Soil and Soil Aggregate Mixtures.

B. American Association of State Highway and Transportation Officials (AASHTO) - latest edition

C. International Masonry Industry All-Weather Council (IMIAC): Recommended Practices and Guide Specification for Cold Weather Masonry Construction.

1.5 QUALITY ASSURANCE

A. An Engineer, selected and paid by the Owner (herein referenced to as "Owner's Engineer"), may be retained to perform construction inspection on-site based on measurement, visual observation, and judgment.

B. Visual field confirmation may be performed by the Owner's Engineer as part of the construction testing requirements.

C. All costs related to reinspection due to failures shall be paid for by the Contractor at no additional expense to Owner. The Owner reserves the right to direct any inspection that is deemed necessary. Contractor shall provide free access to site for inspection activities.

1.6 SUBMITTALS

A. Product Data: Provide manufacturer's certificate for castings, pipe and accessories to certify that products meet or exceed specified requirements.

B. Submit shop drawings of the precast structures to the Owner's Engineer for review prior to fabrication. Shop drawings shall include dimensions, reinforcing, joint treatment, invert elevations and invert locations.

C. Submit shop drawings of structure tops including frames, covers, and/or grates.

D. Submit shop drawings of the below grade stormwater management system including material, layout, elevations, pipe connection locations, inspection ports, access locations, and backfill requirements.

1.7 PROJECT RECORD DOCUMENTS

A. Accurately record actual locations of pipe runs, connections, catch basins, cleanouts, and invert elevations.

B. Identify and describe unexpected variations to subsoil conditions and location of uncharted utilities.

1.8 COORDINATION

A. Coordinate the Work with termination of storm sewer connection outside building including connection to existing storm sewer system.

PART 2 - PRODUCTS

2.1 SEWER PIPE MATERIALS AND ACCESSORIES

A. Reinforced Concrete Pipe (RCP): Straight and flared end sections complying with requirements of ASTM C 76, Class III unless another class type is indicated on the Contract Documents, installed with flexible plastic (Bitumen) gaskets at all joints. Gaskets shall comply with AASHTO M 198 75I, Type B, and shall be installed in strict accordance with pipe manufacturer's recommendations.

B. Corrugated High Density Polyethylene Pipe (HDPE): Shall conform to AASHTO Designation M294 and M252. Pipe must be installed in accordance with pipe manufacturer's installation Guidelines for Culvert Storm Drainage Applications. Acceptable manufacturers: Advanced Drainage Systems, Inc. "ADS N-12" and HANCOR, Inc. "Hi-Q" or approved equal.

C. Polyvinyl Chloride Pipe (PVC)
   1. On-site pipe and fittings shall comply with ASTM D 3034, rated SDR 35 unless otherwise specified on the Contract Documents or required by the local utility. Pipe shall be continually marked with manufacturer's name, pipe size, cell classification, SDR rating, and ASTM D 3034 classification.
   2. Pipe joints shall be integrally molded bell ends per ASTM D 3034, Table 2, with factory supplied elastomeric gaskets and lubricant.

2.2 CATCH BASINS, INLETS, MANHOLES AND COMPONENTS

A. General: All manholes, catch basins and drain inlets shall be built in accordance with, and in the locations shown on the Contract Documents. All structures will require shop drawings approved by the Owner's Engineer and Town Engineer.

B. No concrete or masonry shall be placed when the temperature is below forty (40) degrees Fahrenheit, or when indications are for lower temperatures within twenty-four (24) hours, unless protection of concrete and masonry is approved by the Owner's Engineer. Damage to the structure because of freezing shall be corrected by the Contractor at his own expense, to the satisfaction of the Owner's Engineer.

C. Manholes, catch basins and drain inlets shall be constructed as soon as the pipe laying reaches the location of the structures. Should the Contractor continue his pipe laying without making provisions for completion of the structures, the Owner's Engineer shall have the authority to stop the pipe laying operations until the structure is completed.

D. Any structure which is mislocated or oriented improperly shall be removed and re-built in its proper location, alignment and orientation at the Contractor's expense.

E. Precast Concrete Manholes: AASHTO M199-93/ASTM C478-90b. Manhole diameter shall be selected to accommodate the inflow and outflow pipes.

F. Pour-in-place or Precast Reinforced Concrete Catch Basins (Control Structures): AASHTO M199-93/ASTM C478-90b rated for H20 loading, with minimum concrete strength of 3,000 psi. Inlet size shall be selected to accommodate the inflow and outflow pipes.
   1. Manhole Barrel: Reinforced precast concrete in accordance with ASTM C478 with gaskets in accordance with ASTM C923 & C361
      a. Construct manholes of precast concrete sections as required by Contract Documents to size, shape, and depth indicated, but never less than 4-ft inside diameter.
   2. Mortar and Grout: Mortar for finishing and sealing shall be Class "C". Honeycombing less than two (2) inches deep shall be repaired using Class "D" mortar.
   3. Brick Transition Reinforcement: Formed steel 8-gage wire with galvanized finish.
   4. Foundations: All foundations shall rest on firm soil of uniform bearing and stone subbase as shown on Contract Documents.
   5. Inverts: Brick or smooth concrete invert channels shall be constructed in all manholes and in all catch basins and drain inlets which do not have sumps, to insure a smooth flow of water through the structure.

6. The invert channel shall be constructed to the elevations shown on the Contract Documents and/or as approved by the Owner's Engineer. Channels shall slope smoothly and evenly from the entrance pipe to the outlet pipe.
7. Frames, Cover, and Gratings: Frames, Covers and/or gratings for manholes, catch basins, and drain inlets shall be of the type and size indicated on the Contract Documents. Frames shall be well bedded in mortar and shall be set accurately to the correct alignment and grade.
8. Ladder Rungs: Forged Aluminum to dimensions shown on Contract Documents to be Alco steps 6061T6 or approved equal.
9. Precast Structures: Precast structures shall be installed only after shop drawings have been approved by Owner’s Engineer and shall meet the requirements of ASTM C478.
10. Grout around pipes which protrude through the walls of the structure and on all joints shall contain "Antihydro", or other approved additive to insure water tightness. Cement grout shall contain two parts cement to one part sand and additive in accordance with manufacturer's recommendations. Mortar shall be applied to the bottom 1/3 of the opening before the pipe is inserted.
11. The top grade of the precast concrete corbel section shall be set sufficiently below finished grade to permit a maximum of seven (7) and a minimum of two (2) courses of 8-inch brick to be used as risers to adjust the grade of the casting. Manhole frames shall be set on a grout pad as specified herein above.
12. Provide precast manhole shaft construction with eccentric cone top section and lipped male/female rubber gasket joints or mortar joints.
13. Brick shall be new units conforming to AASHTO Designation M-91, latest revision, Grade MS.
14. Mortar shall conform to ASTM C270, Type M.
15. Pipe joints for rigid pipes shall be made with mortar, grout, gaskets, or as recommended by the pipe manufacturer.
16. Manholes and Pipe constructed within the Right-of-Way shall be manufactured and installed in accordance with all applicable Standard Specifications and the Contract Documents.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that trench cut and excavation is ready to receive work and excavations, dimensions, and elevations are as indicated on Contract Documents.

3.2 PREPARATION

A. Hand trim excavations to required elevations. Correct over excavation with fine aggregate.

B. Remove large stones or other hard matter which could damage piping or impede consistent backfilling or compaction.

C. Protect benchmarks, property corners, and other survey monuments from damage or displacement. If marker needs to be removed it shall be referenced by licensed land surveyor and replaced, as necessary, by same.

3.3 GENERAL

A. The Contractor shall install all drainage structures and pipe in the locations shown on the Contract Documents and/or as approved by the Owner's Engineer. Pipe shall be of the type and sizes specified and shall be laid accurately to line and grade. Structures shall be accurately located and properly oriented.

B. Excavation and Backfill shall be in accordance with Section 312333 of these specifications.

C. Storage and Handling of Pipe - All pipe shall be protected against impact, shock and free fall, and only equipment of sufficient capacity and proper design shall be used in the handling of the pipe. Storage of pipe on the job shall be in accordance with the pipe manufacturer's recommendations.

D. Damage to Pipe - Pipe which is defective from any cause, including damage caused by handling, and determined by the Owner's Engineer as unrepairable, shall be unacceptable for installation and shall be replaced at no cost to the Owner as directed by the Owner's Engineer.

E. Pipe that is damaged or disturbed through any cause prior to acceptance of the Work, shall be repaired, realigned or replaced as directed by the Owner's Engineer, at the Contractor's expense.

3.4 BEDDING

A. Excavate pipe trench and place bedding material in accordance with Section 31 23 33 for work of this Section.

3.5 INSTALLATION - PIPE

A. Laying Pipe: Each length of pipe shall be laid with firm, full and even bearing throughout the entire length, in a trench prepared and maintained in accordance with Section 31 23 33 of these Specifications and Contract Documents. Pipe shall be laid upgrade unless otherwise approved by the Owner’s Engineer.

B. Concrete pipe over 24-inches in diameter shall be laid with the lift holes on top of the pipe. After the pipe is installed, the lift holes shall be sealed with suitable concrete plugs to the satisfaction of the Owner's Representative. No lift holes will be permitted in pipes 24-inches in diameter and smaller.

C. Bell and spigot pipe shall be laid with the bell end upgrade. The pipe shall be joined so that there will be uniform space around the pipe. Trimming of the pipe shall not be allowed.

D. Every length of pipe shall be inspected and cleaned of all dirt and debris before being laid. Prior to placing a length of pipe, the end of the previously laid length shall be carefully and thoroughly wiped smooth and clean to obtain an even and close fitting joint.

E. No length of pipe shall be laid until the preceding lengths of pipe have been thoroughly embedded in place, so as to prevent movement or disturbance of the pipe.

F. Place pipe on minimum 6-inch thick bed of compacted bedding or as detailed on the Contract Documents.

G. Install pipe, fittings, and accessories in accordance with ASTM C12, ASTM D2321, manufacturer's instructions and/or state or local requirements. Seal joints to be watertight.

H. Lay pipe to slope gradients noted on Contract Documents with maximum variation from true slope of 1/8-inch in 10-ft.

I. Place and compact bedding aggregate at sides and to the springline of the pipe as per these Specifications.

J. Refer to Sections 310000 and 312333 of these Specifications for backfill requirements. Do not displace or damage pipe when compacting.

K. Full Lengths of Pipe: Only full lengths of pipe shall be used in the installation except that partial lengths of pipe may be used at the entrance to structures where necessary to obtain a proper connection to the structure.

L. Pipe Entrances to Structures: All pipe entering structures (e.g.: manholes, catch basins, etc.) shall be cut flush with the inside of the structure, and the cut ends of the pipe and surface of the structure shall be properly rounded and finished so that there will be no protrusion, ragged edges, or imperfections that will impede the flow of water or affect the hydraulic characteristics of the installation.

M. Only full sections of pipe shall be used where entering a structure which will be exposed to view, such as endwalls, headwalls, end sections, etc.

N. Bedding and Backfilling: The type of materials to be used in bedding and backfilling and the method and placement shall conform to the requirements of these Specifications.

O. Protection During Construction: The Contractor shall protect the installation at all times during construction, and movement of construction equipment, vehicles and loads over and or adjacent to any pipe shall be performed at the Contractor's risk.

P. Tolerance: Pipe shall be laid accurately to the line and grade shown on the Contract Documents and/or as approved by the Owner's Engineer. Allowable tolerances shall be 1/2-inch on grade and 1-inch on line in any section of pipe between structures. Deviations from these tolerances shall be a basis for rejection of the line of pipe by the Owner's Engineer. Any line which has been rejected shall be rebuilt to correct line and grade by the Contractor at his own expense.

3.6 INSTALLATION - CATCH BASINS, MANHOLES AND CONTROL STRUCTURES

A. Form bottom of excavation clean and smooth to correct elevation.

B. Form and place cast-in-place concrete base pad, with provision for storm sewer pipe to be placed at proper elevation.

C. Place precast reinforced concrete sections with provision for storm sewer pipe sections at the location and elevation specified on the Contract Documents.

D. Level top surface of each precast concrete shaft sections as assembly progresses.

E. Establish elevations and pipe inverts for inlets and outlets as indicated.

F. Lay brick masonry in running bond with full 3/8-inch mortar joints to receive casting assembly. Level casting frame in grout to receive grated inlet or manhole cover.

3.7 PLACING PRE-CAST MANHOLE BARREL SECTIONS

A. Place base pad to proper elevation and location and trowel top surface level for placement of manhole barrel.

B. Place manhole barrel plumb and level to correct elevations and anchor to base pad.
   1. After completion of slab foundation the first joint of manhole barrel shall be lowered into position, grooved end first, and set level and plumb on concrete base. Align and adjust to proper grade prior to placing and forming invert which shall be poured immediately after setting of first section of manhole barrel.
   2. Prior to setting subsequent manhole barrel sections, apply primer to tongue and groove ends and allow to set in accordance with manufacturer recommendations. Place "Ram-nek", or equivalent, plastic rope on tongue end. Lower next section into position, and remove excess material from interior of structure. Add additional material on exterior of joint, if necessary, for completely watertight joint.

3.8 PIPE JOINTS

A. Mortar Joints (RCP): After each length of RCP is laid, the lower portion of the bell shall be filled with mortar, and the succeeding length shall be laid in place so that the inner surfaces of the abutting lengths are flush. The remainder of the joint shall be completely filled with mortar and sufficient additional mortar used to form a bead around the joint flush with the outside diameter of the bell. The inside of the joint shall be wiped and finished smooth. Joints shall be thoroughly wet before the mortar is placed.

B. Cold Applied Joint Sealer (RCP): Bell and spigot or tongue and groove RCP shall be wiped clean and dry before applying the sealer to the pipe joint. Before the pipes are placed in contact with each other, the spigot end or tongue end of the pope shall be completely covered with an excess of sealer, and then the pipe shall be laid to the established line and grade so that the inside surfaces of abutting pipe are flush.

3.9 INTERFACE WITH EXISTING FACILITIES

A. Requirements: The Contractor shall make all required connections of the proposed drainage facilities into existing drainage facilities, where and as shown on the Contract Documents and/or as approved by the Owner's Engineer.

B. Compliance With Facility Owner Requirements: Connections made into existing drainage facilities shall be performed in accordance with the requirements of the Owner of the facility. The Contractor will be required to comply with all such requirements, including securing of all required permits, and paying the costs thereof. The cost of making the connections in accordance with the requirements of the Owner of the existing facility shall be included in the Contract Sum.

3.10 REMOVAL OF EXISTING UTILITIES

A. The Contractor shall remove and legally dispose of off-site all abandoned utilities encountered during installation of the storm drainage facilities. In particular, all components of the existing combined sewer shall be removed from the site and up to the nearest off-site manhole.

3.11 MODIFICATIONS OF EXISTING STRUCTURES

A. General: The Contractor shall alter, reconstruct and/or convert existing structures where and as shown on the Contract Documents, and/or as approved by the Owner's Engineer. In general, alterations shall be performed with the same type of material used in the original construction unless otherwise indicated on the Contract Documents or approved by the Owner's Engineer.

B. Damage to Existing Installations: The Contractor shall exercise extreme care during such alteration, reconstruction and/or conversions so as not to damage any portions of the structure and/or pipe shown to remain. Any such damage shall be repaired by the Contractor at his own expense and to the satisfaction of the Owner's Engineer and Owner of the damaged structure.

3.12 CLEANING AND REPAIR

A. The Contractor will be required to clean the entire drainage system of all debris and obstructions. This shall include, but not be limited to, removal of all formwork from structures, concrete and mortar droppings, construction debris and dirt. The system shall be thoroughly flushed clean and the Contractor shall furnish all necessary hose, pumps, pipe and other equipment that may be required for this purpose. No debris shall be flushed into existing storm drains or streams; all debris shall be removed from the system and disposed of in accordance with all governing agencies.

B. After the system has been cleaned, the Contractor shall thoroughly inspect the system along with the Owner’s Engineer and all repairs shown to be necessary shall be promptly made by the Contractor.

C. All Work of cleaning and repair as specified herein shall be performed at the Contractor's expense and to the complete satisfaction of the Owner's Engineer.

3.13 FINAL INSPECTION

A. Upon completion of the Work and before final acceptance by the Owner, the entire drainage system shall be subject to a final inspection in the presence of the Owner’s Engineer and Town Engineer. The Work shall not be considered as complete until all requirements for line, grade, cleanliness, and workmanship have been completed to the satisfaction of the Owner's Engineer and the Town Engineer.

END OF SECTION

SECTION 37100 - UTILITIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 320000 - General Requirements

C. Section 312333 - Trench Excavation and Backfill for Utilities

D. Local Utility Companies and Governing Agencies

E. Contract Drawings and Documents

1.2 SCOPE OF WORK

A. Work under this Section shall consist of providing all labor, plant facilities, materials and equipment necessary and required to install the gas, electric, telephone and cable television facilities in accordance with the Contract Documents. This Work shall include but not be limited to:
   1. Installation of on-site utilities consisting of pipe, conduit and all necessary and required accessory items and operations associated with said installation.
   2. Coordination with the utility companies regarding the installation of utilities within the right-of-way and on-site as required, including connections to existing facilities.

1.3 COORDINATION

A. All work under this Section shall be coordinated with the gas, electric and telephone utility company and shall comply with all requirements, details, regulations, etc. of said utility company. The Contractor shall coordinate with each utility to define where his limit of work exists before submitting a bid price for this Section.

B. Work shall be coordinated with the electrical and/or mechanical contractors responsible for building and light standard connections.

1.4 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project’s environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a

construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.5 SUBMITTALS

A. General: Product Data: Provide manufacturer's certificate for castings, pipe and accessories to certify that products meet or exceed specified requirements.

PART 2 - PRODUCTS

2.1 GENERAL

A. When available, those materials specified by the appropriate utility company shall be used in lieu of those materials specified in this Section.

2.2 ELECTRIC, TELEPHONE AND CABLE CONDUIT

A. Concrete conduit shall comply with all requirements of applicable utility companies.

2.3 MANHOLE/PULL PITS

A. All manholes and pull pits required by the utility company shall comply with all requirements, regulations, specifications, details, and recommendations of said utility company.

PART 3 - EXECUTION

3.1 CONSTRUCTION

A. General:

1. The Contractor shall install all pipe, conduit and ductbank in the locations as shown on the Drawings and/or as approved by the Owner's Engineer and utility company. Pipe and conduit shall be of the type and sizes specified and shall be laid accurately to line and grade. Any necessary structures shall be accurately located and properly oriented.

B. Excavation and Backfill:

1. When available, those requirements, specifications and procedures, for excavation and backfill, specified by the appropriate utility company shall be used in lieu of these specifications. When such specifications are not available from said utility company, the requirements of this specification shall apply.
2. The provisions of Section entitled "Trench Excavation and Backfill for Utilities" shall govern Work under this Section.

C. Storage and Handling of Conduit and Pipe:

1. All pipe and conduit shall be protected against impact, shock and free fall, and only equipment of sufficient capacity and proper design shall be used in handling. Storage of pipe and conduit on the job shall be in accordance with manufacturer's recommendations, subject to the approval of the Owner's Engineer.

D. Damage to Pipe and Conduit:

1. Pipe or conduit which is defective from any cause, including damage caused by handling, and determined by the Owner's Engineer as unrepairable, shall be unacceptable for installation and shall be replaced at no cost to the Owner as directed by the Owner's Engineer.

2. Pipe or conduit that is damaged or disturbed through any cause prior to acceptance of the Work shall be repaired, realigned or replaced as directed by the Owner's Engineer, at the Contractor's expense.

E. Pipe Installation:

1. All piping and conduit shall be laid in accordance with the requirements and procedures specified by the appropriate utility company. When such requirements are not available from said utility company, the requirements of this specification shall apply.

2. Each length of pipe and conduit shall be laid with firm, full and even bearing throughout its entire length, in a trench prepared and maintained in accordance with Section 312333. Every length of pipe shall be inspected and cleaned of all dirt and debris before being laid. The interior of the pipe and the jointing seal shall be free from sand, dirt and trash before installing the line. Minimum cover over the top of the pipe or conduit shall comply with the utility specifications and shall never be less than 2-ft.

3. Bedding and Backfilling: The type of materials to be used in bedding and backfilling and the method of placement shall comply with the requirements and procedures specified by the appropriate utility company. When such requirements are not available, the type of materials to be used in bedding and backfilling and the method of placement shall conform to the requirements of these specifications and as shown on the Details of the Drawings.

4. Protection During Construction: The Contractor shall protect the installation at all times during construction, and movement of construction equipment, vehicles and loads over and adjacent to any pipe shall be performed at the Contractor's risk.

5. At all times when pipe laying is not in progress, all open ends of pipes shall be closed by temporary watertight plugs. If water is in the trench when work is resumed, the plug shall not

be removed until the trench has been pumped dry and all danger of water entering the pipe has passed.

F. Pipe/Conduit Joints:

1. When available, those specifications and requirements specified by the appropriate utility company shall be used in lieu of these specifications. Where such specifications are not available from said utility company, the requirements of this specification shall apply.

2. All joints are to be made watertight in accordance with the requirements specified herein. Pipe shall be jointed in strict accordance with the Pipe manufacturer's instruction. Jointing of all pipe shall be done entirely in the trench. Assembly of PVC conduit shall be with a solvent type adhesive as recommended by the conduit manufacturer.

G. Manholes/Pull Pits:

1. Any manholes or pull pits required by the appropriate utility shall be fabricated, bedded, located and backfilled in accordance with said utility requirements and recommendations. Final location(s) shall be approved by the Owner’s Engineer.

H. Connection to Existing Facilities:

1. General: The Contractor shall make all required connections of the proposed gas lines into existing gas facilities, where and as shown on the Contract Documents and/or as approved by the gas company. The Contractor shall perform any investigation measures including, but not limited to, exploratory test pits to confirm the point of tie-in and avoidance of other utilities. All investigation measures should be performed a minimum of two weeks prior to the start of gas main installation work. Notify engineer of any conflicts. The Contractor shall be responsible for relocating utilities in conflict.

2. The Contractor shall terminate the upstream end of the electric and telephone conduit at a location specified by the electric and telephone companies.

3. Compliance with Requirements of Owner of Facility: Connections into existing facilities shall be performed in accordance with the requirements of the owner of the facility. The Contractor shall be required to comply with all such requirements, including securing of all required permits, and paying the costs thereof. The cost of making the connections in accordance with the requirements of the Owner of the existing facility shall be included in the Contract Sum.

4. Cable pulling and connection of wire and cable to the existing facilities is not covered under this specification and will be done by others.

5. Construction shall conform to all requirements of the Town Engineer and/or any other agencies having jurisdiction.

I. Service Lines:

1. The Contractor shall install gas piping and electric/telephone conduit to points located 5-ft inside the proposed building lines as shown on the Drawings. All pipes and conduit shall be properly sealed with watertight plugs and shall be clearly marked from above.

2. The Contractor will be required to coordinate his work with the work of the Building Contractor to determine the exact location and elevation of the point of entry into the building. If the Building Contractor has installed his portion of the service lines, Work under this Contract shall also include final connections of the service lines of the building line to the building service line at no additional cost to the Owner.

3.2 INSPECTION AND TESTING

A. The Contractor shall perform all inspection and testing of these installations as required by the appropriate utility company and shall bear all costs arising therefrom.

3.3 FINAL INSPECTION

A. Upon completion of the Work and before final acceptance by the Owner, these installations may be subjected to a final inspection in the presence of the Owner's Engineer, a Town Representative/Engineer or a representative of the utility company. The Work shall not be considered as completed until all requirements for line, grade, cleanliness, tests and workmanship have been met.

3.4 AS-BUILT RECORDS

A. Within 30 days of installation of each utility, Contractor shall maintain records of installed utility lines and provide to owner, owner's engineer and utility companies for purposes of completing as-built plans for the project. Contractor must keep records of and provide locations and elevations to top of conduit at 50 foot intervals along straight sections of utility, and at all bends and appurtenances along the utility lines.

END OF SECTION

LIMITED NESHAP PRE-DEMOLITION HAZARDOUS BUILDING MATERIALS SURVEY REPORT

for

Hillcrest Middle School ("the Project")
530 Daniels Road
Trumbull, Connecticut 06611

1.0 INTRODUCTION

Langan CT, Inc. (Langan) prepared this Limited National Emissions Standards for Hazardous Air Pollutants (NESHAP) Pre-Demolition Hazardous Building Materials (HBM) Survey Report on behalf of TSKP Studio and Trumbull Public Schools to identify hazardous building materials that may exist at the Hillcrest Middle School, 530 Daniels Farm Road, Trumbull, Connecticut. The 1966, one-story school is approximately 119,000 square feet (SF) with classrooms, offices, multipurpose room, kitchen, media center, gymnasium, pool, planetarium, greenhouse, toilet rooms, storage rooms, and boiler/mechanical rooms. The objectives of this survey/report is to identify the presence or absence of accessible asbestos-containing materials (ACM), lead-based paint (LBP), assume suspect polychlorinated biphenyl (PCB) containing sealant compounds and universal waste so these materials can be properly identified/quantified and assessed in support of possible building demolition.

Details pertaining to the building subject to this survey are summarized in the following table.

PROJECT INFORMATION

Client Name:	Michael C. Scott, AIA, WELL AP, MCPPO Partner TSKP STUDIO 146 Wyllys Street Building 1-203 Hartford, CT 06106	Property Visit Date:	14 -16 and 22 July 2025
Professional's Project #:	140325901	Construction Dates:	1966
Consultant's Project Manager:	Matthew A. Myers	No. Buildings:	One
Phone No.:	203-562-5571	No. of Stories:	One
Email:	mmyers@langan.com	Bldgs. Gross Footage:	Main Building - Approximately 119,000 SF
Property Address:	530 Daniels Farm Road		
Property Town, State:	Trumbull, Connecticut	Property Use:	Public Middle School

The following sections summarize the HBM findings for the building surveyed.

2.0 ASBESTOS-CONTAINING MATERIALS

Terminology

Suspect Asbestos-Containing Materials

Asbestos was historically used in certain types of construction and building materials. Until a material is examined by using polarized light microscopy (PLM) or a similar technique, the building material is considered as a suspect asbestos-containing material. A few examples of these materials include wall and ceiling plasters, sheetrock/taping compound, flooring materials, ceiling panels, thermal system insulation, fireproofing insulation, adhesives, roofing materials, damp-proofing/waterproofing materials, caulking and glazing compounds, etc. Any suspect ACM and/or building material of unknown asbestos content should be assumed to be an asbestos containing material and handled and disposed of accordingly. Demolition, renovation, maintenance or daily activities should not disturb building materials that are found to contain asbestos, assumed to contain asbestos or that have not been tested for possible asbestos content.

Asbestos–Containing Material

A material with an asbestos concentration greater than 1% by weight is considered an ACM by the United States Environmental Protection Agency (EPA). Thus, a material which contains asbestos in concentrations greater than 1% by weight is considered "positive" while a material that does not contain asbestos or asbestos is detected in concentrations less than 1% by weight is considered "negative". The Connecticut Department of Public Health (CT DPH) revised the definition of an asbestos-containing material to be a concentration equal to or greater than 1% by weight. However, the Occupational Safety and Health Administration (OSHA) considers any amount of asbestos as regulated and some landfills/states consider building materials containing less than 1% asbestos as regulated asbestos-containing waste.

Regulatory Guidelines and Requirements

Federal

In accordance with the Clean Air Act (CAA), the U.S. Environmental Protection Agency established the National Emission Standards for hazardous Air Pollutants to protect the public from exposure to airborne pollutants. Asbestos was one of the air pollutants, which was addressed under the NESHAP 40 Code of Federal Regulations (CFR) Part 61. The purpose of the asbestos NESHAP regulations is to protect the public health by minimizing the release of asbestos when facilities, which contain ACM, are being renovated or demolished. EPA is

responsible for enforcing regulations related to asbestos during renovation and demolition activities, however, the CAA allows the EPA to delegate this authority to state and local agencies. Even after EPA delegates responsibility to a state or local agency, EPA retains the authority to oversee agency performance and to enforce NESHAP regulations as appropriate. OSHA considers any amount of asbestos to be regulated.

State

Asbestos in Connecticut is regulated by the State of Connecticut Department of Public Health, under Standards for Asbestos Abatement – Section 19a-333a-1 through 16 of Regulations of Connecticut State Agencies (RCSA) and Licensing and Training Requirements for Persons Engaged in Asbestos Abatement and Asbestos Consulting Services – Section 20-440-1 through 9 and Section 20-441 of RCSA.

Asbestos Survey

During this survey, suspect ACM were separated into three US EPA categories. These categories are: thermal system insulation (TSI), surfacing materials, and miscellaneous materials. TSI includes all materials used to prevent heat gain or loss or water condensation on mechanical systems. Typical examples of TSI are boiler, duct and tank insulation, pipe and pipe fitting insulation. Surfacing materials are sprayed, troweled or otherwise applied to an existing surface and common uses are fireproofing, decorative and acoustical plaster applications. Miscellaneous materials include all ACM not listed as TSI or surfacing and include: flooring materials, ceiling tiles, adhesives, transite cement board, sink undercoating, gypsum board/taping and joint compounds, cove base materials, caulking and glazing compounds, damp-proofing/tars/mastics, roofing materials and other materials. State of Connecticut DPH licensed asbestos inspectors Matthew Myers (#000041), Hilton Hernandez (#000424) and Jared Gorborino (#001240) performed the survey.

ACM Results Summary

Bulk sampling results are included as Tables 1 and 2 below. Analytical asbestos laboratory data can be found in Appendix A.

As required by EPA and CT DPH, samples were analyzed by individual layers (e.g. floor tile & the associated mastic were analyzed as two separate samples, rough and finish coat plasters, etc.). Bulk samples of suspect ACM were analyzed using the PLM analytical methodology in accordance with EPA Protocol 600/R-93/116 and possibly by PLM Point Count. Additional analysis

of non-friable organically bound (NOB) materials (e.g. flooring mastics) using NOB and transmission electron microscopy (TEM) was not performed. The samples were analyzed by EMSL of Cinnaminson, New Jersey, accredited by the National Voluntary Laboratory Program (NVLAP) and American Industrial Hygiene Association (AIHA).

Utilizing the EPA and CT DPH protocols and criteria, the following materials **were determined to be ACM:**

Table 1 – Summary of Asbestos-Containing Materials

Material	Location	% Asbestos and Sample ID	Estimated Quantity of ACM
Clock/Speaker Tar (Black) – Miscellaneous Material	Throughout Building	ACM 5% Chrysotile 072304A	80 Clock/Speaker Units
Transite Tabletop and Tabletop Adhesive (Black) – Miscellaneous Materials	Classrooms C1, C5 and C5 Computer Room	ACM 3%-15% Chrysotile 072306A 072307A 0723147A	165 Square Feet (SF)
Laboratory Sink Caulking Compound – Miscellaneous Material	Classroom A17	ACM 4% Chrysotile 0723145A	One Sink (Additional Investigation Recommended – May Be Additional Sinks)
Transite Laboratory Hood and Box – Miscellaneous Material	Classroom A17 and A17 Storage Room	Assumed ACM	82 SF
Laboratory Test Tube Rack and Adhesive – Miscellaneous Materials	Classroom A17	ACM 15% Chrysotile 0723157A and Assumed ACM	16 SF

Material	Location	% Asbestos and Sample ID	Estimated Quantity of ACM
Laboratory Countertops – Miscellaneous Materials	Classrooms A17, A17 Prep Room and A12 – Student, Teacher and Perimeter Classrooms A13 and A14 – Teacher and Perimeter Classroom C5 Computer Room	ACM 15%20% Chrysotile 0723149A 0723150A 0723152A 0723154A	1,100 SF
Electrical Insulation – Miscellaneous Material	Auditorium/Cafeteria and Stage	Assumed ACM	11 Spot Lights and Eight Light Trays (80 Linear Feet (LF))
Light Backing Paper – Miscellaneous Material	Gymnasium Storage Room 1	ACM 20% Chrysotile 072318A	One Light Fixture
Black Tar on Concrete Block – Miscellaneous Material	Main Office Conference Room	ACM 4% Chrysotile 072317A	Two SF Visible
Black Duct Paper/Tar – Miscellaneous Material	Main Office and Nurse Areas	ACM 15% Chrysotile 072331A	16 SF Visible
Duct Insulation Pin Adhesive – Miscellaneous Material	Auditorium/Cafeteria Stage, Gymnasium, Gymnasium Storage Closets 1 and 2 and Planetarium Closet	ACM 3% Chrysotile 072334B	1,050 Square Feet of Duct Visible
Dark Red Fire Penetration Sealant – Miscellaneous Material	Throughout Building	ACM 4% Chrysotile 072351A	Unknown
Pipe Fitting and Roof Drain Insulation – Thermal System Insulation	Throughout Building – Visible in Some Locations and Assumed Inside Pipe Chases (Throughout All Rooms/Areas), Behind Fixed Ceilings, etc.	Assumed ACM (Three Samples of Accessible Insulation were No Asbestos Detected)	Unknown – 1,200 Visible, Estimate Additional 2,000 – 3,000 Inaccessible

Material	Location	% Asbestos and Sample ID	Estimated Quantity of ACM
Older 9"x9" and 12"x12" Floor Tiles and Black Mastic – Miscellaneous Materials	Planetarium Closet/Mechanical Room, Weight Room, Toilet Room Adjacent Classroom C11 and Throughout Building Underneath Millwork/Cabinetry/Fixed Object/Gypsum Walls	ACM 3%-5% Chrysotile 0723122A - 0723124A	700 SF Visible Hidden Underneath Objects Unknown – Estimate Up To 3,500 SF
Black Mastic Underneath 12"x12" Floor Tiles – Miscellaneous Material (Floor Tiles Contaminated)	Throughout Building	ACM 4%-5% Chrysotile 0723134A 0723136A (Mixed Results)	Unknown – Estimate Up To 60,000 SF
Ceramic Wall and Floor Tile Grouts and Mud Beds – Miscellaneous Materials	Throughout Inside of Pool	ACM <0.25%-1.25% Chrysotile 0723178A,B – 0723180A	Estimate 6,600 SF (Quantity Needs to be Verified)
Rock Wall Damp-Proofing Tar/Paper – Miscellaneous Material (Assume Adjacent Materials/Substrates Contaminated)	Exterior/Interior Classrooms D4, Media Center, Planetarium, Main Entrance, Auditorium/ Cafeteria and Courtyard	ACM 22% Chrysotile 0723199A	12,750 SF

Material	Location	% Asbestos and Sample ID	Estimated Quantity of ACM
Damp-Proofing Tar/Paper Behind Brick Walls (including at foundation) – Miscellaneous Material (Assume Adjacent Materials/Substrates Contaminated)	Throughout Exterior	ACM 17%-20% Chrysotile 0723200A 0723201A 0723283A	23,500 SF
Transite Board and Damp-Proofing Tar/Paper Behind Stone Paneling – Miscellaneous Materials (Assume Adjacent Materials/Substrates Contaminated)	Throughout Exterior	ACM 30%-65% Chrysotile 0723203A 0723204A	5,800 SF
Display Case Caulking Compounds (Older) – Miscellaneous Materials	Throughout Corridors	ACM 5% Chrysotile 0723211A	160 LF
Interior Wall, Ceiling, Ceramic Wall Caulking Compounds – Miscellaneous Materials	Throughout Building Interior – All Areas/Rooms/Corridors/Etc.	ACM 3%-8% Chrysotile 0723209A 0723212A – 0723214A	Unknown - ALL

Material	Location	% Asbestos and Sample ID	Estimated Quantity of ACM
Interior Door Caulking, Door/Window Wall Caulking and Glazing, Window Caulking, Window Glazing, Door Window Glazing and Miscellaneous Caulking Compounds – Miscellaneous Materials	Throughout Building Interior, Greenhouse (Interior and Exterior)	ACM 3%-6% Chrysotile 0723226A – 0723228A 0723246A 0723247B 0723250A 0723257A 0723258B 0723259 0723260 0723263 – 0723268 0723270 – 0723275	Unknown - ALL
Exterior Window Caulking, Sill (Including Underneath Sills) Caulking, Window Glazing, Wall Caulking, Foundation Caulking, Door Caulking, Door/Window Wall Caulking and Glazing, Vent Caulking and Miscellaneous Caulking Compounds – Miscellaneous Materials	Throughout Exterior	ACM 3%-8% Chrysotile 0723223A 0723232A 0723234B 0723237 0723239 0723240 0723243 0723244	Unknown - ALL
Exterior Rock Wall and Wall Expansion Caulking Compounds – Miscellaneous Materials	Throughout Exterior	ACM 5%-7% Chrysotile 0723218A 0723221A	Unknown - ALL

Material	Location	% Asbestos and Sample ID	Estimated Quantity of ACM
Conduit Putty – Miscellaneous Material	Throughout Exterior	ACM 8% Chrysotile 0723220B	5 SF
Dome Black Paper Under Metal Roof – Miscellaneous Material (Assume Adjacent Materials/Substrates Contaminated)	Planetarium Exterior	ACM 30% Chrysotile 0723278A	2,500 SF
Roof Field and Flashing Material (Black Middle Layer) – Miscellaneous Material (Assume Adjacent Materials/Substrates Contaminated)	Exterior Pool and Media Center (Curved Roofs)	ACM 18% Chrysotile 0723279A	18,500 SF
Roof Penetration Flashing Materials – Miscellaneous Materials (All Layers) (Assume Adjacent Materials/Substrates Contaminated)	Exterior Roofs Throughout	ACM 8%-12% Chrysotile 0723293 0723294	1,800 SF

Utilizing the EPA and CT DPH protocols and criteria, the following materials **were determined to be non-ACM or less than one percent asbestos:**

Table 2 – Summary of Non-Asbestos-Containing Materials

Material	Location	Sample ID
Wall Adhesive – Miscellaneous Material	Greenhouse	072301A,B
Kiln – Miscellaneous Material	Classroom C1 Closet	072302A,B

Material	Location	Sample ID
Fire Door Interior Insulation – Miscellaneous Material	Classroom C5 (Additional asbestos-containing door insulation may exist throughout building)	072303A,B
Paper Under Wood Floor (Black) – Miscellaneous Material	Auditorium/Cafeteria Stage	072305A,B
Slate Window Sill and Grout – Miscellaneous Materials	Throughout Building	072308A,B 072309A,B
Paper Behind Acoustical Walls – Miscellaneous Material	Music Practice Rooms Adjacent Classroom D4 and Media Center Recording Room	072310A,B
Roof Debris (Paper and Tar) – Miscellaneous Materials	Classroom D5	072311A,B 072312A,B

Roof Perimeter Flashing Black Bottom Layer	Exterior Throughout	0723289A,B – 0723290A-D

DISCLAIMERS: Reasonable care was taken to identify all suspect accessible asbestos containing materials through visual inspection and limited destructive sampling techniques. The building was occupied during this limited survey. It is not currently feasible to uncover all materials that may exist. Additional materials may need to sampled during the selective demolition/demolition process. Some locations/materials were not sampled during this survey due to damage required to inspect certain materials/areas and occupancy.

Interior Hidden Materials - Interior walls/ceilings/floors/other building materials were opened up/accessed in limited locations to investigate for suspect asbestos-containing materials. Additional suspect asbestos-containing materials may be discovered during selective demolition and/or demolition activities despite the inspectors investigating representative areas during the survey. Additional asbestos containing materials may be found:

- Interiors of boilers and walk-in freezers (damp-proofing behind, plastic wall adhesive, etc.), interiors of chimneys, etc. (boiler will need to be sampled prior to demolition);
- Flooring materials/other materials underneath fixed objects (millwork, cabinetry, unit ventilators, etc.), gypsum wallboard and floor leveling materials throughout building;
- Behind water fountains and custodial slop sinks (tar/damp-proofing);
- Damp-proofing behind interior rock walls;
- Materials (damp-proofing, other materials) underneath terrazzo and ceramic floors (limited sampling was performed and could not reach solid concrete underneath sandy material);
- Additional duct pin adhesive and black duct tar/paper that may be currently inaccessible;
- Tar on block walls (found in one area of office – may exist in additional locations);
- Inside HVAC ducts and mechanical systems (sealants and tar-damp-proofing);
- Electrical insulation and light backing insulation (several areas checked);
- Materials inside electric company locked room accessed from exterior;
- HVAC duct vibration isolation cloth (none found and pool and gymnasium appear to have been replaced or inaccessible);
- Materials underneath slate window sills;
- Interior roof debris (sampled in one location);
- Gasketing and tars associated with piping, ducts, etc.
- Adhesives and wall adhesives/glue daubs (and other materials) associated with millwork, cabinetry, shelving, window sills, bulletin boards, behind gypsum board walls/ceilings, on block walls, HVAC ducts, mirrors and wall materials (checked several locations and sampled limited materials);

- Behind fixed ceilings, walls, chases and flooring throughout and above the auditorium/cafeteria/media center ceiling tiles (too high to access) (duct insulation, pipe and pipe fitting insulation, vibration isolation cloth, roofing debris, flooring, etc.);
- Additional older spray applied fireproofing and other materials at pool ceilings (too high to access);
- Vermiculite behind/inside walls, ceilings and chases (checked boiler room wall) and inside planetarium dome;
- Transite cement board, adhesives, pipe insulation, other materials behind radiators, ceilings, soffits, upper gymnasium wall above dividing wall, etc. (checked several locations);
- Damp-proofing and other materials beneath gymnasium wood floor (checked two locations underneath bleachers);
- Pool and media center exterior wall materials and entrance overhangs throughout;
- Science fire blankets, Bunsen burner pads, etc.;
- Inaccessible HVAC duct adhesives, duct pin adhesive, seam and flange sealants and vibration isolation cloths (checked several locations) throughout;
- Fire door/door insulation (checked one location with damage);
- Older interior and exterior hidden caulking and glazing compounds behind newer compounds (checked several locations); and
- Additional asbestos-containing pipe and/or pipe fitting residue/contamination underneath fiberglass insulation (checked several locations).

Foundations/Soil and Buried Piping and Mechanical Conduits – Foundation damp-proofing/tars/mastics may exist under the soil on the building foundations (the building has asphalt/other ground materials that prevented from exposing foundation walls – checked two locations and no damp-proofing was found). Additional damp-proofing materials that have not been investigated/sampled, may exist in other locations, on the inside of foundation walls and underneath floor slabs throughout. It is not known if other materials are buried in the soil adjacent to the building (ex. transite and/or orangeburg piping, etc.). Asbestos containing damp-proofing/tars/mastics/other materials may also exist on piping and mechanical conduits in the subsurface.

3.0 LEAD-BASED PAINT XRF SCREENING

A limited lead-based paint XRF (X-ray Fluorescence) screening survey was performed by a State of Connecticut DPH licensed lead inspector Hilton Hernandez (#002231). LBP was identified

exceeding the HUD/EPA action level of equal to or greater than 1.0 mg/cm^2 on the interior metal ladder (yellow) in custodial office. See Appendix B for the XRF field data sheets.

Toxicity Characteristic Leaching Procedure (TCLP) sampling may need to be performed after the building has been vacated, to determine the proper method of disposal (normal construction debris versus regulated hazardous lead waste) of painted building materials to be demolished. Metal surfaces covered with lead-based paint may be segregated and recycled as scrap metal (without grinding, sawing, sanding or torch cutting).

Contractors should be aware that OSHA has not established a level of lead in a material below which 29 CFR 1926.62 does not apply. Contractor shall comply with exposure assessment criteria, interim worker protection and other requirements of the regulation as necessary to protect workers and occupants/residents.

The information in this report does not constitute a comprehensive lead inspection under the Connecticut Department of Public Health Regulations, Section 19a-111-1 to 11. The survey was an XRF lead screening utilizing an XRF and does not satisfy the testing requirements of US EPA's Renovation, Repair and Painting Rule (RRP) under 40 CFR 745.80 through 92. Reliance on this report for determining RRP or CT DPH applicability is not authorized by Langan.

4.0 PCB SEALANT SOURCE MATERIALS

In recent years, the Unites States Environmental Protection Agency (US EPA) has learned that building sealants (e.g. caulking, glazing, expansion joint and other sealant materials) containing potentially harmful PCBs were used in many buildings in the 1950s through the 1980s. PCBs were added to building sealants for durability, resistance to degradation, and as a softener/plasticizer for application.

Connecticut Department of Energy and Environmental Protection (CTDEEP) has a PCB regulatory limit of 1 ppm and EPA has a regulatory limit of 50 ppm for source materials. The following "older" PCB sealant source materials are assumed to have greater than 50 ppm PCB (PCB Bulk Product Waste):

Table 3 – Summary of Assumed PCB-Containing Source Sealant Materials	
Material	**Location**
Laboratory Sink Caulking Compounds	Throughout Laboratory/Science Rooms
Display Case Caulking Compounds	Throughout Corridors
Interior Wall, Ceiling, Ceramic Wall Caulking Compounds	Throughout Building Interior – All Areas/Rooms/Corridors/Etc.
Interior Door Caulking, Door/Window Wall Caulking and Glazing, Window Caulking, Window Glazing, Door Window Glazing and Miscellaneous Caulking Compounds	Throughout Building Interior, Greenhouse (Interior and Exterior)
Exterior Rock Wall and Wall Expansion Caulking Compounds	Throughout Exterior
Exterior Window Caulking, Sill (Including Underneath Sills) Caulking, Window Glazing, Wall Caulking, Foundation Caulking, Door Caulking, Door/Window Wall Caulking and Glazing, Vent Caulking and Miscellaneous Caulking Compounds	Throughout Exterior
Pool Perimeter Caulking Compounds (Inside and Outside Pool)	Pool
Unit Ventilator Caulking Compounds	Throughout Building
Exterior Dome Caulking Compound	Planetarium
Door Window Glazing Compound – Miscellaneous Material	Exterior

"Newer" sealant compounds were not assumed to contain PCBs.

PCBs can also be found in paints, damp-proofing materials, roofing materials, adhesives, glues, floor mastics, etc. Sampling of these materials and sealant compounds was not authorized at the time of the HBM survey.

5.0 UNIVERSAL WASTE ASSESSMENT

Completion of detailed Universal Waste Assessment (identifying the number and location of Universal Waste items) was not conducted as part of this survey. Universal wastes noted during the visual survey include suspect PCB/DEHP (di (2-ethylhexyl) phthalate) ballasts/capacitors associated with light fixtures, air conditioner and refrigerant coolants, rooftop HVAC units, window air conditioning units, mercury-containing florescent and other mixed used high intensity

light bulbs, smoke detectors and other alarms/sensors containing suspect radioactive materials, batteries and emergency lighting, exit and other signage, possible mercury-containing thermostats, switches, gauges, electronics, paints, wiring, fire extinguishers, cleaning and other chemicals. Laboratory piping and treatment systems may require regulated disposal.

All universal waste that is present in the building that will be impacted by demolition activities, will need to be properly removed, recycled, and/or disposed of at a landfill permitted to accept such waste. The removal, handling, recycling, and disposal must be performed in accordance with applicable Federal, State, and local regulations.

6.0 CONCLUSIONS AND RECOMMENDATIONS

Langan provides the following conclusions and recommendations, based on the findings of this Limited NESHAP Pre-Demolition Hazardous Building Materials Survey:

Both friable and non-friable ACM were identified/assumed throughout the building. Prior to building demolition, the identified ACM and any additional ACM/suspect ACM materials that are found during selective demolition, must be properly removed and disposed in accordance with applicable Federal, State and Local regulations by a State of Connecticut DPH licensed asbestos abatement contractor. A State of Connecticut licensed Asbestos Designer should create abatement specifications and an Asbestos Project Monitor should perform project oversight and air testing in accordance with the Federal and State regulations. These are all requirements of the CT DPH Standards. Additional sampling/destructive sampling/visual investigation is required for materials that have not been sampled to date and the abatement contractor will be required to perform selective demolition throughout the interior and exterior of the building.

Contractors completing demolition and/or abatement activities should be aware that OSHA has not established a level of lead in a material below which 29 CFR 1926.62 does not apply. All contractors working on the project are responsible for having adequate training (RRP or greater amount) and performing their own OSHA compliance requirements. Contractor shall comply with exposure assessment criteria, interim worker protection and other requirements of the regulation as necessary to protect workers and occupants/residents. All contractors must comply with all applicable State and Federal regulations, including but not limited to the lead OSHA regulations.

Toxicity Characteristic Leaching Procedure (TCLP) sampling may need to be performed after the building has been vacated, to determine the proper method of disposal (normal construction

debris versus regulated hazardous lead waste) of painted building materials to be demolished. Metal surfaces covered with lead-based paint may be segregated and recycled as scrap metal (without grinding, sawing, sanding or torch cutting).

"Older" caulking, glazing and sealant compounds to be disturbed by selective demolition/demolition activities are assumed to contain greater than 50 ppm PCB bulk product waste. These materials and other suspect PCB containing materials could be tested at a later date or assumed to contain PCBs (and possibly adjacent building materials and ground surfaces). PCB abatement specification(s) will be required, and if sampling is performed, an EPA PCB compliant plan (requires EPA approval – two to six months is typical for this process) may be required depending upon the sample results. The owner/owners representative and Langan should meet to discuss the testing parameters (what materials is Langan authorized to sample (if any) and when will sampling occur) or what assumptions will be in place to write specifications without sampling (types of source materials to be assumed, extent of adjacent building materials, etc.). Langan recommends that the owner keeps a contingency fund should the contractor's landfill require paint sampling and the painted building materials are found to contain PCBs.

All universal waste that is present in the building that will require removal due to planned demolition activities, will need to be properly removed, recycled, and/or disposed of at a landfill permitted to accept such waste. The removal, handling, recycling and disposal must be performed in accordance with applicable Federal, State, and local regulations. Laboratory piping and treatment systems may require regulated disposal. Langan recommends completion of a universal waste recycling/disposal specification for the project.

7.0 LIMITATIONS

The conclusions and recommendations presented in this report are professional opinions based solely upon Langan's visual observations, laboratory test data, and current regulatory requirements. These conclusions and recommendations are intended exclusively for the purpose stated herein, at the site indicated, and for the project indicated.

It is important to recognize that even the most comprehensive scope of services may fail to detect all hazardous building materials that may be associated with the property. Therefore, Langan cannot act as insurers and cannot "certify" that all hazardous building materials associated with the property have been identified, and no expressed or implied representation or warranty is included or intended in our report, except that our services were performed, within

the limits prescribed by our client, with the customary thoroughness and competence of our profession.

Any suspect material that is not listed in this report must be assumed as ACM, PCBs, LBP, etc. until confirmed otherwise via laboratory testing.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This is a summary report; official reports are available on LabConnect or upon request and relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report must not be used by the client to claim product certification, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetric reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.

Samples analyzed by EMSL Analytical, Inc. Cinnaminson, NJ NVLAP Lab Code 101048-0, AIHA LAP, LLC-IHLAP Lab 100194, PA ID# 68-00367, LA #04127

Report amended: 08/14/202508:06:00 Replaces initial report from: 08/11/202512:21:47 Reason Code: Client-Additional Analysis

DRAFT

1.0 INTRODUCTION

This Soil Management Plan (SMP) has been prepared on behalf of TKSP Studio ("Client") for renovation and expansion of Hillcrest Middle School at 530 Daniels Farm Road in Trumbull, Fairfield County, Connecticut (hereafter referred to as the "Site"). This SMP describes the procedures for the handling and management of soils for the proposed project. Specific components of this plan include, but are not limited to excavation, documentation and management, offsite soil recycling/disposal, onsite soil reuse, stockpiling of excavated soils, and import of backfill soil.

The Connecticut Department of Energy and Environmental Protection (CTDEEP) Remediation Standard Regulations (RSRs) do not apply to the Site unless and until the Site is entered into a formal CTDEEP remediation program. However, the RSRs can serve as suitable benchmarks for analyses and are helpful for the purposes of characterizing soil for potential offsite receiving facilities, and for assisting with managing the risk of improper management of potentially contaminated soils. Soil management activities will follow best management environmental practices, using the RSRs as a guide, for the duration of this proposed redevelopment project.

1.1 Site Description

The Site is part of an approximately 88-acre parcel identified by the Trumbull Tax Assessor as Parcel ID 12708 (530 Daniels Farm Road). The parcel consists of Hillcrest Middle School (the Site) in the southwest and Trumbull High School in the northeast, and surrounding athletic fields and courts. The Site is developed with a 112,342-square foot school building and associated asphalt parking areas, landscaped areas and grass-covered athletic fields. The location of the Site is depicted on Figure 1 (Site Location Map).

1.2 Purpose

The purpose of this SMP is to provide guidance and procedures for documenting and managing the excavation and export of soils (see Section 2.1 for classification definitions), import of soil for backfill, construction of stockpiles, and re-use of onsite soil during the Hillcrest Middle School redevelopment project, in accordance with CTDEEP regulations.

1.3 Proposed Redevelopment

As it pertains to this SMP, the Hillcrest Middle School development project includes the phased construction of a new middle school and subsequent demolition of the existing school. Also included are site parking, landscaping, new playing fields, site lighting, stormwater management, and utility improvements to support the project. The extents of the work area are shown in the 26 March 2026 Phase I drawings.

DRAFT

It is our understanding that the majority of soils generated during excavation activities will be reused onsite; however, if there are soils that cannot be reused onsite, soils shall be recycled or disposed of at an offsite facility permitted to accept such soil (refer to Sections 2.1 and 2.8).

1.4 Limited Phase II Environmental Site Investigation

Langan was retained by Trumbull Public Schools to perform a Phase II Environmental Site Investigation (ESI) for the Site, targeting the seven areas of concern (AOCs) and Recognized Environmental Concerns (RECs) at the Site identified in a Phase I Environmental Site Assessment (ESA) prepared by Eagle Environmental, Inc. (Eagle) and dated June 2024. The AOCs and RECs identified by Eagle during their Phase I ESA consist of the following:

- AOC-1/REC-1: Historical Technical Auto Repair Classroom
- AOC-2/REC-2: 10,000-Gallon Fuel Oil Underground Storage Tanks (USTs)
- AOC-3: Flammable Cabinet and Drum Storage
- AOC-4: Suspected Transformer Room
- AOC-5: Diesel Generator
- AOC-6: Former Paint-Mixing and Spray Booth
- AOC-7: Historical Agricultural Use

The investigation activities described herein were completed in general accordance with the Connecticut Department of Energy and Environmental Protection (CTDEEP) 2007 Site Characterization Guidance Document and Underground Storage Tank Regulations, Regulations of Connecticut State Agencies, Sections 22a-449(d)-1, and Sections 22a-449(d) 101-113.

The Phase II ESI was conducted between 6 and 7 August 2025, and included the completion of a geophysical survey, a visual inspection of AOCs 3 through 5 (conducted to determine whether future subsurface investigation would be needed at one or more of those AOCs), advancement of five soil borings in the vicinity of AOCs 1 and 2, and collection and analysis of 18 grab soil samples and one duplicate soil sample (one associated with AOC-1, two with AOC-2, three with AOC-6 and the remaining 12 with AOC-7).

Visual Observations of AOCs

Based on the visual condition of AOCs 3 through 5, Langan concluded there was no evidence that releases had occurred in relation to these AOCs. As a result, these AOCs were not investigated.

Soil Investigation of AOCs 1 and 2

Five soil borings (LB-01, LB-01A, LB-01B, LB-02 and LB-03) were advanced by Lakewood Environmental Services Corp. (Lakewood), LLC of Smithtown, New York under the supervision

DRAFT

of a Langan field engineer on 6 August 2025. Boring locations were selected to evaluate the subsurface conditions around AOC-1/REC-1 (Historical Technical Auto Repair Classroom) and AOC-2/REC-2 (historical USTs). Borings LB-01, LB-01A and LB-01B were advanced to assess AOC-1/REC-1 and to attempt to install an overburden groundwater monitoring well. Soil borings LB-01A and LB-01B were offsets of LB-01 advanced in attempt to find overburden groundwater. Soil borings LB-02 and LB-03 were advanced in the area of the historical USTs (AOC-2/REC-2).

The five soil borings were completed using a Geoprobe direct-push drill rig. Soil samples were collected from each environmental boring using a 5-foot macrocore sample barrel with dedicated acetate liners. Soil samples retrieved from each boring were visually classified for soil type, grain size and texture. Each soil sample was screened for total organic vapors using a PID equipped with a 10.6-electron volt (-eV) lamp. Soil samples were also evaluated for visual and olfactory indications of environmental impact. Refusal was encountered between 4.5 and 11 feet below ground surface at all five borings. Groundwater was not encountered in any of the boreholes. A Phase II Investigation Map is provided as Figure 2.

To assess AOC-2/REC-2, one discrete (grab) soil sample (composed of 2 x 8 oz. lab-supplied jars and one Terracore set) were collected from each of the two borings in the area of the former USTs (LB-02 and LB-03) at depths of approximately 6.5 to 8 feet below ground surface (bgs) based on anticipated potential release depth and tank bottom depths. To assess AOC-1/REC-1, a grab soil sample was collected from LB-01 at a depth of approximately 2.5 to 4.5 feet bgs, and to correspond to the maximum depth of overburden soils before refusal was encountered. Samples were submitted to York Analytical Laboratory (York), a Connecticut-certified laboratory, for the following analyses:

- Volatile organic compounds (VOCs) (EPA method 8260C) (Samples LB-01 through LB-03)
- Semi-volatile organic compounds (SVOCs) (EPA method 8270D) (Sample LB-01)
- Polycyclic aromatic hydrocarbons (PAHs) (EPA method 8270D) (Samples LB-02 and LB-03)
- ETPH (CT ETPH method) (Samples LB-01 through LB-03)

Samples were collected and analyzed in accordance with Underground Storage Tank Regulations, Regulations of Connecticut State Agencies, Sections 22a-449(d)-1, and Sections 22a-449(d) 101-113. Quality assurance and quality control (QA/QC) samples included the collection of one duplicate soil sample and one trip blank.

VOCs, SVOCs and ETPH were not detected at concentrations exceeding the laboratory reporting limits in soil sample LB-01. VOCs, PAHs and ETPH were not detected at concentrations exceeding the laboratory reporting limits in soil samples LB-02 or LB-03. A summary of sample results is provided as Table 1.

DRAFT

Soil Investigation of AOCs 6 and 7

Fifteen shallow soil samples (SS-01 through SS-03, and AG-01 through AG-12) were collected from shallow soil boring advanced by Lakewood using a hand auger to 2 feet bgs. The shallow soil borings were advanced under the supervision of a Langan field engineer on 6 and 7 August 2025. Soil samples were collected by Langan field staff.

The hand auger locations for soil samples SS-01 through SS-03 were selected to evaluate the shallow subsurface conditions associated with AOC-6 (former paint-mixing and spray booth). These locations consisted of the soil immediately beneath a suspected former exhaust penetration on the north side of the building (SS-01), a location of suspected surficial ground disturbance from the dumping of classroom or other wastewater (SS-02) and beneath the downspout of the roof leader associated with rooftop stormwater drainage in the area of AOC-6 (SS-03).

The hand auger locations for soil samples AG-01 through AG-12 were selected to evaluate the surrounding grass-field areas of the Site for potential residual impacts from pesticides associated with the Site's reported historical use as agricultural land (AOC-7). The AOC-7 sample locations were spread throughout the grassy areas of the Site to provide sufficient coverage for this purpose.

Shallow soil samples were collected from each hand auger boring. The shallow borings were installed using a steel hand auger that was decontaminated between each use. Each soil sample was screened for total organic vapors using a PID equipped with a 10.6-electron volt (-eV) lamp. Soil samples were also evaluated for visual and olfactory indications of environmental impact.

One discrete (grab) soil sample (composed of 2x 8-oz. lab-supplied jars and one Terracore set) were collected from each of the shallow borings. Shallow soil samples were submitted to York Analytical Laboratory (York), a Connecticut-certified for one or more of the following analyses, as noted:

- VOCs (EPA method 8260C) (Samples SS-01 through SS-03)
- ETPH (CT ETPH method) (Samples SS-01 through SS-03)
- Pesticides (EPA method 8081B) (Samples AG-01 through AG-12)
- Total metals (Samples SS-01 through SS-03)

Quality assurance and quality control (QA/QC) samples included the collection of one duplicate soil sample and one trip blank. Additionally, samples LB-02 and LB-03 were collected and analyzed in accordance with Underground Storage Tank Regulations, Regulations of Connecticut State Agencies, Sections 22a-449(d)-1, and Sections 22a-449(d) 101-113, and the CTDEEP Site Characterization Guidance Document (SCGD).

DRAFT

VOCs were not detected at concentrations exceeding laboratory reporting limits in soil sample SS-01, SS-02 or SS-03. Total metals, including arsenic, barium, beryllium, cadmium, lead, mercury and vanadium, were detected in one of more of samples SS-01, SS-02 and/or SS-03 at concentrations exceeding laboratory reporting limits but below applicable CTDEEP RSRs soil criteria. The pesticide total DDT was identified at concentrations exceeding the Pollutant Mobility Criteria for GA/GAA Areas (GA/GAA PMC) in soil samples AG-01, its duplicate (DUP) and AG-04. Total DDT was detected in AG-12 at a concentration exceeding the laboratory reporting limit but below applicable CTDEEP RSRs soil criteria. No other pesticides were detected at concentrations above the laboratory reporting limits. A summary of sample results is provided as Table 1.

Based on these findings, Langan did not recommend additional investigation at the Site.

Langan was not provided with a copy of Eagle's June 2024 Phase I ESA; however, the draft Phase II ESI (dated 16 December 2025) is included as Appendix A.

2.0 SOIL MANAGEMENT PLAN

This section presents the procedures for the handling and management of soils for the proposed development project. Specific components of this plan include but are not limited to excavation, documentation and management, offsite soil disposal, onsite soil re-use and import of backfill. This plan is based on current limited knowledge of Site conditions and may be augmented with additional data collected during the proposed redevelopment activities.

2.1 Soil Classification Definitions

Soil to be excavated for redevelopment of the Site is expected to meet one of the definitions noted below:

Natural or Native Soil – Soil in which all substances naturally occurring therein are present in in the environment in forms that have not been influenced by human activity. For the purposes of this project, natural soils are suitable for unrestricted reuse on- or offsite, assuming the soil also meets geotechnical specifications.

Clean Fill – As defined by the CTDEEP Solid Waste Regulations: "(1) natural soil, (2) rock, brick, ceramics, concrete, and asphalt paving fragments which are virtually inert and pose neither a pollution threat to ground or surface waters nor a fire hazard and (3) polluted soil as defined in subdivision (65) of subsection (a) of section 22a-133k-1 of the Regulations of Connecticut State Agencies … which soil has been treated to reduce the concentration of pollutants to levels which do not exceed the applicable pollutant mobility criteria (PMC) and direct exposure criteria (DEC) established in sections 22a-133k-1 through 22a-133k-3 of the Regulations of Connecticut State Agencies (and which soil is reused in accordance with

DRAFT

R.C.S.A. subdivision (3) of subsection (h) of section 22a-133k-2 of such regulations." Soils imported to the Site must meet the definition of clean fill.

Polluted Soils – According to the CTDEEP RSRs, polluted soil is soil affected by a release of a non-naturally occurring substance at a concentration above the laboratory analytical detection limit for such substance, but below the applicable CTDEEP RSR criteria in accordance with RCSA 22a-133k-1(a)(65). Polluted soil falls within the definition of clean fill (see above).

Contaminated Soils – Soils containing concentrations of compounds that exceed CTDEEP RSR criteria.

Contaminated Debris – Construction, building or other debris that is visibly contaminated or contains concentrations of compounds that exceed CTDEEP RSR criteria. Unless otherwise indicated by the Client and Langan, contaminated debris cannot be reused onsite and must be disposed of at an offsite disposal facility.

Hazardous Materials – Includes all soil/fill soil that exceeds regulatory limits for hazardous substances as defined in 40 CFR, Part 261.20 Subpart C – Characteristics of Hazardous Waste. This soil cannot be reused onsite and must be disposed of at an offsite disposal facility. Based on previously completed soil investigation and remediation, soils meeting the definition of hazardous materials are not expected to be encountered at the Site during redevelopment.

Unforeseen Conditions – An unforeseen condition is a condition not previously ascertained or anticipated by Langan or the Client.

Using these standard definitions, the following group classifications were developed for this development project:

Group 1: Clean Fill

- Group 1-A: Naturally deposited soils or fill soils that contain no detectable substances other than metals at or below background conditions typical for natural soils and meet the Residential Direct Exposure Criteria (RDEC) and GA/GAA PMC. These soils are suitable for unrestricted reuse on- or offsite, assuming the soil also meets geotechnical specifications.
- Group 1-B: Naturally-deposited soils or placed fill that contain substances at concentrations above laboratory detection limits ("polluted soil"), but below CTDEEP RDEC and GA/GAA PMC and that are not otherwise a hazardous waste; in accordance with the RSRs (RCSA 22a-133k-2(h)(3)) and Connecticut's Solid Waste Regulations (RCSA Section 22a-209-1 to 22a-209-17). These soils are suitable for unrestricted

DRAFT

reuse onsite (if proposed by the Contractor and accepted in writing by the Client and Langan) and may be managed offsite at a disposal facility permitted to accept such soil. Non-regulated facilities may require approval by CTDEEP to accept polluted soils.

Group 2: Contaminated Soils

- Group 2: Soils that contain substances at concentrations above the applicable RDEC or GA/GAA PMC, and that are not otherwise a hazardous waste. Removal of soil exceeding RSR criteria is recommended for this project; however, soils with asphalt debris that exceed RDEC and GA/GAA PMC but are below the Industrial/Commercial Direct Exposure Criteria (I/C DEC) may be reused onsite below asphalt parking or buildings if proposed by the Contractor and accepted in writing by the Client and Langan. Other contaminated soils should be managed/disposed at an offsite disposal facility permitted to accept such soil. If excess contaminated soils are slated for removal from the Site, additional characterization may be necessary. Any soil exported should be managed/disposed at an offsite disposal facility permitted to accept such soil.

Group 3: Hazardous/Other Soils

- Group 3: Soils that are considered a hazardous waste, or that otherwise do not meet the definition of a Group 1 or 2 soil, shall not be re-used at the Site, and must be properly disposed of offsite at a licensed disposal facility. Hazardous materials were not identified at the site during the Phase II investigation and are not expected to be encountered during redevelopment based on the previous reports.

Soils associated with the historical agricultural usage of the Site that were found to contain concentrations of pesticides above GA/GAA PMC are identified as Group 2 soils. If necessary, these soils may be analyzed by Synthetic Precipitation Leaching Procedure (SPLP), which may allow them to be reclassified as Group 1-B.

Group Soil Handling

Excavated soils classified as Group 1-A may be reused across the Site with no restrictions. Excavated soils classified as Group 1-B, that have originated on the Site, can be reused onsite for construction purposes upon approval by the Client provided that the following conditions are met:

- Such soil is not placed below the water table;
- Such soil is not placed in an area subject to erosion, and
- Best efforts are made to place these soils below a minimum of 12-inches of Clean Fill as defined above or an impervious surface (i.e. asphalt, concrete, etc.)

DRAFT

Group 2 soil exceeding the I/C DEC is not suitable for reuse onsite and should be disposed of at an appropriate permitted/licensed offsite disposal facility. Group 2 soils exceeding the RDEC but below the I/C DEC can be handled as described above in Group 1-B.

Group 3 soil, if encountered, shall not be reused under any circumstance, and should be disposed offsite at a properly permitted/licensed hazardous waste disposal facility.

Please note that soils may require reclassification prior to or during excavation depending on the results of field screening (using a PID), visual/olfactory observations, and/or results of additional laboratory chemical testing performed.

2.2 Utility Markout

Buried utilities (e.g., electric, gas, water, sewers, telephone, etc.) should be located by the respective utilities. Connecticut Call-Before-You-Dig (CBYD) should be contacted by the Contractor prior to intrusive activities on the Site.

2.3 Erosion Control Measures

Stormwater pollution prevention and erosion control measures shall be implemented as specified in the project construction documents and in accordance with local, state, and federal regulations.

2.4 Dust and Odor Control Measures

The Contractor shall always ensure all stockpiles, haul roads, access roads and equipment storage areas are either covered or free from visible dust that would cause a hazard or nuisance. The Contractor shall also continuously monitor the exterior of the work area for visible emissions of water, dust, or debris. The Contractor shall carry out dust and particulate control measures as necessary to prevent the generation of dust and particulate matter during project activities. Dust and debris shall be confined within the work area boundaries and temporarily uncovered stockpiles should be kept moist as a measure to control dust generation.

Methods that may be applied to control dust emissions both on- and offsite may include, but are not limited to:

- Installing gravel pads at vehicle egress points.
- Application of wetting agents to soil, stockpiles, excavation faces, buckets, and equipment during excavation or roadways. These wetting agents should be water soluble, non-toxic, non-reactive, non-volatile, and non-foaming.
- Covering of excavations after completion of construction activities.
- Direct loading excavated soil to hauling vehicles and minimization of soil stockpiling onsite.
- Covering haul trucks and containers with tarps.

DRAFT

Chemical means for dust and particulate control should not be used without the written approval of the Client.

If, in the opinion of the Client, the paved surfaces of the Site and/or adjacent streets are affected by the transportation of soils from the loading area, the Contractor shall supply, at no additional cost to the Client, mechanized road cleaning equipment to clean the paved surfaces.

2.5 Soil Screening Methods

The soil classifications outlined in Section 2.1 are based on the results of Langan's preliminary characterization program, unless field observations or additional chemical testing indicate the soils to be different from the preliminary classification. Soils may be reclassified prior to or during excavation based on field screening (using a PID), visual and olfactory observations, and results of additional laboratory chemical testing performed. If soils are observed to be stained, exhibit unusual odors or contain other deleterious materials, the Contractor shall notify the Client immediately, and segregate and temporarily stockpile excavated soils, for re-classification by the Client/Langan.

The Contractor shall coordinate with the Client/Langan and arrange for any additional chemical testing required by the Contractor's receiving or temporary offsite stockpiling facilities (if applicable). If additional chemical testing is required to meet proposed receiving facility requirements or to characterize soils deemed not representative of conditions identified by Langan's preliminary characterization data, such sampling will be conducted by Langan. The Contractor shall provide the equipment and labor to obtain the samples at no additional cost to the Client.

2.6 Additional Impacts Contingency Plan

If during construction activities evidence of impacts, including but not limited to free-phase petroleum, visible chemical impacts, staining or vapors/odors, the impacted soil should be segregated from other soils pending proper classification by Langan, under this SMP.

Although not expected at the Site, should the Contractor observe or identify any evidence of impacts or other environmental condition (including but not limited to additional USTs, buried drums or other deleterious material), the Contractor shall notify the Client/Langan immediately and stop all work around the impacted area to prevent worker/public exposure to potential adverse environmental conditions. Appropriate health and safety procedures should also be implemented as required in the Contractor's Health and Safety Plan. The impacted area or environmental condition should only be addressed upon receiving the written authorization of the Client. At the direction of the Client, the Contractor shall segregate and temporarily stockpile potentially impacted soils in accordance with Section 2.7 (i.e., if they are observed to be stained, exhibit unusual odors, contain other deleterious materials, etc.).

DRAFT

2.7 Stockpiling of Excavated Soils

If onsite stockpiling of excavated soils is conducted, and approved by the Client, separate stockpile areas shall be constructed to avoid co-mingling soils of differing types. Stockpiles will be used only when necessary (and only after approval by the Client) and will be removed as soon as practicable. Stockpile areas will meet the following minimum requirements:

- Stockpile areas shall be bermed (with concrete barriers, hay bales, wattles, or "clean" soil) around the perimeter to prevent runoff and erosion, at locations approved by the Client;
- Soils shall be stockpiled on minimum 8-mil polyethylene sheeting, new stockpile liners, or impermeable surfaces such as asphalt (if approved by Langan);
- Stockpiles shall be segregated by classification in the absence of other specific requirements;
- Any soils not pre-characterized shall be stockpiled by lithology (i.e., fill, natural soils, rock, etc.);
- Stockpiles shall be covered with minimum 6-mil polyethylene sheeting or equivalent at the end of every workday, during adverse weather conditions, and when not in use. Cover shall be weighted or staked; and
- The stockpile areas should be inspected by the Contractor daily, and noted deficiencies promptly addressed.

If additional sampling or screening is deemed necessary, Langan should be provided access to all temporary stockpile locations for the purpose of observing Site activities and collecting environmental samples to document Site conditions, as needed.

2.8 Offsite Soil Disposal

2.8.1 Characterization Soil Sampling

If offsite disposal is necessary, the Contractor's proposed disposal/recycling facility will determine the sampling protocols for soils excavated beyond the existing characterization data limits. If more sampling is needed, the minimum protocols are noted below (unless provided by the proposed disposal facility):

- One sample set per approximately 500 CY of soil.
- Each sample set will consist of one 5-point composite sample and one grab sample, collected from representative areas of soils.
- Although the Site is in Connecticut, typical waste characterization laboratory analyses generally accepted at numerous soil disposal facilities in New York, New Jersey, and Massachusetts as well as in Connecticut should be considered and are as follows:

DRAFT

Sample Type	Compounds	Frequency
Grab	Volatile Organic Compounds (VOCs)	1/500 CY
Composite	Extractable Total Petroleum Hydrocarbons (ETPH)	1/500 CY
Composite	Semi-Volatile Organic Compounds (SVOCs)	1/500 CY
Composite	Pesticides and Herbicides	1/500 CY
Composite	Polychlorinated Biphenyls (PCBs)	1/500 CY
Composite	Metals (including chromium VI)	1/500 CY
Site-Wide Composite	Full Toxicity Characteristic Leaching Procedure (TCLP), RCRA Characteristics and Paint Filter Test	1/500 CY

CY = Cubic yards

2.8.2 Offsite Recycling/Disposal Facility Approval

If necessary, the proposed recycling and disposal facilities will be provided to Langan and the Client for review and approval prior to offsite recycling and/or disposal.

For all soils leaving the Site, all proposed project sites and recycling/disposal facilities must be reviewed and approved by the Client and Langan prior to offsite transport. For each proposed offsite receiving facility, the Contractor shall provide the Client and Langan with the following information for review and approval:

- Name, address, and location of the facility, including owner's name, address, telephone number, and the facility contact person;
- The EPA Disposal Facility Identification Number (if applicable) and expiration date;
- Total acreage and total daily capacity of the facility permitted to specifically accept the unsuitable soils generated from the Site (i.e., soil volume accepted per day), if applicable;
- Copies of currently valid permits (if any) from any applicable regulatory agencies to specifically accept the soil. Such permits shall indicate that they are presently in effect and shall state the maximum capacity of the facility to accept the soils;
- A listing of the number and types of analytical tests required for initial determinations of the soil for each disposal facility, including the testing requirements and frequency of testing of the soil once the initial characterization has been made, if applicable; and,
- Unless otherwise indicated by the Client, a signed letter from the facility owner granting permission to bring soil to the facility. The letter must be supplied on the facility's letterhead and include the following:
    - A statement that the facility has reviewed the chemical test data and disposal quantity information provided by the Contractor and can legally accept the soil including any contingencies upon which the acceptance is based;
    - A statement that the facility is in compliance with its permit (if applicable) which outlines any restrictions on delivery schedules or other conditions that may cause rejection of transported soils and the accepted daily quantities of soil that may be disposed;

DRAFT

- Planned use of soils (e.g., reuse, recycle, treatment, disposal);
- Limitations on soils based on material consistency (e.g., granular soil, organic soil, cohesive soil, debris content); and
- If releases have occurred at or adjacent to the site, a statement outlining if they have been reported to CTDEEP, or other applicable agencies, and the status of the release.

Soil characterization sampling results shall be submitted to the proposed recycling and disposal facility for approval prior to initiation of disposal activities.

the Client and Langan will review information submitted by the Contractor and may reject a facility if the submittal is incomplete or if at any time in the submittal process the Client deems the facility unacceptable for any reason that may put the Client at risk or cause delays to the project. Once the submittal requirements outlined above are completed to the satisfaction of the Client, Langan will prepare a letter and data package pursuant to the facility's requirements for acceptance by the facility. This package, once approved, signed and returned to the Client, will constitute approval of the facility.

2.8.3 Loading and Offsite Disposal

Following recycling/disposal facility approval, soil will be loaded into a container, dump truck, or trailer; covered; and transported to the pre-approved state-licensed/-permitted offsite soil recycler or disposal facility. The soil will be handled and transported in accordance with applicable Connecticut Department of Transportation (ConnDOT) regulations and other applicable local, state, and federal regulations. All transport of soils will be performed by licensed haulers with valid permits in accordance with appropriate local, state and federal regulations. Loaded vehicles leaving the Site will be appropriately placarded, lined and securely covered in accordance with applicable federal, state, local and ConnDOT requirements, or other applicable transportation requirements. During redevelopment, and only as needed, Langan and the Contractor will verify the accuracy and existence of and abide by applicable codes, ordinances, and other regulations by obtaining and interpreting state, county, city, or local municipality by-laws for contaminated soil, fill and solid waste removal and disposal.

Unless otherwise indicated by the Client, soil loading and offsite disposal activities will require maintaining records of individual truckload tickets/ waste manifests/soil shipping records for each load of polluted or contaminated soil removed from the Site. At a minimum, each ticket/manifest/record must contain:

- Project Name
- Disposal facility name
- Date of shipment
- Approximate volume/weight (CY/tons)

DRAFT

- Type/Classification of soil

ABSOLUTELY NO SOILS SHOULD BE REMOVED FROM THE SITE ON A HAZARDOUS WASTE OR UNIFORM HAZARDOUS WASTE MANIFEST WITHOUT WRITTEN AUTHORIZATION FROM THE CLIENT.

2.9 Reuse of Site Soils

According to development plans obtained from the Client, backfill and fill soil will be required to support the proposed redevelopment. Soil composition, site logistics, and stockpiling will determine the feasibility of reusing excavated soils as backfill or fill. Soils designated for onsite reuse should be processed (i.e., screened) as necessary to remove oversize cobbles or boulders and should always be protected from the elements (covered) while stockpiled. Soil that becomes unusable shall be disposed offsite in accordance with Section 2.8. Means by which soil may become unusable include but are not limited to inadequate dewatering, failure to protect prepared surfaces, trafficking over prepared surfaces, failure to cover stockpiles, and comingling.

Excavated soils classified as Group 1-A may be reused across the Site with no restrictions. Excavated soils classified as Group 1-B, that have originated on the Site, can be reused onsite for construction purposes upon approval by the Client provided that the following conditions are met:

- Such soil is not placed below the water table;
- Such soil is not placed in an area subject to erosion, and
- Best efforts are made to place these soils below a minimum of 12-inches of Clean Fill as defined above or an impervious surface (i.e. asphalt, concrete, etc.)

Offsite disposal of Group 2 soil that exceeds RSR criteria is recommended for this project; however, soils that exceed RDEC or GA/GAA PMC due to the presence of asphalt fragments but are below the I/C DEC may be reused onsite below asphalt parking or buildings if proposed by the Contractor and accepted in writing by the Client and Langan

Group 3 soil, if encountered, shall not be reused under any circumstance, and should be disposed offsite at a properly permitted/licensed hazardous waste disposal facility.

Please note that soils may require reclassification prior to or during excavation depending on the results of field screening (using a PID), visual/olfactory observations, and/or results of additional laboratory chemical testing performed.

If soils classified as Group 2 are reused onsite, an as-built drawing must be created and submitted documenting locations and depths (in elevation) where any Group 2 soils have been reused onsite and the depths of the source soil (as applicable).

DRAFT

Any soils proposed for reuse as backfill should also satisfy geotechnical requirements per the project construction documents.

2.10 Import of Fill Soils

If fill from offsite sources is proposed for import to the Site, this section shall apply. If proposing import of any soils/fill materials to the Site, other than clean virgin quarry stone, the Contractor shall submit the following information to the Client for review at least 48 hours prior to import:

- The name and address of the company(ies)/facility(ies) that shall supply the import soil.
- Any permits associated with the soil or beneficial use of the soil.
- Connecticut-certified laboratory analytical data for samples collected from the proposed import soil by an environmental professional using standard sample collection practice. Samples shall be collected in accordance with the frequencies set forth in CTDEEP RSRs and approved by Langan. Sample results shall be submitted to Langan for review and approval prior to importing soil to the Site. Once sampled, the stockpile must remain isolated and dedicated to import to this project and may not be commingled with any other soil.
- Each borrow fill facility or company shall issue a letter stating that the import fill is native or virgin soil that has not been commingled with any other soil. They shall also state in the letter that the soil was not sourced from or stored at any environmentally impacted/contaminated properties. The letter shall be issued prior to transporting the soil onto the Site. The letter shall reference any characterization data (by sample ID and report number). Maps shall be provided by the Contractor that show the location of the clean fill facility, location of the stockpile at the facility and location of the sample(s) collected from the stockpile.

If soil or fill material requires sampling and laboratory analysis, the frequency of said sampling will be determined by Langan based on the origin of the soil/material. At a minimum, the sample frequency will be one sample per 500 CY of proposed imported soil/material. Samples will be collected in accordance with CTDEEP RSRs to confirm the proposed imported material meets the definition of certified Clean Fill in accordance with the CTDEEP Solid Waste Regulations (RCSA Section 22a-209-1), and be free of contamination in accordance with the CTDEEP RSRs.

Each sample set of proposed imported soil will consist of one 5-point composite sample and one grab sample, collected from representative areas of the proposed imported soil stockpile at the appropriate frequency based on volume. The proposed imported soil sample sets will be analyzed for the following parameters:

DRAFT

Sample Type	Compounds
Grab	Volatile Organic Compounds (VOCs)
Composite	Extractable Total Petroleum Hydrocarbons (ETPH)
Composite	Semi-Volatile Organic Compounds (SVOCs)
Composite	Pesticides and Herbicides
Composite	Polychlorinated Biphenyls (PCBs)
Composite	CT Metals (including chromium VI)
Stockpile-Wide Composite	Full Toxicity Characteristic Leaching Procedure (TCLP), RCRA Characteristics, and Paint Filter Test

The Contractor shall ensure the facility from which the proposed imported soil is obtained does not and has not added material to the stockpile of soil intended for delivery to the Site after the sampling of the soil has been conducted.

The Client and Langan will review the sampling data, and the Client will provide the Contractor with approval to proceed with the importation or such other directions as may be appropriate based on the sampling data.

2.11 Truck and Equipment Decontamination

All trucks and equipment should be provided to the work site free of contamination and should not be decontaminated onsite if thorough decontamination has not been completed prior to arrival.

Transport vehicles should be inspected prior to leaving the Site to ensure that no soil adheres to the wheels, undercarriage, tailgates, covers, or other areas, and should be cleaned as necessary prior to leaving the Site.

2.12 Employee/ Worker Health and Safety

2.12.1 Potential Exposure Pathways

As identified in Section 1.4, pesticide-impacted soils may be encountered within the proposed development area. Potential exposure pathways associated with the activities outlined in this SMP include dermal absorption, inhalation and ingestion.

Based on current data, Level D Personal Protective Equipment (PPE) should be sufficient to prevent dermal absorption. Those workers whose activities involve direct contact with soils should use PPE deemed appropriate by OSHA and the Contractor's health and safety protocol.

The inhalation risk is to be controlled by implementing dust suppression measures during demolition and excavation activities as outlined in Section 2.4.

DRAFT

Ingestion risk is to be controlled by restricting eating within the work zones and by providing hand wash stations onsite.

2.12.2 Site Specific Health and Safety Plan

Prior to initiation of construction activities, the Contractor shall develop and implement a Site-Specific Health and Safety Plan (HASP) in accordance with OSHA and other applicable regulations. The Contractor shall be responsible for exercising reasonable precaution to protect the health and safety of all onsite personnel, the public, and the environment during the course of the Work.

3.0 RECORD KEEPING, SITE VISITS, AND REPORTING

3.1 Onsite Record Keeping

Records regarding the approximate volumes of all soils except those classified as Group 1 shall be monitored and maintained onsite and all soil imported to or exported from the Site shall be documented, as specified below:

- Individual truck load-tickets for each load of soil imported and removed from the proposed redevelopment area. Each ticket should contain the date, approximate volume (in CY), and type of soil transported.
- Copies of the final disposal facility load tickets, with incoming load weights clearly identified, will be maintained onsite.

Reuse of excavated soil onsite should be documented as described in Section 2.1.

3.2 Site Visits

Site visits related to this SMP are not anticipated at this time.

NOTES:

Q is the Qualifier Column with definitions as follows:
D=result is from an analysis that required a dilution
J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated
U=analyte not detected at or above the level indicated
B=analyte found in the analysis batch blank
E=result is estimated and cannot be accurately reported due to levels encountered or interferences
P=this flag is used for pesticide and PCB (Aroclor) target compounds when there is a % difference for detected concentrations that exceed method dictated limits between the two GC columns used for analysis

* = This duplicate sample was re-run for total SVOCs only due to suspected asphalt contamination in the original sample.
ND = Not detected
NS = this indicates that no regulatory standard has been established for this analyte
NT = Not tested

CTDEEP PMC = Pollutant Mobility Criteria
CTDEEP RDEC = Residential Direct Exposure Criteria
CTDEEP I/C DEC = Residential Direct Exposure Criteria

VOCs = Volatile Organic Compounds
SVOCs = Semi-Volatile Organic Compounds
ETPH = Extractable Total Petroleum Hydrocarbons
mg/kg = miligram per kilogram

Indicates an exceedance of GA Pollutant Mobility Criteria
Indicates an exceedance of Residential Direct Exposure Criteria
Indicates an exceedance of Ind/Comm. Direct Exposure Criteria

Hartford, CT 06106

Re: Draft Limited Phase II Environmental Site Investigation Report
Hillcrest Middle School
530 Daniels Farm Road
Trumbull, Connecticut 06611
Langan Project No. 140325901

Dear Mr. Scott,

Langan CT, Inc. (Langan) prepared this report to document the results of the Limited Phase II Environmental Site Investigation (ESI) completed for the Hillcrest Middle School (HMS) property at 530 Daniels Hill Road in Trumbull, Connecticut (hereafter referred to as the "Subject Property") in connection with Request for Qualifications/Request for Proposals (RFQ/RFP) Bid No. 6546. This report describes the sampling methodology, field observations and analytical results of the subsurface investigation.

BACKGROUND

The Subject Property is part of an approximately 88-acre parcel identified by the Trumbull Tax Assessor as Parcel ID 12708 (530 Daniels Farm Road). The parcel consists of Hillcrest Middle School (the Subject Property) in the southwest and Trumbull High School in the northeast, and surrounding athletic fields and courts. The Subject Property is developed with a 112,342-square foot school building and associated asphalt parking areas, landscaped areas and grass-covered athletic fields. The location of the Subject Property is depicted on Figure 1 (Site Location Map).

Langan's scope of work was conducted in accordance with our approved Proposal for RFQ/RFP Bid No. 6546. Specifically, Langan was retained by Trumbull Public Schools to perform a Phase II Environmental Site Investigation (ESI) for the Subject Property targeting seven areas of concern (AOCs) and Recognized Environmental Concerns (RECs) at the Subject Property identified in a Phase I Environmental Site Assessment (ESA) prepared by Eagle Environmental, Inc. (Eagle) dated June 2024. The AOCs and RECs identified by Eagle during their Phase I ESA consist of the following:

- AOC-1/REC-1: Historical Technical Auto Repair Classroom

- AOC-2/REC-2: 10,000-Gallon Fuel Oil Underground Storage Tanks (USTs)
- AOC-3: Flammable Cabinet and Drum Storage
- AOC-4: Suspected Transformer Room
- AOC-5: Diesel Generator
- AOC-6: Former Paint-Mixing and Spray Booth
- AOC-7: Historical Agricultural Use

The investigation activities described herein were completed in general accordance with the Connecticut Department of Energy and Environmental Protection (CTDEEP) 2007 Site Characterization Guidance Document and Underground Storage Tank Regulations, Regulations of Connecticut State Agencies, Sections 22a-449(d)-1, and Sections 22a-449(d) 101-113. Langan did not complete a full Phase I ESA prior to this Phase II ESI and was not provided with a copy of Eagle's June 2024 Phase I ESA; however, Langan considers assessing potential impacts to the subsurface associated with some of the AOCs listed above to be cause for environmental concern.

Langan's investigation activities were conducted to assess if a release of hazardous/petroleum-related substances had occurred to the subsurface related to AOCs/RECs 1, 2, 6 and 7. Additionally, a visual inspection of AOCs 3 through 5 was conducted to determine whether future subsurface investigation would be needed at one or more of those AOCs.

REGULATORY BACKGROUND

The results from this investigation were compared to the numeric criteria provided in the Connecticut RSRs, sections 22a-133k-1 through 22a-133k-3 of the Regulations of Connecticut State Agencies (RCSA) dated January 1996, and to numeric criteria in the "Approved Criteria for Additional Polluting Substances" dated 30 April 1999. The RSRs were developed by CTDEEP to define the remediation performance standards for soil and groundwater, specific numeric cleanup criteria, and processes for establishing alternative site-specific standards. The RSRs apply specifically to sites at which remedial actions are required by the CTDEEP under Chapters 445 or 446k of the Connecticut General Statutes such as under an administrative order, subsequent to a transfer of an establishment under CGS Section 22a-134a, and to sites that are enrolled in a Voluntary Remediation Program under CGS Sections 22a-133x or 22a-133y.

Soil Criteria

The RSRs define two criteria that apply to soil: the direct exposure criteria (DEC) and the pollutant mobility criteria (PMC). The DEC defines the maximum level of regulated compounds allowed in soil, to a depth of 15 feet to protect against the effects of contact with or ingestion of contaminants in the soil. The PMC defines the maximum level of regulated compounds allowed in soil without posing a threat to groundwater quality. Each criterion is further divided into two

DRAFT

categories; the DEC is based on either residential sites or industrial/commercial sites, while the PMC is based on either GA/GAA or GB groundwater classification areas. The Subject Property is in a Class GA-designated area. The RDEC and GA PMC apply to the Subject Property.

PHASE II ESI

The Phase II ESI was conducted to investigate the identified AOCs/RECs (listed above). The investigation was conducted between 6 and 7 August 2025, and included the completion of a geophysical survey, advancement of five soil borings in the vicinity of AOCs 1 and 2, and collection and analysis of 18 grab soil samples and one duplicate soil sample (one associated with AOC-1, two with AOC-2, three with AOC-6 and the remaining 12 with AOC-7). Langan planned to convert one soil borings downgradient of AOC-1/REC-1 (Historical Technical Auto Repair Classroom) into a temporary groundwater well; however, groundwater was not encountered above presumed bedrock refusal at any of the borings. Groundwater, therefore, could not be sampled during this investigation.

Visual Inspection of AOCs

Prior to the commencement of any investigatory activities, a Langan field engineer conducted a visual inspection of the AOCs to determine their locations, appropriate locations for borings/samples and, in the case of AOCs 3 through 5, to visually assess for whether future investigation was warranted. During the visual inspection of the AOCs, Langan field engineer William Adsit was accompanied by Ramon Lopez, the building maintenance supervisor for HMS. Mr. Lopez assisted Mr. Adsit in locating the AOCs, including the historical auto repair classroom (AOC-1), the suspected USTs grave area (AOC-2), the flammable cabinets and drum storage area (AOC-3), the transformer room (AOC-4), the diesel generator (AOC-5) and the former paint/spray booth (AOC-6). A photo log containing select photographs from the visual inspection is attached as Attachment A.

With respect to AOCs 1, 2 and 6, Mr. Adsit was able to select appropriate drilling, hand auger and sampling locations based on the information gleaned during the visual inspection of these areas. Brief descriptions of observations made in relation to AOCs 3 through 5 are provided below.

AOC-3 – Flammable Cabinets and Drum Storage

The flammable cabinets and drum storage area was observed to be a concrete floor room located north-northeast of the boiler room in Section C of the HMS building. This room is accessed via an overhead, roll-up door on the north-northwest side of the building. The room stores lawn-care equipment and tools, five flammable cabinets, eight 55-gallon drums (three steel and five plastic), trash cans and various other maintenance-related equipment. Two of the steel 55-gallon drums

DRAFT

were labeled as containing non-hazardous waste described as oily rags/speedy dry debris. Mr. Lopez reported the other six drums were empty. He had no knowledge related to the generation of the contents of the two labeled drums. The flammable cabinets were observed to contain gasoline cans (5 gallons or smaller), cans of helium and small quantities of typical maintenance-type substances in manufacturer's packaging. No notable staining or odors were noted in the room, including on the concrete floor, which was observed to be competent and free of obvious cracks or stains. Based on the visual condition of the room, Langan concluded there was no evidence a release occurred in relation to AOC-3. As a result, no future investigation of this AOC is warranted.

AOC-4 – Transformer Room

A transformer room is located east and south of the boiler room area of the school. It contains multiple transformers. Langan originally planned to visually assess the transformer room and collect two concrete samples from the floor if evidence of release of extractable total petroleum hydrocarbons (ETPH) and polychlorinated biphenyls (PCBs) was identified. However, Langan determined these samples were not necessary based on the conditions noted below.

When Langan initially attempted to access the transformer room during this event on 6-7 August 2025, the transformer room was locked and inaccessible by school or town faculty. According to Mr. Lopez, the transformer room was only accessible by United Illuminated (UI) (the electric provider) personnel. Subsequent communications with a UI representative indicated access to the transformer room could not be provided during this event but would have to occur on a later date.

On 15 August 2025, Langan field staff remobilized to the Subject Property when UI personnel was scheduled to access the room. The room could not be accessed during the return visit because the UI representative could not access the room. School staff was subsequently provided access to the transformer room in September 2025. Although Langan was not able to access the transformer room during UI's second visit, school staff collected photographs of the transformer room and provided them to Langan.

The photographs depict multiple (between three and five), corrugated panel-style electrical power transformers. The transformers are labeled as having had the dielectric oil tested to determine its PCBs content as less than 1 parts per million (ppm) PCBs. Dielectric oil with PCBs of less than 1 ppm is considered non-PCBs containing. The photos show the transformers are generally in good condition, and no obvious staining from potential leaks are visible on the concrete floor beneath or around the transformers. Based on the transformers' labels and visible condition, Langan concluded that the transformer room is unlikely to have experienced a release and therefore requires no further investigation.

DRAFT

AOC-5 – Diesel Generator

A Cummins diesel-powered electrical generator is located on the west side of the HMS building in a grass island adjacent to the boiler room. The generator is fueled via an aboveground, belly-style storage tank with a volume estimated to be approximately 100 gallons. The generator is bolted to a concrete pad. Langan observed no staining to the concrete or soil under or around the generator, no stressed vegetation in the area and no other indications of a potential release from the generator or its tank. Based on the visual condition of the generator and its surroundings, Langan concluded there was no evidence a release has occurred in relation to AOC-5. As a result, no future investigation of this AOC is warranted.

Geophysical Survey

A geophysical survey was completed by New England Subsurface Imaging, LLC (NESI) of Newtown, Connecticut under the observation of a Langan field engineer on 6 August 2025. The survey included ground penetrating radar (GPR) to locate and identify current and former utility lines, anomalies, USTs and subsurface structures, and to clear proposed boring locations.

Soil Investigation of AOCs 1 and 2

Five soil borings (LB-01, LB-01A, LB-01B, LB-02 and LB-03) were advanced by Lakewood Environmental Services Corp. (Lakewood), LLC of Smithtown, New York under the supervision of a Langan field engineer on 6 August 2025. Boring locations were selected to evaluate the subsurface conditions around AOC-1/REC-1 (Historical Technical Auto Repair Classroom) and AOC-2/REC-2 (historical USTs) (see Figure 2). Borings LB-01, LB-01A and LB-01B were advanced to assess AOC-1/REC-1 and to attempt to install an overburden groundwater monitoring well. Soil borings LB-01A and LB-01B were offsets of LB-01 advanced in attempt to find overburden groundwater. Soil borings LB-02 and LB-03 were advanced in the area of the historical USTs (AOC-2/REC-2).

The five soil borings were completed using a Geoprobe direct-push drill rig. Soil samples were collected from each environmental boring using a 5-foot macrocore sample barrel with dedicated acetate liners. Soil samples retrieved from each boring were visually classified for soil type, grain size and texture. Each soil sample was screened for total organic vapors using a PID equipped with a 10.6-electron volt (-eV) lamp. Soil samples were also evaluated for visual and olfactory indications of environmental impact. Refusal was encountered between 4.5 and 11 feet below ground surface at all five borings. Groundwater was not encountered in any of the boreholes. Soil boring logs are provided as Attachment B.

To assess AOC-2/REC-2, one discrete (grab) soil sample (composed of 2 x 8 oz. lab-supplied jars and one Terracore set) were collected from each of the two borings in the area of the former

DRAFT

USTs (LB-02 and LB-03) at depths of approximately 6.5 to 8 feet below ground surface (bgs) based on anticipated potential release depth and tank bottom depths. To assess AOC-1/REC-1, a grab soil sample was collected from LB-01 at a depth of approximately 2.5 to 4.5 feet bgs, and to correspond to the maximum depth of overburden soils before refusal was encountered. Samples were submitted to York Analytical Laboratory (York), a Connecticut-certified for the following analysis:

- Volatile organic compounds (VOCs) (EPA method 8260C) (Samples LB-01 through LB-03)
- Semi-volatile organic compounds (SVOCs) (EPA method 8270D) (Sample LB-01)
- Polycyclic aromatic hydrocarbons (PAHs) (EPA method 8270D) (Samples LB-02 and LB-03)
- ETPH (CT ETPH method(Samples LB-01 through LB-03)

Samples were collected and analyzed in accordance with Underground Storage Tank Regulations, Regulations of Connecticut State Agencies, Sections 22a-449(d)-1, and Sections 22a-449(d) 101-113. Quality assurance and quality control (QA/QC) samples included the collection of one duplicate soil sample and one trip blank.

A summary of soil analytical data is presented in Table 1. Analytical reports and chain-of-custody documentation are provided in Attachment C.

Soil Investigation of AOCs 6 and 7

Fifteen shallow soil samples (SS-01 through SS-03, and AG-01 through AG-12) were collected from shallow soil boring advanced by Lakewood using a hand auger to 2 feet bgs. The shallow soil borings were advanced under the supervision of a Langan field engineer on 6 and 7 August 2025. Soil samples were collected by Langan field staff.

The hand auger locations for soil samples SS-01 through SS-03 were selected to evaluate the shallow subsurface conditions associated with AOC-6 (former paint-mixing and spray booth). These locations consisted of the soil immediately beneath a suspected former exhaust penetration on the north side of the building (SS-01), a location of suspected surficial ground disturbance from the dumping of classroom or other wastewater (SS-02) and beneath the downspout of the roof leader associated with rooftop stormwater drainage in the area of AOC-6 (SS-03).

The hand auger locations for soil samples AG-01 through AG-12 were selected to evaluate the surrounding grass-field areas of the Subject Property for potential residual impacts from pesticides associated with the Subject Property's reported historical use as agricultural land (AOC-7). The AOC-7 sample locations were spread throughout the grassy areas of the Subject Property to provide sufficient coverage for this purpose.

DRAFT

Shallow soil samples were collected from each hand auger boring. The shallow borings were installed using a steel hand auger that was decontaminated between each use. Each soil sample was screened for total organic vapors using a PID equipped with a 10.6-electron volt (-eV) lamp. Soil samples were also evaluated for visual and olfactory indications of environmental impact. The shallow soil boring logs are provided as Attachment B.

One discrete (grab) soil sample (composed of 2x 8-oz. lab-supplied jars and one Terracore set) were collected from each of the shallow borings. Shallow soil samples were submitted to York Analytical Laboratory (York), a Connecticut-certified for one or more of the following analyses, as noted:

- VOCs (EPA method 8260C) (Samples SS-01 through SS-03)
- SVOCs (Sample LB-01)
- ETPH (CT ETPH method) (Samples SS-01 through SS-03)
- Pesticides (EPA method 8081B) (Samples AG-01 through AG-12)
- Total metals (Samples SS-01 through SS-03)

Quality assurance and quality control (QA/QC) samples included the collection of one duplicate soil sample and one trip blank. Additionally, samples LB-02 and LB-03 were collected and analyzed in accordance with Underground Storage Tank Regulations, Regulations of Connecticut State Agencies, Sections 22a-449(d)-1, and Sections 22a-449(d) 101-113, and the CTDEEP Site Characterization Guidance Document (SCGD).

A summary of soil analytical data is presented in Table 2. Analytical reports and chain-of-custody documentation are provided in Attachment C.

Groundwater Investigation

Langan's 2025 Phase II ESI proposal included installation of one temporary well downgradient to the former automotive classroom (AOC-1/REC-1) and the collection of one groundwater sample. LB-01 was advanced for this purpose. However, refusal was encountered in LB-01 at approximately 4.5 feet bgs, and groundwater was not observed in overburden soils. Two offset borings were advanced to attempt to reach overburden groundwater: soil boring LB-01A was advanced approximately 7 feet south-southwest of LB-01 boring, and LB-01B was advanced approximately 20 feet south-southeast. Refusal was encountered in both offset boring locations at a similar depth with no detection of groundwater. Given the lack of groundwater at LB-01, Langan could not successfully install and sample a temporary well.

DRAFT

OBSERVATIONS AND RESULTS

Geophysical Survey

As stated above, a geophysical survey was conducted to locate and identify current and former utility lines, anomalies, USTs, subsurface structures, and to clear proposed boring locations. As Langan was not provided with Eagle's Phase I ESA, the precise locations of the former USTs were unknown. Mr. Lopez identified the likely former location, which the GPR survey confirmed was the likely location of the former USTs. This area is located immediately north of the diesel generator in the asphalt lot. The GPR survey identified a suspected area where bedrock was excavated to accommodate the former USTs. This area was observed to be covered by an obvious asphalt patch. Subsequent investigation in this area through soil boing LB-02 identified peastone/gravel fill and a thin layer of concrete consistent with a former tank pad and surrounding fill. Additionally, deeper drilling refusal (11 feet bgs) was observed in this area compared to the surrounding area (4.5 feet bgs to 7 feet bgs). However, no USTs or anomalies were detected, suggesting the former USTs have been removed.

Subsurface Observations

The stratigraphy underlying the Subject Property consists of approximately 6 to 12 inches of topsoil consisting of brown silt or silty fine sand with some gravel and roots. Soils below 6 to 12 inches generally consisted of light reddish brown to brown silt or silty fine sand with varying amounts of gravel, light brown fine- to medium-sands with some orange streaks and crushed rock at varying intervals. These materials are believed to be native. Refusal was encountered from 4.5 to 11 feet bgs, and groundwater was not encountered in overburden soils. Suspected perched water was observed in LB-02, which was advanced in the middle of the suspected UST grave. The UST grave was suspected to be within a concave area carved into the bedrock to hold the USTs underground. Petroleum impacts (e.g., staining, odors, elevated PID readings, etc) were not identified in any boring. Soil boring logs are provided in Attachment B.

Soil Sample Analytical Results

Eighteen soil samples and one duplicate soil sample were submitted for the laboratory analyses identified in the previous section. Analytical results were compared to CTDEEP GA/GAA PMC and residential DEC (RDEC). The results are discussed below in relation to the corresponding AOC/REC. A summary of soil analyses is provided in Table 1, and laboratory reports are included as Attachment C.

DRAFT

AOC-1/REC-1

VOCs, SVOCs and ETPH were not detected at concentrations exceeding the laboratory reporting limits in soil sample LB-01.

AOC-2/REC-2

VOCs, PAHs and ETPH were not detected at concentrations exceeding the laboratory reporting limits in soil sample LB-02 or LB-03.

AOC-6

VOCs were not detected at concentrations exceeding laboratory reporting limits in soil sample SS-01, SS-02 or SS-03. Total metals, including arsenic, barium, beryllium, cadmium, lead, mercury and vanadium, were detected in one of more of samples SS-01, SS-02 and/or SS-03 at concentrations exceeding laboratory reporting limits but below applicable CTDEEP RSRs soil criteria.

AOC-7

The pesticide total DDT was identified at concentrations exceeding the GA PMC in soil samples AG-01, its duplicate (DUP) and AG-04. Total DDT was detected in AG-12 at a concentration exceeding the laboratory reporting limit but below applicable CTDEEP RSRs soil criteria. No other pesticides were detected at concentrations above the laboratory reporting limits.

CONCLUSIONS AND RECOMMENDATIONS

Based on the observations and results of this investigation, Langan concludes the following:

- Overburden groundwater was not identified and bedrock groundwater is likely deeper than 11 feet bgs.
- No evidence of petroleum or releases (staining, odors and/or elevated PID readings) associated with AOCs 1, 2, 4 or 6 was identified during this investigation.
- Total DDT was detected in samples AG-01, its duplicate (DUP) and AG-04 at concentrations exceeding the GA PMC, and in AG-12 at a concentration exceeding the laboratory reporting limit. The relatively low-level detections of total DDT are attributable to historical application of pesticides when the Subject Property was used for agricultural purposes.

Based on our findings, Langan does not recommend additional environmental investigation at the Subject Property at this time. However, as part of redevelopment activities at the Subject Property, Langan recommends the preparation and implementation of a site-specific soil

DRAFT

management plan (SMP) to provide guidance and procedures for documenting and managing the excavation and export of soils, import of soil for backfill, construction of stockpiles and re-use of on-site soil during the redevelopment project.

LIMITATIONS

This Phase II ESI report was prepared expressly for TKSP Studio for the Hillcrest Middle School portion of the parcel at 530 Daniels Farm Road in Trumbull, Connecticut (identified in Figure 2) and for the objectives defined herein. Langan cannot assume responsibility for the use of this report for any property other than the specific site addressed in this report, or by any third party without specific written authorization from Langan. The conclusions and opinions provided in this report are based on subsurface conditions ascertained from the analysis of a limited number of samples and from environmental reports prepared by other professionals. Actual conditions encountered during redevelopment may differ from those presented herein and if evidence of a release is identified, it should be brought to our attention to determine how such impacts may affect our conclusions.

Sincerely,
Langan CT, Inc.

NOTES:

Q is the Qualifier Column with definitions as follows:
D=result is from an analysis that required a dilution
J=analyte detected at or above the MDL (method detection limit) but below the RL (Reporting Limit) - data is estimated
U=analyte not detected at or above the level indicated
B=analyte found in the analysis batch blank
E=result is estimated and cannot be accurately reported due to levels encountered or interferences
P=this flag is used for pesticide and PCB (Aroclor) target compounds when there is a % difference for detected concentrations that exceed method dictated limits between the two GC columns used for analysis

* = This duplicate sample was re-run for total SVOCs only due to suspected asphalt contamination in the original sample.
ND = Not detected
NS = this indicates that no regulatory standard has been established for this analyte
NT = Not tested

CTDEEP PMC = Pollutant Mobility Criteria
CTDEEP RDEC = Residential Direct Exposure Criteria
CTDEEP I/C DEC = Residential Direct Exposure Criteria

VOCs = Volatile Organic Compounds
SVOCs = Semi-Volatile Organic Compounds
ETPH = Extractable Total Petroleum Hydrocarbons
mg/kg = miligram per kilogram

Appendix C Laboratory Analytical Reports

Technical Report

prepared for:

Langan Engineering & Environmental Services (CT)
Long Wharf Maritime Center, 555 Long Wharf Drive
New Haven CT, 06511-6107
Attention: William Adsit

Report Date: 08/13/2025
Client Project ID: 140325901
York Project (SDG) No.: 25H0361

Report Date: 08/13/2025
Client Project ID: 140325901
York Project (SDG) No.: 25H0361

Langan Engineering & Environmental Services (CT)
Long Wharf Maritime Center, 555 Long Wharf Drive
New Haven CT, 06511-6107
Attention: William Adsit

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on August 06, 2025 and listed below. The project was identified as your project: **140325901**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 25H0361

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Approved By  **Date:** 08/13/2025

Cassie L. Mosher
Laboratory Manager

Sample and Data Qualifiers Relating to This Work Order

S-GC	Two surrogates are used for this analysis. One surrogate recovered within control limits therefore the analysis is acceptable.
S-08	The recovery of this surrogate was outside of QC limits.
QR-03	The RPD value for the sample duplicate or MS/MSD was outside of QC acceptance limits due to matrix interference. QC batch accepted based on LCS and/or LCSD recovery and/or RPD values.
QL-02	This LCS analyte is outside Laboratory Recovery limits due the analyte behavior using the referenced method. The reference method has certain limitations with respect to analytes of this nature.
M-DUPS	The RPD between the native sample and the duplicate is outside of limits due to sample non-homogeneity
M-CCV1	The recovery for this element in the Continuing Calibration Verification (CCV) was outside the 90-110% recovery criteria.
ICVE20	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration verification (recovery exceeded 20% of expected value).
ICVE	The value reported is ESTIMATED. The value is estimated due to its behavior during initial calibration verification (recovery exceeded 30% of expected value).
CCVE	The value reported is ESTIMATED. The value is estimated due to its behavior during continuing calibration verification (>20% Difference for average Rf or >20% Drift for quadratic fit).

Definitions and Other Explanations

*	Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.
ND	NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)
RL	REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.
LOQ	LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.
LOD	LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.
MDL	METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.
Reported to	This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.
NR	Not reported
RPD	Relative Percent Difference
Wet	The data has been reported on an as-received (wet weight) basis
Low Bias	Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
High Bias	High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.
Non-Dir.	Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Purpose and Results

This report contains the analytical data for the sample(s) identified on the attached chain-of-custody received in our laboratory on August 07, 2025 and listed below. The project was identified as your project: **140325901**.

The analyses were conducted utilizing appropriate EPA, Standard Methods, and ASTM methods as detailed in the data summary tables.

All samples were received in proper condition meeting the customary acceptance requirements for environmental samples except those indicated under the Sample and Analysis Qualifiers section of this report.

All analyses met the method and laboratory standard operating procedure requirements except as indicated by any data flags, the meaning of which are explained in the Sample and Data Qualifiers Relating to This Work Order section of this report and case narrative if applicable.

The results of the analyses, which are all reported on dry weight basis (soils) unless otherwise noted, are detailed in the following pages.

Please contact Client Services at 203.325.1371 with any questions regarding this report.

General Notes for York Project (SDG) No.: 25H0413

1. The RLs and MDLs (Reporting Limit and Method Detection Limit respectively) reported are adjusted for any dilution necessary due to the levels of target and/or non-target analytes and matrix interference. The RL(REPORTING LIMIT) is based upon the lowest standard utilized for the calibration where applicable.
2. Samples are retained for a period of thirty days after submittal of report, unless other arrangements are made.
3. York's liability for the above data is limited to the dollar value paid to York for the referenced project.
4. This report shall not be reproduced without the written approval of York Analytical Laboratories, Inc.
5. All analyses conducted met method or Laboratory SOP requirements. See the Sample and Data Qualifiers Section for further information.
6. It is noted that no analyses reported herein were subcontracted to another laboratory, unless noted in the report.
7. This report reflects results that relate only to the samples submitted on the attached chain-of-custody form(s) received by York.
8. Analyses conducted at York Analytical Laboratories, Inc. Stratford, CT are indicated by NY Cert. No. 10854; those conducted at York Analytical Laboratories, Inc., Richmond Hill, NY are indicated by NY Cert. No. 12058.

Approved By  **Date:** 08/15/2025

Cassie L. Mosher
Laboratory Manager

Sample and Data Qualifiers Relating to This Work Order

S-GC Two surrogates are used for this analysis. One surrogate recovered within control limits therefore the analysis is acceptable.

S-08 The recovery of this surrogate was outside of QC limits.

Definitions and Other Explanations

* Analyte is not certified or the state of the samples origination does not offer certification for the Analyte.

ND NOT DETECTED - the analyte is not detected at the Reported to level (LOQ/RL or LOD/MDL)

RL REPORTING LIMIT - the minimum reportable value based upon the lowest point in the analyte calibration curve.

LOQ LIMIT OF QUANTITATION - the minimum concentration of a target analyte that can be reported within a specified degree of confidence. This is the lowest point in an analyte calibration curve that has been subjected to all steps of the processing/analysis and verified to meet defined criteria. This is based upon NELAC 2009 Standards and applies to all analyses.

LOD LIMIT OF DETECTION - a verified estimate of the minimum concentration of a substance in a given matrix that an analytical process can reliably detect. This is based upon NELAC 2009 Standards and applies to all analyses conducted under the auspices of EPA SW-846.

MDL METHOD DETECTION LIMIT - a statistically derived estimate of the minimum amount of a substance an analytical system can reliably detect with a 99% confidence that the concentration of the substance is greater than zero. This is based upon 40 CFR Part 136 Appendix B and applies only to EPA 600 and 200 series methods.

Reported to This indicates that the data for a particular analysis is reported to either the LOD/MDL, or the LOQ/RL. In cases where the "Reported to" is located above the LOD/MDL, any value between this and the LOQ represents an estimated value which is "J" flagged accordingly. This applies to volatile and semi-volatile target compounds only.

NR Not reported

RPD Relative Percent Difference

Wet The data has been reported on an as-received (wet weight) basis

Low Bias Low Bias flag indicates that the recovery of the flagged analyte is below the laboratory or regulatory lower control limit. The data user should take note that this analyte may be biased low but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

High Bias High Bias flag indicates that the recovery of the flagged analyte is above the laboratory or regulatory upper control limit. The data user should take note that this analyte may be biased high but should evaluate multiple lines of evidence including the LCS and site-specific MS/MSD data to draw bias conclusions. In cases where no site-specific MS/MSD was requested, only the LCS data can be used to evaluate such bias.

Non-Dir. Non-dir. flag (Non-Directional Bias) indicates that the Relative Percent Difference (RPD) (a measure of precision) among the MS and MSD data is outside the laboratory or regulatory control limit. This alerts the data user where the MS and MSD are from site-specific samples that the RPD is high due to either non-homogeneous distribution of target analyte between the MS/MSD or indicates poor reproducibility for other reasons.

If EPA SW-846 method 8270 is included herein it is noted that the target compound N-nitrosodiphenylamine (NDPA) decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine (DPA). These results could actually represent 100% DPA, 100% NDPA or some combination of the two. For this reason, York reports the combined result for n-nitrosodiphenylamine and diphenylamine for either of these compounds as a combined concentration as Diphenylamine.

If Total PCBs are detected and the target aroclors reported are "Not detected", the Total PCB value is reported due to the presence of either or both Aroclors 1262 and 1268 which are non-target aroclors for some regulatory lists.

2-chloroethylvinyl ether readily breaks down under acidic conditions. Samples that are acid preserved, including standards will exhibit breakdown. The data user should take note.

Certification for pH is no longer offered by NYDOH ELAP.

Semi-Volatile and Volatile analyses are reported down to the LOD/MDL, with values between the LOD/MDL and the LOQ being "J" flagged as estimated results.

For analyses by EPA SW-846-8270D, the Limit of Quantitation (LOQ) reported for benzidine is based upon the lowest standard used for calibration and is not a verified LOQ due to this compound's propensity for oxidative losses during extraction/concentration procedures and non-reproducible chromatographic performance.

Re: Geotechnical Engineering Letter Report
Hillcrest Middle School
Trumbull, Connecticut
Langan Project No.: 140325901

Dear Mr. Scott,

This report presents our geotechnical engineering study for the proposed Hillcrest Middle School in Trumbull, Connecticut. The purposes of this study were to explore subsurface conditions, evaluate feasible foundation options, and develop geotechnical engineering design and construction recommendations. Services were performed in accordance with our authorized proposal (15 August 2025).

Our approach and recommendations have been developed considering a plan entitled "Site Plan, Hillcrest Middle School" provided by TKSP Studio (21 August 2025). We understand that concepts are currently being developed and the proposed grading in the above-referenced plan is preliminary. Any changes to the design scheme must be reviewed by Langan for impacts on our recommendations.

Elevations noted here are taken from a "Partial Boundary & Topographic Survey" prepared by Langan (11 July 2025) which references the North American Vertical Datum of 1988 (NAVD88).

SITE DESCRIPTION

The existing school site is bound by an asphalt driveway with Trumbull Agriscience, auxilary buildings and landscaping to the north; athletic fields and parking lots to the east; residential properties and wooded areas to the south; and Daniels Farm Road and residential properties to the west. Figure 1 shows the site location and surrounding area.

The existing school footprint is about 146,000 square feet (SF) with a finished floor elevation (FFE) between about el +393.3 and +397.6. Surrounding site features includes concrete walkways, asphalt parking lots, drive aisles, auxiliary structures, landscape areas, grass fields, and sports fields.

Overall site grades slope down from the northwest to the south (about el +405 to +368). A slope with an about 14-foot grade change is located in the middle of the site and divides the site into the northern and southern parts. The northern half of the site contains the existing school building and upper fields, where site grades slope down from northwest to the east between about el +405 and +385. In the southern half of the site with the sports fields, the site grades slope down from north to south between about el +390 and +368.

Underground utilities including electric, communication, sanitary, stormwater, and gas are present throughout the existing development. Electric service runs overhead along the eastern perimeter of the school then to the west with service connections along Daniels Farm Road.

PROPOSED CONSTRUCTION

The proposed development will include the demolition of the existing school and parking lots and the construction of a new one- to three-story school building. The proposed building will have a footprint of about 48,900 SF and FFE of about el +391 to the north and about el +377 to the south. No basement levels are proposed.

Associated site features include new concrete sidewalks, asphalt parking lots, drive aisles, landscape features, site utilities, and athletic fields. A finalized grading plan is not available at this time, but we anticipate fills up to about 14 feet to reach proposed finished floor elevations and site fill retaining walls where steep grade changes occur.

The structural engineer has noted maximum column loads of 250 kips for the proposed structure.

REVIEW OF AVAILABLE INFORMATION

Regional Geology

The 1992 "Surficial Materials Map of Connecticut" (Figure 2) and the 1985 "Bedrock Geological Map of Connecticut," (Figure 3) both prepared by the Connecticut Geological and Natural Resource Survey, show that the overburden material is till and the bedrock is Straits Schist (DSt), defined as silvery to gray, coarse-grained schist and Trap Falls Formation (Otfc), defined as interlayered gray, rusty-weathering schist and light gray gneiss.

Federal Emergency Management Agency Flood Map

We reviewed the Flood Insurance Rate Map (FIRM) for the town of Trumbull published by the Federal Emergency Management Agency (FEMA), Map No. 09001C0289F effective 18 June 2010 (Figure 4). The site is located in Zone X – unshaded, "Areas determined to be outside the 500-year floodplain."

SUBSURFACE EXPLORATION

Langan performed a subsurface exploration consisting of eight geotechnical borings within and adjacent to the proposed building footprint. A boring location plan is shown in Figure 5.

Borings

Eight borings (LB-01 through LB-08) were advanced between 23 and 24 of July 2025 by General Borings, Inc. under Langan's full-time observation. The borings were advanced with a Diedrich D-50 track mounted drill rig using hollow-stem-auger drilling techniques. Borings were terminated between about 8 to 25 feet below grade (bottom of borings between about el +358 and +375).

The borings were hand cleared to a depth of 5 feet then Standard Penetration Test N-values[1] were documented and soil samples were generally obtained continuously to a depth of 13 feet and every 5 feet thereafter using hollow-stem-auger drilling techniques. Disturbed soil samples were obtained using a standard 2-inch-outer-diameter split-spoon sampler driven by a 140-pound automatic hammer in accordance with ASTM D1586, Standard Penetration Test.

Recovered soil samples were visually examined and classified in the field in general accordance with the Unified Soil Classification System (USCS). Soil classifications, N-values, and other field observations were recorded on our field logs provided in Appendix A.

Laboratory Tests

Select samples were sent to a testing laboratory to confirm visual classifications and to determine physical and mechanical index properties. As part of our assessment, we performed four grain size determinations and four moisture content tests. Laboratory results are provided in Appendix B.

SUBSURFACE CONDITIONS

The subsurface conditions generally consist of a surficial layer of topsoil underlain by layers of fill, glacial till, weathered rock, and finally bedrock. Bedrock was inferred between about 8 to 25 feet below existing grades as indicated by auger and split spoon refusal. Groundwater was observed in some borings between about 12 and 14 feet below existing grades. A detailed description of subsurface materials encountered is provided below in order of increasing depth.

[1] The Standard Penetration Test (SPT) is an in situ testing technique used to infer soil density and consistency. The SPT N-value is defined as the number of blows required to drive a 2-inch-diameter split-barrel sampler 12 inches after an initial penetration of 6-inches using a 140-pound hammer falling freely from 30 inches.

Surficial Material – An about 6-inch-thick layer of topsoil was encountered in all borings. The topsoil is generally composed of brown sand with varying amounts of gravel, silt, and roots.

Fill – Below the surficial material, an about 2.5- to 9.5-foot-thick layer of fill (bottom of layer corresponding to between about el +366.5 and +386) was encountered in all borings, except LB-08. The fill is generally composed of brown sand with varying proportions of gravel, silt, and roots. The SPT N-values within the fill layer vary from about 2 to 4 blows per foot (bpf). However, SPT N-values were not obtained within the top 5 feet due to hand clearing. Laboratory testing of one sample from the fill layer indicated a fines content of about 29% and a moisture content of about 16%.The fill layer is generally classified as silty sand (SM) in accordance with the USCS.

Glacial Till – Below the fill, an about 2- to 15-foot-thick layer of glacial till (top of layer corresponding to between about el +366.5 and +386) was encountered in all borings. The glacial till is generally composed of gray to brown sand with varying proportions of silt and gravel. The SPT N-values within the glacial till layer vary from about 19 bpf to split spoon refusal (greater than 50 blows to penetrate 6 inches). Laboratory testing of the glacial till layer indicated a fines content between about 18% and 19% and a moisture content between about 8% and 11%. The glacial till layer is generally classified as poorly graded sand and silty sand (SP/SM) in accordance with the USCS.

Weathered Rock – Below the glacial till, an about 2- to 10-foot-thick layer of weathered rock was encountered in all the borings (top of layer corresponding to between about el +361.5 and +378). The weathered rock is generally composed of gray weathered rock fragments with varying proportions of sand, silt and gravel. The SPT N-values within the weathered rock layer vary from about 31 bpf to split-spoon refusal. Laboratory testing of the weathered rock layer indicated a fines content of about 14% and a moisture content of about 2%. The layer is generally classified as silty sand or poorly graded sand (SM/SP) in accordance with the USCS.

Bedrock – Bedrock was encountered between about 8 and 25 feet below grade (top of bedrock between about el +358 and +375) as inferred by refusal of drilling equipment or by rock cores. The bedrock underlying the site consists of gray schist. Bedrock was cored in one boring, LB-01; the REC for was about 97% and the RQD was about 49%, indicating poor to fair quality bedrock.

Groundwater – Groundwater was encountered in borings LB-02, LB-04, LB-06, and LB-07. Groundwater was encountered at depths ranging from about 12 to 14 feet below existing grades (between about el +364.5 and +377). Groundwater should be expected to fluctuate with time as a result of seasonal changes, utility breaks, precipitation, construction, etc.

GEOTECHNICAL DESIGN RECOMMENDATIONS

Seismic Evaluation

This section presents seismic design recommendations for use with the 2022 Connecticut State Building Code (2021 International Building Code). We have considered the soil conditions encountered in the borings to be consistent and representative of the soil conditions in the top 100 feet of soil at this site. The soil conditions found in the borings were used to determine site class and recommendations.

Based on the spectral accelerations and the anticipated risk category, we have estimated the Seismic Design Category (SDC). The structural engineer is responsible for confirming the appropriate use group, occupancy category, and final SDC for the proposed structure.

Table 1. Seismic Design Values

Description	Parameter	Recommended Value
Mapped Spectral Acceleration for short periods:	S_s	0.210 g
Mapped Spectral Acceleration for 1-sec period:	S_1	0.054 g
Site Class:	--	**C – Very dense soil & soft rock**
Site Coefficient:	F_a	1.3
Site Coefficient:	F_v	1.5
5% damped design spectral response acceleration at short periods:	**S_{DS}**	**0.182 g**
5% damped design spectral response acceleration at 1-sec period:	**S_{D1}**	**0.054 g**
Anticipated Risk Category	--	**III**
Seismic Design Category	**--**	**B**

The Building Code requires an evaluation of the liquefaction potential of non-cohesive soils below the groundwater table. Subsurface materials below the foundations are typically dense soils and rock. Thus, liquefaction potential is not a concern and need not be considered in the design.

Foundation System

The materials encountered at the anticipated footing elevation (about el +387.5 and +373.5) consist of fill, glacial till, or will consists of structural fill used to raise grades. The surficial materials and existing fills are not suitable for foundation support and should be completely removed in accordance with the removal and replacement section of this report prior to final grading and fill operations.

Following the removal and replacement program, the proposed building can be supported on shallow foundations bearing on structural fill or natural glacial till with an allowable bearing pressure of 4 kips per square foot (ksf).

All exterior footings should be constructed 42 inches or deeper below the lowest adjacent grade for frost protection. Interior footings in heated spaces should be at least 1.5 feet below the finished-floor elevation. Isolated column footings should have a minimum dimension of 3 feet and strip footings should have a minimum width of 2 feet even if smaller dimensions can be justified using the recommended allowable bearing pressure.

Foundations should not be located such that one foundation is located within the zone of influence of an adjacent foundation. The zone of influence is taken as a 1 horizontal to 1 vertical (1H:1V) projection extending outward and downward from the edge of the foundation. Additionally, the zone of influence for proposed footings should not intersect adjacent footings.

For mass concrete poured directly against approved subgrade materials, the following coefficient of sliding friction values can be used and are per the Connecticut State Building Code:

- 0.25 – Compacted, approved soil subgrade, and
- 0.35 – Minimum of 6-inch-thick layer of compacted clean stone aggregate on top of the approved, compacted soil subgrade.

Settlement

Total settlements of the structure are estimated to be on the order of 1 inch or less, provided the bearing pressures and removal/replacement approaches recommended here are used and the subgrade preparation work described here is performed. Differential settlements of adjacent new structure columns are expected to be about ½ inch. The majority of the settlement is expected to take place during construction.

Slab Design

We recommend that ground-floor slabs be constructed as a slab-on-grade bearing on proof-compacted existing fill, structural fill, or natural glacial till in accordance with the recommendations herein. Subgrade must be prepared in accordance with the recommendations in this report. Slab-on-grade should be designed using a modulus of subgrade reaction of 125 pounds per cubic inch (pci).

Slab-on-grade areas should be protected from moisture with a minimum 6-inch-thick layer of ¾-inch clean crushed stone. A vapor barrier should be used below the ground-floor slab to limit transmission of water vapor through the slab (and below-grade walls). We recommend a robust

membrane such as the Florprufe product by GCP Applied Technologies. Omission of a vapor barrier can lead to floor-covering problems including delamination and mold.

Permanent Groundwater Control

We recommend a perimeter foundation drain be installed to intercept and divert groundwater flow away from the structure during prolonged precipitation, snowmelt, or utility breaks. Where the building steps down with existing grade, the perimeter drain should be installed at the uphill side of the structure to prevent water from accumulating behind buried walls. Manufactured geocomposite drainage panels (such as Hydroduct) or a 12-inch-wide layer of ¾-inch clean crushed stone encased in filter fabric should be installed against the outside of all below-grade perimeter walls and should extend to within 1 foot of adjacent surface grade. The drainage panels (or crushed stone) should connect to a perforated PVC footing drainpipe, having a minimum diameter of 6-inches, installed at the base of the footing. The footing drain should be encased in 6 inches of washed ¾-inch clean crushed stone encased in a filter fabric (such as Mirafi 140N). The footing drains should be connected to the site stormwater system, and where possible, drain by gravity. Where used, drainage panels must be secured in place and the filter-fabric side must face the soil.

Below-Grade Walls

Permanent below-grade walls considered to be fixed against rotation, should be designed to resist soil and surcharge pressures. We recommend that the below-grade foundation walls (i.e. fixed walls) be designed using a triangular earth-pressure distribution having an equivalent fluid weight 60 lb/ft^2 per foot of depth. This design lateral pressure provided presumes that groundwater levels coincide with the bottom of wall and free-draining clean stone is used as backfill or a manufactured drain panel is installed behind the walls. Surcharge loading on the below-grade foundation walls should be included by adding a uniform stress equal to one-half the surcharge load in addition to the soil loading. Backfill should not be placed against below-grade walls until the wall concrete has reached its 28-day compressive design strength and has been approved by the structural engineer.

Site Retaining Walls

Site fill retaining walls may be designed as geogrid reinforced modular block walls (such as Mesa, Keystone, Versa-lok, or Redi-Rock type walls) or gravity-type retaining walls, depending on the final location, size, and loading of the proposed walls. The retaining walls can be preliminarily designed using a moist unit weight of 135 pounds per cubic foot, a drained angle of internal friction of 32°, and a coefficient of active earth pressure of Ka = 0.31. The walls should be designed to include drainage features to avoid water build up behind the wall face.

We recommend the same allowable bearing pressure and subgrade preparation recommendations for foundations noted herein be used for design of the walls. Removal and replacement may also need to be performed below retaining walls to reach suitable bearing materials. A minimum 1-foot-thick granular pad (such as ¾-inch clean crushed stone) should be used for the base of the wall.

The proposed retaining wall designs (including calculations and global stability) and construction means and methods signed and sealed by a Professional Engineer licensed in Connecticut should be submitted by the contractor for review.

Soil Slopes

Permanent cut and fill slopes will be used across the site. We recommend that cut or fill slopes in soil be designed with a slope inclination of 3H:1V, or flatter, wherever feasible. Soil slopes steeper than 3H:1V should be stabilized with horizontal layers of geogrid or surface protection such as riprap underlain by a non-woven geotextile. Temporary stabilization, keying and benching, or other measures may be required during steep slope construction until the final condition is completed. Slope angles steeper than 2H:1V are not recommended for soil slopes. Critical slopes should be analyzed for global stability. The slope design recommendations above are based on an average angle of internal friction of about 30 to 32 degrees for on-site fill materials and natural soils in the slope areas.

Surface armoring (i.e., riprap underlain by a non-woven geotextile, vegetative cover, etc.) should be established on the slope surfaces as soon as practical after final grading to reduce erosion and the potential for sloughing failures. The thickness of organic topsoil on the surface of vegetated slopes should be 12 inches or less, unless otherwise approved by the Geotechnical Engineer.

GEOTECHNICAL CONSTRUCTION RECOMMENDATIONS

Site Preparation

All existing foundations, floor slabs, pavements, utilities, and building remnants should be completely removed within 10 feet of the proposed building footprint unless specified to remain. If encountered, buried debris should be completely removed beneath proposed building slab and footing locations. Below-grade structures outside of the building footprint can be abandoned in place provided they are removed to at least 4 feet below finished subgrade levels, 3 feet below proposed utilities, and to eliminate conflicts with new utilities or structures. Existing utilities outside of the proposed building footprints should be removed or abandoned in place by completely filling with grout. Slabs left in place should be sufficiently broken up to allow water to drain, and so that a geotechnical engineer can observe if voids exist beneath the slab. Existing asphalt pavement and concrete walkways should be completely removed.

Excavations made to remove below-grade elements should be backfilled with approved, compacted fill in accordance with the Excavation, Fill, Placement, and Compaction Criteria section of this report and any environmental requirements.

Clearing and grubbing of any vegetation designated for removal (including root systems) should be performed. Topsoil should be stripped from the proposed building and pavement areas and should be stockpiled and protected from erosion. Topsoil should be evaluated by a landscape architect for reuse in landscape areas (if permitted by the environmental engineer). All clearing and stripping activities should be performed in strict accordance with the approved soil-erosion and sediment-control plan and the environmental reports prepared for the project.

All demolition and site-clearing work should be performed in accordance with any environmental requirements established for the site, and all local, state, and federal regulations. All debris and trees and other vegetation should be properly disposed of off-site in accordance with applicable regulations. All construction work should be performed so as not to adversely impact the neighboring buildings, nearby structures or utilities, including the existing utilities and trees that are to remain. Protection of these elements should be provided as necessary. Before beginning grading or placing fill, any miscellaneous trash, debris, or other unsuitable materials should be removed from the site.

Subgrade Preparation

All footing and utility-trench soil subgrades should be proofrolled with six overlapping coverages of a double-drum 1-ton walk-behind vibratory roller. All slab subgrade areas should be proofrolled with six overlapping coverages of a vibratory drum roller having a minimum static drum weight of 10 tons.

Soft areas identified during proofrolling should be excavated and replaced with approved structural fill as described in the Excavation, Fill, Placement and Compaction Criteria section. The actual extent of necessary removal and replacement should be determined by a qualified Langan geotechnical engineer. Care should be taken when proofrolling near any existing underground utilities that are to remain.

Soil footing subgrades should be excavated level and if any cobbles or boulders are encountered at the footing subgrade level such that a relatively level subgrade is not achieved, the cobbles or boulders should be removed and replaced with compacted structural fill, compacted ¾-inch crushed stone, or lean concrete. All soil subgrades for footings or slabs should be compacted to the project specified compaction criteria.

Steps should be taken by the contractor to control and remove surface-water runoff and precipitation. When soil is wet and subjected to construction traffic, previously acceptable subgrades can soften and become unacceptable. A smooth drum roller should be used to seal

the surface and provide for better drainage. We also recommend crowning or sloping the subgrade to provide positive drainage off the subgrades. If foundations are not poured in a timely manner, the subgrade should be protected with a lean concrete mud mat to protect the footing subgrades. Any approved footing bottom exposed to precipitation must be reinspected prior to concrete placement.

Removal and Replacement

The fill in its current state is unsuitable to support the proposed building foundations. Some areas of the proposed building footprint require mass fills and therefore recommend the removal and replacement program be performed prior to mass filling to minimize over-excavation depths during foundation construction.

We estimate over-excavations up to about 7 feet below existing elevations to reach the native soils. Where encountered beneath foundations, the fill should be removed within the foundation zone of influence (i.e. 1H to 1V downward projection from the edge of footing). The resulting native subgrade material should be proofrolled in accordance with the Subgrade Preparation section outlined herein. The resulting excavation should be backfilled with structural fill, performed in accordance with the Excavation, Fill, Placement, and Compaction Criteria recommendations outlined herein.

Excavation, Fill, Placement, and Compaction Criteria

Excavation

Excavation through the fill and the underlying glacial till can likely be performed using conventional earthmoving equipment (e.g., backhoes, excavators, dozers, etc.). Excavations made for footings and utilities should be conducted to minimize disturbance to the subgrade (i.e., backhoe with a smooth-edge bucket).

All excavations should be properly sloped or braced and conform with applicable OSHA regulations including, but not limited to, temporary shoring, trench boxes, temporary rock stabilization, or proper benching or both.

Fill Materials

The following types of fill can be used:

Structural Fill – Structural fill should be well-graded sand and gravel having a maximum particle size of 3 inches and no more than 10% passing the No. 200 sieve. Additionally, the structural fill should be free of organics, clay, roots, concrete, other non-soil constituents, and other deleterious or compressible materials. Any approved imported structural fill

should be certified "clean fill" free of hazardous substances and meeting all local, state, and federal regulations.

Material Reuse – The contractor may reuse the on-site fill or glacial till as structural fill provided the soils meet the requirements for structural fill outlined above and is approved by the environmental engineer. Note that samples obtained within the fill have reported fines contents (passing the #200 sieve) of up to 29% and may be sensitive to moisture. The overall amount of soil that can be reused will be dependent on the amount of fines present within the soil, the time of year the earthwork is carried out (e.g., potentially inclement weather), and the earthwork contractor's ability to stage, aerate and process the material to facilitate placement and compaction.

General Fill – On-site soils not meeting the requirements for structural fill can be used as general fill for site landscape and other nonstructural areas (e.g., landscaped areas) if environmentally suitable for reuse. The fill layers may be used as general fill, if required.

Compaction Criteria

All fill should be placed in uniform 12-inch-thick loose lifts and compacted. Fill in landscaped areas should be compacted to 90% of its maximum dry unit weight as determined by ASTM D1557; all other fill should be compacted to at least 95%. In restricted areas where only hand-operated compactors can be used, the maximum lift thickness should be limited to 8 inches. The appropriate water content at the time of compaction should be plus or minus 2% points of optimum as determined by the laboratory compaction tests of proposed fill. No backfill should be placed on areas where free water is standing or on frozen subsoil areas.

Temporary Groundwater Control

We anticipate that dewatering will likely be required during construction. Water infiltration to the foundation excavation, during the removal and replacement program, and utility construction can be controlled using gravity-fed sump pumps via gravel trenches or sumps assisted with collector trenches. More robust dewatering mean (well points, etc.) may be required where excavations extend below the groundwater table). The final dewatering measures required should be evaluated and designed by the contractor. The dewatering measures implemented should adequately dewater all foundation-related excavations such that compaction of footing subgrades is feasible.

Collection of rainwater runoff will also be needed during the excavation of the removal and replacement program and during the subgrade preparation work. Water runoff is expected to be controlled with the use of gravel-lined collection trenches, pits and submersible pumps. Care should be taken to provide drainage during all phases of excavation work. Environmental

pretreatment of groundwater, if necessary, is beyond the scope of this work. Collected water should be discharged in accordance with applicable regulations.

LIMITATIONS

The geotechnical conclusions and recommendations provided in this study result from our interpretation of the geotechnical conditions existing at the site inferred from a limited number of borings as well as concept information, and information provided by the project team. They are the result of limited engineering studies and our interpretations of the geotechnical conditions existing at the site at the time of investigation. Actual subsurface conditions may vary. Recommendations provided are dependent upon one another and no recommendation should be followed independent of the others.

Any proposed changes to the structures and site features or their locations should be brought to Langan's attention as soon as possible so we can determine whether such changes affect our geotechnical conclusions and recommendations. Information on subsurface strata and groundwater levels shown on the logs represent conditions encountered only at the locations indicated and at the time of our exploration. If different conditions are encountered during construction, they should immediately be brought to Langan's attention for evaluation because they may affect our recommendations.

This report has been prepared to assist the owner, architect, structural engineer, and site civil engineer in the design process and is only applicable to the design of the specific project identified. Our firm prepared this report for the exclusive use of our client and their representatives on this project in accordance with the generally accepted geotechnical engineering practice as it exists in the site area at the time of our investigation. No warranty is expressed or implied. The information in this report cannot be used or depended on by engineers or contractors involved in evaluations or designs of facilities (including underpinning, grouting, stabilization, etc.) on adjacent properties beyond the limits of that which is the specific subject of this report. This report shall not be used for the design of temporary works including scaffolding, construction hoists, and crane pads.

CLOSING

We have appreciated being of service on this project and look forward to working with you to successfully complete this project.

Sincerely,
Langan CT, Inc.

Taylor Dalling, P.E.
Senior Project Engineer

Alfred Jones, P.E.

Location:	Trumbull, CT			Project No:	GTX-321494
Boring ID:	LB-07	Sample Type:	Jar	Tested By:	ajl
Sample ID:	S-1	Test Date:	07/30/25	Checked By:	ank
Depth :	5-7'	Test Id:	826202		
Test Comment:	---				
Visual Description:	Moist, brown silty sand with organics				
Sample Comment:	---				

Particle Size Analysis - ASTM D6913

% Cobble	% Gravel	% Sand	% Silt & Clay Size
—	9.3	61.9	28.8

Sieve Name	Sieve Size, mm	Percent Finer	Spec. Percent	Complies
0.75 in	19.00	100		
0.5 in	12.50	96		
0.375 in	9.50	95		
#4	4.75	91		
#10	2.00	85		
#20	0.85	76		
#40	0.42	63		
#60	0.25	51		
#100	0.15	39		
#140	0.11	33		
#200	0.075	29		

Coefficients

D_{85} = 1.9737 mm D_{30} = 0.0825 mm

D_{60} = 0.3695 mm D_{15} = N/A

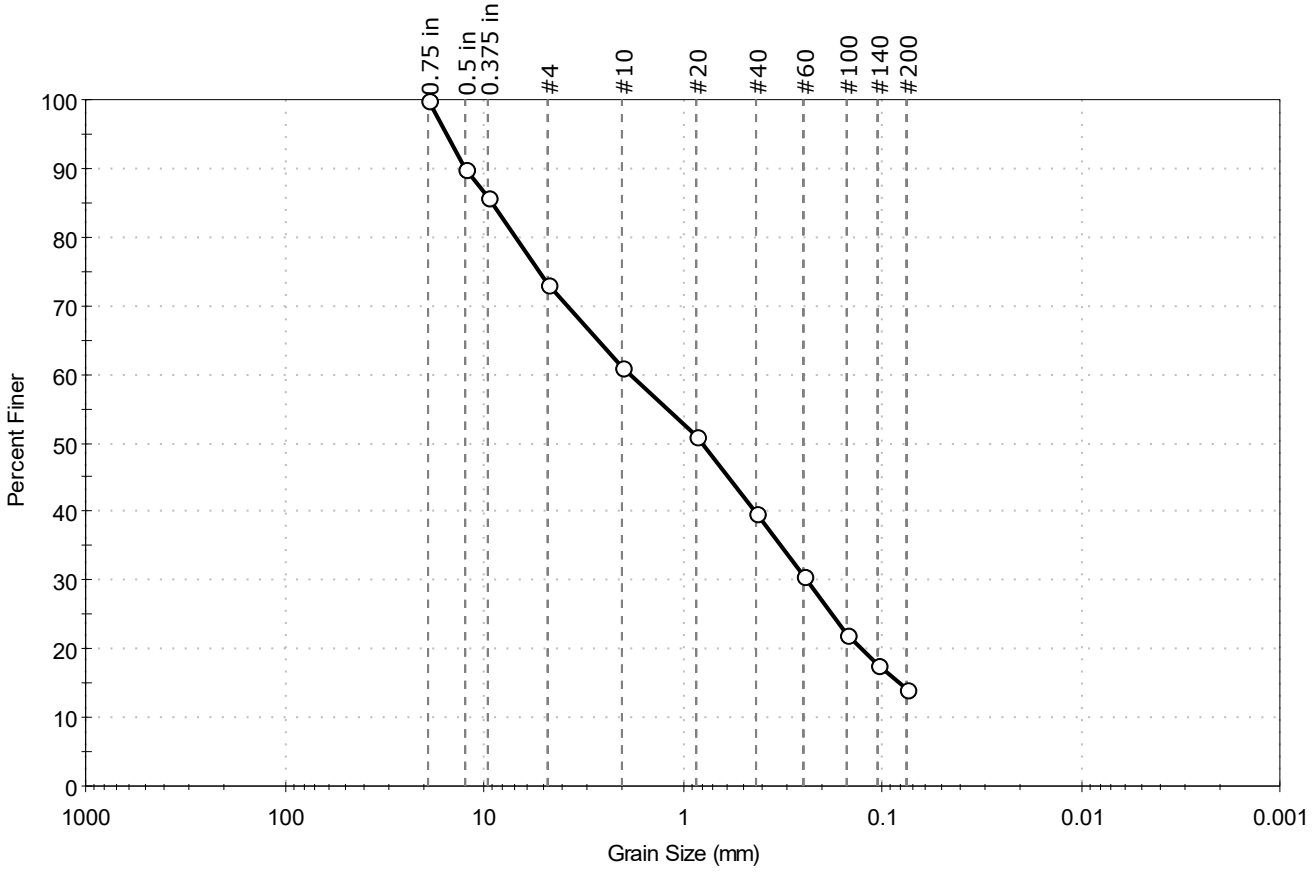
D_{50} = 0.2353 mm D_{10} = N/A

C_u = N/A C_c = N/A

Classification

ASTM N/A

AASHTO Silty Gravel and Sand (A-2-4 (0))



Sample/Test Description

Sand/Gravel Particle Shape : ANGULAR

Sand/Gravel Hardness : HARD

Client:	Langan Engineering				
Project:	Trumbull MS-TSKP				
Location:	Trumbull, CT			Project No:	GTX-321494
Boring ID:	LB-08	Sample Type:	Jar	Tested By:	ajl
Sample ID:	S-1	Test Date:	07/30/25	Checked By:	ank
Depth :	5-7'	Test Id:	826203		
Test Comment:	---				
Visual Description:	Moist, brown silty sand with gravel				
Sample Comment:	---				

Particle Size Analysis - ASTM D6913

% Cobble	% Gravel	% Sand	% Silt & Clay Size
—	27.0	58.7	14.3

Sieve Name	Sieve Size, mm	Percent Finer	Spec. Percent	Complies
0.75 in	19.00	100		
0.5 in	12.50	90		
0.375 in	9.50	86		
#4	4.75	73

ALTERNATES

PHASE 2:

Alternate #2.1: Add PV array, racks, and equipment on roof depicted on PV-0.01 Array 1

Alternate #2.2: Add PV array, racks, and equipment on roof depicted on PV-0.01 Array 1 and Array 2

Alternate #2.3: Delete Folding partition at B041, replace with corridor partition with GFCMU

Alternate #2.4: Delete horizontal and vertical solar shading devices on Curtain Wall and Storefront assemblies

Alternate #2.5: Delete exterior steel bus canopies, foundations, and cladding depicted on A4.28.

Alternate #2.6: Delete irrigation system
