G. Assemble and install piping without undue strain and stress and with provision for expansion, contraction and structural settlement. Do not cut or notch structural members unless adequate provision is made with the approval of the A/E. Anchors shall be approved by the A/E before they are used.

3.2 PIPE HANGERS AND SUPPORTS

A. Provide a hanger within one (1) foot or less of each horizontal elbow and valves that are above three (3) inches in size. If spacing between horizontal elbows (or plugged tees used as elbows) is less than six (6) feet, provide only one (1) hanger located between the elbows.

B. For fire protection piping, space according to NFPA 13.

C. Pipe Hanger Loading
1. Total hanger rod load (including piping, insulation, and fluid) not exceeding following limits:

Nominal Rod Diameter	Maximum Load
3/8 inch	610 lb.
1/2 inch	1,130 lb.
5/8 inch	1,810 lb.
3/4 inch	2,710 lb.

2. Do not exceed manufacturer's recommended maximum safe load if smaller than above.

D. Trapeze Hangers
1. Suspend trapeze hangers from concrete inserts of approved structural clips.
2. Construct trapeze hangers of galvanized angle iron, channels or other structural shapes with flat surfaces for point of support.

E. Vertical Pipe Supports
1. Support all vertical pipe runs in pipe chases at base of riser.
2. Support pipes for lateral movement with clamps or brackets.

F. Concrete Inserts
1. Provide individual or continuous slot concrete inserts for use with hangers for piping and equipment exposed in finished areas, and as required.
2. Provide concrete inserts in time for installation in concrete.

3.3 ANCHORS

A. All connections to the structure shall be sized according to actual applied load plus any seismic vertical component increase.

B. Pipe Anchors
   1. Provide as indicated and required to permit complete installation of system.
   2. Do not anchor piping to plaster or gypsum wallboard partition walls.
   3. Provide anchoring devices at the locations indicated.
   4. Do not use powder driven fasteners, expansion nails, or friction spring clamps.

3.4 SLEEVES

A. Coordinate location of any opening in structural systems with A/E and other trade contractors.

B. Maintain rating of fire- and smoke-rated construction.

C. Set sleeves plumb or level, in proper position, tightly fitted into the work.

D. Set all sleeves with ends flush with finished wall and ceiling surfaces.

E. Seal around all pipes and use firestopping for all fire protection penetrations through floor slabs, fire rated walls and partitions, and at each floor level in vertical utility service shafts.
   1. Install firestopping as described in manufacturer's installation instructions.

F. Seal around all sleeves.

G. Fill openings made by others for piping penetrations, with same construction as work opening is in, or construction of equivalent fire or smoke rating.

H. Firestopping shall be provided under the applicable firestopping specification section, coordinated by this Contractor.

3.5 MISCELLANEOUS STEEL

A. Piping Contractor (or Fire Protection Contractor, as applicable) to provide all miscellaneous steel as required to accommodate pipe supports and hangers.

B. Provide Shop Drawings detailing miscellaneous steel layout and connection to structural members. Indicate all point loads where miscellaneous steel is supported by structural members.

C. All miscellaneous steel to be galvanized steel. Repair galvanized steel at field cuts and connections.

3.6 SEISMIC RESTRAINTS

A. Provide seismic restraints per NFPA 13.

B. Do not mix seismic bracing designs within a new system design.

C. Seismic force applications shall be engineered by the contractor and submitted for approval prior to installation.

D. Provide hanger rod stiffeners, braces, and seismic attachments as required by NFPA 13 and by the submitted engineered seismic bracing design.

END OF SECTION

SECTION 211313 - FIRE PROTECTION SYSTEMS – WET-PIPE

PART 1 - GENERAL

1.1 RELATED SECTIONS

A. The Contractor's attention is directed to the General and Special Conditions, COMMON REQUIREMENTS FOR FIRE PROTECTION and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. Each Contractor's attention is also directed to Specification Section HANGERS AND SUPPORTS FOR FIRE PROTECTION PIPING AND EQUIPMENT .

C. All applicable requirements of other portions of the Contract Documents apply to the work of this Section including, but not limited to, Division 01 General Requirements.

D. Refer to Specification Section 019113 General Commissioning Requirements.

1.2 DESCRIPTION OF WORK

A. Work under this Section shall include furnishing and installing a complete wet-pipe automatic sprinkler system, including sprinkler piping, fittings, valves, alarm devices furnished with the sprinkler system, supervisory devices, inspectors' test assemblies, drains, sprinkler heads, escutcheons, sleeves, hangers, seismic bracing, and all accessories required for a complete and code-compliant installation.

B. Coordinate all fire alarm interface devices and wiring requirements with Division 26 and Division 28.

C. Fire protection systems include:
1. Wet-Pipe Sprinkler Piping and Fittings
2. Heads and Accessories
3. Valves, Alarms, Flow Switches, Drains
4. Fire Department Connection
5. Backflow Preventer
6. Standpipes
7. Seismic Bracing and Hangers
8. Sleeves, Escutcheons, Identification

1.3 QUALITY ASSURANCE

A. Design Criteria

1. Provide a complete fire protection system as indicated and as required by local authorities.
2. Where there is conflict between local authority requirements or other agencies' standard requirements and these Drawings and specifications, requirements of local authorities or other agencies shall govern.
3. Design and install the entire system in accordance with indicated codes, standards and regulations.
4. Contractor shall hydraulically calculate the sprinkler system in accordance with NFPA 13 for the hazard classification indicated or required by the AHJ. Hydraulic calculations shall be based on a current certified flow test and shall include a safety margin of 5 psi or 10 percent of system demand, whichever is greater.
5. Do not downsize piping indicated to serve future areas.
6. Drawings are diagrammatic only to indicate rooms/areas of sprinkler protection and piping clearances when appropriate.
7. Submit coordinated shop drawings and hydraulic calculations to the AHJ and all required reviewing agencies for approval. Obtain all required approvals prior to fabrication and installation.
8. Coordinate head locations with ceiling layouts.
9. Provide a supervised floor control valve assembly at each floor unless otherwise indicated or prohibited by system configuration/authority having jurisdiction.
10. Each assembly shall include control valve, tamper switch, waterflow switch, test and drain assembly, pressure gauges, inspector's test connection, sight glass, and drain piping as required for a complete installation.
11. Limit the velocity of the water in the sprinkler system piping to 20 feet per second.
12. Coordinate sprinkler system layout with structure, ceilings, lighting, ductwork, and other trades to avoid conflicts and maintain code-required coverage and clearances.

B. Water Supply Requirements
1. Fire flow to meet local fire department and State of Connecticut requirements.
2. Fire protection contractor shall arrange and pay for a certified fire hydrant flow test performed near the point of service connection, unless a current test acceptable to the AHJ and Engineer is provided by others. Submit copies of the certified test report to the Engineer, Owner, and authorities having jurisdiction as required.
3. Hazard Class: Refer to Contract Drawings for sprinkler protection requirements and hazard classification.
4. Indicate classification of all sprinkled spaces on shop drawings.

C. Codes and Standards
1. NFPA 13, Sprinkler Systems.
2. NFPA 14, Standard for the Installation of Standpipe and Hose Systems.
3. NFPA 24, Installation of Private Fire Service Mains and Their Appurtenances.
4. NFPA 25, Standard for the Inspection, Testing, and Maintenance of Water-Based Fire Protection Systems
5. NFPA 72, National Fire Alarm and Signaling Code
6. Connecticut State Fire Code and applicable adopted codes and amendments.

D. Authorities Having Jurisdiction
1. Connecticut State Inspection Agency (Building Code Dept.).
2. Trumbull Inspection Agency (Building Code Dept.).

3. State Fire Marshal's requirements.
4. Local Fire Marshal's requirements.
5. Connecticut State Insurance Services Office requirements.
6. Owner's insurance company or loss prevention division.

E. Installer's Qualifications
1. The systems are to be designed and installed by a Connecticut State-certified firm regularly engaged in the design and installation of automatic fire protection systems in accordance with the requirements of the National Fire Protection Association and the State of Connecticut, and by the authorized Insurance and Reviewing Agents of the Owner. Evidence to support the above requirements is to be provided, and any proposed installer who cannot show suitable experience will be rejected.
2. The term qualified means experienced in such work (experienced shall mean having a minimum of 5 previous projects similar in size and scope to this Project), familiar with all precautions required, and has complied with all the requirements of the authority having jurisdiction. Upon request, submit evidence of such qualifications to the A/E and Owner.

1.4 JOB CONDITIONS

A. Arrange and pay for all permits, fees and inspections required.

B. Fire sprinkler contractor shall furnish all sprinkler-system-mounted supervisory and alarm devices, including waterflow switches, tamper switches, and related components required for a complete and code-compliant system. Coordinate electrical requirements, wiring responsibilities, and interface with the fire alarm system with the Electrical Contractor and fire alarm contractor. Electrical Contractor shall provide conduit, wire, and final electrical connections unless otherwise indicated.

C. Coordinate the exact location of this work with the work of other trades prior to fabrication and installation. Verify all dimensions and elevations. Provide additional offsets and section of piping as required to meet job conditions. Coordinate with and review all related Drawings of all trades prior to start of work.

1.5 WARRANTY

A. Provide manufacturer’s standard warranty and contractor’s warranty in accordance with Division 01 requirements.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver materials in original packaging with labels intact. Store in a clean, dry, protected location.

B. Protect piping, fittings, sprinkler heads, valves, and accessories from dirt, moisture, corrosion, and physical damage. Reject and replace any damaged or deteriorated materials at not additional cost to the Owner.

C. Keep piping capped or plugged during storage and installation to prevent contamination.

D. Handle sprinkler heads carefully. Do not install heads that are dropped, damaged, painted, or contaminated. Keep protective covers in place until installation.

E. Protect valves and devices from debris and damage. Keep openings capped until installation.

F. Protect installed work from damage during construction. Replace damaged components at no additional cost to the Owner.

G. At completion, remove temporary protections, clean all components, and leave systems ready for testing and operation.

H. Do not install any materials that have been exposed to conditions that could impair performance, including corrosion, contamination, or physical damage.

PART 2 - PRODUCTS

2.1 PIPE, FITTINGS, AND HANGERS

A. Fire Sprinkler Piping Above Ground
   1. Black steel, Schedule 40 (1 inch thru 2 inches) and Schedule 10 (2-1/2 inches thru 8 inches), with threaded or mechanical joints, ductile iron couplings, and ductile iron grooved fittings. Schedule 10 piping shall be permitted only where compliant with NFPA 13 and used with listed grooved mechanical systems.
   2. Threaded Fittings: Malleable iron.
   3. Mechanical Joint Fittings: Black steel pipe with rolled-grooved ends by Victaulic, Grinnell or approved equal.
   4. Grooved mechanical couplings shall consist of two ASTM A536 ductile iron housings, pressure-responsive, synthetic rubber gasket, and plated steel bolts and nuts.
   5. Rigid Type: Housings shall be cast with offsetting, angle-pattern bolt pads to provide system rigidity and support and hanging in accordance with NFPA 13.
      a. 1-1/4-inch through 8-inch: “Installation Ready” stab-on-design, for direct “stab” installation onto grooved end pipe without prior field disassembly and no loose parts. Victaulic FireLock EZ Style 009H (1-1/4 inch to 4 inch) or approved equal and Victaulic Style 107H QuickVic (2 inch to 8 inch) or approved equal.
      b. 10-inch and larger: Victaulic Style 07 Zero-Flex® standard rigid coupling.
   6. Flexible Type: Provide where required for seismic applications in accordance with NFPA 13 and applicable IBC/ASCE standards.
      a. 2 inch through 8 inch: “Installation Ready” stab-on design, for direct “stab” installation onto grooved end pipe without prior field disassembly and no loose parts. Victaulic Style 177 QuickVic or approved equal.
      b. 10 inch and larger: Victaulic Style 75 or 77 standard flexible couplings or approved equal.
   7. Provide corrosion-resistant coatings or materials where piping is exposed to moisture, exterior conditions, or corrosive environments.

B. Fire Sprinkler Piping Below Ground: Ductile cast iron, lined and coated, with mechanical joint fittings.

C. Pipe Hangers
1. All purpose type, UL-listed and FM-approved.
2. Comply with Division 21 Section “Hangers and Supports for Fire Suppression Piping and Equipment”.
3. Space in accordance with requirements of NFPA 13.
4. Hangers, hanger rods, inserts and clamps constructed as approved by NFPA 13.

2.2 VALVES AND HOSE CONNECTIONS

A. Valves and Hose Connections - General
1. UL approved and/or FM global listed.
2. Minimum 175 psi class.
3. Outlet/inlet threads to fit local fire department standards.
4. Finish (including accessories, caps and wall plates)
   a. Rough brass.
   b. Polished brass.
   c. Rough chrome.
   d. Polished chrome plate.

B. Gate Valves
1. 2 inch and Smaller: 175 lb. UL-FM bronze, non-shock, solid wedge, OS&Y gate valve. Replaceable bronze wedge facing rings. Valve to be capable of being repacked under pressure with valve wide open. Screwed ends.
2. 2-1/2 inch and Larger: 175 lb. UL-FM iron body non-shock, solid wedge, OS&Y gate valve. Replaceable wedge facing rings and yoke bonnet. Valve to be capable of being repacked under pressure with valve wide open. Flanged ends.
3. 2-1/2 inch and Larger: 250 psi CWP, UL-FM, ductile iron body, resilient wedge, bronze mounted, OS&Y gate valve with EPDM-coated cast iron disc, grooved ends. Victaulic Series 771.
4. Provide either flanged or grooved end valves compatible with piping system.

C. Butterfly Valves
1. 2 inch and Larger: 175 lb. UL-FM cast or ductile iron body butterfly, O-ring seat, alum-bronze or nickel-plated ductile iron disc, stainless steel stem, Buna-N seal, flanged.
2. 2 inch and Larger: 365 psi CWP, UL-FM ductile iron body, nickel-plated ductile iron disc, nitrile seat, stainless steel stem, weather-proof actuator housings with 2 prewired supervisory switches supervised in the open position. Victaulic Series 765 or 705.
3. Provide integral supervisory (tamper) switches for all control valves.

D. Check Valves
1. 2-1/2 inch and Larger: 250 lb**.** UL-FM iron body check, Buna-N seat, spring-actuated, wafer-style, or grooved-end body.
2. 2 inch and Larger: Up to 365 psi CWP, UL-FM ductile iron body, spring-actuated, stainless steel or EPDM-coated ductile iron disc, nickel-plated or welded-in nickel seat, grooved ends. Victaulic Series 717 or approved equal.

3. Provide check valves compatible with piping system (wafer, flanged, or grooved).

E. Post Indicator Valve
1. 2-1/2 inch and Larger: 175 lb. UL-FM iron-body gate, solid wedge disc, non-rise stem, indicator post flange.
2. 2-1/2 inch and Larger: 250 psi CWP, UL-FM ductile iron body, EPDM-coated cast iron disc, bronze mounted, resilient wedge, brass non-rising stem, grooved ends. Victaulic Series 772.

F. Indicator Post: 2-piece indicator post for non-rising stem gate valve, target plate OPEN and SHUT, vertical type, cast iron body with operating wrench, extension rod, and adjustable cast iron barrel of length required for depth of burial of valve.

G. Outside Clapper Type Fire Department Connections
1. Finish: Polished brass.
2. Lettering: Auto Sprinkler (SPKR), Combination Auto Sprinkler and Standpipe, Fire Department Connection as appropriate.
3. Flush wall connections.
   a. Drop clappers, cast brass body, plugs and chain, lettering.
4. Exposed Wall Connections
   a. Drop clappers, body, escutcheon plate with lettering, caps and chain.
5. Free-standing Connections
   a. Brass sleeve, brass base plate with lettering, caps and chain.
6. Swing Check Valve
   a. Install on inlet of fire department connection.
   b. 4-inch forged body with spring loaded brass check, body taped 1/2-inch NPT at inlet for ball drip.
   c. Potter-Roemer 4500 Series.
7. Coordinate inlet size, thread type, Storz configuration, and signage with local fire department requirements.

H. Automatic Ball Drip Valve
1. Straight or angle cast brass ball drip, 1/2-inch.
2. Mount on siamese side of check valves and fire pump test header OS&Y valve.
3. Potter-Roemer 5981 or 5983.
4. Provide where required by NFPA 13 and local authority.

I. Alarm Check Valve
1. 300 lb. UL-FM ductile iron body, aluminum bronze clapper, EPDM O-ring seal, tapped bosses for and with water pressure gages, alarm test valve, main drain valve, alarm retarding chamber.
2. Include angle valves, globe valves, alarm line strainer, orifice restriction, pipe nipples and fittings.
3. Victaulic FireLock® Series 751.

J. Alarm Test Device
1. Single device or unit that provides visual verification of waterflow (as required by NFPA 13) in a fire sprinkler system and allows for draining of a floor section.
2. UL-listed and FM-approved.

3. Contains sight glass, inspector test valve, auxiliary drain valve and test orifice.
4. Optional replacement for conventional alarm test loop.
5. Victaulic "TestMaster".

K. Backflow Preventers
1. General
   a. UL and FM approved.
   b. size as indicated on the Drawings.
2. Double Check Detector Assembly
   a. Epoxy coated ductile iron valve bodies (2 gates), stainless steel valve body and internal parts (2 checks), replaceable bronze seats, stainless steel internal parts.
   b. 175 psi; UL/FM resilient seated OS&Y gates, spring check valves.
   c. Provide displacement type meter with cubic feet per minute register.
   d. 6 psi maximum pressure loss through middle one-third of flow range.
   e. Watts Series 774DCDAOSYCFM.
3. Coordinate type and installation requirements with local water authority and AHJ.

L. Provide identification tags for all valves in accordance with Division 21 identification requirements.

2.3 ALARM AND SIGNAL DEVICES

A. Devices specified in this section are furnished under Division 21 and shall be coordinated with Division 26 and Division 28 for power, wiring, and system integration.

B. Waterflow Detector
1. Vane type flow switch with retard mechanism or manual adjustment to prevent false alarm.
2. 175 psi rated.
3. 115 VAC rated for pilot duty only.
4. Suitable for a minimum working pressure of 175 psi.
5. Provide with contacts for remote signal wiring.
6. Potter VSR-F.
7. Provide separate contacts for alarm bell and fire alarm systems.

C. Alarm Bell
1. Audible horn alarm signal; electrically operated.
2. UL listed, 115 VAC.
3. For use with waterflow detector systems.
4. 10 inch bell.
5. Potter PBA-AC.

D. Valve Tamper Switch
1. 115 VAC/ 30 VDC.
2. Switches for Butterfly Valves: Approved type.
3. Two sets of SPDT contacts.
4. Potter OSYSU-A2, Simplex 2097-9031 or Notifier NGV (OS&Y valve), Potter PIVSU-A2 or Notifier NIP (post indicator valve) supervisory switch.

E. Pressure Gages
1. Weiss Model 3 PGA-1 3-1/2-inch dial glass face, black aluminum case, 1% accuracy, bronze tube, brass socket, range 0 to 250 psig. Provide a 1/4-inch gauge cock.
2. Optional Manufacturers: Ashcroft, Trerice, Marshalltown, or Jay.

2.4 SPRINKLER HEADS

A. Sprinkler Heads – General
1. Provide head types required for service indicated.
2. Standard 165 deg F rating except when application requires higher rating.
3. All sprinklers to be UL and/or FM listed as required for Project.
4. Metallic fusible link or glass-bulb-type.
5. Head Application
   a. Rooms without ceilings: Type 1 and type 4
   b. Finished Rooms: Type 2 ACT (lay-in ceilings)
   c. Finished Rooms: Type 3 (drywall/hard ceilings / specialty ceilings)
6. Provide sprinkler K-factor as required by hydraulic calculations and hazard classification.
7. Final head selection and layout shall comply with NFPA 13 and approved shop drawings.

B. Sprinkler Head Type 1
1. Upright or pendant design as required.
2. Standard bronze finish sprinkler.
3. Victaulic Model V27.

C. Sprinkler Head Type 2
1. Recessed design, deflector 1 to 1-1/2-inch below finished ceiling.
2. 2-piece recessed escutcheon with 1/2-inch adjustment.
3. Allow removal of escutcheon and ceiling tile without disturbing head and drop assembly.
4. Chrome finish, escutcheon and sprinkler.
5. Victaulic Model V27.

D. Sprinkler Head Type 3
1. Adjustable flush concealed, quick response.
2. White ceiling plate flush with finished ceiling.
3. 1/2-inch housing adjustment.
4. Chrome finish sprinkler.

E. Sprinkler Head Type 4
1. Horizontal sidewall design.
2. Satin chrome finish sprinkler and escutcheon.
3. Victaulic Model V36.

F. Tools: Furnish one emergency rubber ball shut-off on long handle to be used for temporary closing of sprinkler head after fire has been extinguished.

G. Sprinkler Cabinet: Provide spare heads of each type and sprinkler wrench for each type in quantity required by NFPA 13.
1. Provide cabinet in an accessible location approved by the Owner.

H. Sprinkler Head Guards
   1. Heavy-duty welded wire.
   2. Red baked enamel finish.
   3. Reliance Model B, sprinkler guards.
   4. Provide for all heads in electrical, telephone, communication**,** and mechanical rooms gymnasiums, CTE rooms & area at the bottom of stairwells.

I. Sprinkler escutcheons and guards shall be listed, supplied, and approved for use with the sprinkler, by the sprinkler manufacturer.

J. Coordinate sprinkler head types, finishes, and escutcheons with architectural requirements.

2.5 FLEXIBLE SPRINKLER DROPS

A. In lieu of rigid pipe offsets or return bends for sprinkler drops, the Victaulic AquaFlex® stainless steel or approved equal, multiple-use sprinkler fitting system may be used to locate sprinklers as required by final finished ceiling tiles and walls only where approved by Engineer.

B. The drop system shall consist of a braided or unbraided (corrugated) type 304 stainless steel flexible tube, a zinc-plated steel 1-inch NPT male threaded nipple for connection to branch-line piping, and a zinc-plated steel reducer with a 1/2-inch or 3/4-inch NPT female thread for connection to the sprinkler head.

C. The flexible drop must be listed for a minimum of three 90-degree bends to assure proper installation. Union joints shall be provided for ease of installation.

D. The flexible drop shall attach to the ceiling grid using a one-piece open gate bracket (the bracket shall allow for sprinkler installation before or after the bracket is secured to the sprinkler grid).

E. All hoses shall be factory-pressure tested to 400 psi.

2.6 ACCEPTABLE MANUFACTURERS

A. Alarm Valves, Wet Systems, and Valves: Reliable, Grinnell/Gem, Globe Fire Equipment Co., Viking Corp., Victaulic, Or Approved Equal.

B. Fire Department Connections: Elkart, Potter-Roemer, Croker-Standard, Guardian Or Approved Equal.

C. Alarm and Signal Devices: Federal Signal Corp., Potter Electric Signal Co., Viking, Grinnell, Simplex, System Sensor, Or Approved Equal.

D. Sprinkler Heads: Globe Fire Equipment Co., Tyco, Viking Corp., Reliable, Victaulic, Or Approved Equal.

E. Flexible Sprinkler Drops: Victaulic Aquaflex®, Flexhead Industries, Viking, Or Approved Equal.

F. Backflow Preventers: Ames, Conbraco, Watts, Febco, Victaulic, Or Approved Equal.

G. Valves: Clow, Crane, DeZurik, Nibco, Mueller, Kennedy, Stockham, Victaulic, Or Approved Equal.

PART 3 - EXECUTION

3.1 GENERAL

A. Cooperate with other trades to ensure adequate space for equipment and piping placement.

B. Review plans, specifications, and shop drawings of other trades to coordinate work.

C. Install in strict accordance with approved shop drawings.

D. Install all piping, valves, and connections required for a complete and operational fire protection system.

E. Do not begin installation until all required agency approvals have been obtained and submitted to the Engineer.

3.2 INSTALLATION OF PIPING, VALVES, AND ACCESSORIES

A. Install sprinkler piping in accordance with NFPA 13, applicable codes, and approved shop drawings.
   1. Offset, crossover and otherwise route piping to install system in available space.
   2. Pitch all branch lines, cross mains, feed mains and risers to drainage points.
   3. Provide angle drain valves at all low points.
   4. Plugs permitted at offsets when approved by local authority.
   5. Coordinate pipe routing with other trades prior to fabrication or installation.

B. Provide control valve and waterflow switch assemblies at each of the following locations:
   1. Each zone takes off within sprinkler piping system.
   2. Each sprinkler branch take-off from fire hose standpipe within combination sprinkler standpipe system.
   3. Base of all sprinkler risers.

C. Provide tamper (supervisory) switches on all control and isolation valves, including OS&Y valves, butterfly valves, and post indicator valves.

D. Provide auto ball drip valves at outside fire department connections between hose connection and check and shut-off valve.

E. Flush outside fire water mains prior to connecting to inside system.

F. Install indicator posts approximately 3 ft. above grade.

G. Install pressure gauges at the top of each sprinkler riser and elsewhere as required by local authority.

H. Install piping to sprinkler heads in elevator pits.

I. Provide sprinklers beneath ductwork exceeding 4 feet in width where required by NFPA 13.

J. Coordinate routing of main drains, inspector's test connections, and discharge piping to prevent freezing and icing hazards. Provide discharge to approved locations in accordance with local code and AHJ requirements.

K. Coordinate all inspections and approvals with the local Fire Marshal, Building Official, and all authorities having jurisdiction. Obtain final approval prior to system acceptance.

3.3 SPRINKLER INSTALLATION

A. Install in accordance with approved Shop Drawings.
   1. Modifications to system design or arrangement after approval of Drawings by local authority, may only be made after receiving written approval of authority and A/E.
   2. Minor field adjustments shall not compromise code compliance, hydraulic performance, or required coverage, and shall be subject to review by the A/E.
   3. Make all revisions in accordance with NFPA 13.

B. Install approved sediment traps (dirt legs) and drain valves at low points of all piping to permit complete drainage of system without disconnection of any piping.
   1. Drain valves at base of risers to have 1-1/2 inch hose adapters matching threads of hose systems in buildings.

C. Extend 2-inch main drain(s) to the exterior of building. Extend 1-inch inspector's tests connections on ends of sprinkler branches to nearest floor drain, janitor's sink, or exterior of building.
   1. Label all valves and outlets

D. Provide chrome plated escutcheon plates at pipe penetrations of ceilings, floors, and walls.

E. Firestop penetrations in accordance with Division 07 and 21 Section "Hangers and Supports for Fire Suppression Piping and Equipment".

F. Locate heads centered in ceiling tile and in center of metal strip in linear metal ceilings, if such location makes added heads necessary, provide all added heads as required to meet code.

G. Relocate heads if necessary to coordinate with ceiling layout.

H. Install sprinkler heads to provide and maintain minimum 18-inch clear between bottom of deflector and top of storage, files, shelving and cabinets.

I. Install sprinklers at the base of hydraulic elevators.

J. Do not install sprinklers or associated piping above electrical switchgear.

3.4 ELECTRICAL WIRING

A. Fire Protection Contractor shall provide wiring diagrams and all device-specific wiring not provided under Division 26 or Division 28 necessary for a complete and operational system.

B. Electrical Contractor to provide:
   1. Supervised wiring from main waterflow indicator to outside alarm bell and fire alarm panel.
   2. Supervised wiring from sprinkler flow switches to fire alarm panel.
   3. Supervised wiring from valve tamper switches to fire alarm panel.

C. Fire Protection Contractor to be responsible for:
   1. Wiring diagrams for all devices
   2. All other wiring not specified to provide an operating system

3.5 FIELD QUALITY CONTROL

A. Upon completion of sprinkler system installation, the Contractor is to test the entire system per NFPA 13 requirements. The contractor is to notify the authority having jurisdiction and the Owner's representative of time and date system testing will be performed so that tests can be witnessed by same. Contractor shall complete the "Contractor's Material and Test Certificate" and have signed by the authority having jurisdiction, Owner's representative, and Contractor who witnessed the testing. Copies are to be made of the Certificate and distributed to the approving authority and Owner's representative.

B. Test sprinkler piping, including outside supplies, under hydrostatic pressure to 200 psi for 2 hours.
   1. Prove system tight to satisfaction of A/E.
   2. Inside piping shows no leakage.
   3. Leakage in underground piping in accordance with NFPA 24.

C. Test complete alarm system including control and signal circuits wired by Electrical Contractor.
   1. Coordinate with electrical.
   2. Complete testing prior to acceptance by Owner.
   3. Notify Commissioning Agent of any field quality control testing.

D. Give advance notice and arrange for field tests and inspections by local authority.

E. Flushing and sterilization of fire system water lines to be as required by NFPA 13.

F. Provide final system flow test data including static pressure, residual pressure, and flow rate. Conduct testing during peak demand conditions where feasible.

3.6 PAINTING

A. Refer to Division 09 Section “Interior Painting”.

3.7 PROTECTION

A. Protect installed piping, valves, and sprinkler heads from damage during construction. Replace damaged components prior to acceptance.

3.8 CLOSEOUT

A. Provide record (as-built) drawings showing actual routing of piping, valve locations, and head locations.

B. Provide Contractor’s Material and Test Certificates.

C. Provide spare sprinkler heads and wrench as specified.

D. Provide operation and maintenance manuals.

E. Provide training to Owner on system operation and inspection requirements.

END OF SECTION

SECTION 220501 - COMMON WORK RESULTS FOR PLUMBING

PART 1 – GENERAL

1.1 RELATED DOCUMENTS

1. Drawings and General Provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

2. Refer Specification Section 019113 General Commissioning Requirements.

1.2 CODES & STANDARDS (INCLUDING BUT NOT LIMITED TO THE FOLLOWING)

1. 20222 Connecticut State Building Code (CSBC) (IBC 2021 w/ amendments)

2. 2022 Connecticut State Plumbing Code Regulation (CSPC) (IPC 2021 w/ amendments)

3. Connecticut Boiler and Pressure Vessel Code

4. 2022 Connecticut State Energy Conservation Code (CSECC) (IECC 2021 w/ amendments)

5. 2022 Connecticut State Building Performance Standard (High Performance Schools)

1.3 GENERAL SCOPE OF WORK

1. The plumbing work for this project consists of scope throughout the architectural floor plans.

1.4 SYSTEMS & ENERGY MANAGEMENT MANUAL OUTLINE:

A. Cx Report (including testing records, reports, meeting minutes, and all related documentation to the Cx process, noting storage location of specific documentation).

B. Ongoing Cx report (provide blank testing forms, schedule for re-commissioning, recommendations for recalibration, ongoing instructions for energy savings, description of systems)

C. Seasonal Operating guide

D. Construction Record Documents (As-builts, TAB final report, ATC as-built, warranties, design documents)

E. Project Operations and Maintenance Manuals (as specified)

F. Manual shall be compiled in electronic format, shall be unprotected, and shall be searchable. The documents within this manual shall be easy to navigate (provided with table of contents, filed individually tabbed & bookmarked.

G. All manufacturers, suppliers, fabricators, contractors, etc. Submitting proposals to any part if for work, services, materials or equipment to be used on or applied to this project are hereby directed to familiarize themselves with all documents of Contract Documents. In case of conflict between these common work results and the general and/or special conditions, the affected Contractor shall contact the Engineer for clarification and final determination prior to the bid.

H. The work included in this Division consists of the furnishing of all labor, equipment, transportation, excavation, backfill, supplies, material, appurtenances and services necessary for the satisfactory installation of the complete and operating plumbing systems indicated or specified in the Contract Documents.

I. Any materials, labor, equipment or services not mentioned specifically herein which may be necessary to complete any part of the plumbing systems in a substantial manner, in compliance with the requirements stated, implied or intended in the Plans and/or Specifications, shall be included in the bid as part of this Contract.

J. It is not the intent of this section of the Specifications to make any Contractor, other than the General Contractor, responsible to the Owner, Architect and Engineer. All transactions such as submittal of shop drawings, claims for extra costs, requests for equipment or materials substitution, shall be routed through the General Contractor to the Architect, then to the Engineer. Also, this section of the Specifications shall not be construed as an attempt to arbitrarily assign responsibility of work, material, equipment or services to a particular trade or Contractor. Unless stated otherwise, the subdivision and assignment of work under the various sections shall be optional.

K. The Architect and Engineer do not define the scope of individual trades, subcontractors, material suppliers and vendors. Any sheet numbering system or Specification numbering system used which identifies disciplines is solely for the Architect and Engineer's convenience and is not intended to define a subcontractor's scope of work. Information regarding individual trades, subcontractors, material suppliers and vendors may be detailed, described and indicated at different locations throughout the Contract Documents. No consideration will be given to requests for change orders for failure to obtain and review the complete set of Plans and Specifications when preparing bids, prices and quotations.

L. This section of the Specifications or the arrangement of the Contract Documents shall not be construed as an attempt to arbitrarily assign responsibility for work, material, equipment or services to a particular trade contractor or sub-contractor. Unless stated otherwise, the subdivision and assignment of work under the various sections shall be the responsibility of the General Contractor holding the prime contract.

M. It is the intent of the Contract Documents to deliver to the Owner a new, complete and operational project once the work is complete. Although Plans and Specifications are complete to the extent possible, it shall be the responsibility of the Contractors involved to remove and/or relocate or re-attach any existing or new systems which interfere with new equipment or materials required for the complete installation without additional cost to the Owner.

N. In general, all work shall be accomplished without interruption of existing facilities operations. The Contractor shall advise the Owner at least forty-eight (48) hours prior to the interruption of any services. The Owners shall be advised of the exact time that interruption will occur and the length of time the interruption will last. Failure to comply with this requirement may result in complete work stoppage for the Contractors involved until a complete schedule of interruptions can be developed.

O. Whenever utilities are interrupted, either deliberately or accidentally, the Contractor shall work continuously to restore said service. The Contractor shall provide tools, materials, skilled journeymen of Contractor's own and other trades as necessary, premium time as needed and coordination with all applicable utilities, including payment of utility company charges (if any), all without requests for extra compensation to the Owner, except where otherwise provided for in the contract for the work.

P. Each Contractor shall also be governed by any unit prices and addenda insofar as they may affect part of their work or services.

1.5 DEFINITIONS AND ABBREVIATIONS:

A. Contractor - Any Contractor whether bidding, proposing or working independently or under contract with GeneralContractor, and who installs any type of Mechanical/Plumbing Work as specified in the Contract Documents or the GeneralContractor.

B. Engineer - The Consulting Mechanical-Electrical-Plumbing Engineer either consulting to the Owner, Architect, or Other, etc. In this case: CMTA, Inc., Consulting Engineers.

C. Architect - The Architect of Record for the project.

D. Contract Documents - All documents pertinent to the quality and quantity of work to be performed on this project. Includes, but not limited to: Plans, Specifications, General and Special Conditions, Addenda, Alternates, Unit Prices, Shop Drawings, Field Orders, Change Orders, Construction Contract with Owner, and other documents enumerated in the Owner/Contractor Agreement.

E. Bidder/Proposer - Any person, agency or entity submitting a proposal to any person, agency or entity for any part of the work required under this contract.

F. The Project - All of the work required under this Contract.

G. Furnish - Deliver to the site in good condition and turn over to the Contractor who is to install.

H. Provide - Furnish and install complete, tested and ready for operation.

I. Install - Receive and place in satisfactory operation.

J. Indicated - Listed in the Specifications, shown on the Plans or Addenda thereto or incorporated in the Contract Documents by reference.

K. Typical or Typ.- Where indicated repeat this work, method or means each time the same or similar condition occurs whether indicated or not.

L. ADA - Americans with Disabilities Act.

M. ANSI - American National Standards Institute.

N. ASME - American Society of Mechanical Engineers.

O. IBC - International Building Code.

P. NEC - National Electrical Code.

Q. NEMA - National Electrical Manufacturers Association.

R. NFPA - National Fire Protection Association.

S. OSHA - Office of Safety and Health Administration.

T. UL - Underwriters Laboratories.

PART 2 - INTENT AND INTERPRETATION

2.1 GENERAL INFORMATION

A. It is the intention of the Contract Documents to call for a complete and operational system, including all components, accessories, finish work, etc. as necessary for trouble free operation; tested and ready for operation. Anything that may be required, implied, or inferred by the Contract Documents shall be provided and included in the contract sum.

B. Details not usually shown or specified, but necessary for the proper installation and operation of systems, equipment, materials, etc., shall be included in the work, the same as if herein specified or indicated.

C. The Bidder/Proposer shall completely review the Contract Documents. Any interpretation as to design intent or scope shall be provided by the Engineer / Architect. Should an interpretation be required, the Bidder/Proposer shall request a clarification not less than ten (10) days prior to the submission of the proposal so that the condition may be clarified by addendum. In the event of any conflict, discrepancy, or inconsistency develops; the interpretation of the Engineer shall be final.

D. The Contractor shall give written notice of any materials or apparatus believed inadequate or unsuitable; in violation of laws, ordinances, rules or regulations of authorities having jurisdiction; and any necessary items of work omitted a minimum of ten days prior to bid. In the absence of such written notice and by the act of submitting a bid, it shall be understood that the Contractor has included the cost of all required items in the bid, and that will be responsible for the approved satisfactory functioning of the entire system without extra compensations.

PART 3 – INDEMNIFICATION

3.1 GENERAL INFORMATION

A. Refer to Project General Conditions and Supplementary Conditions and Division 01.

B. The Contractor shall hold harmless and indemnify the Engineer, employees, officers, agents and consultants from all claims, loss, damage, actions, causes of actions, expense and/or liability resulting from, brought for, or on account of any personal injury or property damage received or sustained by any person, persons, (including third parties), or any property growing out of, occurring, or attributable to any work performed under or related to this contract, resulting in whole or in part from the negligence of the Contractor, any subcontractor, any employee, agent or representative.

PART 4- PLANS AND SPECIFICATIONS:

4.1 GENERAL INFORMATION

A. The Plans are diagrammatic only and indicate the general arrangement of the systems and are to be followed. If deviations from the layouts are necessitated by field conditions, detailed layouts of the proposed departures shall be submitted to the Engineer for approval before proceeding with the work. The Plans are not intended to show every item which may be necessary to complete the systems. All Bidder/Proposers shall anticipate that additional items may be required and submit their bid accordingly.

B. The Plans and Specifications are intended to supplement each other. No Bidder/Proposer shall take advantage of conflict between them, or between parts of either. Should this condition exist, the Bidder/Proposer shall request a clarification not less than ten (10) days prior to the submission of the proposal so that the condition may be clarified by addendum. In the event that such a condition arises after work is started, the interpretation of the Engineer shall be final.

C. The Plans and Specifications shall be considered to be complementary and anything appearing in the Specifications which may not be indicated on the Plans or conversely, shall be considered as part of the contract and must be executed the same as though indicated by both.

D. Contractor shall make all of their own measurements in the field and shall be responsible for correct fitting. The work shall be coordinated with all other branches of work in such a manner as to cause a minimum of conflict or delay.

E. The Engineer shall reserve the right to make adjustments in location of piping, equipment, etc. Where such adjustments are in the interest of improving the project.

F. Should conflict, overlap or duplication of work between the various trades become evident, this shall be called to the attention of the Engineer. In such event neither trade shall assume to be relieved of the work which is specified under their branch until instructions in writing are received from the Engineer.

G. Unless dimensioned, the Plans only indicate approximate locations of equipment, piping, etc. Dimensions given in figures on the Plans shall take precedence over scaled dimensions and all dimensions, whether given in figures or scaled, shall be verified in the field to insure no conflict with other work.

H. Each Bidder/Proposer shall review all Plans in the Contract Documents to ensure that the work they intend to provide does not create a conflict with or affect the work of others in any way. Where such effect does occur, it shall be the Bidder/Proposer's responsibility to satisfactorily eliminate any such conflict or effect prior to the submission of their proposal. Each Bidder/Proposer shall in particular ensure that there is adequate space to install their equipment and materials. Failure to do so shall result in the correction of such encroachment conflict or effect of any work awarded the Bidder/Proposer and shall be accomplished fully without expense to others and that they are reasonably accessible for maintenance. Check closely all mechanical and electrical closets, chases, ceiling voids, wall voids, crawl spaces, etc., to insure adequate spaces.

I. Where on the Plans a portion of the work is drawn out and the remainder is indicated in outline, or not indicated at all, the parts drawn out shall apply to all other like portions of the work. Where ornamentation or other detail is indicated by starting only, such detail shall be continued throughout the courses or parts in which it occurs and shall also apply to all other similar parts of the work, unless otherwise indicated.

J. Details not usually shown or specified, but necessary for the proper installation and operation of systems, equipment, materials, etc., shall be included in the work, the same as if herein specified or indicated.

K. Where within the Contract Documents the word “typical” or “typ.” Is used, it shall mean that the work method or means indicated as typical shall be repeated in and each time it occurs whether indicated or not.

L. Each Contractor shall evaluate ceiling heights specified on architectural Plans. Where the location of equipment or systems may interfere with ceiling heights or maintenance and access of equipment or systems, the Contractor shall call this to the attention of the Engineer in writing prior to making the installation. Do not install equipment or systems in the affected area until the conflict is resolved. Any such changes shall be anticipated and requested sufficiently in advance so as to not cause extra work or cost incurred on the part of the Contractor or unduly delay the work.

PART 5- EXAMINATION OF SITE AND CONDITIONS:

5.1 GENERAL INFORMATION

A. Each Bidder/Proposer shall inform their self of all of the conditions under which the work is to be performed, the site of the work, the structure of the ground, above and below grade, the obstacles that may be encountered, the availability and location of necessary facilities and all relevant matters concerning the work.

B. Each Bidder/Proposer shall also fully acquaint their self with all existing conditions as to ingress and egress, distance of haul from supply points, routes for transportation of materials, facilities and services, availability of utilities, etc. A proposal shall cover all expenses or disbursements in connection with such matters and conditions. No allowance will be made for lack of knowledge concerning such conditions after bids are accepted.

PART 6- EQUIPMENT AND MATERIALS SUBSTITUTIONS OR DEVIATIONS:

6.1 GENERAL INFORMATION

A. When any Contractor requests approval of materials and/or equipment of different physical size, weight, capacity, function, color, access, it shall be understood that such substitution, if approved, will be made without additional cost to anyone other than the Contractor requesting the change regardless of changes in connections, space requirements, electrical characteristics, etc. From that indicated, electrical service, etc. In all cases where substitutions affect other trades, the Contractor requesting such substitutions shall advise all such Contractors of the change and shall compensate them for all necessary changes in their work. Any Plans, Specifications, Diagrams, etc., required to describe and coordinate such substitutions or deviations shall be professionally prepared at the responsible Contractor's expense. Review of Shop Drawings by the Engineer does not in any way absolve the Contractor of this responsibility.

B. Notwithstanding any reference in the Specifications to any article, device, product, material, fixture, form, or type of construction by name, make or catalog number, such reference shall be interpreted as establishing a standard of quality and shall not be construed as limiting competition; unless specifically indicated; any devices, products, materials, fixtures, forms, or types of construction which, in the judgment of the Engineer, are equivalent to those specified are acceptable, provided the provisions of this Part met. Requested substitutions shall be submitted to the Engineer a minimum of ten (10) days prior to Bid. If this procedure is not followed, the substitution will be rejected. If prevailing laws of cities, towns, states or countries are more stringent than these Specifications regarding such substitutions, then those laws shall prevail over these requirements.

C. Wherever any equipment and material are specified exclusively only such items shall be used unless substitution is accepted in writing by the Owner utilizing Procurement Substitution Requests or Substitution for Cause as indicated in Division 01 Specifications.

D. Each Bidder/Proposer shall furnish along with their proposal a list of specified equipment and materials which is to be provided. Where several makes are mentioned in the Specifications and the Contractor fails to state which they propose to furnish, the Engineer shall choose any of the makes mentioned without change in price. Inclusion in this list shall not ensure that the Engineer will approve shop drawings unless the equipment, materials, etc., submitted in shop drawings are satisfactorily comparable to the items specified and/or indicated.

E. Ten (10) days prior to the submission of a proposal, each Bidder/Proposer shall give written notice to the Engineer of any materials or apparatus believed inadequate or unsuitable; in violation of laws, ordinances, rules or regulations of authorities having jurisdiction; and any necessary items of work omitted. In the absence of such written notice, Bidder/Proposers signify that they have included the cost of all required items in the proposal and that the Bidder/Proposer will be responsible for the safe and satisfactory operation of the entire system.

PART 7- CODES, RULES, PERMITS, FEES, INSPECTIONS, REGULATIONS, ETC.:

7.1 GENERAL INFORMATION

A. The Contractor shall give all necessary notices, obtain and pay for all permits, government sales taxes, fees, inspections and other costs, including all utility connections, meters, meter settings, taps, tap fees, extensions, etc. In connection with their work. They shall also file all necessary Plans, prepare all documents and obtain all necessary approvals of all governmental departments and/or the appropriate municipality or utility company having jurisdiction, whether indicated or specified or not. They shall also obtain all required certificates of inspection for their work and deliver same to the Engineer before request for acceptance and final payment for the work.

B. Ignorance of Codes, Rules, Regulations, Laws, etc. shall not render the Contractor irresponsible for compliance. The Contractor shall also be versed in all Codes, Rules and Regulations pertinent to their part of the work prior to submission of a proposal.

C. The Contractor shall include in their work, without extra cost, any labor, materials, services, apparatus and Plans in order to comply with all applicable laws, ordinances, rules and regulations, whether or not indicated or specified.

D. All materials furnished and all work installed shall comply with the national fire codes of the National Fire Protection Association, with the requirements of local utility companies, or municipalities and with the requirements of all governmental agencies having jurisdiction.

E. All materials and equipment so indicated and all equipment and materials for the electrical portion of the plumbing systems shall bear the approval label of, or shall be listed by the Underwriters' Laboratories (UL), incorporated. Each packaged assembly shall be approved as a package. Approval of components of a package shall not be acceptable.

F. All plumbing work shall be accomplished in accordance with the International Plumbing Code and amendments thereto, and the National Fire Protection Association.

G. The Contractor shall furnish three (3) copies of all final inspection certificates obtained to the Engineer when work is complete. Final payment for work will be contingent upon compliance with this requirement.

H. Where minimum code requirements are exceeded in the design, the design shall govern.

I. The Contractor shall insure that their work is accomplished in accord with the OSHA standards and that they conduct their work and the work of their personnel in accord with same.

J. All work relating to the handicapped shall be in accord with regulations currently enforced by the Authority Having Jurisdiction.

K. Discharge of any toxic, odorous or otherwise noxious materials into the atmosphere or any system shall be subject to regulations of the Environmental Protection Agency (EPA) and/or the air pollution control commission. If in doubt, contact the Connecticut state department for environmental protection.

L. Where conflict arises between any code and the Plans and/or Specifications, the code shall apply except in the instance where the Plans and Specifications exceed the requirements of the code. Any changes required as a result of these conflicts shall be brought to the attention of the Engineer at least ten (10) days prior to bid date, otherwise the Contractor shall make the required changes at their own expense. The provisions of the codes constitute minimum standards for wiring methods, materials, equipment and construction and compliance therewith will be required for all electrical work, except where the Plans and Specifications require better materials, equipment, and construction than these minimum standards, in which case the Plans and Specifications shall be the minimum standards.

PART 8- QUALIFICATIONS OF CONTRACTOR/WORKERS:

8.1 GENERAL INFORMATION

A. All plumbing work shall be accomplished by qualified workers competent in the area of work for which they are responsible. Untrained and incompetent workers, as evidenced by their workmanship, shall be summarily relieved of their responsibilities in areas of incompetency. The Engineer shall reserve the right to determine the quality of workmanship of any workers and unqualified or incompetent workers shall refrain from work in areas not deemed satisfactory. Requests for relief of a workers shall be made through the normal channels of Architect, Contractor, etc.

B. The installation of all plumbing by any Contractor shall be performed by a licensed Contractor with journeymen or master tradesmen as defined under Connecticut state regulations and code.

C. All insulation and pipe fitting work shall be installed by workers normally engaged in this type work.

D. All automatic control systems shall be installed by workers normally engaged or employed in this type work.

E. All electrical work shall be accomplished by licensed Contractors with journeymen or master electrician as defined under Connecticut state regulations and code. All applicable codes, utility company regulations, laws and permitting authority of the locality shall be fully complied with by the Contractor.

PART 9- SUPERVISION OF WORK:

9.1 GENERAL INFORMATION

A. The Contractor shall personally supervise the work for which they are responsible or have a competent superintendent, approved by the Engineer, on the work at all times during progress with full authority to act on behalf of the Contractor.

PART 10- CONDUCT OF WORKERS:

10.1 GENERAL INFORMATION

A. The Contractor shall be responsible for the conduct of all workers under their supervision. Misconduct on the part of any worker to the extent of creating a safety hazard, or endangering the lives and property of others, shall result in the prompt relief of that worker.

The consumption of alcoholic beverages or other intoxicants, narcotics, barbiturates, hallucinogens or dehabilitating drugs on the job site is strictly forbidden.

PART 11- COOPERATION AND COORDINATION WITH OTHER TRADES:

11.1 GENERAL INFORMATION

A. The Contractor shall give full cooperation to all other trades and shall furnish in writing with copies to the Engineer, any information necessary to permit the work of other trades to be installed satisfactorily and with the least possible interference or delay.

B. Where any work is to be installed in close proximity to, or will interfere with work of other trades, each shall cooperate in working out space conditions to make a satisfactory adjustment. If so directed by the Engineer, the Contractor shall prepare composite working drawings and sections at a suitable scale not less than ¼" = 1'-0", clearly indicating how their work is to be installed in relation to the work of other trades, or so as not to cause any interference with work of other trades. Make the necessary changes in the work to correct the condition without extra charge.

C. The Contractor shall furnish to other trades, as required, all necessary templates, patterns, setting plans, and shop details for the proper installation of work and for the purpose of coordinating adjacent work.

PART 12- GUARANTEES AND WARRANTIES:

12.1 GENERAL INFORMATION

A. The Contractor shall guarantee all equipment, apparatus, materials, performance, and workmanship entering into their contract to the best of its respective kind and shall replace all parts at their own expense, which are proven defective for a minimum of one year in addition to the time frames outlined in the General Conditions of the contract. The effective date of completion of the work shall be the date of the Engineer's statement of substantial completion. Items of equipment which have longer guarantees, as called for in these Specifications, shall have warranties and guarantees completed in order, and shall be in effect at the time of final acceptance of the work by the Engineer. The Contractor shall present the Engineer with such warranties and guarantees at the time of final acceptance of the work. The Engineer shall then submit these warranties, etc. To the Owner. The Owner reserves the right to use equipment installed by the Contractor prior to date of final acceptance. Such use of equipment shall not invalidate the guarantee except that the Owner shall be liable for any damage to equipment during this period, due to negligence of their operator or other employees. Refer to other sections for any special or extra warranty requirements.

B. Provide all warranty certificates to Owner. All warranties begin starting at the substantial completion date, submit warranty certificates accordingly.

PART 13- CHANGES IN MECHANICAL WORK:

A. REFER TO GENERAL AND SPECIAL CONDITIONS.

PART 14 - CLAIMS FOR EXTRA COST:

A. REFER TO GENERAL AND SPECIAL CONDITIONS.

PART 15 - MATERIALS AND WORKMANSHIP:

15.1 GENERAL INFORMATION

A. All equipment, materials and articles incorporated in the work shall be new and of comparable quality to that specified. Each Bidder/Proposer shall determine that the materials and/or equipment they propose to furnish can be brought into the building(s) and installed within the space available. In certain cases, it may be necessary to remove and replace walls, floors and/or ceilings and this work shall be the responsibility of the Contractor. All equipment shall be installed so that all parts are readily accessible for inspection, maintenance, replacement of filters, etc. Extra compensation will not be allowed for relocation of equipment for accessibility or for dismantling equipment to obtain entrance into the building(s). Insure, through coordination that no other Contractor seals off access to space required for equipment materials, etc.

B. Materials and equipment, where applicable, shall bear Underwriters' Laboratories label where such a standard has been established.

C. Use extreme care in the selection of equipment and its installation to ensure that noise and vibration are kept at a minimum. The Engineer's determination shall be final and corrections to such discrepancies shall be made at the cost of the Contractor.

D. Each length of pipe, fitting, trap, fixture and device used in the plumbing or drainage systems shall be stamped or indelibly marked with the weight or quality thereof and with the manufacturer's mark or name.

E. All equipment shall bear the manufacturer's name and address. All electrically operated equipment shall bear a data plate indicating required horsepower, voltage, phase and ampacity. Pumps shall have a data plate indicating horsepower, static pressure head and flow rate.

PART 16- HAZARDOUS MATERIALS:

16.1 GENERAL INFORMATION

A. The Contractor is hereby advised that it is possible that asbestos and/or other hazardous materials are or were present in this building or site.

B. Any worker, occupant, visitor, inspector, etc., who encounters any material of whose content they are not certain shall promptly report the existence and location of that material to the Contractor and/or Owner.

The Contractor shall, as a part of their work, ensure that their workers are aware of this potential and what they are to do in the event of suspicion. The Contractor shall also keep uninformed persons from the premises during construction. Furthermore, the Contractor shall insure that no one comes near to or in contact with any such material or fumes therefrom until its content can be ascertained to be non-hazardous.

C. CMTA, Inc., Consulting Engineers, have no expertise in the determination of the presence of hazardous materials. Therefore, no attempt has been made by them to identify the existence or location of any such material. Furthermore, CMTA nor any affiliate thereof will neither offer nor make any recommendations relative to the removal, handling or disposal of such material.

D. If the work interfaces, connects or relates in any way with or to existing components which contain or bear any hazardous material, asbestos being one, then, it shall be the Contractor's sole responsibility to contact the Owner and so advise them immediately.

E. The Contractor by execution of the contract for any work and/or by the accomplishment of any work thereby agrees to bring no claim relative to hazardous materials for negligence, breach of contract, indemnity, or any other such item against CMTA, its principals, employees, agents or consultants. Also, the Contractor further agrees to defend, indemnify and hold CMTA, its principals, employees, agents and consultants, harmless from any such related claims which may be brought by any subcontractors, suppliers or any other third parties.

F. No asbestos or mercury containing materials shall be installed in this project.

PART 18 - COORDINATION DRAWINGS:

A. Reference Specification Section 01 31 00.

PART 19 - SURVEY, MEASUREMENTS AND GRADE:

19.1 GENERAL INFORMATION

A. The Contractor shall lay out their work and be responsible for all necessary lines, levels, elevations and measurements. The Contractor must verify the figures shown on the Plans before laying out the work and will be held responsible for any error resulting from failure to do so.

B. The Contractor shall base all measurements, both horizontal and vertical from established bench marks. All work shall agree with these established lines and levels. Verify all measurements at the site and check the correctness of same as related to the work.

C. Should the Contractor discover any discrepancy between actual measurements and those indicated which prevents following good practice or the intent of the Contract Documents, the Contractor shall promptly notify the Engineer and shall not proceed with this work until the Contractor has received instructions from the Engineer on the disposition of the work.

PART 20- PROTECTION OF EQUIPMENT:

20.1 GENERAL INFORMATION

A. The Contractor shall be entirely responsible for all material and equipment they furnish in connection with their work and special care shall be taken to properly protect all parts thereof from damage during the construction period. Such protection shall be by a means acceptable to the Engineer. All piping, etc., shall be properly plugged or capped during construction in a manner approved by the Engineer. Equipment damaged stolen or vandalized while stored on site, either before or after installation, shall be repaired or replaced by the Contractor at their expense.

PART 21- REQUIRED CLEARANCES FOR ELECTRICAL EQUIPMENT:

21.1 GENERAL INFORMATION

A. The NEC has specific required clearances above, in front, and around electrical gear, panels etc. The Contractor shall not install any piping in the required clearance. If any appurtenance is located in the NEC required clearance, it shall be relocated at no additional cost.

PART 22 - EQUIPMENT SUPPORT:

22.1 GENERAL INFORMATION

A. Do not support piping from existing plaster ceilings and/or supports. Each piece of equipment, apparatus, piping, or conduit mounted above the floor level shall be provided with suitable structural support, pipe stand, platform or carrier in accordance with the best recognized practice. Such supporting or mounting means shall be provided by the Contractor for all equipment and piping. Exercise extreme care that structural members of building are not overloaded by such equipment. Provide any required additional bracing, cross members, angles, support, etc.

PART 23- PIPE MOUNTING HEIGHTS:

23.1 GENERAL INFORMATION

A. All exposed or concealed piping, etc., shall be held as high as possible unless otherwise noted and coordinated with all other trades. Exposed piping shall, insofar as possible, run perpendicular or parallel to the building structure.

PART 24- BROKEN LINES AND PROTECTION AGAINST FREEZING:

24.1 GENERAL INFORMATION

A. No conduits, piping, troughs, etc. Carrying water or any other fluid subject to freezing shall be installed in any part of the building where danger of freezing may exist without adequate protection being given by the Contractor whether or not insulation is specified or indicated on the particular piping. All damages resulting from broken and/or leaking lines shall be replaced or repaired at the Contractor's own expense. If in doubt, contact the Engineer. Do not install piping across or near openings to the outside whether they are carrying static or moving fluids or not. Insulation on piping does not necessarily ensure that freezing will not occur.

PART 25- WEATHERPROOFING:

25.1 GENERAL INFORMATION

A. Where any work pierces waterproofing including waterproof concrete, the method of installation shall be as approved by the Architect and Engineer before work is performed. The Contractor shall furnish all necessary sleeves, caulking and flashing required to make openings permanently watertight.

B. Wherever work penetrates roofing, it shall be done in a manner that will not diminish or void the roofing guarantee or warranty in any way. Coordinate all such work with the roofing installer.

PART 26- FINAL CONNECTIONS TO EQUIPMENT:

26.1 GENERAL INFORMATION

A. The Contractor shall finally connect to plumbing services for any terminal equipment, kitchen equipment, etc., provided under this and other divisions of the work. Various equipment connections indicated are based upon “basis of design” equipment selections. Such connections shall be made in strict accord with current codes, safety regulations and the equipment manufacturer’s recommendations. If in doubt, contact the Engineer prior to installation.

PART 27- ACCESSIBILITY:

27.1 GENERAL INFORMATION

A. The Contractor shall be responsible for the sufficiency of the size of shafts and chases, the adequate clearance in double partitions and hung ceilings for the proper installation of their work. They shall cooperate with all others whose work is in the same space. Such spaces and clearances shall, however, be kept to the minimum size required.

B. The Contractor shall locate and install all equipment so that it may be serviced, and maintained as recommended by the manufacturer. Allow ready access and removal of the entire unit and/or parts such as valves, filters, fan belts, motors, prime shafts, etc.

C. Whether shown on the Plans or not, the Contractor shall provide in the bid access panels for each concealed shut-off valve, motorized control damper, manual air damper or other device requiring service as shown on Engineer's Plans or as required. Locations of these panels shall be identified in sufficient time to be installed in the normal course of work.

PART 28 - SCAFFOLDING, RIGGING AND HOISTING:

28.1 GENERAL INFORMATION

A. The Contractor shall furnish all scaffolding, rigging, hoisting and services necessary for erection and delivery onto the premises of any equipment and apparatus furnished. All such temporary appurtenances shall be set up in strict accord with OSHA standards and requirements. Remove same from premises when no longer required.

PART 29 - CONCRETE WORK:

A. Refer to Division 03 Specifications.

PART 30- RESTORATION OF NEW OR EXISTING LANDSCAPING, PAVING, SURFACES, ETC.:

30.1 GENERAL INFORMATION

A. The Contractor shall at their expense restore to their original conditions all paving, curbing, surfaces, drainage ditches, structures, fences, landscaping, existing or new building surfaces and appurtenances, and any other items damaged or removed by their operations. Replacement and repairs shall be in accordance with good construction practice and shall match materials employed in the original construction of the item and shall be to the satisfaction of the Owner and/or Engineer.

PART 31 - MAINTENANCE OF EXISTING UTILITIES AND LINES:

31.1 GENERAL INFORMATION

A. The locations of all piping, conduits, cables, utilities and manholes existing, or otherwise, that comes within the contract construction site, shall be subject to continuous uninterrupted service with no other exception than the Owner of the utilities permission to interrupt same temporarily. Provide a seven (7) day written notice to Engineer, Architect and Owner prior to interrupting any utility service or line.

B. Known utilities and lines as available to the Engineer are shown on the Plans. However, it is additionally required that, prior to any excavation being performed, each Contractor ascertain and mark all utilities or lines that would be endangered by the excavation. Contractor shall bear costs of repairing damaged utilities.

C. If utilities or lines occur in the earth within the construction site, the Contractor shall probe and locate the lines prior to machine excavation in the respective area.

D. Cutting into existing utilities and services shall be done in coordination with and as designated by the Owner of the utility. The Contractor shall work continuously to restore service(s) upon deliberate or accidental interruption, providing premium time and materials as needed without extra claim to the Owner.

E. The Contractor shall repair to the satisfaction of the Owner and Engineer, any surfaces or subsurface improvements damaged during the course of the work, unless such improvement is shown to be abandoned or removed.

F. Machine excavation shall not be permitted with ten feet of gas lines, fuel lines, electrical lines or lines carrying combustible and/or explosive materials. Hand excavate only in accord with utility company, agency or other applicable laws, standards or regulations.

G. Protect all new or existing lines from damage by traffic, etc. During construction. Repairs or replacement of such damage shall be at the sole expense of the party responsible.

H. Protect existing trees, indicated to remain with fencing or other approved method. Hold all new subsurface lines outside the drip line of trees, offsetting as necessary to protect root structures. Refer to planting or landscaping Plans, or in their absence, consult with the Architect.

PART 32 - CLEANING:

32.1 GENERAL INFORMATION

A. The Contractor shall, at all times, keep the area of their work presentable to the public and clean of rubbish and debris caused by their operations; and at the completion of the work, shall remove all rubbish, debris, all of their tools, equipment, temporary work and surplus materials from and about the premises, and shall leave the area clean and ready for use. If the Contractor does not attend to such cleaning upon request, the Engineer may cause cleaning to be done by others and charge the cost of same to the Contractor. The Contractor shall be responsible for all damage from fire which originates in, or is propagated by, accumulations of their rubbish or debris.

B. After completion of all work and before final acceptance of the work, the Contractor shall thoroughly clean all equipment and materials and shall remove all foreign matter such as grease, dirt, plaster, labels, stickers, etc., from the exterior of piping, equipment, fixtures and all other associated or adjacent fabrication.

PART 33- TEMPORARY USE OF EQUIPMENT:

33.1 GENERAL INFORMATION

A. The permanent plumbing equipment, when installed, may be used for temporary services, with the consent of the Owner and Engineer. Should the permanent systems be used for this purpose the Contractors shall make all temporary connections required at their expense. They shall also make any replacement required due to damage wear and tear, etc., leaving the same in "as new" condition.

B. Permission to use the permanent equipment does not relieve the Contractors from the responsibility for any damages to the building construction and/or equipment which might result because of its use.

PART 34- NOISE, VIBRATION OR OSCILLATION:

34.1 GENERAL INFORMATION

A. All work shall operate under all conditions of load without any sound or vibration which is objectionable in the opinion of the Engineer. In case of moving machinery, sound or vibration noticeable outside of room in which it is installed, or annoyingly noticeable inside its own room, or exceeds the noise criteria limits as scheduled, will be considered objectionable. Sound or vibration conditions considered objectionable by the Engineer shall be corrected in an approved manner by the Contractor at their expense.

B. All equipment subject to vibration and/or oscillation shall be mounted on vibration supports whether indicated or not suitable for the purpose of minimizing noise and vibration transmission, and shall be isolated from external connections such as piping, ducts, etc. By means of flexible connectors, vibration absorbers, or other approved means. Unitary equipment, such as small room heating units, small exhaust fans, etc., shall be rigidly braced and mounted to wall, floor or ceiling as required and tightly gasketed and sealed to mounting surface to prevent air leakage and to obtain quiet operation. Flush and surface mounted equipment such as diffusers, grilles, etc., shall be gasketed and affixed tightly to their mounting surface.

C. The Contractor shall provide supports for all equipment they furnish. Supports shall be liberally sized and adequate to carry the load of the equipment and the loads of attached equipment, piping, etc. All equipment shall be securely fastened to the structure either directly or indirectly through supporting members by means of bolts or equally effective means. If strength of supporting structural members is questionable, contact Engineer.

PART 35- EQUIPMENT/CONTROLS STARTUP & VERIFICATION:

35.1 GENERAL INFORMATION

A. The Contractor shall include in the bid to provide equipment and controls startup and verification for all plumbing systems specified for this project.

B. Specific startup/verification Specifications are included throughout the Plumbing Specifications. In general, as part of the verification process, equipment suppliers shall perform start-up by their factory authorized technicians, not third-party Contractors, and shall complete and submit start-up reports/checklists.

The Contractor shall have appropriate trades on site to correct all deficiencies noted by the factory representative. For each deficiency noted, documentation of corrective action (including date and time) shall be submitted to the Engineer and Owner. Where factory start-up is not specified for a particular piece of equipment or system, the Contractor shall be responsible to perform start-up. All information shall be completed by the Contractor and submitted to the Owner/Engineer prior to acceptance of the equipment.

C. The manufacturer's recommended startup procedures and checklists will be acceptable for use in the project. Where "manufacturer" startup is not specified, then this Contractor shall perform startup services in strict accordance with manufacturer's instructions. All startup/verification process shall be thoroughly documented by the Contractor and shall include the time and date when performed.

PART 36 - INSPECTION, APPROVALS AND TESTS

36.1 GENERAL INFORMATION

A. Before requesting a final review of the installation from the Architect and/or Engineer, each Contractor shall thoroughly inspect their installation to assure that the work is complete in every detail and that all requirements of the Contract Documents have been fulfilled. Failure to accomplish this may result in charges from the Architect and/or Engineer for unnecessary and undue work on their part.

B. The Contractor shall provide as a part of this contract any required agency inspection, licensed and qualified to provide such services. All costs incidental to the provisions of inspections shall be borne by the Contractor.

C. The Contractor shall advise each inspecting agency in writing, with an informational copy of the correspondence to the Architect and/or Engineer, when they anticipate commencing work. Failure of the inspecting agency to inspect the work in the stage following and submit the related reports may result in the Contractor's having to expose concealed work not so inspected. Such exposure will be at the expense of the responsible Contractor.

D. Inspections shall be scheduled for rough-in as well as finished work. The rough-in inspections shall be divided into as many inspections as may be necessary to cover all roughing-in without fail. Report of each such agency inspection visit shall be submitted to the Architect, Engineer and the Contractor within three days of the inspection.

E. Approval by an agency inspector does not relieve the Contractor from the responsibilities of furnishing equipment having a quality of performance equivalent to the requirements set forth in these Plans and Specifications. All work under this contract is subject to the review of the Architect and/or Engineer, whose decision is binding.

F. Before final acceptance, the Contractor shall furnish the original and three (3) copies of the certificates of final approval by the agency inspectors to the Engineer with one copy of each to the appropriate government agencies, as applicable. Final payment for the work shall be contingent upon completion of this requirement.

PART 37- ABOVE-CEILING AND FINAL PUNCH LISTS:

37.1 GENERAL INFORMATION

A. The Contractor shall review each area and prepare and complete their own punch list for each of the subcontractors as required for the project schedule.

B. Seven (7) days notice shall be given to the Engineer for review of above ceiling work that will be concealed by tile or other materials. Seven (7) days notice shall be given to the Engineer for review of below ceiling work and final inspection.

C. When all work from the Contractor's punch list is complete at each of the major project stages and prior to completing ceiling installations (or at the final punch list stage), the Contractor shall request that the Engineer develop a punch list. This request is to be made in writing seven (7) days prior to the proposed date. After all corrections have been made from the Engineer's punch list, the Contractor shall review and initial off on each item. This signed-off punch list shall be submitted to the Engineer. The Engineer shall return to the site once to review each punch list and all work prior to the ceilings being installed and at the final punch list review. The Contractor's representative may be requested at the inspections.

D. If additional visits are required by the Engineer to review work not completed by this review, the Engineer shall be reimbursed directly by the Contractor by check or money order (due net 10 days from date of each additional visit) at a rate of $250.00 per hour for extra trips required to complete either of the above ceiling, below ceiling or final punch lists.

PART 38- OPERATING INSTRUCTIONS AND TRAINING:

38.1 GENERAL INFORMATION

A. Upon completion of all work and all tests, each Contractor shall furnish the necessary skilled labor and helpers for operating the systems and equipment for a period of one (1) day of eight (8) hours and as specified for other systems. During this period, instruct the Owner or their representatives fully in the operations, adjustment, and maintenance of all equipment furnished.

Give at least seven (7) days written notice to the Owner, Architect and Engineer in advance of this training period. The Engineer may attend any such training sessions or operational demonstrations. The Contractor shall certify in writing to the Engineer that such demonstrations have taken place, noting the date, time and names of the Owner's representatives that were present.

B. Each Contractor shall video each training session and furnish the video via thumb-drive (3 sets required). Also, furnish three digital sets on thumb-drive and three complete bound sets for approval to the Engineer instructions for operating and maintaining all systems and equipment included in this contract. All instructions shall be submitted in draft, for approval, prior to final issue. Manufacturer's advertising literature or catalogs will not be acceptable for operating and maintenance instructions.

C. Each Contractor, in the above-mentioned instructions, shall include the maintenance schedule for the principal items of equipment furnished under this contract and a detailed, easy to read parts list and the name and address of the nearest source of supply.

D. Notify the CxA in advance of training sessions.

E. Refer to the Owner's Project Requirements (OPR) for training requirements. Training schedules, agendas and material should all be submitted for review prior to holding any training sessions.

PART 39- RECORD DRAWINGS:

39.1 GENERAL INFORMATION

A. The Contractor shall insure that any deviations from the design are as they occur recorded in red, erasable pencil on record drawings kept at the jobsite. The Engineer shall review the record documents from time to time to ensure compliance with this Specification. Compliance shall be a contingency of final payment. Pay particular attention to the location of water lines, shut-off valves, cleanouts and other appurtenances important to the maintenance and operation of plumbing systems. Also, pay particular attention to deviations in the control systems and all exterior utilities. Keep information in a set of drawings set aside at the job site especially for this purpose and deliver to the Engineer upon completion of the work.

B. Refer to the Owner's OPR for additional requirements.

PART 40 - COMMISSIONING - CONTRACTOR RESPONSIBILITIES:

40.1 GENERAL INFOMRATION

A. Refer Specification Section 019113 General Commissioning Requirements.

B. Contractor shall assign representatives with expertise and authority to act on its behalf and shall schedule them to participate in and perform commissioning process activities including, but not limited to, the following:

C. Evaluate performance deficiencies identified in test reports and, in collaboration with entity responsible for system and equipment installation, recommend corrective action.

D. Cooperate with the CxA for resolution of issues recorded in the Issues Log.

E. Attend commissioning team meetings.

F. Integrate and coordinate commissioning process activities with construction schedule.

G. Complete electronic construction checklists as Work is completed and provide to the Commissioning Authority.

H. Review and accept commissioning process test procedures provided by the Commissioning Authority.

I. Complete commissioning process test procedures.

PART 41 - PLUMBING DEMOLITION & SALVAGE:

41.1 GENERAL INFORMATION

A. IT IS the intent of the project to completely remove all components of the existing plumbing system within the building unless specifically noted otherwise. This project is considered a “renovate-as-new” project and therefore none of the existing systems will be reused as part of this project except limited amounts of sanitary & storm piping noted. The general scope of the plumbing system demolition is indicated on the drawings. Where plumbing systems are removed, also remove all associated branch piping, hangers, insulation, concrete pads, controls, etc. Contractor shall field verify existing conditions prior to bid. Refer to the demolition drawings for general indication of equipment and piping to be demolished. If other equipment or piping is found during construction which is not indicated on the drawings, it must also be removed.

C. Unless otherwise indicated, the Contractor shall be responsible for the patching and repairing by qualified tradesmen of all holes, etc. In the ceiling, wall, roof and floors where plumbing equipment and systems are removed.

END OF SECTION

SECTION 220502 - SHOP DRAWINGS, MAINTENANCE MANUALS AND PARTS LISTS

PART 1 - GENERAL

1.1 GENERAL INFORMATION

A. The Contractor's attention is directed to the General and Special Conditions, COMMON WORK RESULTS FOR PLUMBING and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. Drawings and General Provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.
   1. Refer Specification Section 019113 General Commissioning Requirements.
   2. Refer to the Owner’s OPR for additional items related to as-builts and O&Ms.

C. The Contractor shall prepare and submit shop drawings, product data, certified equipment drawings, installation instructions, and operation and maintenance data for all plumbing systems and equipment in accordance with Division 01 requirements and the project submittal schedule.

D. Submittals shall be prioritized to support the construction schedule, including early submission of long-lead and critical-path equipment.

E. Provide all shop drawings and submittals in electronic/PDF format through proper channels. The Engineer’s comments will be returned in electronic format.

F. Submittal data shall include materials of construction, dimensions, capacities, performance data, pressure drops, electrical characteristics (if applicable), wiring diagrams, and accessories. No material requiring submittal review shall be fabricated, delivered, or installed until the submittal has been reviewed.

G. Submittal data shall include specification data including metal gauges, finishes, accessories, etc. Also, the submittal data shall include certified performance data, wiring diagrams, dimensional data, and a spare parts list. Submittal data shall be reviewed by the Engineer before any equipment or materials is ordered or any work is begun in the area requiring the equipment.

H. All submittal data shall have the stamp of approval of the Contractor submitting the data as well as the Design-Build Contractor and the Architect to show that the drawings have been reviewed by the Contractor. Any drawings submitted without these stamps of approval may not be considered and will be returned for proper resubmission.

I. The Contractor shall make any corrections or changes required by the Engineer and shall re-submit for final review as outlined above.

J. It shall be noted that review of shop drawings by the Engineer applies only to conformance with the design concept of the project and general compliance with the information given in the contract documents. In all cases, the Contractor alone shall be responsible for furnishing the

proper quantity of equipment and/or materials required, for seeing that all equipment fits the available space in a satisfactory manner and that piping, electrical and all other connections are suitably located.

K. The Engineers review of shop drawings, schedules or other required submittal data shall not relieve the Contractor from responsibility for: adaptability of the item to the project; compliance with applicable codes, rules, regulations and information that pertains to fabrication and installation; dimensions and quantities; electrical characteristics; and coordination of the work with all other trades involved in this project.

L. Submittals for plumbing equipment shall include all relevant performance and construction data, including but not limited to flow rates, pressure ratings, materials, finishes, and accessories.

M. Colors for equipment in other than mechanical spaces shall be selected from the Manufacturer's standard and factory optional colors. Color samples shall be furnished with the shop drawing submission for such equipment.

N. All submittals for mechanical equipment shall include all information specified. This shall include air and water pressure drops, RPM, noise data, face velocities, horsepower, voltage motor type, steel or aluminum construction, and all accessories clearly marked.

O. All items listed in the schedules shall be submitted for review in a tabular form similar to the equipment schedule. All items submitted shall be designated with the same identifying tag as specified on each sheet.

P. Any submittals received in an unorganized manner without options listed and with incomplete data will be returned for resubmittal.

Q. Indicate compliance with CT High Performance Building Standards as applicable.

R. Indicate compliance with LEED v4.1 Standards as applicable.

PART 2 - SHOP DRAWINGS

2.1 REQUIREMENTS

A. Shop Drawings, descriptive literature, technical data and required schedules shall be submitted on the following:
1. Floor Drains
2. Insulation
3. Plumbing Fixtures, Fittings and Trim
4. Plumbing Equipment
5. Elevator Sump Pump
6. Piping
7. Plumbing Specialties
8. Roof Drains
9. Valves

10. Water Heaters
11. Domestic Water Storage Tanks

2.2 SPECIAL NOTES

A. Upon substantial completion of the project, the Contractor shall deliver to the Engineers (in addition to the required Shop Drawings) three (3) complete copies of operation and maintenance instructions and parts lists for all items marked above. These documents shall include at least:
   1. Approved submittals and product data
   2. Installation and startup procedures
   3. Detailed operating instructions
   4. Preventative maintenance procedures and schedules
   5. Parts lists and exploded diagrams
   6. Manufacturer contact information
   7. Wiring diagrams and control sequences (if applicable)
   8.

B. Shop drawings for the Control Systems shall include detailed, scaled plans and schematic diagrams indicating the function and operation of the system. Refer to Specification Section – AUTOMATIC TEMPERATURE CONTROLS FOR HAVC for additional requirements.

C. The Contractor shall submit project specific UL listed firestopping installation drawings to the Authority having jurisdiction.

PART 3 - EXECUTION

3.1 REQUIREMENTS

A. Upon substantial completion of the project, the Contractor shall submit to the Engineer a PDF version of the Certified Hydronic Balance Report.

3.2 INSTALLATION

A. Installation shall comply with manufacturer’s written instructions and applicable codes and authority having jurisdiction (AHJ) requirements.

3.3 USE OF APPROVED SUBMITTALS

A. All work shall be installed in accordance with reviewed submittals. Where discrepancies exist between the Contract Documents and reviewed submittals, the more stringent requirement shall govern. Notify the Engineer of such discrepancies prior to installation.

3.4 FIELD VERIFICATION

A. Verify field conditions, dimensions, and utility requirements prior to installation and fabrication.

B. Do not proceed with installation where conflicts exist until such conflicts are resolved.

3.5 COORDINATION

A. Coordinate installation of plumbing systems and equipment with other trades, including structural, architectural, mechanical, and electrical work.

B. Ensure proper access, service clearances, and routing prior to installation.

3.6 CLOSE OUT DOCUMENTS

A. Submit final, complete operation and maintenance manuals incorporating all approved submittals and field changes.

B. Manuals shall reflect as-installed conditions and include final equipment selections, settings, and configurations.

END OF SECTION

SECTION 220507 - EXCAVATION, TRENCHING, BACKFILLING AND GRADING

PART 1 - GENERAL

1.1 GENERAL INFORMATION

A. Drawings and General Provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this section.

B. The Contractor shall include all excavating, filling, grading, backfilling and related items required to complete the work as shown on the drawings and specified herein or as required to complete, connect and place all plumbing systems in satisfactory operation on the interior and exterior of the building.

C. Refer to Division 31 – Earthwork for requirements associated with site excavation, trenching, dewatering, bedding, backfilling, compaction, grading, and surface restoration. Plumbing Contractor shall coordinate all work with Division 31 and comply with those requirements except where more stringent requirements are specified herein.

D. Unless otherwise shown or required, provide separate trenches for sewers, water lines and other underground raceways, with a minimum of 10 feet measured from outside diameter between pipes. In locations, such as close to buildings where separate trenches for sewers and water lines are impractical, lay the water pipe on a solid shelf at least 2'-0" above the top of the sewer and 2’-0" to the side.

E. Water lines crossing under sewer lines, or crossing less than 2 feet above sewer lines, must be concrete encased for a distance not less than 5 feet on either side of the point of crossover.

F. Without regard to the materials encountered, all excavation and materials excavated shall be unclassified. Materials to be excavated shall be unclassified, and shall include earth, rock, concrete or any other obstructions encountered in excavation and/or trenching to install underground utility pipes or other equipment.

G. Include all costs for rock removal, including mass rock and trench rock in the bids. No adjustment in the contract sum will be made on account of the presence or absence of rock, shale, or other materials encountered in the excavating. The Contractor shall be responsible for the removal of all materials encountered as required for the installation of the work.

H. It shall be distinctly understood that references to rock, earth, topsoil or any other excavated or non-excavated material or other material on the construction plans, cross section, contract documents, technical specification or provisions, whether in numbers, words, letters, lines or graphically shown, is solely for information for the Engineer and Owner. This information shall not be taken as an indication of the classification of the material to be excavated, bored or removed by any method, including drilling and blasting, or materials not removed. This information shall not be taken as to the quantity of either rock, earth, topsoil, or any other material involved, or the quality of the material such as hardness, wetness, workability or suitability of the material either during excavation and construction or as a material to be reused during construction.

I. Maintain carefully all benchmarks, monuments and other reference points. If disturbed or destroyed, replace as directed.

PART 2 - PRODUCTS

2.1 BEDDING AND BACKFILL MATERIALS

A. Bedding Material:
1. Manufactured sand or #8 crushed stone, clean, well-graded, and free of debris, organic material, frozen material, and stones larger than 1/2 inch.
2. Provide material suitable for uniform pipe support and in accordance with pipe manufacturer's recommendations.

B. Initial Backfill:
1. Same material as bedding unless otherwise required.
2. Place and compact carefully to avoid displacement or damage to piping.

C. General Backfill:
1. Native material free of debris, organic material, frozen material, and rocks larger than 2 inches.
2. Material shall be suitable for compaction and shall not contain materials that may damage piping or impair compaction.

D. Topsoil:
1. Clean, fertile topsoil free of subsoil, debris, weeds, and stones larger than 1 inch.
2. Suitable for seeding or sodding and matching adjacent site conditions.

E. Tracer Wire:
1. Provide tracer wire for non-metallic underground pressure piping.
2. Solid copper or copper-clad steel, minimum 12 AWG, insulated, suitable for direct burial.
3. Install continuously along piping with access at valve boxes, cleanouts, and building entry points.

F. Warning Tape:
1. Detectable underground warning tape, minimum 6 inches wide, color-coded per utility type.
2. Install continuously above piping at approximately 12 inches below finished grade.
3. Provide continuous labeling indicating type of utility buried below.

G. Imported Fill (if required):
1. Where native material is unsuitable, provide imported fill meeting requirements of general backfill.
2. Source and material shall be subject to Engineer approval.

H. Unsuitable Materials:
1. Materials classified as unsuitable by the Engineer or geotechnical report shall not be used for bedding or backfill.
2. Dispose of unsuitable material off-site in accordance with applicable regulations.

PART 3 - EXECUTION

3.1 EXCAVATION

A. Excavate trenches of sufficient width for proper installation of the work. Excavate to 6" below the bottom of new pipes for installation of specified bedding material.

B. Sheet, shore, and brace trenches as necessary to protect workers and adjacent structures and to comply with applicable OSHA, state, and local requirements. Do not remove sheeting until trench is backfilled sufficiently to protect piping and prevent caving. Where removal of sheeting and/or bracing is hazardous, leave in place. Cut off sheeting not removed at least 3 feet below finished grade.

C. Rules and regulations governing the respective utilities shall be observed in executing all work under this Division. Active utilities discovered in the course of excavation shall be protected or relocated in accordance with written instructions from the Engineer. Inactive and abandoned utilities encountered in trenching operations shall be removed and abandoned with ends plugged or capped in accord with current codes and safe practice. If utility status or required disposition is uncertain, notify the Engineer before proceeding.

D. Machine excavation shall not be allowed within ten (10) feet of existing electric lines, natural gas lines or other lines carrying combustible materials. Use only hand tools.

E. The removal of rock shall be accomplished by use of hand or power tools only. Blasting shall not be permitted unless authorized in writing by the Engineer. Any damage to existing structures, exterior services, or rock intended for bearing, shall be corrected at the responsible Contractor's expense.

F. Perform final grading of trench bottoms by hand tools; carry machine excavation only to such depth that soil bearing for pipes and raceways will not be disturbed. Grade the bottom of trenches evenly to insure uniform bearing for all piping and raceways. Cut bell holes as necessary for joints and jointmaking. Except as hereinafter specified, bottom of trenches for bell and spigot pipe, flanged pipe, etc. shall be shaped to the lower quadrant of pipe with additional excavation for bell or flange. Piping installed where it rests on bell or flange and/or is supported with blocks or wedges will not be accepted.

G. Keep trenches free from water while construction therein is in progress. Under no circumstances lay pipe or appurtenances in water. Pump or bail water from bell holes to permit proper joining of pipe. Any dewatering from this Contractor's trenches which is required during construction, shall be included in this Contract.

H. In no case shall excavation work be accomplished that will damage in any way the new structure, existing structures, equipment, utility lines, large trees to remain, etc. The Contractor shall take the necessary steps to prevent flow of eroded earth by water or landslide onto the property of others, or against the structures. The repair of all such damage or any other damage incurred in the course of excavation shall be at the responsible Contractor’s expense.

I. Use surveyor's level to establish elevations and grades.

J. Machine excavation shall be held a sufficient distance from foundations and footings to ensure no damage to same. Contractors shall accept full responsibility and pay for repairs and/or replacement of structural members, footings, etc.

K. The Contractor shall remove trash, rubbish, and unsuitable material from areas of excavation prior to starting work.

L. The Contractor shall provide and maintain barricades and temporary bridges around excavations as required for safety. Temporary bridges shall be provided where excavations cross paved areas and walks. The Contractor shall maintain these bridges in a safe and passable condition for all traffic until removal. Refer to OSHA Standards for such installations and comply with same in all details.

M. Pay particular attention to existing utilities and lines to avoid damage. The locations of existing lines which are indicated on the plans were taken unconfirmed from drawings prepared for previous construction and locations are approximate only. Also, certain water, gas, electric, storm and sanitary sewer lines and other underground appurtenances, active or abandoned, may not appear on the drawings. It shall be each Contractor's responsibility to ascertain the location of all lines and excavate with caution in their area.
   1. Unauthorized excavation consists of removal of materials beyond indicated subgrade elevations or dimensions without specific direction of Engineer. Unauthorized excavation, as well as remedial work directed by Engineer, shall be at Contractor’s expense.

3.2 BACKFILLING AND GRADING

A. Backfilling for Plumbing Work shall include all trenches, manhole pits, storage tank pits, and/or any other earth and/or rock openings which are excavated under this Contract. Backfilling shall be carefully performed and the surface restored to its original level to receive new finish. Wherever trenches and earth openings have not been properly filled and/or settlement occurs, they shall be re-excavated, re-filled and properly compacted, smoothed off and finally made to conform to the level of the original ground surface.

B. Provide 6 inches of bedding material below pipe and 12 inches above the top of pipe. Install piping on compacted bedding material. Install tracer wire where required for non-metallic underground piping. Complete required testing and verify pipe alignment and grade prior to final backfill. Backfill remainder of trench with approved material free of rock and debris, compacted in layers. Water settling shall not be used as the sole means of compaction.

C. Backfill and compact beneath areas to be seeded or sodded within six (6) inches of finished grade. The remaining six (6) inches shall be backfilled with clean top soil.

D. Backfill and compact beneath paved areas, walks, etc. shall be brought to proper grade to receive the sub-base and paving. No paving shall be placed on uncompacted fill or unstable soil.

E. Wherever, in the opinion of the Engineer, the soil at or below the requisite pipe grade is unsuitable for supporting piping, special support shall be provided as directed by the Engineer.

F. Unsuitable material and surplus excavated material not required for backfill shall be removed from the site. The location of dump and length of haul shall be the affected Contractor's responsibility.

G. Provide and place any additional fill material from off the site as may be required for backfill. Fill obtained from off site shall be of kind and quality as specified for backfill and the source approved by the Engineer and shall be brought to the site by the Contractor requiring the fill.

H. If not specified or indicated elsewhere in the Contract Documents to be performed by Others, the Contractor shall lay new sod over their excavation work for existing disturbed grassy areas. Level, with adjacent surface, compact and water in accord with sound sodding practice.

I. Control soil compaction during construction providing minimum percentage of density specified for each area classification indicated as follows.

J. At a minimum, fill in grass areas shall be compacted to 90% Standard Proctor Density, ASTM D-698, at moisture content between 2 percent below to a 3 percent above the optimum moisture content or as specified in Specification Division EARTHWORK; whichever is most stringent.

K. At a minimum, fill in concrete or asphalt area shall be compacted to 98% Standard Proctor Density, ASTM D-698, at moisture content between 2 percent below to a 3 percent above the optimum moisture content or as specified in Specification Division EARTHWORK; whichever is most stringent.

L. Place backfill and fill materials evenly adjacent to structures, piping, or conduit to required elevations. Prevent wedging action of backfill against structures and displacement of piping or conduit by placing and compacting material uniformly on both sides in each lift.

M. Do not place final backfill until required inspections and tests have been completed.

N. Grading Outside Building Lines: Restore grading and exterior surfaces in accordance with Division 31 – EARTHWORK and to match adjacent existing conditions unless otherwise indicated.

O. Maintenance Settling: Where settling is measurable or observable at excavated areas during Project Warranty Period, remove surface (pavement, concrete or any other surface or finish), add backfill material, compact, and replace surface treatment. Restore appearance, quality, and condition of surface or finish to match adjacent work, and eliminate evidence of restoration.

P. Disposal of Excess Non-organic Soil and Rock: Any excess excavated waste material shall become the property of the Contractor and shall be disposed of by the Contractor off site at no additional cost to the Owner.

Q. Unless otherwise directed by the Owner during construction, excess topsoil and subsoil suitable for fill shall be disposed of by the Contractor off site at no additional cost to the Owner

3.3 MINIMUM DEPTHS OF BURY TO TOP OF PIPE

A. In the absence of other indication, the following shall be the minimum depth of bury to top of pipe of exterior utility lines. Check drawings for variations.
   1. Storm Lines 36 inches below final grade.
   2. Sanitary Lines 36 inches below final grade.
   3. Water Lines 48 inches below final grade.
   4. All Other Lines Not Listed36 inches below final grade.

END OF SECTION

SECTION 220513 - COMMON MOTOR ELECTRICAL REQUIREMENTS FOR PLUMBING EQUIPMENT

PART 1 - GENERAL

1.1 GENERAL INFORMATION

A. Drawings and General Provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this section.

B. Through coordination with other Contractors, Vendors and Suppliers associated with this Project, this Contractor shall ensure a complete, fully functional, tested, inspected, and approved system. All equipment shall be furnished for a single point electrical connection unless specifically excluded as a requirement.

C. Review the Specification Section – TEMPERATURE CONTROLS AND SEQUENCE OF OPERATIONS FOR HVAC to determine controls, including variable frequency drives, to be furnished. Coordinate with Division 23 and Division 26 to determine responsibility for furnishing and installation of variable frequency drives (VFDs), starters, and control devices.

D. Prior to ordering any materials or rough-in of any kind, the Plumbing Contractor shall be responsible for final coordination of all electrical requirements (i.e. voltage, phase, circuit breaker, wire sizing, etc.) with the Electrical Contractor. There will be no change in the Contract Amount for any discrepancies. A final coordination meeting shall be held with the General Contractor, Plumbing Contractor, Electrical Contractor and their sub-contractors.

1.2 ELECTRICAL COORDINATION SUBMITTAL

A. Submit coordinated electrical data for all equipment including:

B. Voltage, phase, MCA, MOCP

C. Disconnect requirement

D. Starter/VFD requirements

E. Control voltage

PART 2 - MOTORS

2.1 REQUIREMENTS

A. The following are basic requirements for simple or common motors. For special motors, more detailed and specific requirements are specified in the individual equipment specifications and drawing schedules.

B. Torque characteristics shall be sufficient to satisfactorily accelerate the driven loads.

C. Motor sizes shall be large enough so that the driven load will not require the motor to operate in the service factor range.

D. Motors shall be capable of frequency of starts as indicated by automatic control system and not less than five (5) evenly time spaced starts per hour for manually controlled motors.

E. Motors shall have a 1.15 service factor for poly-phase motors and 1.35 service factor for single phase motors.

F. Motors shall have a temperature rating for 40 deg C ambient environment with maximum 90 deg C temperature rise for continuous duty at full load with 1.15 service factor and Class B insulation.

G. Unless otherwise noted or required by application, motors shall conform to NEMA Standard MG 1 (Table 12-10) for general purpose, continuous duty, horizontal, T-frame, single speed, design “A” or “B”. Utilize design "C" motors where required for high starting torque.

H. Motor frames shall be NEMA Standard No. 48 or 56. Use driven equipment (fans, pumps, etc.) manufacturer's standards to suit specific application.

I. Provide inverter rated motors where variable frequency drives are utilized. Motor shall be premium efficiency type with Class F insulation and shall conform to NEMA MG 1 parts 30 and 31. Inverter duty rated motors shall have a temperature rating for 40 deg C ambient environment with maximum of 105 deg C temperature rise. Motors controlled by VFDs shall be suitable for inverter duty, including insulation systems, shaft grounding (where required), and bearing protection to prevent damage from induced shaft currents.

J. Motor bearings shall be ball or roller bearings with inner and outer shaft seals. Bearings shall be re-greaseable, except permanently sealed where motor is normally inaccessible for regular maintenance. Bearings shall be designed to resist thrust loading where belt drives or other drives produce lateral or axial thrust in motor. Bearings shall be rated for a minimum L10 life of 100,000 hours.

K. Motor enclosure type shall be open drip-proof motors for indoor use where satisfactorily housed or remotely located during operation. Enclosures shall be guarded drip-proof type motors where exposed to contact by employees or building occupants. Enclosure shall be weather protected Type I for outdoor use or Type II where not housed.

L. Provide built-in thermal overload protection and, where required, internal sensing device suitable for signaling and stopping motor at starter.

M. Provide energy efficient motors with a minimum efficiency in accordance with NEMA MG 1, Table 12-10 for 1800 rpm, enclosed motors. If efficiency not specified, motors shall have a minimum efficiency as listed below:

1. 1 hp - 85.5%	5 hp – 89.5%	20 hp – 93.0%
2. 1.5 hp – 86.5%	7.5 hp – 91.7%	25 hp – 93.6%
3. 2 hp – 86.5%	10 hp – 91.7%	30 hp – 93.6%
4. 3 hp – 89.5%	15 hp – 92.4%	40 hp – 94.1%

N. On the motor nameplate, indicate the full identification of manufacturer, ratings, characteristics, construction, special features and similar information.

PART 3 - MOTOR STARTERS

3.1 REQUIREMENTS

A. Where variable speed operation is indicated or scheduled, provide variable frequency drives (VFDs) in lieu of across-the-line starters. VFDs shall comply with Section 232923 – VARIABLE FREQUENCY DRIVES.

B. Provide motor starters where indicated on the plumbing equipment schedules or elsewhere in the Contract Documents.

C. Motor starters shall be NEMA style. Their sizing and installation shall be coordinated with the equipment manufacturer's requirements and in accordance with the National Electrical Code.

D. All starters shall be size 0 minimum. They shall be constructed and tested in accord with latest edition of NEMA standards. All starters shall be across-the-line magnetic type, unless indicated otherwise. On motors of 20 H.P. or greater rating, the supplier shall provide starters capable of limiting inrush currents. These shall be the reduced voltage open-transition type. Do not utilize closed transition starters unless specifically indicated.

E. Magnetic starters shall be furnished with the following characteristics and accessories as a minimum. See other sections of these specifications and plumbing schedules for further requirements.

F. Contacts shall be silver-alloy, double-break type except NEMA size 8 and 9 shall be single-break type. Contacts shall be replaceable without removal of wiring or removal of starter from enclosure. Number of contacts shall be as required for service indicated. Contacts shall be gravity dropout type, positive operation.

G. Coil voltage shall be 120 volts, A.C., 60 HZ or less, as required to suit control systems available voltages. Coils shall be of molded construction, except for size 8 and 9 which shall be hand wound. Provide coil clearing contact as required.

H. Provide control transformer of adequate K.V.A. as required on all starters with line-to-line voltages higher than 120 volts A.C. Provide fuse block and slow-blow fuse to protect control transformer per NEMA, N.E.C. and U.L. HOA switches shall be lockable in the OFF position.

I. Provide hand-off-auto selector switch in face of starter, wired into hand and off switch positions. Auto position (if needed) to be field wired as indicated for automatic control. HOA switches shall be lockable in the OFF position.

J. Provide NEMA Class 20 resettable overload relays, accurately sized to the motor nameplate rating of the motor served and the temperature differential between motor and controller. Overloads shall be easily replaceable, and resettable without opening enclosure, via a push

button or similar means. Class 10 or Class 30 overloads may be used depending on type of motor duty encountered.

K. Provide at least one N.O. auxiliary contact (field-convertible to N.C. operation) with each starter. All starters shall have space for two additional single-pole contacts.

L. All starters shall be thru-wiring type.

M. Provide phase failure sensing relay to open starter coil circuit (on loss of one or more phases) on all three-phase starters controlling motors of 7½ H.P. or larger.

PART 4 - ELECTRICAL REQUIREMENTS FOR PLUMBING EQUIPMENT

4.1 REQUIREMENTS

A. All plumbing equipment shall be provided for single point electrical connection unless noted otherwise.

B. The equipment manufacturer shall provide internally mounted fuses with his equipment, as required, to comply with the U.L. listing on the equipment name plate. (i.e., hermetically sealed compressors or equipment with name plate data that recommends or requires fuse protection.) See also, National Electrical Code, Article 440, Part C, and other applicable sections of the N.E.C.

C. The Contractor shall furnish all equipment with complete internal wiring and controls. The Electrical Contractor shall provide power wiring, disconnects, and overcurrent protection unless specifically noted otherwise. Final responsibility shall be coordinated per Division 26.

D. Each separate contractor engaged for the project shall coordinate with all other trades to ensure all necessary equipment and labor is included for fully functioning plumbing systems, installed per Code and Project requirements.

E. All interlock or other control wiring, unless specifically noted otherwise, is the responsibility of this Contractor.

F. All equipment shall be suitably enclosed. All enclosures for equipment shall be rated and approved for the environment in which it operates. (i.e., NEMA 1, NEMA 3R, NEMA 7, NEMA 12, etc.) Verify the requirement with the installation condition if not indicated on the plans.

G. Observe the following standards for manufacture of equipment and in selection of components: (1) Starters, control devices and assemblies - NEMA (I.E.C. style not acceptable), (2) Enclosures for electrical equipment – NEMA, (3) Enclosed switches – NEMA, (4) All electrical work, generally NFPA 70, (5) All electrical work in industrial occupancies - J.I.C. standards, (6) All electrical components and materials - U.L. listing required.

H. Where scheduled on the drawings, provide disconnect switches and contactors. Disconnect switches shall be fusible type or circuit breaker type. Disconnect switches shall be within sight of the equipment unless otherwise permitted by code.

PART 5 - REQUIREMENTS FOR PLUMBING EQUIPMENT 3/4 H.P. OR LESS

5.1 REQUIREMENTS

A. Small equipment with motor(s) of 3/4 H.P., single phase or less are generally not required to be furnished with starter(s), unless otherwise noted. Electronically commutated motors (ECMs) may be provided where applicable. For such equipment, provide integral contactor or horsepower-rated relay where controlled by DDC controls, thermostat or other type of switch. Contactors or relays shall be as recommended by the manufacturer of the equipment.

B. Provide transformer within unit as required to provide low voltage A.C. for thermostat control.

C. Provide internal fusing for unit motor and other loads in fuse block or in-line fuse holder. Internal fusing shall be coordinated with manufacturer requirements and UL listing.

D. Where externally-mounted disconnecting means is required and would be impractical, unsightly or inappropriate in the judgment of the Engineer, disconnects shall be located within the unit. These disconnects may be fusible H.P.-rated snap switches or manual starters with overload elements, as required. Locate this and other electrical equipment within enclosure where easily accessible behind access panel or door on unit, and as acceptable to the electrical inspector or local authority having jurisdiction.

END OF SECTION

SECTION 220519 - METERS AND GAUGES FOR PLUMBING PIPING

PART 1 - GENERAL

1.1 REQUIREMENTS

A. The Contractor's attention is directed to the General and Special Conditions, COMMON WORK RESULTS FOR PLUMBING and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. The Contractor shall include all thermometers, pressure gauges and/or compound gauges at the locations indicated. All thermometers, pressure gauges and/or compound gauges shall be provided with a petcock to allow the gauge to be removed and replaced without shutting down system.

1.2 SUMMARY

A. This sections includes the following types of meters and gauges
   1. Temperature gauges and fittings
   2. Pressure gauges and fittings

B. Meters and gauges furnished as part of factory-fabricated equipment are specified as part of equipment assembly in other Division 22 specifications.

1.3 QUALITY ASSURANCE

A. UL Compliance: Comply with applicable UL standards pertaining to meters and gauges.

B. ASME and ISA Compliance: Comply with applicable portions of ASME and Instrument Society of America (ISA) standards pertaining to construction and installation of meters and gauges.

1.4 SUBMITTALS

A. Shop Drawings, descriptive literature, technical data and required schedules shall be submitted on the following:
   1. Product Data for each type of thermometer and gauge
   2. Calibration Certificates
   3. Operation and Maintenance Manuals

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Subject to compliance with requirements, provide products by one of the following or approved equal:
   1. Thermometers and Wells: Trerice, WIKA, Ashcroft, Winters
   2. Pressure Gauges: Trerice, WIKA, Ashcroft, Winters
   3. Test Plugs: Trerice, Sisco, Watts, Peterson Equipment Co

B. All instruments shall be factory calibrated.

C. All components shall be rated for system design pressure and temperature.

D. Install instruments to be readable from normal operating position.

E. Provide instruments compatible with building automation system where indicated.

F. Provide products compliant with NSF 61 and NSF 372 for potable water systems.

2.2 THERMOMETERS

A. Type: Bimetal dial-type, adjustable angle, stainless steel case and stem.

B. Dial Size: Minimum 2-1/2-inch diameter (3-inch typical; 4-1/2-inch preferred in mechanical rooms).

C. Accuracy: ±1% of full scale.

D. Scale: Dual scale (°F/°C), permanently etched.

E. Range: Selected for system served (typically 25°F to 125°F for domestic water unless noted otherwise) and centered around normal operating conditions.

F. Stem Length: As required for proper immersion.

G. Provide thermometers installed in separable stainless steel wells for all piping applications. Direct immersion without wells is not permitted.

2.3 DIGITAL THERMOMETERS

A. Provide digital thermometers where indicated on drawings.

B. Range: -50°F to 300°F.

C. Accuracy: ±1% or ±1°F, whichever is greater.

D. Display: Minimum 3/8-inch LCD.

E. Power: Self-powered (solar) or battery as applicable.

2.4 THERMOMETER WELLS

A. Material: Brass or stainless steel.

B. Rating: Suitable for system design pressure and temperature.

C. Provide extension length to clear insulation.

D. Provide threaded cap with retaining chain.

2.5 PRESSURE GAUGES

A. Type: ASME B40.1, bourdon tube.

B. Case: Stainless steel with glass or polycarbonate lens.

C. Dial Size: Minimum 2-1/2-inch (4-1/2-inch preferred in mechanical rooms).

D. Connection: 1/4-inch NPT, bottom connection unless noted otherwise.

E. Accuracy: ±2% of full scale.

F. Range: Selected so normal operating pressure is approximately mid-scale (typical domestic water: 0–100 psi unless noted otherwise).

G. Provide gauges rated for system design pressure.

2.6 PRESSURE GAUGE ACCESSORIES

A. Provide gauge cock or ball valve at each pressure gauge for isolation and removal.

B. Provide snubbers where required to prevent pulsation or vibration damage.

C. Provide siphons for steam service only.

2.7 TEST PLUGS

A. Provide test plugs with 1/4-inch NPT fitting to accept 1/8-inch OD temperature or pressure probes.

B. Body: Solid brass, nickel-plated, with dual self-sealing valve cores.

C. Core Material:
   1. Neoprene for temperatures up to 200°F.
   2. EPDM (Nordel) for temperatures between 200°F and 275°F.

B. Length:
   1. Minimum 3-inch length for insulated piping.
   2. Minimum 1-1/2-inch length for uninsulated piping

C. Cap: Provide gasketed, color-coded cap with retaining strap.

D. Pressure Rating: Minimum 1000 psig at 140°F.

PART 3 - EXECUTION

3.1 THERMOMETER INSTALLATION

A. Install thermometers in locations and orientations to be readable from a standing position at floor level.

B. Install thermometers in piping using separable wells; direct immersion is not permitted.

C. Install thermometer wells in piping tees at locations indicated. Orient wells to ensure proper immersion and readability.

D. Provide extension lengths to clear insulation.

3.2 INSTALLATION OF PRESSURE GAUGES

A. Install pressure gauges in piping tees with gauge cock or ball valve for isolation.

B. Locate gauges for maximum readability from normal operating position.

C. Install gauges at a minimum at the following locations:
   1. Incoming domestic water service.
   2. Top of domestic hot and cold water risers.
   3. Additional locations indicated on drawings.

D. Provide snubbers where required to prevent pulsation or vibration damage.

E. Do not install gauges directly on vibrating piping; provide remote mounting with flexible tubing where required.

3.3 INSTALLATION OF TEST PLUGS

A. Install test plugs in piping tees at locations indicated and where required for testing and balancing.

B. Locate test plugs for accessibility and readability.

C. Install test plugs adjacent to each location where temperature or pressure measurement is required by the controls or balancing specifications.

D. Ensure test plugs extend beyond insulation and provide access for probe insertion.

E. Secure caps after installation.

3.4 ADJUSTING AND CLEANING

A. Adjusting: Adjust faces of meters and gauges to proper angle for best visibility.

B. Cleaning: Clean windows of meters and gauges and factory-finished surfaces.

C. Replace cracked and broken windows and repair scratched and marred surfaces with manufacturer's touch-up paint.

3.5 CONNECTIONS

A. Install meters and gauges to allow adequate clearance for servicing, removal, and maintenance.

B. Coordinate final locations with piping, equipment, and insulation to ensure accessibility and proper operation.

C. Comply with Division 22 piping requirements for installation of associated piping, fittings, and specialties.

END OF SECTION

SECTION 220523 - GENERAL-DUTY VALVES FOR PLUMBING PIPING

PART 1 – GENERAL

1.1 RELATED SECTIONS

A. The Contractor's attention is directed to the General and Special Conditions, COMMON WORK RESULTS FOR PLUMBING and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

1.2 QUALITY ASSURANCE

A. Each Contractor shall provide all valves required to control, maintain and direct flow of all fluid systems indicated or specified. This shall include, but may not be limited to all valves of all types including balancing valves, air vents, drain valves, check valves, special valves for special systems, etc., for all Plumbing Systems.

B. The following type valves shall not be acceptable: Zinc, plastic, fiber or non-metallic.

C. Each type of valve shall be of one manufacturer, i.e., ball valves, one manufacturer, butterfly valves, one manufacturer, check valves, one manufacturer, etc.

D. All valves shall comply with applicable codes and standards, shall be new, and shall be rated for the intended service, pressure, and temperature.

E. Contractor shall provide colored tape on ceiling tile where valves are located above ceiling. Provide access panels where valves are located above hard ceiling.

1.3 STANDARDS

A. General valve applications include: fixture and equipment isolation valves, branch shutoff valves, check valves, drain valves, thermostatic mixing, backflow preventers and relief valves are usually elsewhere, not here

B. Valve Bodies, Shells and Seats: Factory-tested.

C. Standard for 125 psi and 150 psi saturated steam rated valve pressure containing parts: ASTM B62.

D. Standard for 200 psi and 300 psi valves with metallic seats: ASTM B61.

E. Iron Body Valves
   1. Pressure-containing parts: ASTM A126, Grade B.
   2. Face-to-face and end-to-end dimensions: ASME B16.10.
   3. Design, workmanship, materials, and testing: MSS SP-70 and MSS SP-71.

F. Butterfly valves: face-to-face and end-to-end dimensions shall conform to MSS SP-67.

G. Valve Stems: ASTM B371, Alloy C69400; ASTM B371, Alloy C65100H04 (rolled silicon brass); or other material equally resistant to dezincification.

H. Pressure Castings: Free of impregnating materials.

I. Manufacturer's name or trademark and working pressure stamped or cast into body.

J. Valves for potable domestic water service shall comply with the Reduction of Lead in Drinking Water Act and shall be certified lead-free in accordance with applicable federal and state requirements. Valves intended for potable domestic water service shall comply with 42 USC 300g-6, NSF/ANSI 61, and NSF/ANSI 372, and shall be certified lead-free.

1.4 JOB CONDITIONS

A. Coordinate the exact application and location of this work with the work of other trades prior to installation within various piping systems. Verify all positions and elevations. Provide additional offsets and section of piping as required to position valves for equipment clearance and accessibility as well as system and valve operational conditions.

B. Valve manufacturer shall verify indicated figure or model numbers so that selection meets required description and conditions specified. Specified data for valve shall take precedence over indicated figure or model number. Provide proper seat and seal material for applicable temperature, pressure and service indicated for each valve application.

PART 2 – PRODUCTS

1.5 ACCEPTABLE MANUFACTURERS

A. Subject to compliance with requirements, provide products by one of the following or approved equal: NIBCO, Crane, Jenkins, Milwaukee, DeZurik, Bell & Gossett, Apollo, Watts, Wilkins, and Bradley

1.6 VAVLES AND SPECIALITIES FOR DOMESTIC WATER PIPING

A. Gauge valves for 1/8-inch and 1/4-inch gauge connections shall be bronze globe valves with threaded or solder end connections as applicable, union bonnet, renewable seat and disc, and suitable for minimum 300 psi working pressure.

B. For shutoff valves within 1/4 inch through 2-1/2-inch size copper piping shall be two-piece full-port bronze ball valves with solder ends, stainless steel ball and stem, PTFE seats, and lever handle, rated for not less than 600 psi WOG.

C. For shutoff valves in copper piping and grades 3-inch size and greater; 200 psi WOG butterfly valve, lug-style body, suitable for dead-end and isolation service.

D. For shutoff valves within steel piping of 1/4 inch through 2-1/2”-inch size; two-piece ball valve with bronze FNPT threaded ends, lever handle, stainless steel ball and stem, full port, rated for not less than 600 psi WOG.

E. For shutoff valves within steel piping of 3 inch or above; 200 psig w.o.g butterfly valves, installed between standard ANSI Class 125/150 flanges, suitable for dead-end and isolation service without use of downstream flanges. 3 inch through 6-inch size valves to have manual stem position, lock to prevent tampering, notched plate and latching handle while valves of 8 inch size and above shall have manual enclosed weatherproof handwheel actuators with gear box and position indicator window, and all meeting the following criteria.

	Part	Specifications
1.	Stem	Stainless Steel, ASTM A-582 Type 410
2.	Collar Bushing	Brass, ASTM B-124
3.	Stem Seal	EPDM
4.	Body Seal	EPDM
5.	Nameplate	Aluminum
6.	Upper Bushing	Copper CDA 122
7.	Liner	EPDM
8.	Disc	Al. Bronze, ASTM B-148 Alloy 954/955
9.	Lower Bushing	Copper CDA 122
10.	Body (Lug)	Ductile iron, ASTM A-536

F. Check valves 2-inches and smaller shall be bronze swing check valve with teflon disc, threaded or soldered ends as applicable, renewable seat and dick, Class 150 Rated for 300 psi minimum as follows:

	Part	Material	Specifications
1.	Body	Bronze	ASTM B62
2.	Cap	Bronze	ASTM B62
3.	Lever	Bronze	Commercial
4.	Disc	Teflon	
5.	Disc Holder	Brass	ASTM B16 1/4 inch & 1/2 inch
		Bronze	ASTM B62 3/4 inch to 2 inch incl
6.	Pin	Stainless Steel	Commercial
7.	Plug	Bronze	ASTM B16
8.	Retaining Ring	Stainless Steel	Commercial
9.	Disc Nut	Bronze	Commercial

G. For vertical up-flow applications in steel or copper domestic water piping, provide bronze lift check valves with threaded ends and suitable for minimum 300 psi WOG.

H. For check valves within steel piping of 2-1/2-inch size and larger, for vertical up-flow applications, Class 250 w.o.g flanged iron body flat style silent check; and for horizontal applications, Class 125 w.o.g flanged iron body horizontal swing check.

I. For check valves within copper piping of 2-1/2 inch through 4-inch size, Class 300 w.o.g bronze for horizontal or vertical installation with solder ends.

J. Pressure Reducing Valves: Watts #U5B water pressure reading valve with bronze body, bolted bonnet, integral stainless steel strainer and outlet water pressure gauge. Internal disc, diaphragm and stainless steel seat shall all be removable. Valve shall be rated for inlet water pressures up to 300 psi. Provide water pressure-reducing valves where system pressure exceeds the allowable working pressure of downstream piping, fixtures, or equipment.

K. Vacuum Breakers: Watts #288A atmospheric type vacuum breaker with brass body. Vacuum breaker shall be rated for 210 degrees F and 125 psi working pressure and shall meet ASSE Standard 1001.

L. Reduced Pressure Backflow Preventers: Reduced pressure backflow preventers shall be provided with inlet strainer, two (2) gate valves for isolation, three (3) test ports and air gap fitting. Assembly shall be rated for 110 degrees F water temperature and 175 psi water pressure. Reduced pressure backflow preventers shall be UL listed and meet USC, ASSE, and AWWA C511 standards. Watts #909 or equal by Wilkins. All valves 3" and less in size shall bronze body construction, over 3" in size shall have epoxy coated cast iron bodies. Assemblies 2" and under in size shall have threaded ends, over 2" in size shall have flange ends. Perform backflow preventer test and provide results with closeout documentation.

M. All valves and specialties in contact with potable domestic water shall be lead-free and compliant with NSF/ANSI 61 and NSF/ANSI 372.

PART 3 – EXECUTION

3.1 GENERAL

A. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling. Examine mating flange faces for conditions that might cause leakage. Check bolting for proper size, length, and material.

B. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.

C. Examine threads on valve and mating pipe for form and cleanliness.

D. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.

E. Do not attempt to repair defective valves; replace with new valves.

3.2 VALVE INSTALLATION

A. Valve installation shall meet the following:
1. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.
2. Locate valves for easy access and provide separate support where necessary.
3. Install valves in horizontal piping with stem at or above center of pipe.
4. Install valves in position to allow full stem movement.

5. Install chain wheels on operators for all butterfly valves 6" and larger and more 8 foot above floor. Extend chains to 5 foot above finished floor.
6. Install check valves for proper direction of flow and as follows:
7. Swing Check Valves: In horizontal position with hinge pin level.
8. Valves: In horizontal or vertical position, between flanges.
9. Lift Check Valves: With stem upright and plumb.
10. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

3.3 GENERAL REQUIREMENTS FOR VALVE APPLICATIONS

A. Unless otherwise indicated, provide valves with the following applications:

1. Shutoff service, 2 inches and smaller: Ball valves.
2. Shutoff service, 2-1/2 inches and larger: Butterfly valves, where acceptable for the intended plumbing service.
3. Fixture connections: Provide shutoff valves at each plumbing fixture where required by code, indicated on the Drawings, or required for servicing.
4. Equipment connections: Provide isolation valves at each piece of plumbing equipment to permit servicing or removal without shutting down the entire system.
5. Branch connections and risers: Provide shutoff valves where required to isolate portions of the plumbing system for maintenance or phased shutdown.
6. Domestic water connections to equipment: Provide shutoff valve and check valve where indicated, required by code, or required by equipment manufacturer.
7. Low points of water piping systems and bases of risers: Provide drain valves where required to permit draining of piping and equipment.
8. Dead-end service: Provide lug-style butterfly valves only where rated for dead-end service.
9. Do not use shutoff valves for throttling unless specifically indicated otherwise.
10. Domestic hot water return branches: Provide balancing valves where indicated.

END OF SECTION

SECTION 220529 – HANGERS AND SUPPORTS FOR PLUMBING PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 REQUIREMENTS

A. The Contractor's attention is directed to the General and Special Conditions, COMMON WORK RESULTS FOR PLUMBING and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. This Section includes, but is not limited to, furnishing and installing supports, anchors, and accessories for plumbing piping and plumbing equipment. Furnishing and installing shall be by each trade as required for completion of its work.

C. Power driven anchors and expansion anchors shall be permitted only when permission is granted in writing by the Architect and Engineer.

PART 2 - MATERIALS AND EQUIPMENT

2.1 Hangers, Clamps, Attachments Schedule:

A. ACCEPTABLE MANUFACTURERS: Grinnell, Elcen, Fee & Mason or approved equal.
1. All hangers, clamps and attachments shall be manufactured products.
2. Pipe Rings (2-inch pipe and smaller) – adjustable swivel split ring or split pipe ring.
3. Pipe Clevis (2.5-inch pipe and larger) – adjustable wrought clevis type.
4. Pipe Clevis (All pipe sizes) – steel clevis for insulated pipe.
5. Riser Clamps (All pipe sizes) – extension pipe or riser clamp.
6. Beam Clamps (All pipe sizes) – malleable beam clamp with extension piece.
7. Brackets (All pipe sizes) – medium weight steel brackets.
8. Concrete Inserts (All pipe sizes) – wrought or wedge type inserts.
9. Concrete Fasteners (All pipe sizes) – self-drilling concrete inserts.
10. Rod Attachments (All pipe sizes) – extension piece, rod coupling, forged steel turnbuckle
11. U-bolts (All pipe sizes) – standard u-bolt.
12. Welded Pipe Saddles (All pipe sizes) – pipe covering protection saddle sized for thickness of insulation.
13. Pipe Roll (All pipe sizes) – adjustable swivel pipe roll.
14. Protection Saddle (All pipe sizes) – 180-degree coverage, sheet metal pipe protection saddle.
15. Hanger Rods (All pipe sizes) – Steel, diameter of hanger threading.
16. Concrete Channel Inserts (All pipe sizes) – continuous heavy-duty slot inserts Unistrut.
17. Adjustable Spot Inserts (All pipe sizes) – continuous heavy-duty spot insert Unistrut.
18. Miscellaneous steel such as steel angles, rods, bars, channels, etc used in framing for supports, fabricated brackets, anchors, etc. shall confirm to ASTM A36.

2.2 HANGER RODS:

A. Hanger rods or single rod hangers shall conform to the following:

PIPE SIZE	HANGER ROD DIAMETER STEEL PIPE	HANGER ROD DIAMETER COPPER, PLASTIC, HDPE PIPE
2" and smaller	3/8"	3/8"
2-1/2" through 3-5/8"	1/2"	1/2"
4" and 5"	5/8"	½"
6"	3/4"	5/8"
8" through 12"	7/8"	3/4"
14"	1"	7/8"

B. Rods for double-rod hangers may be reduced in size, but in no case shall the minimum rod diameter be less than 3/8 inch.

C. Hanger rods and accessories installed in interior dry locations shall have ASTM B633 electroplated zinc finish.

PART 3 - INSTALLATION

3.1 REQUIREMENTS

A. Unless otherwise specified, all supporting, hanging, and anchoring of plumbing piping and plumbing equipment shall be performed by the installing trade as necessary for completion of the work and as directed in the following paragraphs.

B. Supporting and hanging shall be done so that excessive load will not be placed on any one hanger or structural member and as required to allow for proper pitch and expansion of piping.

C. Hangers and supports shall be placed near joints, turns, and branches, with additional supports provided where required to prevent sagging or excessive movement.

D. For concrete construction, utilize adjustable concrete inserts for fasteners. Expansion anchors and power-driven devices may be used when approved in writing by the Architect/Engineer.

E. Utilize beam clamps for fastening to steel joists and beams and expansion anchors in masonry construction.

F. When piping is routed in joists, piping shall be top mounted on trapeze type hangers with each pipe individually clamped to trapeze hanger. Do not support piping from bridging angles.

G. Trapeze hangers are not allowed, unless specifically approved by the Engineer.

H. Install all miscellaneous steel other than designed building structural members as required to provide means of securing hangers, supports, etc., where piping does not pass directly below or cross steel joists.

I. Piping shall not be supported by the equipment to which it is connected. Support all piping so as to remove any load or stress from the equipment.

J. Where piping, etc., is routed vertically, approved riser clamps, brackets or other means shall be utilized at approximately 10'-0" center to center minimum and an approved adjustable base stand or fitting on concrete support base shall be utilized at the base of the vertical run.

K. Where piping is routed along walls, knee braced angle frames, etc. pipe brackets with saddles, clamps, and rollers mounted on structural brackets fastened to walls or columns shall be used.

L. Support all ceiling hung equipment with approved vibration isolators.

M. Where copper tubing is specified, hangers shall be of copper clad type when piping is uninsulated.

N. Uninsulated piping hung from above shall be supported with ring and clevis type pipe hangers. Uninsulated piping mounted on trapeze and wall bracket type support shall be held in place with U-bolts. U-bolts shall allow for axial movement in the piping.

O. All insulated piping shall be supported with clevis type and pipe roll hangers. Hangers shall be sized to allow the pipe insulation to pass through the hangers. Install insulation protection saddles at all hanger locations. Welded pipe saddles shall be installed at all hangers on piping 5" and larger. The pipe saddles shall be sized for the thickness of insulation used. Hangers shall fit snugly around outside of insulation saddles.

P. Under no conditions will perforated band iron or steel wire driven hangers be permitted.

Q. Support steel and copper piping at a minimum of eight (8) foot intervals for piping 3" and smaller and ten (10) foot intervals for larger piping. Provide additional support at end of the branches and change of direction.

R. All pipes shall be supported in a neat and workmanlike manner and wherever possible, parallel runs of horizontal piping shall be grouped together on hangers. Vertical risers shall be supported at each floor line with approved steel pipe riser clamps. Spacing of pipe supports shall not exceed eight (8) foot intervals for pipes 3” and smaller and ten (10) foot intervals on all other piping. Small vertical pipes (1” and less) shall be bracketed to walls, structural members, etc. at four (4) foot intervals so as to prevent vibration or damage by occupants. Reference 220529 for additional piping support requirements.

S. Ensure that all bolts and nuts are tightened.

END OF SECTION

SECTION 220553 - IDENTIFICATION FOR PLUMBING PIPING AND EQUIPMENT

PART 1 – GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section including, but not limited to, Division 01 General Requirements.

1.2 DESCRIPTION OF WORK

A. Work of this Section includes, but is not limited to:

1. Plumbing Piping identification.
2. Plumbing Equipment identification.

1.3 QUALITY ASSURANCE

A. Piping System Identification: ANSI A13.1-2015, "Scheme for the Identification of Piping Systems."

PART 2 – PRODUCTS

2.1 TAGS AND CHARTS

A. Provide and install on appropriate valves on the plumbing system a valve tag made of bronze or baked phenolic tag fitted to each valve so that it cannot be removed. Each tag shall be embossed with an identifier. Valve numbering scheme shall be coordinated with the Engineer and reflected in Record Documents. Identifiers include bypass valves, normally open/normally closed valves, zone isolation, etc.

1. Main Isolation Valves
2. Branch Isolation Valves
3. Equipment Isolation Valves
4. Emergency Shutoff Valves
5. Balancing Valves
6. Pressure Reducing Valves
7. Thermostatic Mixing Valves
8. Reduced Pressure Backflow Preventer

B. Provide in the operation manual valve tag information indicating valve identifier, the valves service, normal position and its location.

C. All emergency shutoff valves shall be identified with a permanent engraved tag hung from the valve with 1-inch high lettering. Emergency shutoff valves shall be identified as any valve whose closure could create an emergency condition in the facility (i.e. water, domestic hot water, main valves, etc.).

D. Provide piping identification in accordance with ANSI A13.1-2015 standards.

E. Valve Tag Fasteners: 4-ply 0.018 copper or monel wire meter seals, brass "S" hooks or No. 16 brass jack chain.

2.2 PIPE MARKERS

A. Conform to ANSI A13.1-2015 and shall be pre-printed, color coded, and include flow arrows.

1. Pressure-sensitive vinyl (self-sticking) material.
2. Mechanically Fastened Type: Snap-on or strap-on or piping in damp, dirty, oily, exterior, or other locations where adhesive markers may not remain secure.
3. Provide with direction of flow arrows.
4. Provide marker size, color field length, and letter size in accordance with ANSI A13.1 for the actual outside diameter of pipe or insulation.

Outside Diameter of Pipe or Pipe Covering	**Length of Color Field**	**Size of Letters and Arrows**
3/4 to 1-1/4 inch	8 inch	1/2 inch
1-1/2 to 2 inch	8 inch	3/4 inch
2-1/2 to 6 inch	12 inch	1-1/4 inch
8 to 10 inch	24 inch	2-1/2 inch
Over 10 inch	32 inch	3-1/2 inch

2.3 EQUIPMENT NAME PLATES

A. Provide engraved limacoid, bronze, baked phenolic or engraved aluminum nameplates, black background with white or natural aluminum letters, minimum 1/16 inch thick.

1. Two 3/8-inch mounting holes.
2. Lettering size: Minimum 1/2-inch high.
3. Fasteners: Commercial quality, rust-resisting nuts and bolts with backwashers and self-tapping screws or rivets.

2.4 ACCEPTABLE MANUFACTURERS

A. Pipe and Equipment Markers

1. Craftmark Identification Systems.
2. W. H. Brady Co.
3. EMED Company, Inc.
4. Kolbi Industries, Inc.
5. 3M Co.
6. Seton Name Plate Corp.

PART 3 – EXECUTION

3.1 EQUIPMENT IDENTIFICATION

A. Provide equipment nameplates for plumbing equipment, tanks, control panels, and major accessories. Nameplate wording shall match the equipment designation used on the Drawings and equipment schedules.

1. Tag and locate all items indicated on drawing equipment schedules.

B. Equipment tags shall be engraved limacoid plates with equipment tag ID and electrical panel number and circuit number.

C. Install tags on all devices with numbers and letters corresponding to charts.

D. Fasten tags securely to devices with tag fasteners in a manner for easy reading.

E. Attach equipment nameplates in conspicuous location on item of equipment or apparatus such as starters, pumps, and control panels.

1. Secure nameplates with self-tapping screws, or nuts and bolts.

F. For unsuitable conditions, such as high temperature or lack of space, use copper or brass rings or chains to attach tags.

3.2 PIPE IDENTIFICATION

A. Soil, waste, vent, and storm drainage piping shall be identified in mechanical rooms, janitor rooms, accessible pipe spaces, and other exposed locations.

B. Install pipe markers at each valve, at each branch connection, at each riser, at wall and floor penetrations, at each pipe passage to underground, and at intervals not exceeding 20 feet on straight pipe runs, with at least one marker in each room and each story traversed by piping.

C. Identify piping service and direction of flow. Identify return piping where applicable, including domestic hot water return.

D. Install markers in accordance with manufacturer’s instructions. Install on completed insulation where applicable.

3.3 SERVICE ABBREVIATIONS

A. General

1. DCW Domestic Cold Water
2. DHW Domestic Hot Water Supply
3. DHWR Domestic Hot Water Recirculating
4. PD Pump Discharge -Sump Pump/Sewage Ejector
5. SAN Sanitary Waste
6. V Vent
7. ST Storm
8. TW Tempered Water
9. TWR Tempered Water Return

10. GW Grease Waste

END OF SECTION

SECTION 220561 - PREPARATION OF PLUMBING SYSTEMS

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section including, but not limited to, Division 01 General Requirements.

B. Comply with all applicable requirements of the governing plumbing code and local authorities having jurisdiction for cleaning, disinfection, and testing of plumbing systems.

1.2 SUBMITTALS

A. Submit reports and certifications demonstrating completion of cleaning, disinfection, testing, and verification of plumbing systems.

B. Submit disinfection report indicating date of disinfection, disinfectant used, concentration, duration of application, residual test results, and corrective actions taken, if any.

C. Submit bacteriological test results, when required by the Owner or authorities having jurisdiction, from a laboratory acceptable to the authority having jurisdiction.

D. Submit certifications for backflow preventer testing performed by personnel certified in accordance with applicable state and local requirements.

E. Submit operational verification report indicating systems tested, dates of testing, deficiencies identified, corrective actions taken, and final acceptance status.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 CLEANING AND FLUSHING

A. After completion of the domestic water distribution system and prior to placing the system into service, verify that all valves are in the proper position and capable of full operation.

B. Flush domestic water piping systems with potable water in an orderly sequence from the source toward the most remote outlets.

C. Open outlets and permit water to flow until the water runs clear and all foreign matter is removed from the system.

D. Continue flushing through branch lines and risers until the entire system has been thoroughly cleaned.

E. The A/E may witness flushing procedures and require additional flushing if, in their opinion, the system has not been adequately cleaned.

3.2 DISINFECTION OF DOMESTIC WATER SYSTEMS

A. After flushing is complete, disinfect the domestic water distribution system in accordance with the requirements of the governing authorities having jurisdiction.

B. Disinfect the system by introducing chlorine or a solution of calcium hypochlorite or sodium hypochlorite and filling the piping system slowly to achieve a concentration of 50 parts per million chlorine, as verified by residual chlorine testing at remote points in the system.

C. Open and close valves and other appurtenances during disinfection to ensure complete distribution of the disinfecting solution throughout the system.

D. Maintain the disinfecting solution within the system for a minimum period of 24 hours.

E. At the end of the 24-hour period, test for residual chlorine at remote points in the system. If residual chlorine is less than 25 parts per million, repeat the disinfection procedure until the required residual is achieved.

F. After successful disinfection, flush the system with potable water until chemical residue has been removed and the system is suitable for service.

G. If required by the Owner or authorities having jurisdiction, provide additional bacteriological testing prior to final acceptance. If test results indicate the water is unsafe, re-disinfect and retest the system until acceptable results are obtained.

H. Provide written certification that flushing, disinfection, and required corrective measures have been completed and that the system is ready for service.

3.3 TESTING OF SANITARY WASTE, VENT, AND STORM DRAINAGE SYSTEMS

A. Test sanitary waste, vent, and storm drainage systems in accordance with the governing plumbing code and the requirements of local and state plumbing inspection authorities.

B. Repair leaks and defects disclosed by testing and retest systems until satisfactory results are obtained.

C. Provide written certification that required testing has been completed and that systems are free of leaks and ready for service.

3.4 OPERATIONAL VERIFICATION

A. Verify proper operation of plumbing fixtures, faucets, flush valves, stops, pumps, alarms, backflow preventers, water pressure reducing valves, thermostatic mixing valves, water heaters, and other plumbing specialties and appurtenances provided under the Contract.

B. Verify that domestic hot water systems are operating and delivering water at intended setpoints.

C. Verify that pumps operate without excessive noise or vibration and that controls function as intended.

D. Verify that floor drains, roof drains, indirect wastes, and similar drainage components flow freely and drain properly.

E. Verify that backflow preventers are tested and certified by qualified personnel where required by code or authority having jurisdiction.

F. Document deficiencies identified during operational verification and correct deficiencies prior to final acceptance.

G. Submit written verification report indicating date of test, systems tested, personnel performing the work, deficiencies found, corrective actions taken, and final status of each system.

H. Test systems as recommended by Local and State Plumbing Inspection Authorities.

END OF SECTION

SECTION 220593 - PLUMBING SYSTEMS TESTING, ADJUSTING, AND BALANCING

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section including, but not limited to, Division 01 General Requirements.

B. Refer to Specification Section 019113 General Commissioning Requirements.

1.2 DESCRIPTION OF WORK

A. Work Includes
   1. Furnishing all labor, materials, tools, equipment, and services to test, adjust, and balance plumbing systems as indicated, in accordance with provisions of the Contract Documents.
   2. Complete coordination with work of all other trades.
   3. Performing all testing, adjusting, and balancing required to place plumbing systems into proper and fully functional operation.

B. Test, balance, and adjust following plumbing systems:
   1. Domestic Hot Water Circulating system
   2. Domestic Cold Water systems where pressure and flow is indicated
   3. Tempered Water System
   4. Domestic Hot water heating system

1.3 QUALITY ASSURANCE

A. Agency Qualifications: Independent testing and balancing agency specializing in testing and balancing of hydronic and domestic water systems, and certified by the Associated Air Balance Council (AABC) or the National Environmental Balancing Bureau (NEBB).

B. Personnel Certification: Supervisors and technicians performing the Work shall be currently certified by AABC or NEBB for water balancing procedures applicable to the systems specified.

C. Balancing Standards: Perform testing and balancing procedures in accordance with the applicable requirements and recommendations of AABC or NEBB.

D. Instrument Calibration: Accurately calibrate all test instruments and maintain in good working order. Instruments shall have been calibrated within the last 12 months by an independent laboratory traceable to NIST standards. Maintain calibration records at the Project site and submit copies with final report.

1.4 SUBMITTALS

A. Submit the following in accordance with Division 01 requirements:
   1. Testing and balancing agency qualifications.
   2. Current certification documentation for firm and personnel performing the Work.
   3. List of test instruments to be used, including most recent calibration dates.
   4. Preliminary TAB procedures and report forms proposed for use on this Project.
   5. Preliminary deficiency report identifying conditions preventing proper testing and balancing.
   6. Final certified TAB report.

B. Submit final report signed by the certified TAB supervisor responsible for the Work.

1.5 RESPONSIBILITIES OF TESTING AND BALANCING AGENCY WORK

A. Schedule Work with trades involved.

B. Check, adjust, and balance system components to obtain optimum conditions for function and operation of system.

C. Evaluate operation of systems and advise installer of necessary adjustments and corrective measures.

D. Report in writing any conditions preventing proper balancing including, but not limited to, incomplete systems, air-bound piping, dirty strainers, improper pump rotation, non-functioning controls, missing balancing devices, inaccessible valves, missing test ports, or defective equipment.

E. Balance to within plus or minus 10 percent of set point of balancing valves or pumps unless otherwise indicated.

F. Prepare and submit test reports.

G. Recheck systems after corrections have been made and revise reports accordingly.

1.6 RESPONSIBILITIES OF PLUMBING CONTRACTOR'S WORK

A. Start systems and maintain correct operation during balancing operations.

B. Clean strainers prior to balancing system.

C. Vent all air from piping systems and place systems in full normal operation prior to balancing.

D. Verify that pumps, water heaters, water pressure booster systems, thermostatic mixing valves, aquastats, temperature controls, alarms, and associated accessories are installed, connected, and operating properly prior to balancing.

E. Make personnel accessible to provide necessary adjustments and corrections to systems as directed by balancing agency.

F. Maintain accessibility to test locations and devices requiring adjustment.

G. Provide to the Testing and Balancing Agency a complete set of approved Shop Drawings and submittals and a posted set of Plumbing Drawings indicating any and all changes to the Contract Documents.

H. Install all required balancing valves, pressure gauges, thermometer wells, test plugs, flow measuring devices, and other required accessories prior to start of TAB Work.

I. Complete piping flushing, cleaning, sterilization, and disinfection procedures where applicable before TAB Work begins.

1.7 JOB CONDITIONS

A. Balance at time directed by General Contractor and Owner's Representative.

B. Do not begin TAB Work until systems have been completed, tested, cleaned, and are in full operation.

C. Perform testing and balancing only when systems can be operated under normal load and occupancy conditions to the greatest extent possible.

1.8 GUARANTEE

A. Provide extended warranty of 90 days, after completion of test and balance work, during which time the CM/Owner may, at their discretion, request recheck or resetting of any equipment or system which is not performing satisfactorily. Provide technicians to assist as required in making such tests.

1.9 CLOSEOUT DOCUMENTATION

A. Submit final certified TAB report as part of closeout documents.

B. Include final settings of all balancing valves, pump data, temperatures, pressures, flows, control setpoints verified during TAB, and all deficiency and corrective action records.

C. Provide marked record documentation identifying final balancing positions and settings for each device adjusted.

D. Submit copies of all instrument calibration certificates with final TAB report.

E. Submit final report to Engineer, Owner, CM, and Commissioning Authority where applicable.

PART 2 - PRODUCTS (NOT USED)

PART 3 - EXECUTION

3.1 GENERAL

A. Accurately calibrate and maintain all test instruments in good working order.

B. Do not begin balancing until the system(s) have been completed and are in good order.

C. Record all inspections, tests, and adjustments.

D. Verify that systems are free of air, strainers are clean, valves are open or in proper operating position, and equipment is operating correctly prior to balancing.

E. Notify Contractor and Engineer in writing of any conditions preventing proper testing and balancing.

3.2 WATER BALANCE PROCEDURE

A. Open all valves to full open position unless otherwise required for proper system operation.

B. Check pump rotation.

C. Check expansion tanks to determine they are not air-bound.

D. Check for installation and proper operation of manual and automatic air vents.

E. Check hot and cold water supply temperatures and return water temperatures at mains. Reset to correct design temperatures where required and where controls are adjustable by this Contractor.

F. After completing balancing valve adjustments to set points noted on Drawings, test hot and cold water pressures and flows at pumps and re-adjust if required.

G. Check the following in domestic hot and cold water systems:
   1. Leaving water temperature at water heater.
   2. Leaving water temperature at thermostatic mixing valve.
   3. Pressure of domestic cold water at water service entrance.
   4. Pump operating suction and discharge pressures and final total dynamic head.
   5. Water metering device readings where provided.
   6. Domestic hot water return temperatures at each recirculation branch or as many locations as required to verify system balance.
   7. Water temperature and pressure at the most remote fixtures and highest fixtures indicated for verification.

H. Adjust domestic hot water recirculation balancing valves to achieve design flow and/or intended return temperature at each branch.

I. For booster pump systems, verify cut-in pressure, cut-out pressure, lead-lag sequence, and pump operation through full operating range.

J. List all mechanical specifications of pumps.

K. Record nameplate data and actual operating amperages of pump motors.

3.3 OPERATING TEST

A. After systems are balanced, conduct operating test of not less than 8 hours' duration each for domestic hot (and cold) water systems to demonstrate to satisfaction of the CM/Owner that systems comply with requirements of plans and specifications, and that all equipment and controls are functioning properly.

B. Upon completion of and prior to acceptance of the installation, the Contractor shall subject the plumbing system to operating tests to demonstrate satisfactory functional and operational efficiency. Such operating tests shall cover a period of not less than 8 hours for each system and shall include the following information in a report with conclusion as to the adequacy of the system:
   1. Time, date, and duration of test.
   2. Water pressure at the most remote and the highest fixtures.
   3. Operation of each fixture and fixture trim.
   4. Operation of each valve, hydrant, and faucet.
   5. Pump suction and discharge pressures.
   6. Temperature of each domestic hot water supply.
   7. Operation of each floor and roof drain by flooding with water.
   8. Operation of each vacuum breaker and backflow preventer.
   9. Complete operation of each water pressure booster system (when applicable), including pump start pressure and stop pressure.
   10. Final balancing valve settings and temperature readings at representative return branches.
   11. List of deficiencies encountered and corrective measures taken.

3.4 FINAL REPORT

A. Final TAB report shall include, as a minimum, the following:
   1. Project name and location.
   2. Name of testing and balancing agency.
   3. Names and certification numbers of personnel performing the Work.
   4. Dates testing and balancing was performed.
   5. List of instruments used and calibration dates.
   6. Identification of each system tested.
   7. Pump schedule including manufacturer, model number, size, speed, motor horsepower, design flow, and actual operating data.
   8. Recorded suction pressure, discharge pressure, and calculated total dynamic head for each pump tested.
   9. Entering and leaving water temperatures for water heaters, mixing valves, recirculation loops, and other devices tested.
   10. Pressures and temperatures at water service entrance, remote fixtures, highest fixtures, and other points required by the Contract Documents.
   11. Final balancing valve settings for each valve adjusted.
   12. Statement of compliance or non-compliance with specified tolerances.

13. Deficiencies noted and corrective actions taken.
14. Signature of certified TAB supervisor attesting to accuracy and completeness of report.

END OF SECTION

SECTION 220700 - PLUMBING INSULATION

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section including, but not limited to, Division 01 General Requirements.

1.2 DESCRIPTION OF WORK

A. Work of this Section includes but is not limited to.
   1. Pipe insulation.
   2. Equipment insulation.
   3. Insulation adhesives, mastics and caulking.

B. Definitions
   1. Concealed Insulated Surfaces: Piping and equipment in walls, partitions, floors, pipe chases, pipe shafts, duct shafts, sealed interstitial spaces, and above suspended ceilings.
   2. Exposed Insulated Surfaces: Piping and equipment located in mechanical rooms, tunnels, and rooms/spaces without suspended ceilings.

1.3 QUALITY ASSURANCE

A. Comply with fire and smoke hazard ratings indicated.
   1. Fire and smoke hazard ratings shall be as determined by ASTM E84, NFPA 255, or UL 723.
   2. Accessories including adhesives, mastics, cements, tapes, and glass fabric shall have flame-spread and smoke-developed ratings equal to or better than the insulation being installed.
   3. Following are the rating requirements:
      a. Flame spread (maximum): 25
      b. Smoke developed (maximum): 50
      c. Products or shipping cartons shall bear appropriate labels identifying flame-spread and smoke-developed ratings.
      d. Where prohibited by code or local authorities, do not use elastomeric insulation in return-air plenums or other environmental air plenums.

B. Provide plumbing insulation in accordance with applicable energy code requirements and minimum insulation thicknesses required by the governing code, except where more stringent requirements are indicated on the Drawings or specified herein.

C. Cold piping insulation systems shall be installed with continuous vapor barrier protection and sealed joints, seams, penetrations, and terminations to prevent condensation.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Glass Fiber Pipe Covering, Calcium Silicate, and Thermal Insulating Wool: John Manville, Owens-Corning, Knauf or approved equal.

B. Fire-Retardant Adhesive: John Manville, Benjamin Foster, 3M, Insul-Coustic or approved equal.

C. Lagging Adhesive: John Manville, Benjamin Foster, 3M, Insul-Coustic or approved equal.

D. Elastomeric Pipe Insulation and Equipment Covering: Armacell, K-Flex, Aeroflex USA, or approved equal

E. Insulated Fitting Covers: John Manville, Certain-Teed, Knauf, or approved equal.

F. Insulation Caulking: Dow 790, Dow 732, or manufacturer's recommended compatible sealant.

2.2 GENERAL

A. Provide fire and smoke hazard ratings as indicated for entire composite (insulation, jacket or facing, and adhesive used to adhere the facing or jacket to the insulation).

B. Do not use material that exceeds specified flame and smoke ratings.

C. Use permanent treatments to jackets or facings to impart specified fire ratings.

D. Use of water-soluble treatments is prohibited.

E. At hangers and supports, provide insulation protection saddles, shields, inserts, and vapor-barrier protection as required by Section 'Hangers and Supports for Plumbing Piping and Equipment' and manufacturer's recommendations.

2.3 PIPE INSULATION, NON-FLEXIBLE

A. Pipe Insulation, Non-flexible
   1. Glass fiber pipe insulation with factory-applied all-service jacket (ASJ), maximum thermal conductivity of 0.23 Btu-in./hr-sq. ft.-deg F at 75 deg F mean temperature.
   2. Apply to the following piping in thickness indicated:
      a. Domestic Cold Water, Tempered Water (potable & non-potable):
         1) Runouts to fixture (less than12 feet)..…….....1/2 inch
         2) 1-1/4 inch and smaller.....…….....1/2 inch
         3) 1-1/2 and larger.....…….....1 inch
      b. Domestic hot/recirculating water (thru 140 deg F): (potable and non-potable)
         1) 1-1/4 inch and smaller……..1 inch
         2) 1-1/2 inch and larger…….....1-1/2 inch

c. Horizontal rain leaders, including 24 inches above and below horizontal offsets and to underside of roof deck, shall receive 1-inch insulation

2.4 INSULATION FOR DOMESTIC WATER HEATER STORAGE AND SWING TANKS

A. Insulation for Domestic Water Heater Storage Tanks
   1. O-C Type 703 fiberglass board, 2 inch thickness, 3.0 pcf density, unfaced.
   2. Thermal conductivity (K value): Not greater than 0.23 at mean temperature of 75deg F.
   3. Apply to all domestic water heater storage tanks, and swing tanks except when specified as factory-insulated.

2.5 INSULATION FOR COLD EQUIPMENT

A. Insulation for Cold Equipment
   1. Armstrong Armaflex II sheet insulation; 3/4 inch material installed in 2 layers with joints staggered, 1-1/2 inch total.
   2. Thermal conductivity (K value): Not greater than 0.27 at mean temperature of 75 deg F.
   3. Apply to following equipment in thickness indicated:
      a. Domestic water meter.....…….....3/4 inch
      b. Roof drain bodies.....……3/4 inch

2.6 INSULATION ACCESSORIES

A. Provide all accessory materials required for complete installation of insulation systems, including cements, adhesives, mastics, coatings, tapes, sealing compounds, fitting covers, jackets, bands, shields, saddles, and inserts. Accessories shall be compatible with insulation materials, jackets, and service conditions.

B. ASJ Tape: Provide pressure-sensitive tape matching the insulation jacket, suitable for sealing joints in ASJ jacketed insulation

C. PVC Fitting Covers and Jackets: Provide pre-molded polyvinyl chloride fitting covers and jacketing, with matching accessories, for valves, fittings, flanges, unions, and specialties where indicated or where required for a neat, durable finish.

D. Bands for Outdoor Jackets: Provide stainless steel or aluminum bands, seals, and clips for securing aluminum jackets on insulated piping exposed to weather.

E. Insulation Shields and Saddles: Provide galvanized steel or stainless steel protection shields and saddles at hangers and supports to prevent compression of insulation. Provide insulation inserts where required to maintain the integrity of the insulation and vapor barrier system.

F. Vapor Barrier Lap Adhesive: Provide fire-resistant vapor barrier lap adhesive compatible with insulation jacket and vapor retarder materials, for sealing laps, joints, seams, penetrations, and terminations in cold piping insulation systems.

G. Outdoor Aluminum Jacket: Provide aluminum jacket with moisture barrier for insulation installed outdoors, complete with matching fittings, bands, and accessories for a weatherproof installation.

H. Insulation Inserts: Provide load-bearing insulation inserts, same thickness as adjacent insulation, at hangers and supports on insulated piping where required to prevent compression of insulation and maintain vapor barrier continuity. Inserts shall be suitable for the pipe size, insulation thickness, and service conditions.

I. Protection Shields: Provide galvanized steel protection shields at hangers and supports for insulated piping. Shields shall be of length and gauge recommended by insulation manufacturer for the application.

PART 3 - EXECUTION

3.1 APPLICATION - GENERAL

A. Do not insulate piping until satisfactory completion of required pressure tests.

B. Apply insulation only to clean, dry surfaces and in strict accordance with manufacturer’s installation instructions.

C. Butt insulation tightly together. Seal longitudinal and end joints with compatible jackets, facings, tapes, and adhesives to maintain continuous thermal and vapor barrier integrity.

D. Apply adhesives, mastics and coatings per manufacturer's recommendations and as specified.

E. Provide continuous vapor barrier at hangers, supports, anchors, and other penetrations on cold piping and cold equipment.
   1. Adequately insulate and vapor seal hangers, supports, and anchors that are secured directly to cold surfaces to prevent condensation.

F. Continue insulation through sleeves, wall penetrations, and ceiling penetrations unless otherwise prohibited by firestopping or code requirements. Coordinate insulation terminations at fire-rated assemblies with firestopping requirements.

G. Insulate all fittings, valve bodies, flanges and other pipeline accessories.

H. At hangers and bracing, install in accord with Division 22 Section “Hangers and Supports for Plumbing Piping and Equipment”.

I. Provide insulation inserts and protection shields at pipe hangers, supports, and clamps to prevent compression of insulation. Maintain continuous insulation and vapor barrier at cold piping supports.

J. Provide removable and reusable insulation blankets, pads, or covers on valves, strainers, pressure reducing valves, heat exchangers, pumps, specialties, and other components requiring access for maintenance, operation, or inspection. Blanket insulation shall provide thermal performance equivalent to adjacent insulation and be securely fastened for neat reinstallation after removal.

K. Do not insulate unions, cleanouts, relief valve discharge piping terminals, access panels, balancing devices requiring adjustment, equipment nameplates, tags, labels, or operating and safety devices where insulation would interfere with operation, maintenance, inspection, or identification. Carefully terminate insulation at such locations.

L. Replace insulation that is wet, damaged, compressed, stained, or improperly installed. Patched insulation will not be permitted where, in the opinion of the A/E, the vapor barrier or thermal performance has been compromised.

3.2 APPLICATION OF NON-FLEXIBLE PIPE INSULATION

A. On piping, install with lap joint attached using outward clinching staples, 3-inch centers, 1/4 inch from edge on hot piping.
   1. On cold piping, use self-sealing lap system or adhesive applied to both surfaces per manufacturer's recommendation.
   2. Do not staple cold piping.
   3. Butt adjoining sections of insulation tightly together and continue jacket by installing self-sealing lap closures and butt strips in accordance with manufacturer’s recommendations.

B. Installation of Insulation of Fittings
   1. For pipe sizes 2 inches and smaller, finish with mineral fiber cement to thickness of adjoining pipe insulation.
   2. Over 2 inches, insulate with mitered pipe insulation segments or preformed fiberglass fittings secured with vinyl faced insulation strapping tape or 18 ga galvanized annealed wire and finished with one coat of mineral fiber cement.
   3. Finish fitting insulation with glass cloth and mastic or with premolded fitting covers in accordance with manufacturer’s recommendations.
   4. Prefabricated fitting covers approved for use at pipe fittings may be used instead of finishing method outlined above.
   5. Install in accordance with manufacturer's recommendations.

C. Cover all insulated piping exposed to weather with additional jacket of 0.016-inch smooth aluminum with moisture barrier.
   1. Apply aluminum jacket with 0.020-inch x 3/8-inch aluminum bands on 9-inch centers, minimum 2-inch lap joint.
   2. Provide weatherproof aluminum jacketing over insulated piping exposed outdoors.
   3. Use Ceel-Co 300 Series plastic jacketing applied per manufacturer's recommendations.

D. Reinforce jackets on insulated piping in mechanical rooms and central plant less than 8 ft. above floor.
   1. Cover with 0.030 inch PVC jacket conforming to 25-50 fire requirements.

3.3 APPLICATION OF INSULATION ON HOT EQUIPMENT

A. Install insulation on hot plumbing equipment in accordance with manufacturer’s recommendations.
   1. Install insulation with lap joint attached using outward clinching staples, 3-inch centers, 1/4 inch from edge.
   2. Butt adjoining sections of insulating tightly together and continue jacket by installing self-adhering butt strips over entire joint.

3. Insulate flanges and fittings with mineral fiber cement.
4. Finish body with 0.016-inch aluminum jacket. Reinforce end and irregular surfaces with Glass Fab embedded in 2 coats of Foster 30-36 adhesive.

3.4 APPLICATION OF INSULATION ON DOMESTIC WATER HEATER STORAGE TANKS WHEN TANKS NOT FACTORY-INSULATED

A. Install insulation with lap joint attached using outward clinching staples, 3-inch centers, 1/4 inch from edge.

B. Butt adjoining sections of insulating tightly together and continue jacket by installing self-adhering butt strips over entire joint.

C. Insulate flanges and fittings with mineral fiber cement.

D. Finish body with 0.016-inch aluminum jacket. Reinforce end and irregular surfaces with Glass Fab embedded in 2 coats of Foster 30-36 adhesive.

3.5 APPLICATION OF INSULATION ON COLD EQUIPMENT

A. Apply with Armstrong 520 adhesive covering entire surface as well as back of insulation.

B. Coat all butt edges and press firmly together with 1/8-inch overlay pressure.

C. Apply two (2) coats of Armstrong Armaflex finish over sheet surfaces.

D. On cold piping systems, maintain continuous insulation and vapor barrier over the full insulated surface. Seal all joints, seams, laps, penetrations, and terminations vapor-tight. Insulation installation shall prevent condensation under all operating conditions.

END OF SECTION

SECTION 221116 - PLUMBING PIPING

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section including, but not limited to, Division 01 General Requirements.

1.2 DESCRIPTION OF WORK

A. This Section applies to non-potable and potable cold water, hot water, hot water recirculation, and tempered water piping.

1.3 EQUIPMENT BY OTHERS

A. Include all necessary roughing-in and final equipment connections by plumbing trade as required.

B. Wherever equipment is furnished and set in place under Work of another Section or by Owner, they shall furnish detailed Drawings and exact rough-in dimensions and locations at the Site.
   1. Information shall be furnished sufficiently in advance to allow proper installation of all required services.
   2. If information is not furnished sufficiently in advance to permit proper rough-in and coordination, promptly notify the Architect/Engineer. Coordinate final locations prior to installation.
   3. This Division shall include all required service rough-ins and final connections to the equipment.

1.4 QUALITY ASSURANCE

A. General
   1. Provide all supervision, labor, tools, materials, equipment, accessories and specialties necessary to completely install, clean and test the plumbing systems.
   2. All materials shall be free from defects impairing strength and durability and shall be of the best quality for the indicated purposes. All Work shall have structural properties sufficient to solely sustain or withstand strain and stresses to which it is normally subjected; all Work shall be true to detail.

B. Codes and Standards (Division 22 Section “Common Work Results for Plumbing” Listings and the following).
   1. Plumbing installation shall be in accordance with the state of Connecticut and local Trumbull plumbing code, and all other codes having jurisdiction.
   2. American Standard Code for Pressure Piping ANSI B31.1
   3. National Association of Corrosion Engineers

4. American National Standards Institute (ANSI)
5. American Society of Mechanical Engineers (ASME)
6. American Society for Testing and Materials (ASTM)
7. American Water Works Association
8. Manufacturer's Standardization Society of the Valve and Fitting Industry
9. Plumbing and Drainage Institute
10. State of Connecticut or local Plumbing Code, as applicable.
11. State of Connecticut or local Building Code, as applicable.
12. 42 USC 300G: The Reduction of Lead In Drinking Water Act.

C. Material Standards
1. ASTM B32-20: Specification for Solder, Metal Sizes.
2. ASTM B42-25: Specification for Seamless Copper Pipe, Standard Size.
3. ASTM B75/B75M-26-: Specification for Seamless Copper Tube.
4. ASTM B88-22: Specification for Seamless Copper Water Tube.
5. ASTM B251/B251M-25: Specification for General Requirements for Wrought Seamless Copper and Copper-Alloy Tube.
6. ASTM B302-17: Specification for Threadless Copper Pipe.
7. ASTM A53/A53M-24: Specification for Pipe, Steel, Black and Hot Dipped, Zinc-Coated Welded and Seamless.
8. AWWA C651-23: Standard for Disinfecting Water Mains.

1.5 HANDLING, DELIVERY, AND STORAGE

A. General
1. Handling, delivery, and storage shall be in accordance with the manufacturer's recommendations.
2. No extra cost shall be charged the Owner for handling, delivery, or storage.
3. In no case shall the pipe or appurtenance be dumped, dropped, or thrown.

1.6 JOB CONDITIONS

A. Coordinate the exact location of this work with the work of other trades prior to fabrication and installation. Verify all dimensions and elevations. Provide additional offsets and a section of piping as required to meet job conditions. Coordinate with and review all related Drawings of all trades prior to start of work.

B. All uninsulated piping and fittings exposed to public view in kitchen and servery shall be chrome-plated or stainless steel. All piping and fittings in kitchen not exposed to public view shall be chrome-plated or painted with high-temperature aluminum paint.

PART 2 - PRODUCTS

2.1 PIPING

A. General
1. The outside of all piping and fittings shall bear the Manufacturer's standard marking for type, pressure, etc.
2. The A/E does not guarantee the accuracy of the figure numbers as listed.

B. Pipe - General
1. All pipe and fittings shall be equal to or better than the grade specified.
2. All piping material shall be new and free from defects and shall be subject to standard mill test before being shipped.
3. Pipe shall be labeled.
4. Fittings and valves shall have the Manufacturer's name or trademark legibly raised or cut into each piece.
5. All pipes shall be cut off even and reamed full bore. Threads shall be cut smooth, true and to full standard size. Piping shall be installed clean of chips, burrs, or oil.
6. No salvaged or used pipe shall be used without the written approval of the A/E or Owner. Wherever such approval is given, recut the ends of the pipe, square, cut new threads on screwed pipe, and thoroughly clean the pipe of all rust, dirt, scale and foreign matter before installation.

C. Pipe 4-inch Size and Smaller
1. Pipe: Copper tube, seamless, type L hard temper, ASTM B-88, above ground, and type K soft temper, 2-inch and smaller, below ground.
   a. Fittings: Cast brass or wrought copper, solder type, ASTM 75, ANSI B16.22, or B16.18.
   b. Joints: Soldered, 95-5 tin-antimony solder above ground, and silver solder below ground.
   c. Unions: Sweat-end, 150 lb. cast brass, ground joint.
   d. Mechanically formed tee connections and couplings, such as T-drill, are acceptable. All joints shall be brazed with brazing material conforming to AWS A5.8 Classification BCUP-3 or BCUP-4.
   e. Copper press fittings may be used as an option, per ASTM B16.18 or ASTM B16.22. O-rings shall be EPDM. Copper press fittings to be equal to ProPress as manufactured by Viega or Nibco Press System.
   f. For 2-1/2-inch through 4-inch Type L copper piping above ground, the use of a grooved piping system including couplings, reducers, elbows, tees, and flange adaptors that are certified and approved by BOCA, IAMPMO, SBCCI, and UL for up to 300 psig working pressure and up to 230 deg F operating temperature is acceptable. All copper piping shall be roll grooved.

D. Pipe 5-inch Size and Larger
1. Pipe: Galvanized steel, Schedule 40, ASTM A-120 or A-53.
   a. Coating: Hot-dipped galvanized inside and outside.
2. Fittings
   a. Threaded, galvanized, 125 lb. SWP, ANSI B16.4.

b. Galvanized flanged, 125 lb. C I, ANSI B16.1.

3. Joints: Threaded, galvanized 125 lb. C I, ANSI B16.1, Victaulic, Aeroquip or Stockham.
4. Unions: Same as joints.
5. Gaskets: 1/16-inch-thick rubber. Type of gaskets selected shall protect ends of galvanized pipe and be as recommended by piping and joint manufacturers for the specific applications, temperatures and water conditions.
6. Also acceptable for 4 inch and larger galvanized steel, Schedule 40 piping above ground, is the use of a Victaulic grooved piping system including couplings, reducers, elbows, tees, and flange adaptors that are certified and approved by BOCA, IAPMO, SBCCI and UL for up to 300 psig working pressure and up to 230 degrees F operating temperature.
7. Also acceptable for 5-inch and larger is the use of copper piping, similar to the data listed for copper pipe 4-inch size and smaller.

E. Pipe and Fittings 3-inch and Larger (Underground)
1. Ductile Iron Pipe
a. Pipe: Conform to AWWA C151.
b. Cement-mortar lining: Conform to AWWA C104.
c. Protective coating outside: Bitumastic or coal tar enamel.
d. Thickness class: 53.
e. Pressure class: 350 psi
f. Joints: Mechanical or push-on, conform to AWWA C111.
g. Fittings
1) Gray iron or ductile iron
2) Full body: Conform to AWWA C110, or
3) Compact: Conform to AWWA C153.
4) Class
5) 250 or 350 up to 24-inch diameter.
6) Bituminous coating: Inside and outside.
7) Cement lining: Conform to AWWA C104.
8) Polyethylene encasement.
9) Conform to AWWA C105.
10) Thickness: 8 mil.

2.2 PIPING AUXILIARIES/SPECIALTIES

A. General: All auxiliaries and specialties shall be guaranteed by the manufacturer for the pressure, temperature and materials being handled. All auxiliaries and specialties shall be suitable for the piping to which they are attached.

B. Interior Hose Bibbs
1. Manufacturers:
a. Woodford, Prier, Crane, Nibco, or Red-White.

C. Wall Hydrants
1. Manufacturers: Josam, J.R. Smith, Mifab, Wade, Woodford, or Zurn.

D. Hose Valves
1. Manufacturers:

a. NIBCO, Harvel, or Spears.

E. Water Meter
1. Meter is purchased from the utility company and installed by the Plumbing Contractor.
2. Provide meter installation meeting utility company requirements.

F. Strainers
1. Manufacturers: Sarco, Anderson, Armstrong, Crane, or Watts.
2. Sarco type BT or BF-150, bronze body with stainless steel screen. Provide drain valve on strainer.

G. Washer Connection Boxes
1. Manufacturers: Guy Gray, Oatey, Water-Tite, or Acorn.
2. Guy Gray Co. Model No. FB-200 (bottom supply) or #FBB-200TS (top supply) with 1/2-inch combination MPT brass sweat connection, 1/2-inch hose end valves, 2-inch drainpipe and overflow guard.
3. Where boxes are installed in concrete block walls, Contractor shall provide a stainless steel or chrome-plated trim on box so that it is flush with wall. No concrete block shall be exposed within enclosure. All exposed screws to be vandalproof.

H. Water Hammer Arresters
1. Manufacturers: Josam, Mifab, Wade, J.R. Smith, Watts, or Zurn.
2. Josam type “Absorbatron”.
3. Meet the requirements of PDI Standard WH-201 for size and location.
4. Size of unit shall be clearly indicated on unit.

I. Vacuum Breakers and Dual Checks
1. Manufacturers: Watts, Chicago Faucet, Febco, Wilkins, Conbraco, or Woodford.
2. Hose Connections: ASSE 1011, Watts #8A, 3/4-inch hose thread. (#8AC in finished areas).
3. Ice Machines: ASSE 1024, Watts Series 7 with two chrome nickel plated brass replaceable dual checks for 3/8 inch through 1 inch size.
4. Coffee Maker: ASSE 1022, Watts SD-3 with stainless steel body, dual checks, wye strainer and drain port for 1/4 inch through 3/8-inch size. Pipe drain port to drain and terminate with air gap.

J. Backflow Preventers
1. Manufacturers: Watts, Conbraco, Febco, Wilkins, Zurn, Ames, or Mifab, .
2. Pipes 1-1/2 inch and Smaller: ASSE 1013, Watts LF009 Series, all bronze, lead free, reduced-pressure-type with two ball valves. Provide strainer upstream.
3. Pipes 2 inch and Larger: ASSE 1013, Watts 957 Series, lead free, reduced-pressure-type with two check valves, pressure relief valve, and two ball (2-inch size) or gate valves. Provide strainer upstream.
4. Backflow preventers shall be serviceable without removal from pipeline.
5. Provide indirect drain with air gap fitting.

K. Trap Primer
1. Manufacturers: Josam, J.R. Smith, Wade, Zurn, Watts, or Mifab.
2. Mifab M-500 trap primer with M1-DU distribution unit as required.

3. Provide 1/2 inch soft type K copper pipe from the trap primer distribution devices to the trap primer inlet of the floor drains.
4. Trap primer shall require no greater than 3 psi to activate.

L. Trap Primer Manifold System
1. Precision Plumbing Products “Prime-Time” electronic trap priming manifold with atmospheric vacuum breaker, solenoid valve, water hammer arrestor, 3/4-inch copier manifold with 1/2 inch compression fitting taps, and 24-hour timer all installed in a 16 ga. steel enclosure with prime-coated access door and screwdriver door latch.
2. Provide 1/2-inch soft type “K” copper pipe from the trap primer distribution system to the trap primer inlet of the floor drains.
3. Electrical Contractor to provide 120 volt, one-phase, power to unit.
4. See noted data on Plans relating to locations of distribution systems and number of outlets required at each system.
5. Manufacturer: Precision Plumbing Products, Mifab, or Zurn.

M. Trap Seal Protection Devices
1. Subject to compliance with requirements, provide SureSeal Manufacturing; Inline Floor Drain Trap Sealer or approved equal.
2. Standard: ASSE 1072-2007
3. Body: ABS Plastic
4. Diaphragm & Sealing Gasket: Neoprene Rubber
5. Size: 2 inch (50 mm), 3 inch (75 mm), 4 inch (100 mm).
6. Gravity Drain Outlet Connection: Compression fit sealing gasket 80 durometer.

N. Domestic Water Valve Cabinet
1. 16-inch x 16 inch x 4 inch deep recessed cabinet with 1 inch flange all around flush with wall.
2. Cabinet shall be constructed of 18-gauge, 304 stainless steel with #3 polished finish.
3. Cabinet shall have continuously hinged door (gasketed) with keyed cam lock. Door shall be same construction as cabinet.
4. Cabinet to be manufactured by Karp Associates, Inc., Milcor, Mifab, Wilconsin Co., or equal.

O. Drain Valves: Powell 502-HS with cap and chain, or equal by Hammond, Keystone, or Watts.

P. Water Pressure Regulator: Cash Acme type E-55, or equal by Cla-Val, Conbraco, Mifab, Watts.

Q. Gauge Cocks: Powell Fig. 757, or equal by Anvil, Waltec, Victaulic, White Rogers.

R. Hot Water Balancing Valves.
1. Manufacturers:
   a. ½” up to 2”: Circuit Solver CSUA (no exceptions).
   b. 2 ½” and larger: Sarco W-SS-6, Flow Design Model (FDI) Model UA, Griswold or Tour Anderson (TA) Combination Balancing/Shut-Off.

1. Manual throttling venturi with union, chrome-plated ball, teflon seats, blowout-proof stem, adjustable memory stop, dual pressure and temperature ports, threaded or soldered connections, brass body, 600 psig at 205 deg F, ±3 percent accuracy.

S. Relief Valves

1. ASME tested and certified.
2. Shall have capacity to handle 100% of service.
3. Shall be set at 10% above the working pressure of equipment or service to which it is connected, or as noted.
4. Shall be iron body with stainless steel trim, renewable discs and seat rings, slow-opening-type.
5. Discharge shall be piped to nearest floor drain and arranged for safe discharge.
6. Manufacturers: Consolidated, Farris, Leslie, Lonergan, Manning-Maxwell-Moore.

T. Temperature Regulators
1. ASME-coded.
2. Shall be pilot operated, of packless construction, for dead-end service.
3. Main valve shall be cast iron body, single-seated, with SECO metal seat, normally closed and guaranteed to shut tight.
4. Shall have an adjustable bi-metal thermostat, with a bronze or stainless-steel bulb suitable for the application. Shall be complete with gages.
5. Shall be sized to meet the capacity and service indicated.
6. Shall be installed with strainer, shut-off valves.
7. Manufacturers: Spence Engineering Co., Fisher, A W Cash, McLear.

U. Temperature and Pressure Relief Valves
1. ASME-coded
2. All-bronze construction with seat-to-disc alignment that will not stick or freeze.
3. Shall start to open at 230 deg F and shall be fully open at 240 deg F.
4. Shall have snap action thermostat and sensing bulb sized to water heater Manufacturer's recommendations
5. Manufacturers: Watts, McDonnel, Wilkins, Conbraco.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. Comply with Division 22 Section “Common Work Results for Plumbing”, as well as the requirements of Division 22 Sections “Hangers and Supports for Plumbing Piping, and “Plumbing Insulation”.

B. Piping shall be installed in a manner which permits easy removal of valves and disconnection of equipment. Unions or flanged joints shall be installed for this purpose.

C. Piping shall be installed, supported, guided, and anchored to properly provide for movement due to expansion and contraction without undue strains on the joints and in such a manner that it will not sag, buckle or sway.

D. Piping shall not be supported from other pipes, conduits, ducts or similar installations.

E. No piping shall be supported by the equipment to which it is connected. Install base elbows, hangers or other approved independent method of support for the pipe.

F. Connections to equipment shall be arranged to facilitate ease of removal and service without dismantling of the runouts of main piping, and shall be installed by the use of multiple elbows or other similar methods to minimize strain on the equipment connections.

G. No field-fabricated welding fittings shall be permitted. All welding tees, elbows, reducers, and caps shall be commercially manufactured products.

H. Do not obstruct passageways, headroom, door and window operation, and similar areas with the installation of the piping.

I. All open ends of pipes, including equipment connections, shall be properly sealed at all times during installation to keep dirt and all foreign material out of the piping. Plugs used shall be commercially manufactured products.

J. Pipe size reductions shall be made with factory-fabricated eccentric reducers or reducing fittings and shall be installed in a manner which does not cause pocketing or inhibit the flow of the material.

K. Install shut-off service valves with unions on all connections to equipment and on each side of control valves as required for ease of proper servicing and maintenance; see Division 22 Section "General Duty Valves for Plumbing Piping".

L. Unless otherwise indicated, the discharge from pressure-and temperature-relief valves and equipment drains shall be piped to the nearest floor drain, hub drain, or mop sink, installed with an approved air gap as required, and arranged for safe discharge.

M. No pipe shall penetrate any structural member without the written approval of the A/E. Where such penetration is allowed, the structural member shall be reinforced subject to the approval of the A/E.

N. Flanges and Gaskets
   1. Where forged steel flanges are to be bolted to cast iron flanges, a smooth or flat-face forged steel flange with a full-face gasket shall be used.
   2. All gaskets, other than teflon envelope or full-face, shall be of the flat ring type, with the outside diameter of the gasket extending to the edge of the bolts.
   3. Gaskets for all joints shall have an inside diameter equal to the outside diameter of the pipes on which they are to be used, to ensure that no portion of the gasket will project into the ports of valves, pipe, or fittings.
   4. The dimensions of all gaskets shall conform to ANSI Standard B-16.21 for non-metallic gaskets.

O. Dielectric Separation
   1. Provide dielectric separation at all copper piping and valves connected to ferrous piping.
   2. Brass or bronze valves installed in ferrous piping shall not require dielectric separation.
   3. Connections between copper piping and ferrous flanged piping and equipment connections shall be with a bronze companion flange with dielectric separation for flanges and bolts.
   4. Connections between copper piping and screwed ferrous piping shall be Clearflow Dielectric Waterway fittings.

P. Movement
   1. Mains: Provide adequate offsets, bends, loops, flexible joints and guides as required to prevent over-stressing of piping and/or the structure.

2. Branches: Provide for expansion and contraction by means of offsets, swings, joints or loops to eliminate stress on connected piping, valves or equipment. Provide for proper drainage as required.
3. Maintain a free floating, properly braced and supported piping system.

Q. Provide all rough-in and final connections to equipment and services indicated in the Contract Documents for equipment and services to be functional.

R. Cross Connections and Interconnections: No plumbing fixtures, devices, equipment or pipe connections shall be installed that will provide a cross-connection or interconnection between a potable water supply and any source of nonpotable water such as a drainage system, a soil or waste pipe, or a boiler or cooling tower where the water may be chemically treated.

S. Painting of Piping: Refer to Division 09 Section “Interior Painting”.

3.2 SLEEVES

A. General
1. All sleeves shall be accurately located as required under this Division and shall be properly sealed. Sleeves shall be set true to line, grade and position, shall be plumb or level, and shall be maintained during the work under other Divisions.
2. Sufficient advance notice shall be supplied to the proper trade to enable the installation to progress.
3. Whenever improper location or insufficient notice is provided for the installation of the sleeves, such work shall be done by the proper trade at the cost of this Division, with no change in the Contract Sum or the Date of Substantial Completion.
4. Sleeves shall not penetrate any structural member, except as shown on Drawings, without written approval from the A/E. Wherever any additional reinforcing of members is required, the cost shall be under this Division.
5. Provide sleeves when underground piping passes under or through footings/grade beams. Sleeves under footings/grade beams shall have lean concrete from sleeve to underside of footing/grade beam.

3.3 BUILDING PIPING SYSTEM: INSTALLATION

A. Potable and Non-Potable Domestic Water: Cold, Hot, Tempered, Recirculating, sump pump discharge and relief lines.
1. General and Sub pump Discharge and Relief Lines
   a. All piping shall be copper installed and pitched to provide proper drainage.
   b. Install drain valves at all low points and as required to provide drainage facilities for the piping. Wherever system is sectionalized, install drain valves between each sectional shut-off valve.
   c. All hot water piping shall be pitched to provide natural gravity recirculation regardless of a recirculation pump.
   d. Install pressure gauge in domestic cold-water main at water entrances to building.
2. Shock Elimination
   a. All piping shall be protected against water shock.

b. Provide water hammer arrestors at quick-closing valves and at fixture groups where required to control hydraulic shock. Size and locate water hammer arrestors in accordance with PDI WH 201 and manufacturer recommendations. Install arrestors in accessible locations or provide access panels where concealed.
c. Install a water hammer arrestor of the proper size at the end of the main, at the end of all branch lines, and at the end of lines serving groups of fixtures.
d. Water hammer arrestors shall be sized and installed as recommended by the Plumbing and Drainage Institute and shall eliminate water hammer.
e. All water hammer arrestors shall be installed in locations where they are readily accessible for service. Where required, provide suitable access doors.

3. Contamination Protection
   a. All new distribution systems shall be protected against contamination due to backflow from non-potable sources.
   b. Provide an approved backflow preventer of the reduced pressure zone type at each connection to a fixture where indicated or required by code.
   c. Pipe to nearest floor drain.
4. Backflow Prevention
   a. Install a code approved backflow preventer unit in the service main, where indicated on the Drawings, or as required by code.
   b. Include strainer, dual-service shut-off valves, double-check valves, and check cocks.
   c. Properly support, independent of the piping, with union connections.
5. Trap Primer
   a. All trap primers are to be in an accessible area, preferably in mechanical rooms, janitor's closets, or accessible chases.
   b. Install trap primer so that, for every 20 feet of piping to floor drain inlet, the device is mounted one foot above the finished floor.
6. Water Meter
   a. Arrange for and pay all costs involved in the installation of a water meter in the building service line, where indicated.
   b. Support independent of the piping with union connections.
   c. Installation and meter shall be in accord with and approved by the water utility company.
   d. The entire domestic hot, cold and recirculating hot water system shall be sterilized in strict accordance with requirements of the Department of Health Codes, Rules and Regulation for the State of Connecticut.

END OF SECTION

SECTION 221316 - BUILDING SANITARY, STORM DRAINAGE, AND ACID WASTE

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section including, but not limited to, Division 01 General Requirements.

B. Refer to Specification Section 019113 General Commissioning Requirements.

1.2 DESCRIPTION OF WORK

A. Work of this Section includes, but is not limited to:
   1. Provide a complete building storm water drainage system to 5 feet outside building exterior wall. Work includes, but is not limited to, the following:
      a. Roof drains.
      b. Area drains.
      c. Trench drains.
      d. Pipe materials.
      e. Expansion joints.
      f. Clean-outs.
   2. Provide a complete soil, waste and vent piping system to 5 feet outside building exterior wall. Work includes, but is not limited to the following:
      a. Equipment coordination when equipment or fixtures are supplied by others.
      b. Pipe materials.
      c. Piping auxiliaries/specialties.
      d. Drains.
      e. Clean-outs.

1.3 EQUIPMENT BY OTHERS

A. Include all necessary roughing-in and final equipment connections by the plumbing trade as specified.

B. Wherever equipment is furnished and set in place under Work of another Section or by Owner, they shall furnish detailed Drawings and exact rough-in dimensions and locations at the Site.
   1. Information shall be furnished sufficiently in advance to allow proper installation of all required services.
   2. This Division shall include all required service rough-ins and final connections to the equipment.

1.4 QUALITY ASSURANCE

A. General
1. Provide all supervision, labor, tools, materials, equipment, accessories and specialties necessary to completely install, clean and test the building sanitary and storm plumbing systems.
2. All materials shall be free from defects impairing strength and durability and shall be of the best quality for the purposes indicated. All Work shall have structural properties sufficient to solely sustain or withstand strain and stresses to which it is normally subjected and shall be true to detail.

B. Codes and Standards (Division 22 Section "Common Work Results for Plumbing" Listings and the following.)
1. Plumbing installation shall be in accordance with the state of Connecticut and local plumbing code and all other codes having jurisdiction.
2. American Standard Code for Pressure Piping ANSI B31.1.
3. National Association of Corrosion Engineers.
4. American National Standards Institute (ANSI).
5. American Society of Mechanical Engineers (ASME).
6. American Society for Testing and Materials (ASTM).
7. American Water Works Association.
8. Manufacturer's Standardization Society of the Valve and Fitting Industry.
9. Plumbing and Drainage Institute.
10. State of Connecticut or local Plumbing Code, as applicable.
11. State of Connecticut or local Building Code, as applicable.

C. Material Standards
1. ASTM A74-04: Specifications for Cast Iron Soil Pipe and Fittings.
2. ASTM A53-04: Specifications for Pipe, Steel, Black and Hot-Dipped, Zinc-Coated (Galvanized) Welded and Seamless, for Ordinary Uses.
3. ASTM B306-02: Specifications for DWV Copper Pipe.
4. ASTM C564-03: Specifications for Rubber Gaskets for Cast Iron Soil Pipe and Fittings.
5. Cast Iron Soil Pipe Institute CISPI No. 301-90 and ASTM A888-04: Specification Data for Hubless Cast Iron Pipe Systems with No-Hub Pipe and Fittings.
6. Cast Iron Soil Pipe Institute CISPI No. 310-90: Specification for coupling for use in connection with no-hub cast iron soil pipe and fittings for sanitary and storm drain, waste, and vent piping applications.
7. ASTM C1053-00: Specification for Borosilicate Glass Pipe and Fittings for Drain, Waste, and Vent (OWV) Application.
8. ANSI A112.21.1-91: Floor Drains.
9. ANSI A112.36.2M-1991 (R2002): Metallic Clean-Outs.
10. ANSI A112.1.2-04: Air Gaps in Plumbing Systems.
11. ANSI A112.21.2M-1983: Roof Drains.

1.5 HANDLING, DELIVERY AND STORAGE

A. General
1. Handling, delivery and storage shall be in accordance with the manufacturer's recommendations.
2. No extra cost shall be charged to the Owner for handling, delivery or storage.
3. In no case shall the pipe or appurtenances be dumped, dropped or thrown.

PART 2 - PRODUCTS

2.1 PIPE MATERIALS

A. General
1. All pipe shall be cut off even and reamed full bore. Threads shall be cut smooth, true and to full standard size. Piping shall be installed clean of chips, burrs or oil.
2. No salvaged or used pipe shall be used without the written approval of the A/E or Owner. Wherever such approval is given, recut the ends of the pipe, square, cut new threads on screwed pipe, and thoroughly clean the pipe of all rust, dirt, scale and foreign matter before installation.
3. All cast iron pipe and fittings shall be marked with the trademark of the Cast Iron Soil Pipe Institute and listed by NSF International.

B. Buried Soil, Waste, and Vent Piping
1. ASTM A74 service weight cast iron pipe as manufactured by AB&I, Tyler, or Charlotte with bell and spigot joints, drainage fittings with ASTM C564 gasketed joints.
2. Options
   a. ASTM A888 and CISPI 301 hubless cast iron pipe as manufactured by AB&I, Tyler, or Charlotte with mechanical joints, drainage fittings with 304 corrugated stainless-steel couplings.
   b. ASTM D2665 solid schedule 40 plastic pipe with drainage fittings and solvent welded joints.
      1) PVC plastic pipe is not permitted within one hundred (100) feet downstream of any kitchen equipment.

C. Above-Ground Soil, Waste and Vent
1. ASTM A888 and CISPI 301 hubless cast iron pipe as manufactured by AB&I, Tyler, or Charlotte with mechanical joints, drainage fittings with 304 corrugated stainless-steel couplings.
2. Options
   a. ASTM A74 service weight cast iron pipe as manufactured by AB&I, Tyler, or Charlotte with bell and spigot joints, drainage fittings with ASTM C564 gasketed joints.
   b. ASTM A53 Schedule 40 galvanized steel pipe with cast iron screwed drainage fittings.
   c. ASME A112.3.1 type 316L stainless steel drainage pipe and fittings, spigot, and socket joints with EDPM gaskets.
   d. ASTM D2665 solid schedule 40 plastic pipe with drainage fittings and solvent welded joints.

1) PVC plastic pipe is not permitted within a return air plenum.

D. Indirect Waste and Drains Above Ground
1. ASTM B306 DWV copper tubing with DWV copper fittings.
2. Options
a. ASTM D2665 solid schedule 40 plastic pipe with drainage fittings and solvent welded joints.
b. Same materials as soil, waste, and vent.

E. Grease, Waste and Vent Piping (Below Slab):
1. Hubless Cast Iron pipe and fittings shall be manufactured from gray cast iron and shall conform to ASTM A 888 and CISPI Standard 301. All pipe and fittings shall be marked with the collective trademark of the Cast Iron Soil Pipe Institute ® and listed by NSF® International. Heavy Duty Couplings shall conform to CISPI Standard 310 and be certified by NSF® International. Heavy Duty couplings shall conform to ASTM C 1540 and shall be used. Gaskets shall conform to ASTM C 564. All pipe and fittings to be produced by a single manufacturer and are to be installed in accordance with manufacturer's recommendations and applicable code requirements. Couplings shall be installed in accordance with the manufacturer's band tightening sequence and torque recommendations. Tighten bands with a properly calibrated torque limiting device. The system shall be hydrostatically tested after installation to 10 ft. of head (4.3 psi maximum).
2. Piping below slab shall be a minimum of 2" in size.

F. Sump Pump Discharges
1. ASTM A53 Schedule 40 galvanized steel with cast iron screwed drainage fittings shall be used to point of connection to a gravity storm line or terminating with air gap at plumbing fixture/equipment.
2. Options: ASTM B306 DWV copper tubing with DWV copper fittings.

G. Interior Buried Storm Piping
1. ASTM A74 cast iron service weight soil pipe as manufactured by AB&I, Tyler, or Charlotte with bell and spigot joints, drainage fittings with ASTM C564 gasketed.
2. Options
a. CISPI 301 hubless cast iron pipe as manufactured by AB&I, Tyler, or Charlotte with mechanical joints, drainage fittings with 304 corrugated stainless-steel couplings.
b. ASTM D1785 solid schedule 40 plastic pipe with ASTM D2665 drainage fittings and solvent welded joints.

H. Above Ground Storm Piping
1. CISPI 301 hubless cast iron pipe, as manufactured by AB&I, Tyler, or Charlotte with mechanical joints, drainage fittings with heavy duty 304 corrugated stainless-steel couplings.
2. Options
a. ASTM A74 service weight cast iron pipe, bitumastic-coated, bell and spigot joints, drainage fittings with ASTM C564 gasketed.
b. ASTM A53 Schedule 40 galvanized steel pipe with cast iron screwed drainage fittings.

c. ASTM A112.3.1 type 316L stainless steel drainage pipe and fittings, spigot and socket joints with EDPM gaskets.
d. ASTM D1785 solid schedule 40 plastic pipe with ASTM D2665 drainage fittings and solvent welded joints.

2.2 PIPING AUXILIARIES/SPECIALTIES

A. General: All auxiliaries and specialties shall be guaranteed by the manufacturer for the pressure, temperature and materials being handled, and shall be suitable for the piping to which they are attached.

B. Air Gap Fitting
1. J.R. Smith Fig 3951, rough bronze or plain end with set screw, threaded inlet and threaded outlet, sizes as indicated.
2. Manufacturers: Mifab, Watts, Wade, or Zurn.

C. Vent Flashings
1. Furnish 6 lb. lead flashing for General Contractor installation.
2. Flashing shall extend 12 inches in all directions, sealed between roofing plies, extended up to end of vent and clamped with vandalproof vent cap.
3. Vents Thru Roof (VTR): Refer to Architectural Drawings for vent thru roof detail in EPDM roof.

D. Vandalproof Vent Cap
1. J.R. Smith Fig. 1748 cast iron with set screws.
2. Manufacturers: Josam, Mifab, Stoneman, Wade, or Zurn.

E. Storm and Sanitary Piping Hubless Cast Iron Couplings
1. Shield constructed of type 304 stainless steel meeting ASTM 240. Neoprene gaskets shall conform to ASTM C564.
2. Couplings shall have a minimum of 4 bands and be capable of tightening to 80 lbs. torque.
3. The use of sealant or adhesives on couplings is not permitted unless approved by the manufacturer.
4. Couplings shall be heavy duty in accordance with ASTM C1540.

F. Cast Iron No-hub Restraints
1. Cast iron no-hub horizontal pipe and fittings, larger than 4”, shall be suitably braced to prevent horizontal movement. Install at every branch opening or change in direction by the use of braces, blocks and rods to prevent movement or joint separation. This bracing may be field fabricated or a manufactured system.
2. Holdrite 117 series or equal.

2.3 DRAINS

A. General
1. All drains installed in waterproof slabs shall be provided with a flashing ring.
2. Install a 30-inch x 30-inch x 6 lb. lead flashing properly fastened to the flashing ring.

3. Cast Iron roof, area, and floor drain manufacturers: J.R. Smith, Josam, Kusel, Mifab, Wade, Watts and Zurn.
4. Corrosion resistant floor drain manufacturers: Zurn, Watts, Kusel, Orion, R&G Sloan, and Duriron.

B. Roof Drains
1. Refer to plumbing schedules for basis of design manufacturer and model.

C. Area Drains
1. Refer to plumbing schedules for basis of design manufacturer and model.

D. Floor Drains
1. Finish areas: Refer to plumbing schedule for make & model. Provide adjustable cast iron body, round nickel bronze strainer. Vandalproof screws. Caulk outlet. 1/2-inch trap primer inlet.
2. General areas: Refer to plumbing schedule for make & model. Provide cast iron body, 12-inch-diameter cast iron tractor grate, solid free-standing sediment bucket, 1/2-inch trap primer inlet. Size as indicated on Drawings.

E. Trench Drains: 6-inch-wide modular interlocking system with 0.6% built-in sloped channels as manufactured by ACO Drain, Inc., S100K Series, or equal. First sloped channel shall be 5-1/2-inch deep. Channels shall all be the same width and length and be constructed of precast polyester concrete with water absorption rate of less than 1%. Provide a slotted ductile iron grating over the entire drain, including catch basin section, with a Class F load rating. Grating shall be secured with a locking device including all nuts and bolts. Provide SK900 Series catch basin of the same width as channels with knock-out panel for piping and a plastic lift-out trash bucket. Provide trench drain complete with all channel end caps and neutral (non-sloped) channels so that total length is as noted on Drawings, inclusive of catch basin.

2.4 CLEANOUTS

A. General
1. Capable of adjustment to match finish surface.
   a. Be round.
2. All cover plates/plugs shall be permanently labeled to match the drain service.
3. For cast iron fittings
4. Cast Iron clean-out manufacturers: Josam, J.R. Smith, Mifab, Wade, Zurn, Watts
5. Corrosion-Resistant Clean-Out Manufacturer: Duriron.

B. Clean-Out Types
1. Floor Clean-Outs
   a. Finished Floor and Tile Floor: J. R. Smith Fig. 4020, Duco cast iron body and frame with round adjustable scoriated nickel bronze top. Vandalproof top. Top Labeled Co. Provide nickel bronze carpet clamping frame with vandalproof screw in carpeted areas.
   b. Unfinished Floor and Equipment Area Floor: J. R. Smith Fig. 4240, Duco cast iron body and frame with round adjustable scoriated cast iron top. Vandalproof top. Top Labeled Co.

2. Wall Cleanouts
   a. J. R. Smith Fig. 4422, Duco cast iron caulk ferrule with vast bronze taper thread plug and prime-coated steel shallow cover. Vandalproof screws.

PART 3 - EXECUTION

3.1 INSTALLATION, GENERAL

A. General
1. Comply with Division 22 Section “Common Work Results for Plumbing”.
2. Piping shall be installed in a manner to permit easy removal of valves and disconnect of equipment. Unions or flanged joints shall be installed for this purpose.
3. Piping shall be installed, supported, guided, and anchored to properly provide for movement due to expansion and contraction without undue strains on the joints and in such a manner that it will not sag, buckle or sway.
4. Piping shall not be supported by other pipes, conduits, ducts or similar installations.
5. No piping shall be supported by the equipment to which it is connected. Install base elbows, hangers or other approved independent method of support for the pipe.
6. Connections to equipment shall be arranged to facilitate ease of removal and service without dismantling of the runouts of main piping and shall be installed using multiple elbows or other similar methods to minimize strain on the equipment connections.
7. No field-fabricated welding fittings shall be permitted. All welding tees, elbows, reducers, and caps shall be commercially manufactured products.
8. Do not obstruct passageways, headroom, door and window operation, and similar areas with the installation of the piping.
9. All open ends of pipes, including equipment connections, shall be properly always sealed during installation to keep dirt and all foreign material out of the piping. Plugs used shall be commercially manufactured products.
10. Pipe size reductions shall be made with factory-fabricated eccentric reducers or reducing fittings and shall be installed not to cause pocketing or inhibit the flow of the material.
11. No pipe shall penetrate any structural member without the written approval of the A/E. Where such penetration is allowed, the structural member shall be reinforced subject to the approval of the A/E.
12. Provide all rough-in and final connections to equipment and services indicated in the Contract Documents for equipment and services to be functional.

B. Cross Connections and Interconnections: No plumbing fixtures, devices, equipment or pipe connections shall be installed that will provide a cross-connection or interconnection between a potable water supply and any source of nonpotable water such as a drainage system, a soil or waste pipe, or a boiler or cooling tower where the water may be chemically treated.

3.2 JOINT CONSTRUCTION

A. Hub-and-Spigot, Cast-Iron Soil Piping Gasketed Joints: Join according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for compression joints.

B. Hub-and-Spigot, Cast-Iron Soil Piping Calked Joints: Join according to CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for lead-and-oakum calked joints.

C. Hubless, Cast-Iron Soil Piping Coupled Joints: Join according to CISPI 310 and CISPI's "Cast Iron Soil Pipe and Fittings Handbook" for hubless-piping coupling joints.

D. Threaded Joints: Thread pipe with tapered pipe threads according to ASME B1.20.1. Cut threads full and clean using sharp dies. Ream threaded pipe ends to remove burrs and restore full ID. Join pipe fittings and valves as follows:
   1. Apply appropriate tape or thread compound to external pipe threads unless dry seal threading is specified.
   2. Damaged Threads: Do not use pipe or pipe fittings with threads that are corroded or damaged. Do not use pipe sections that have cracked or open welds.

E. Join copper tube and fittings with soldered joints according to ASTM B 828 procedure. Use ASTM B 813, water-flushable, lead-free flux and ASTM B 32, lead-free-alloy solder.

F. Grooved Joints: Cut groove ends of pipe according to AWWA C606. Lubricate and install gasket over ends of pipes or pipe and fittings. Install coupling housing sections, over gasket, with keys seated in piping grooves. Install and tighten housing bolts.

G. Flanged Joints: Align bolt holes. Select appropriate gasket material, size, type, and thickness. Install gasket concentrically positioned. Use suitable lubricants on bolt threads. Torque bolts in cross pattern.

H. Plastic, Nonpressure-Piping, Solvent-Cemented Joints: Clean and dry joining surfaces. Join pipe and fittings according to the following:
   1. Comply with ASTM F 402 for safe-handling practice of cleaners, primers, and solvent cements.
   2. ABS Piping: Join according to ASTM D 2235 and ASTM D 2661 Appendices.
   3. PVC Piping: Join according to ASTM D 2855 and ASTM D 2665 Appendices.

3.3 SLEEVES: INSTALLATION

A. General
   1. All sleeves shall be accurately located as required under this Division. Sleeves shall be set true to line, grade and position, shall be plumb or level, and shall be maintained during the work under other Divisions.
   2. Sufficient advance notice shall be supplied to the proper trade to enable the installation to progress.
   3. Whenever improper location or insufficient notice is provided for the installation of the sleeves, such work shall be done by the proper trade at the cost of this Division, with no change in the Contract Sum or the Date of Substantial Completion.
   4. Sleeves shall not penetrate any structural member, except as shown on Drawings, without written approval of the A/E. Wherever any additional reinforcing of members is required, the cost shall be under this Division.
   5. Provide sleeves when underground piping passes under or through footings/grade beams. Sleeves under footings/grade beams shall have lean concrete from sleeve to underside of footing/grade beams.

3.4 FLASHINGS: INSTALLATION

A. General
   1. All penetrations of roofs and similar areas required for installation of vents, roof drains, and piping under this Division shall be properly flashed and made watertight.
   2. Coordinate with all necessary General Trades Work sufficiently in advance and install in conjunction with roofing installation.

B. Flashing of Vent and Soil Pipe Extensions: All vent and soil pipe extensions through roof shall be minimum 3-inch size and flashed with 6 lb. sheet lead or 16 oz copper, 24-inch square, with sleeve soldered on, extending to top of pipe and turned down 2-inch inside.

C. Flashing of Roof Drains: All roof drains shall be flashed with 6 lb. sheet lead extending 12 inches from outer edge of drain opening.

D. Flashing of Curbs
   1. Curbs shall be flashed under the General Trades Divisions of this Specification.
   2. Provide counterflashing as required for weathertight construction.

3.5 BUILDING DRAINAGE SYSTEM: INSTALLATION

A. General
   1. All storm and sanitary lines shall be of the sizes noted and routed as indicated.
   2. Unless otherwise indicated or required by codes, all building drains shall be installed with a minimum uniform grade of one percent (1%).
   3. No underground drains shall be installed in water. Trenches shall be dry and acceptable before laying of pipe.
   4. All overhead lines shall be installed as close to the building structure as possible.
   5. All overhead cast iron drains shall be supported at each joint, each change of directions, each cast iron trap, and all necessary intermediate points to maintain a uniform pitch without sagging or pocketing of the line.

B. Floor Drains
   1. Install floor drains with lead flashing in waterproof floors per manufacturer's recommendations.
   2. Install floor drains 1/2-inch lower than finished floor elevations to ensure positive drainage. Coordinate installation closely with General Contractor.

C. Cleanouts
   1. Install at each of the following points, but not limited to:
      a. Base of each soil and waste stack
      b. Base of interior storm downspouts
      c. Change of direction of 45 deg or greater in the building drains
      d. Inside where the drains leave the building
      e. Where a battery of wall hung water closets are installed, provide cleanout at end of sanitary line in wall.
      f. Where indicated
      g. Install on continuous runs of the drains at 100' intervals on the storm and sanitary.
      h. As directed by local code

2. Shall be connected to the main with long sweep or sanitary wye fittings, unless otherwise noted.
3. Shall be installed to match the finished surface line.
4. Removable plugs shall be lubricated with a mixture of grease and graphite.

D. Traps
1. Install on all floor drains, all waste and soil discharge connections, and where indicated. Locate for ease of service. Any other traps required by official bodies having jurisdiction shall be installed at no additional cost to the Owner.
2. Where traps on plumbing fixtures are installed below grade or otherwise concealed, a clean-out shall be installed in the adjacent finished surface as indicated.

3.6 FIELD QUALITY CONTROL

A. During installation, notify authorities having jurisdiction at least 24 hours before inspection must be made. Perform tests specified below in presence of authorities having jurisdiction.
1. Roughing-in Inspection: Arrange for inspection of piping before concealing or closing-in after roughing-in.
2. Final Inspection: Arrange for final inspection by authorities having jurisdiction to observe tests specified below and to ensure compliance with requirements.

B. Reinspection: If authorities having jurisdiction find that piping will not pass test or inspection, make required corrections and arrange for reinspection.

C. Reports: Prepare inspection reports and have them signed by authorities having jurisdiction.

D. Test storm drainage piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:
1. Test for leaks and defects in new piping and parts of existing piping that have been altered, extended, or repaired. If testing is performed in segments, submit separate report for each test, complete with diagram of portion of piping tested.
2. Leave uncovered and unconcealed new, altered, extended, or replaced storm drainage piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.
3. Test Procedure: Test storm drainage piping, except outside leaders, on completion of roughing-in. Close openings in piping system and fill with water to point of overflow, but not less than 10-foot head of water. From 15 minutes before inspection starts until completion of inspection, water level must not drop. Inspect joints for leaks.
4. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
5. Prepare reports for tests and required corrective action.

E. Test force-main piping according to procedures of authorities having jurisdiction or, in absence of published procedures, as follows:
1. Leave uncovered and unconcealed new, altered, extended, or replaced force-main piping until it has been tested and approved. Expose work that was covered or concealed before it was tested.

2. Cap and subject piping to static-water pressure of 50 psig above operating pressure, without exceeding pressure rating of piping system materials. Isolate test source and allow to stand for four hours. Leaks and loss in test pressure constitute defects that must be repaired.
3. Repair leaks and defects with new materials and retest piping, or portion thereof, until satisfactory results are obtained.
4. Prepare reports for tests and required corrective action.

END OF SECTION

SECTION 221331 - ELEVATOR SUMP PUMP

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section including, but not limited to, Division 01 General Requirements.

1.2 DESCRIPTION OF WORK

A. Work of this Section includes, but is not limited to:
   1. Elevator sump pump.

1.3 QUALITY ASSURANCE

A. General
   1. Provide all equipment as necessary for a complete installation of the Plumbing Systems.
   2. Receptacle and associated wiring shall be provided by the Electrical Contractor.
   3. The complete installation shall be in accordance with all applicable state and local codes.

1.4 SUBMITTALS

A. Shop Drawings: Submit shop drawings of all products in this section.

B. Product Data
   1. Manufacturer's cut sheets and literature.
   2. Performance data.
   3. Pump curves.
   4. Wiring diagrams for control panels.

C. Samples: Not required for review.

D. Reference Submittals: Not required for review.

E. Contract Close-Out
   1. Operating and maintenance information.
   2. Owner instruction report.
   3. Guarantees and warranties.

PART 2 - PRODUCTS

2.1 ELEVATOR SUMP PUMP (ESP-1)

A. One simplex Zoeller Pump Co. Series 153 Submersible Pump shall be furnished. Pump shall be capable of pumping storm water. Pump shall be equipped with hermetically sealed, Class F insulated motor, installed in a heavy ribbed cast iron shell. Pump shall be rated for 50 GPM @ 20 feet TDH each pump when driven by a 1/2 HP, 1750 RPM, 115 volt / 60 HZ, 1 phase hermetically sealed motor.

B. Pump construction to include single mechanical seal. The motor shell and pump volute shall be made of close grained cast iron. Pump shaft shall be stainless steel and all fastening hardware shall be stainless steel. The pump impeller shall be bronze closed type, accurately machined to the proper diameter, and dynamically balanced prior to installation in the pump. The impeller shall be non-overloading throughout the entire range of the pump curve. Pump and motor unit to receive a coat of red chromate primer and finish coat of water resistant metallic blue enamel.

C. Integral mechanical float type liquid level control shall be furnished for proper pump operation.

D. Manufacturers: Zoeller, Weil, Liberty, or equivalent.

2.2 PUMP CONTROLLER

A. Supply one UL listed - NEMA 1 or 4X steel simplex control panel suitable for wall mounting. Panel shall be completely factory wired and bench tested for satisfactory operation prior to shipment. The pump controller shall include oil detection circuitry which will shut down the pump, sound an alarm and energize a dry contact if a hydrocarbon is present in water in the sump pit. The following features will be included in the controller:
   1. Properly sized NEMA rated starter pump.
   2. High water alarm with light and silencing switch.
   3. Main fused disconnect switch.
   4. Circuit breaker.
   5. Oil detection circuitry with alarm and silence switch.
   6. Dry contacts for remote alarm monitoring for the following:
      a. High water alarm.
      b. Oil detection alarm.

2.3 OPERATING CONTROLS

A. Mercury float type liquid level controls shall be furnished for proper pump and alarm operation. Supply an oil sensor to detect hydrocarbons in the sump and disable the pump.

B. Three mercury switches, each sealed in a corrosion resistant polypropylene float shall be provided. Each switch to have a PVC coated UL listed cable and to be attached to a corrosive-resistant bracket to a stainless steel suspension rod. The switch bracket to be provided with a reinforcing sleeve to prevent sharp bending and damage to the cable.

C. One oil sensor, containing an infrared LED and a light receiver. Continuous light from the LED is directed into a prism, which forms the tip of the sensor. Two probes extend from the prism which measure conductivity to detect oil in the water and shut the pump down.

2.4 FIBERGLASS BASIN

A. Supply a fiberglass basin 24 inch ID x 3-foot depth, constructed of resin reinforced with not less than 20 percent glass strands.

B. Cover plate shall be minimum 1/4-inch-thick perforated and painted steel with necessary openings for pump discharge, power and control cables.

C. Manufacturers: Jackel, Topp Industries, Weil.

2.5 VALVES

A. Bronze check valve shall be installed on the pump discharge.

B. A Bronze shutoff valve shall be installed on the pump discharge.

2.6 WARRANTY

A. Warranty time shall be one-year from start up. Warranty shall extend to material and workmanship of the complete system.

PART 3 - EXECUTION

3.1 EXECUTION

A. See additional details and diagrams on the project drawing documents.

B. The complete installation of all items of equipment shall be in accordance with the Manufacturer's instructions. The entire system shall be tested and adjusted under actual operating conditions.

C. These pumps are not to be used during construction.

D. Flush all incoming lines to the pump basin and thoroughly clean the basin prior to placing pumps into operation.

E. A representative of the manufacturer shall be present during the pump start-up and shall completely check the pump system prior to the placing of pumps into operation.

3.2 START-UP

A. The pump manufacturer shall provide a technician for one (1) day start-up of the complete system, to insure ample time to make corrections and/or repairs. Start-up will consist of but not limited to the following:
   1. Start-up and run of pump
   2. Check all electrical devices
   3. Provide a start-up report to the contractor, within 48 hours from start-up date for review and corrections if needed.

END OF SECTION

SECTION 223300 - DOMESTIC WATER HEATER AND ACCESSORIES

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section including, but not limited to, Division 01 General Requirements.

B. Refer to Specification Section 019113 General Commissioning Requirements.

1.2 DESCRIPTION OF WORK

A. Work of this Section includes, but is not limited to:
   1. Electric water heater.
   2. Heat pump water heater.
   3. Recirculation pumps.
   4. Thermostatic mixing valves.
   5. Expansion tanks.
   6. Accessories.

1.3 QUALITY ASSURANCE

A. UL Standards: Provide water heater complying with the following:
   1. UL 1453, Electric Booster and Commercial Storage Tank Water Heaters.

B. Electrical Component Standard: Provide components complying with NFPA 70, National Electric Code.

C. Listing and Labeling: Provide water heaters that are listed and labeled.
   1. The terms "listed" and "labeled" shall be as defined in the National Electric Code, Article 100.
   2. Listing and Labeling Agency Qualifications: A Nationally Recognized Testing Laboratory (NRTL) as defined in OSHA Regulation 1910.7.

D. ASHRAE Standards: Provide water heaters with performance efficiencies not less than prescribed in ASHRAE 90A, Energy Conservation in New Building Design.

1.4 WARRANTY

A. Special Project Warranty
   1. Submit a written warranty, executed by manufacturer, agreeing to repair or replace water heater units that fail in materials or workmanship within the specified warranty period. Failures include, but shall not be limited to, tanks. This warranty shall be in addition to, and a limitation of, rights the Owner may have against the Contractor under the Contract Documents.

2. Warranty period is 3 years after date of Substantial Completion.

PART 2 - PRODUCTS

2.1 WATER-TO-WATER GEOTHERMAL WATER HEATER (DWH-1)

A. Summary
1. Provide factory-assembled, water-cooled modular scroll chiller(s) with integral heat-recovery capability, including compressors, heat exchangers, refrigerant circuits, controls, insulation, electrical components, and accessories required for a complete operational system.
2. Units basis of design shall be Multistack Model (2) MSH020Y water-cooled modular scroll chiller modules with dedicated heat-recovery condenser. Acceptable manufacturers include WaterFurnace, Trane or approved equal.

B. References
1. AHRI Standard 550/590 – Performance Rating of Water-Chilling Packages Using the Vapor Compression Cycle.
2. UL 207 (CSA C22.2 No. 140.3-15) – Refrigerant Equipment.
3. NEC (NFPA 70).

C. Performance
1. Provide selection that meets or exceeds Heating Capacity shown on drawings. Unit shall meet or exceed a cooling COP of 2.4 and heating COP of 3.4.
2. Refrigerant shall be an A2L R-454B or R-32.
3. Waterside pressure rating of 150psi and Refrigerant side pressure rating of 650 psi.

D. Construction
1. Brazed-plate evaporate and condenser heat exchangers.
2. Double-wall vented heat-recovery exchanger with stainless steel fittings.
3. Stainless steel evaporator and condenser supply headers.
4. Factory-installed strainers/filters in evaporator and condenser supply headers.
5. 3/4 inch closed-cell foam insulation on evaporator and condenser assemblies.
6. Indoor-rated acoustical panels and premium sound package compressor wraps
7. Furnish refrigerant monitoring sensor and alarm contact at each module plus master control common alarm output.

E. Compressors
1. Hermetic scroll compressors, variable speed
2. Independent refrigeration circuits per module.
3. Lead/Lag sequencing for 24-hr rotation.
4. Automatic rescheduling in fault conditions.
5. Electrical - Provide with single-point power via hinger panel distribution box, in 460 Volts, 60 Hertz, 3 phase and SCCR rating of 65kaic. MCA shall be 91 amps with an MOP of 125.

F. Controls
1. Factory DDC chiller control system with master controlling supporting electronic hot-water temperature control, fault logging, and trend monitoring.
2. Expansion inputs/outputs for field connection to differential pressure transmitters. Each module shall included thermal dispersion flow switch (24V factory powered) and refrigerant monitor alarm with contact.
3. System must integrate with BAS via BACnet MSTP communications.
4. Refer to plumbing schedule for manufacturer make, model, and design characteristics.

2.2 RECIRCULATING PUMPS (CP-1 THRU CP-4)

A. In-line all lead-free bronze pump with gauge ports at nozzles and with vent and drain ports. Ceramic or carbon steel shaft supported by permanently lubricated carbon or steel bearings. Pump suitable for continuous operation at 230 deg F at 150 psi working pressure. Built-in overload protection. Motor shall be non-overloading at any point on the pump curve. Capacity and electrical characteristics as noted on the Drawings.

B. Manufacturers: Bell & Gossett, Grundfos, TACO, Armstrong.

2.3 THERMOSTATIC MIXING VALVES

A. Primary, Thermostatic, Water Mixing Valves
1. Basis-of-Design Product: Subject to compliance with requirements, provide product indicated on Drawings or comparable product by one of the following:
   a. Armstrong International, Inc.
   b. Lawler Manufacturing Company, Inc.
   c. Leonard Valve Company.
   d. Powers; a division of Watts Water Technologies, Inc.
   e. Symmons Industries, Inc.
   f. Bradley Corp.
2. Standard: ASSE 1017.
3. Pressure Rating: 125 psig (860 kPa) minimum unless otherwise indicated.
4. Type: Exposed-mounted, thermostatically controlled, water mixing valve.
5. Material: Bronze body with corrosion-resistant interior components. Lead-free design.
6. Connections: Threaded union inlets and outlets.
7. Accessories: Manual temperature control, check stops on hot- and cold-water supplies, wall mounting bracket, and adjustable temperature-control. Thermometer on outlet.
8. Tempered-Water Setting: As noted on Drawings.
9. Valve Finish: Rough bronze.
10. Refer to Drawings for design characteristics such as flow rate and pressure drop.

2.4 EXPANSION TANKS

A. Description: Steel, pressure-rated tank constructed with welded joints and factory-installed, butyl-rubber diaphragm. Include air precharge to minimum system-operating pressure at tank.
1. Available Manufacturers
   a. AMTROL Inc.

b. Armstrong Pumps, Inc.
c. Elbi of America, Inc.
d. Taco, Inc.
e. Watts Regulator Co.
f. Bell & Gossett.

2. Construction
   a. Tappings: Factory-fabricated steel, welded to tank before testing and labeling. Include ASME B1.20.1 pipe thread. Include tap for pressure gauge.
   b. Interior Finish: Comply with NSF 61 barrier materials for potable-water tank linings, including extending finish into and through tank fittings and outlets.
   c. Air-Charging Valve: Factory installed.
   d. ASME rated.
3. Capacity and Characteristics
   a. Working-Pressure Rating: 150 psig (1035 kPa).
   b. Capacity Acceptable: Refer to Schedule on Drawings.
   c. Air Precharge Pressure: Set air pressure equal to incoming water pressure downstream of water service backflow preventer.

2.5 WATER HEATER ACCESSORIES

A. Drain Pans: Corrosion-resistant metal with raised edge. Comply with ANSI/CSA LC3. Include dimensions not less than base of domestic-water heater and include drain outlet not less than NPS 3/4 (DN 20) WITH ASME B1.20.1 pipe threads or with ASME B1.20.7 garden-hose threads.

B. Piping-Type Heat Traps: Field-fabricated piping arrangement according to ASHRAE/IESNA 90.1.

C. Combination Temperature-and-Pressure Relief Valves: Include relieving capacity at least as great as heat input and include pressure setting less than domestic-water heater working-pressure rating. Select relief valves with sensing element that extends into storage tank.

D. Pressure Relief Valves: Include pressure setting less than domestic-water heater working-pressure rating.

E. Vacuum Relief Valves: ANSI Z21.22/CSA 4.4-M.

F. Domestic-Water Heater Stands: Manufacturer's factory-fabricated steel stands for floor mounting, capable of supporting domestic-water heater and water. Provide dimensions that will support bottom of domestic-water heater a minimum of 18 inches (457 mm) above the floor.

G. Domestic-Water Heater Mounting Brackets: Manufacturer's factory-fabricated steel bracket for wall mounting, capable of supporting domestic-water heaters and water.

PART 3 - – EXECUTION

3.1 CONCRETE BASES

A. Construct concrete equipment base.

B. Install reinforcing bars, tied to frame and place anchor bolts and sleeves using manufacturer's installation template.

C. Place concrete and allow to cure before installation of equipment.

3.2 WATER HEATER INSTALLATION

A. General: Install water heaters on 4-inch concrete bases. Set and connect units in accordance with manufacturer's written installations instructions. Install units' plumb and level, firmly anchored in locations indicated and maintain manufacturer's recommended clearances. Orient so controls and devices needing servicing are accessible.

3.3 CONNECTIONS

A. Piping installation requirements are specified in other Sections of Division 22. The drawings indicate general arrangement of piping, fittings and specialties. The following are specific connection requirements:
   1. Install piping adjacent to equipment arranged to allow servicing and maintenance.
   2. Connect hot and cold water to units with shut-off valves and unions. Extend relief valve discharge full-size to closest floor drain.
      a. Where water heater piping connections are dissimilar metals, make connections with dielectric fittings or dielectric unions specified in Division 22 Section "Common Work Results for Plumbing".
      b. Install expansion tanks at cold water inlet piping as shown on drawings.
   3. Install drain as indirect waste spill into open drain or over floor drain.
      a. Install drain valves at low point in water piping, for water heaters not having tank drain.
      b.

B. Water-To-Water Domestic Water Heater Piping Connections
   1. Install a unit differential pressure transmitter directly downstream of chiller with no pressure-adding devices between. (DP1)
   2. Installed a system differential pressure transmitter on the system side (DP2).
   3. Provide a system bypass valve sized for minimum gallons per minute and characterized ball or globe valve type with <60s stroke time.
   4. Bypass loop volume and loop time shall meet manufacturer recommendations.
   5. Pump bypass valves must be controlled such that's pumps or bypass maintain unit DP setpoint and opposite device maintains system DP setpoint.

C. Electric Connections
   1. Power wiring and disconnect switches area specified in Division 26.

2. Grounding: Connect unit components to ground in accordance with the National Electric Code.

3.4 FIELD QUALITY CONTROL

A. General
   1. Provide the services of a factory-authorized service representative to test and inspect unit installation, provide start-up service, and demonstrate and train Owner's maintenance personnel as specified below.
   2. Notify Commissioning Agent of any field quality control testing.
   3. Test and adjust operating and safety controls. Replace damaged and malfunctioning controls and equipment.

B. Train Owner's maintenance personnel on procedures and schedules related to start-up and shut-down, troubleshooting, servicing and preventative maintenance.
   1. Review data in Operating and Maintenance Manuals. Refer to Division 01 Section “Contract Close-Out”.
   2. Schedule training with at least 7 days’ advance notice.

3.5 COMMISSIONING

A. Perform the following before start-up final checks:
   1. Fill water heater with water.
   2. Piping system test complete.
   3. Check for pipe connection leaks.
   4. Test operation of safety controls and devices.

B. Perform the following start-up procedures:
   1. Energize circuits.
   2. Adjust operating controls.
   3. Adjust hot water outlet temperature setting.

END OF SECTION

SECTION 224000 - PLUMBING FIXTURES

PART 1 - GENERAL

1.1 REFERENCE

A. All applicable requirements of other portions of the Contract Documents apply to the work of this Section including, but not limited to, Division 01 General Requirements.

1.2 DESCRIPTION OF WORK

A. Work of this Section includes, but is not limited to:
   1. Inclusion of all plumbing fixtures, complete and ready for use.
      a. All fixtures, except as otherwise specified, shall be constructed of vitreous china with all visible exposed surfaces glazed.
   2. Providing all stops, traps, escutcheons, connections, etc., as are necessary to complete the installation of each fixture, whether such items are listed or not.
   3. Plumbing Trim
      a. All finished exposed faucets, traps, connecting piping, stops, flush valves and other fixture trim shall be chromium-plated brass unless otherwise specified and shall be supported rigidly to fixtures and to walls with matching brackets at not more than 2'-0" center. All fastenings shall be chromium-plated brass or may be 302 stainless steel if of matching color and finish.
      b. Faucets shall be furnished as required. All faucets shall be lead-free.
      c. Vacuum breakers shall be provided as a part of the fixture trim wherever there is a possibility of back-siphoning.
   4. Fixture Stops
      a. Shut-offs for urinal and water closet flush valves shall be an integral part of the fixture or fitting; shut-offs for all other fixtures shall be loose-key, lock-shield-type.
      b. All fixture stops shall be angle- or straight-type adapted for each particular location and shall be located immediately adjacent to the fixture. Use threaded adaptors when used in conjunction with copper tube work. All stop valves shall be lead-free
   5. All exposed screws or fasteners for plumbing fixtures and faucets shall be vandalproof. Contractor shall take care to coordinate this item with his suppliers prior to Shop Drawings submittal.
   6. Aerators, where required for sinks and lavatories shall be vandalproof.

1.3 QUALITY ASSURANCE

A. Meet the requirements of the following:
   1. State of Connecticut Plumbing Code.
   2. State of Connecticut Department of Housing, Buildings and Construction.
   3. 42 USC 300G: The Reduction of Lead In Drinking Water Act.
   4. Material Standards

5. ANSI/ASME A112.19.2-2003: Vitreous China Plumbing Fixtures.
6. ANSI/ASME A112.19.3-2000 (R2004): Stainless Steel Plumbing Fixtures (Designed for Residential Use).
7. ANSI/ASME A112.19.4M-94: Porcelain Enameled Formed Steel Plumbing Fixtures.
8. ANSI/ASME A112.19.5-1999: Trim for Water Closet Bowls, Tanks, and Urinals.
9. ANSI/ASSE 1016-90: Performance Requirements for Thermostatic, Pressure Balancing and Combination Control Valves for Bathing Facilities.
10. ANSI/ASSE 1025-78: Performance Requirements for Diverters for Plumbing Faucets with Hose Spray, Anti-Siphon-Type, Residential Applications.

PART 2 - PRODUCTS

2.1 MATERIALS - GENERAL

A. Acceptable Manufacturers
   1. Plumbing Faucets (Commercial Grade): Chicago Faucet, Delta, Moen, Powers, Symmons, Speakman, T&S Brass Co., Hydrotek
   2. Flush Valves: Sloan, American Standard, Zurn, Kohler, and Hydrotek
   3. Vitreous China Plumbing Fixtures: American Standard, Kohler, Eljer, Zurn.
   4. Mop Sinks
      a. Terrazzo: Crane, Creative Industries, Fiat, Florestone, Stern and Williams.
      b. Molded Stone: Crane, Fiat, Florestone, Mustee, Swan Corp., Zurn.
   5. Closet Seats: Church, Sperzel, Olsonite, Beneke, Centoco.
   6. Shower Mixing Valves: Powers, Leonard, Lawler, Speakman, Bradley.
   7. Stainless Steel Sinks: Elkay, Just, CECO, Metcraft.
   8. Emergency Showers or Eyewash: Guardian, Speakman, Haws, Watersaver, Encon, Bradley.
   9. Electric Water Coolers: Elkay, Haws, Oasis, Murdock.
   10. Precast Shower Receptacles: Fiat, Stern and Williams, Swan Corp.
   11. Acrylic/Fiberglass Prefabricated Showers and Tubs: Aquatic, Aqua Glass, Aquarius, American Bath, Kohler.
   12. Carriers: Josam, Mifab, Smith, Wade, Watts, Zurn.
   13. Supply Stop Valves: McGuire, Brasscraft, Nibco, Watts.
   14. Plumbing Fixtures – General: Constructed or equipped with anti-siphon devices to prevent siphoning waste material into potable water supply system.
   15. Escutcheons and Plates: Conceal all holes where pipes pass through walls, floors or ceilings; use plates or escutcheons.
   16. Piping Exposed in Finished Areas (including fittings and trim): Chromium-plated or nickel-plated brass with polished bright surface.
   17. Trim for Lavatories and Sinks: Provide with renewable cartridges.
   18. Vitreous Caps: Provide for water closet bolts.
   19. Sealant: Silicone-type. See Division 7 Section “Joint Sealants”.

2.2 DECONTAMINATION EYEWASH

A. Provide multiple nozzle emergency eyewash, galvanized steel piping, 12 chrome-plated brass full-cone, direction preset, non-adjustable, self-cleaning nozzles, 2 weep sprays, universal

emergency sign, instant action valve with stay-open chrome-plated ball valve with stainless steel push flag, 1-inch supply.

1. Refer to plumbing schedule for make & model #: Tempered water system consists of a thermostatic mixing valve with integral check stops, dial thermometer range 0 to 140 degrees, secondary thermostatic mixing valve set to open cold water upon temperature rise over 95 degrees, 1-1/4-inch inlets and 1-1/4-inch outlet, stainless steel lockable wall mounted cabinet. System to be set to 90 degrees and 72 gpm.
   a. Leonard Model TM-850-STSTL-EXP.

2.3 CHAIR CARRIERS

A. Carriers for Water Closets
1. Use cast iron couplings where required by Code.
2. Josam 12000 Series.
3. Carrier for Urinals: Josam 17800 or 17810.
4. Carriers for Lavatories: Josam 17100, 17100-76.
5. Carriers for Electric Water Coolers: Josam 17900 or 17905.
6. Carriers for Service Sinks: Josam 17720.

2.4 INSULATION AT HANDICAPPED (ADA-COMPLIANT) LAVATORIES

A. Insulation
1. Handicapped lavatories: exposed waste, hot and cold-water supply lines shall be insulated with a molded, flexible vinyl insulation system with all fasteners. Provide insulation for 1-1/4-inch waste offset drain, tailpiece, P-trap and waste arm and 3/8-inch supply tubing and 3/8-inch keyed stop valve. Color shall be white.

1. Manufacturers/Products

a) IPS Corp Truebro Lav-Guard 2.
b) Plumberex Pro-Extreme.
c) McGuire ProWrap.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Sink manufacturer shall provide proper template to architectural woodwork supplier for cutting of countertop.

B. Plumber shall place sink in countertop and complete faucet and piping.

C. Install all fixtures in accordance with Manufacturer's recommendations.

D. All fixture support carriers shall be of the type necessary to permit adjustment to fit variations in construction. All grounds or special supports necessary for setting fixtures shall be provided before plastering or other finished construction work is begun. All fixtures shall be hung at standard height unless otherwise indicated by the A/E.

E. Minimum fixture connection sizes are shown on the Drawings.

F. Provide chrome-plated brass escutcheons on all waste and supply piping penetrating the walls and floors for fixtures, including piping within cabinets.

G. Provide fixture carriers and required drainage fittings on all wall hung fixtures. Anchor carriers securely to floor.

H. Where plumbing fixtures abut to walls, floors, and countertops, seal all joints with sealant.

I. Seal floor sinks to wall and floor with building sealant. Color shall match fixture.

J. Provide anchors behind the wall for flush valve supply piping.

K. Adjust self-sustaining closet seats for proper operation and to sustain in any position.

L. Adjust electric water coolers flow for correct operation and temperature.

M. Insulate the hot and cold water and waste piping under handicapped lavatories.

N. Adjust shower mixing valves for correct leaving water temperature.

O. After all fixtures have been set and are ready for use, and before the Contractor leaves the job, they shall thoroughly clean all fixtures furnished and set by them, removing all stickers, rust stains and any other matter or discoloration of fixtures, leaving every part in new condition. They shall, further, adjust all flush valves and other fixture water tempering or balancing at supplies to give proper water flow of fixtures.

END OF SECTION

SECTION 230100 – COMMON WORK RESULTS FOR HVAC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and General Provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

B. Refer Specification Section 019113 General Commissioning Requirements.

1.2 CODES & STANDARDS (INCLUDING BUT NOT LIMITED TO THE FOLLOWING)

A. 2022 Connecticut State Building Code (CSBC) (IBC 2021 w/ amendments)

B. 2022 Connecticut State Mechanical Code (CSMC) (IMC 2021 w/ amendments)

C. 2022 Connecticut State Energy Conservation Code (CSECC) (IECC 2021 w/ amendments)

D. 2022 Connecticut State Building Performance Standard (High Performance Schools)

1.3 GENERAL SCOPE OF WORK

A. The mechanical work for this project consists of scope throughout the architectural floor plans.

1.4 REQUIREMENTS

A. The General, Special and Supplementary Conditions, and all other Contract Documents shall apply to the Contractor's work as well as to each of their Sub-Contractor's work.

B. All manufacturers, suppliers, fabricators, contractors, etc. submitting proposals to any part if for work, services, materials or equipment to be used on or applied to this project are hereby directed to familiarize themselves with all documents of Contract Documents. In case of conflict between these Common Work Results and the General and/or Special Conditions, the affected Contractor shall contact the Engineer for clarification and final determination prior to the Bid.

C. The work included in this Division consists of the furnishing of all labor, equipment, transportation, excavation, backfill, supplies, material, and appurtenances and services necessary for the satisfactory installation of the complete and operating Mechanical Systems indicated or specified in the Contract Documents.

D. Any materials, labor, equipment or services not mentioned specifically herein which may be necessary to complete any part of the Mechanical Systems in a substantial manner, in

compliance with the requirements stated, implied or intended in the Plans and/or Specifications, shall be included in the Bid as part of this Contract.

E. It is not the intent of this Section of the Specifications to make any Contractor, other than the Construction Manager, responsible to the Owner, Architect and Engineer. All transactions such as submittal of shop drawings, claims for extra costs, requests for equipment or materials substitution, shall be routed through the Construction Manager to the Architect, then to the Engineer. Also, this Section of the Specifications shall not be construed as an attempt to arbitrarily assign responsibility of work, material, equipment or services to a particular trade or Contractor. Unless stated otherwise, the subdivision and assignment of work under the various sections shall be optional.

F. The Architect and Engineer do not define the scope of individual trades, subcontractors, material suppliers and vendors. Any sheet numbering system or specification numbering system used which identifies disciplines is solely for the Architect and Engineer's convenience and is not intended to define a subcontractor's scope of work. Information regarding individual trades, subcontractors, material suppliers and vendors may be detailed, described and indicated at different locations throughout the Contract Documents. No consideration will be given to requests for change orders for failure to obtain and review the complete set of Plans and Specifications when preparing Bids, prices and quotations.

G. This Section of the Specifications or the arrangement of the contract documents shall not be construed as an attempt to arbitrarily assign responsibility for work, material, equipment or services to a particular trade Contractor or Sub-Contractor. Unless stated otherwise, the subdivision and assignment of work under the various sections shall be the responsibility of the Contractor holding the prime contract.

H. It is the intent of the Contract Documents to deliver to the Owner a new, complete and operational project once the work is complete. Although Plans and Specifications are complete to the extent possible, it shall be the responsibility of the Contractors involved to remove and/or relocate or re-attach any existing or new systems which interfere with new equipment or materials required for the complete installation without additional cost to the Owner.

I. In general, all work shall be accomplished without interruption of existing facilities operations. The Contractor shall advise the Owner at least forty-eight (48) hours prior to the interruption of any services. The Owners shall be advised of the exact time that interruption will occur and the length of time the interruption will last. Failure to comply with this requirement may result in complete work stoppage for the Contractors involved until a complete schedule of interruptions can be developed.

J. Whenever utilities are interrupted, either deliberately or accidentally, the Contractor shall work continuously to restore said service. The Contractor shall provide tools, materials, skilled journeymen of Contractor's own and other trades as necessary, premium time as needed and coordination with all applicable utilities, including payment of utility company charges (if any), all without requests for extra compensation to the Owner, except where otherwise provided for in the contract for the work.

K. Each Contractor shall also be governed by any unit prices and Addenda insofar as they may affect part of their work or services.

L. Definitions and Abbreviations:
1. Contractor - Any Contractor whether bidding, proposing or working independently or under contract with Construction Manager, and who installs any type of Mechanical Work as specified in the Contract Documents or the Construction Manager.
2. Engineer - The Consulting Mechanical-Electrical Engineer either consulting to the Owner, Architect, or Other, etc. In this case: CMTA, Inc., Consulting Engineers.
3. Architect - The Architect of Record for the project.
4. Contract Documents - All documents pertinent to the quality and quantity of work to be performed on this project. Includes, but not limited to: Plans, Specifications, General and Special Conditions, Addenda, Alternates, Unit Prices, Shop Drawings, Field Orders, Change Orders, Construction Contract with Owner, and other documents enumerated in the Owner/Contractor Agreement.
5. Bidder/Proposer - Any person, agency or entity submitting a proposal to any person, agency or entity for any part of the work required under this contract.
6. The Project - All of the work required under this Contract.
7. Furnish - Deliver to the site in good condition and turn over to the Contractor who is to install.
8. Provide - Furnish and install complete, tested and ready for operation.
9. Install - Receive and place in satisfactory operation.
10. Indicated - Listed in the Specifications, shown on the Plans or Addenda thereto or incorporated in the contract documents by reference.
11. Typical or Typ.- Where indicated repeat this work, method or means each time the same or similar condition occurs whether indicated or not.
12. ADA - Americans with Disabilities Act.
13. ANSI - American National Standards Institute.
14. ASHRAE - American Society of Heating, Refrigeration and Air Conditioning Engineers.
15. ASME - American Society of Mechanical Engineers.
16. IBC - International Building Code.
17. NEC - National Electrical Code.
18. NEMA - National Electrical Manufacturers Association.
19. NFPA - National Fire Protection Association.
20. OSHA - Office of Safety and Health Administration.
21. SMACNA - Sheet Metal and Air Conditioning Contractors National Association.
22. UL - Underwriters Laboratories.

PART 2 - INTENT AND INTERPRETATION

2.1 REQUIREMENTS

A. It is the intention of the Contract Documents to call for a complete and operational system, including all components, accessories, finish work, etc as necessary for trouble free operation; tested and ready for operation. Anything that may be required, implied, or inferred by the Contract Documents shall be provided and included in the contract sum.

B. Details not usually shown or specified, but necessary for the proper installation and operation of systems, equipment, materials, etc., shall be included in the work, the same as if herein specified or indicated.

C. The Bidder/Proposer shall completely review the Contract Documents. Any interpretation as to design intent or scope shall be provided by the Engineer / Architect. Should an interpretation be required, the Bidder/Proposer shall request a clarification not less than ten (10) days prior to the submission of the proposal so that the condition may be clarified by Addendum. In the event of any conflict, discrepancy, or inconsistency develops; the interpretation of the Engineer shall be final.

D. The Contractor shall give written notice of any materials or apparatus believed inadequate or unsuitable; in violation of laws, ordinances, rules or regulations of authorities having jurisdiction; and any necessary items of work omitted a minimum of ten days prior to bid. In the absence of such written notice and by the act of submitting a bid, it shall be understood that the Contractor has included the cost of all required items in the bid, and that will be responsible for the approved satisfactory functioning of the entire system without extra compensations.

PART 3 - INDEMNIFICATION:

3.1 REFER TO PROJECT GENERAL CONDITIONS AND SUPPLEMENTARY CONDITIONS.

A. The Contractor shall hold harmless and indemnify the Engineer, employees, officers, agents and consultants from all claims, loss, damage, actions, causes of actions, expense and/or liability resulting from, brought for, or on account of any personal injury or property damage received or sustained by any person, persons, (including third parties), or any property growing out of, occurring, or attributable to any work performed under or related to this contract, resulting in whole or in part from the negligence of the Contractor, any subcontractor, any employee, agent or representative.

PART 4 - PLANS AND SPECIFICATIONS

4.1 REQUIREMENTS

A. The Plans are diagrammatic only and indicate the general arrangement of the systems and are to be followed. If deviations from the layouts are necessitated by field conditions, detailed layouts of the proposed departures shall be submitted to the Engineer for approval before proceeding with the work. The Plans are not intended to show every item which may be necessary to complete the systems. All Bidder/Proposers shall anticipate that additional items may be required and submit their Bid accordingly.

B. The Plans and Specifications are intended to supplement each other. No Bidder/Proposer shall take advantage of conflict between them, or between parts of either. Should this condition exist, the Bidder/Proposer shall request a clarification not less than ten (10) days prior to the submission of the proposal so that the condition may be clarified by Addendum. In the event that such a condition arises after work is started, the interpretation of the Engineer shall be final.

C. The Plans and Specifications shall be considered to be complementary and anything appearing in the Specifications which may not be indicated on the Plans or conversely, shall be considered as part of the Contract and must be executed the same as though indicated by both.

D. Contractor shall make all of their own measurements in the field and shall be responsible for correct fitting. The work shall be coordinated with all other branches of work in such a manner as to cause a minimum of conflict or delay.

E. The Engineer shall reserve the right to make adjustments in location of piping, ductwork, equipment, etc. where such adjustments are in the interest of improving the project.

F. Should conflict, overlap or duplication of work between the various trades become evident, this shall be called to the attention of the Engineer. In such event neither trade shall assume to be relieved of the work which is specified under their branch until instructions in writing are received from the Engineer.

G. Unless dimensioned, the Plans only indicate approximate locations of equipment, piping, ductwork, etc. Dimensions given in figures on the Plans shall take precedence over scaled dimensions and all dimensions, whether given in figures or scaled, shall be verified in the field to insure no conflict with other work.

H. Each Bidder/Proposer shall review all Plans in the Contract Documents to ensure that the work they intend to provide does not create a conflict with or affect the work of others in any way. Where such effect does occur, it shall be the Bidder/Proposer's responsibility to satisfactorily eliminate any such conflict or effect prior to the submission of their proposal. Each Bidder/Proposer shall in particular ensure that there is adequate space to install their equipment and materials. Failure to do so shall result in the correction of such encroachment conflict or effect of any work awarded the Bidder/Proposer and shall be accomplished fully without expense to others and that they are reasonably accessible for maintenance. Check closely all mechanical and electrical closets, chases, ceiling voids, wall voids, crawl spaces, etc., to insure adequate spaces.

I. Where on the Plans a portion of the work is drawn out and the remainder is indicated in outline, or not indicated at all, the parts drawn out shall apply to all other like portions of the work. Where ornamentation or other detail is indicated by starting only, such detail shall be continued throughout the courses or parts in which it occurs and shall also apply to all other similar parts of the work, unless otherwise indicated.

J. Details not usually shown or specified, but necessary for the proper installation and operation of systems, equipment, materials, etc., shall be included in the work, the same as if herein specified or indicated.

K. Where within the Contract Documents the word “typical” or “typ.” is used, it shall mean that the work method or means indicated as typical shall be repeated in and each time it occurs whether indicated or not.

L. Each Contractor shall evaluate ceiling heights specified on Architectural Plans. Where the location of equipment or systems may interfere with ceiling heights or maintenance and access of equipment or systems, the Contractor shall call this to the attention of the Engineer in writing prior to making the installation. Do not install equipment or systems in the affected area until the conflict is resolved. Any such changes shall be anticipated and requested sufficiently in advance so as to not cause extra work or cost incurred on the part of the Contractor or unduly delay the work.

PART 5 - EXAMINATION OF SITE AND CONDITIONS

5.1 REQUIREMENTS

A. Each Bidder/Proposer shall inform their self of all of the conditions under which the work is to be performed, the site of the work, the structure of the ground, above and below grade, the obstacles that may be encountered, the availability and location of necessary facilities and all relevant matters concerning the work.

B. Each Bidder/Proposer shall also fully acquaint their self with all existing conditions as to ingress and egress, distance of haul from supply points, routes for transportation of materials, facilities and services, availability of utilities, etc. A proposal shall cover all expenses or disbursements in connection with such matters and conditions. No allowance will be made for lack of knowledge concerning such conditions after Bids are accepted.

PART 6 - EQUIPMENT AND MATERIALS SUBSTITUTIONS OR DEVIATIONS

6.1 REQUIREMENTS

A. When any Contractor requests approval of materials and/or equipment of different physical size, weight, capacity, function, color, access, it shall be understood that such substitution, if approved, will be made without additional cost to anyone other than the Contractor requesting the change regardless of changes in connections, space requirements, electrical characteristics, etc. from that indicated, electrical service, etc. In all cases where substitutions affect other trades, the Contractor requesting such substitutions shall advise all such Contractors of the change and shall compensate them for all necessary changes in their work. Any Plans, Specifications, Diagrams, etc., required to describe and coordinate such substitutions or deviations shall be professionally prepared at the responsible Contractor's expense. Review of Shop Drawings by the Engineer does not in any way absolve the Contractor of this responsibility.

B. Notwithstanding any reference in the Specifications to any article, device, product, material, fixture, form, or type of construction by name, make or catalog number, such reference shall be interpreted as establishing a standard of quality and shall not be construed as limiting competition; unless specifically indicated; any devices, products, materials, fixtures, forms, or types of construction which, in the judgment of the Engineer, are equivalent to those specified are acceptable, provided the provisions of this Part met. Requested substitutions shall be submitted to the Engineer a minimum of ten (10) days prior to Bid. If this procedure is not followed, the substitution will be rejected. If prevailing laws of cities, towns, states or countries are more stringent than these specifications regarding such substitutions, then those laws shall prevail over these requirements.

C. Wherever any equipment and material are specified exclusively only such items shall be used unless substitution is accepted in writing by the Owner utilizing Procurement Substitution Requests or Substitution for Cause as indicated in Division 01 specifications.

D. Each Bidder/Proposer shall furnish along with their proposal a list of specified equipment and materials which is to be provided. Where several makes are mentioned in the Specifications and the Contractor fails to state which they propose to furnish, the Engineer shall choose any of the makes mentioned without change in price. Inclusion in this list shall not ensure that the Engineer will approve shop drawings unless the equipment, materials, etc., submitted in shop drawings are satisfactorily comparable to the items specified and/or indicated.

E. Ten (10) days prior to the submission of a proposal, each Bidder/Proposer shall give written notice to the Engineer of any materials or apparatus believed inadequate or unsuitable; in violation of laws, ordinances, rules or regulations of authorities having jurisdiction; and any necessary items of work omitted. In the absence of such written notice, Bidder/Proposers signify that they have included the cost of all required items in the proposal and that the Bidder/Proposer will be responsible for the safe and satisfactory operation of the entire system.

PART 7 - CODES, RULES, PERMITS, FEES, INSPECTIONS, REGULATIONS, ETC.:

7.1 REQUIREMENTS

A. The Contractor shall give all necessary notices, obtain and pay for all permits, government sales taxes, fees, inspections and other costs, including all utility connections, meters, meter settings, taps, tap fees, extensions, etc. in connection with their work. They shall also file all necessary plans, prepare all documents and obtain all necessary approvals of all governmental departments and/or the appropriate municipality or utility company having jurisdiction, whether indicated or specified or not. They shall also obtain all required certificates of inspection for their work and deliver same to the Engineer before request for acceptance and final payment for the work.

B. Ignorance of Codes, Rules, Regulations, Laws, etc. shall not render the Contractor irresponsible for compliance. The Contractor shall also be versed in all Codes, Rules and Regulations pertinent to their part of the work prior to submission of a proposal.

C. The Contractor shall include in their work, without extra cost, any labor, materials, services, apparatus and Plans in order to comply with all applicable laws, ordinances, rules and regulations, whether or not indicated or specified.

D. All materials furnished and all work installed shall comply with the National Fire Codes of the National Fire Protection Association, with the requirements of local utility companies, or municipalities and with the requirements of all governmental agencies having jurisdiction.

E. All materials and equipment so indicated and all equipment and materials for the electrical portion of the mechanical systems shall bear the approval label of, or shall be listed by the Underwriters' Laboratories (UL), Incorporated. Each packaged assembly shall be approved as a package. Approval of components of a package shall not be acceptable.

F. All Heating, Ventilation and Air Conditioning work shall be accomplished in accordance with the International Mechanical Code (IMC) and amendments thereto, the latest standards recognized by the American Society of Heating, Refrigerating and Air Conditioning and the National Fire Protection Association.

G. The Contractor shall furnish three (3) copies of all Final Inspection Certificates obtained to the Engineer when work is complete. Final payment for work will be contingent upon compliance with this requirement.

H. Where minimum code requirements are exceeded in the Design, the Design shall govern.

I. The Contractor shall insure that their work is accomplished in accord with the OSHA Standards and that they conduct their work and the work of their personnel in accord with same.

J. All work relating to the handicapped shall be in accord with regulations currently enforced by the Authority Having Jurisdiction.

K. Discharge of any toxic, odorous or otherwise noxious materials into the atmosphere or any system shall be subject to regulations of the Environmental Protection Agency (EPA) and/or the air pollution control commission. If in doubt, contact the State Department for Environmental Protection.

L. Where conflict arises between any code and the Plans and/or Specifications, the code shall apply except in the instance where the Plans and Specifications exceed the requirements of the code. Any changes required as a result of these conflicts shall be brought to the attention of the Engineer at least ten (10) days prior to bid date, otherwise the Contractor shall make the required changes at their own expense. The provisions of the codes constitute minimum standards for wiring methods, materials, equipment and construction and compliance therewith will be required for all electrical work, except where the Plans and Specifications require better materials, equipment, and construction than these minimum standards, in which case the Plans and Specifications shall be the minimum standards.

PART 8 - QUALIFICATIONS OF CONTRACTOR/WORKERS:

8.1 REQUIREMENTS

A. All Mechanical Contractors and their subcontractors bidding this project must have been a licensed company for a minimum of three (3) years to qualify to Bid this project. Individual employee experience does not supersede this requirement.

B. All mechanical subcontractors bidding the mechanical work must have completed one project of 70% this subcontract cost size and two projects of 50% this subcontract cost size.

C. All mechanical work shall be accomplished by qualified workers competent in the area of work for which they are responsible. Untrained and incompetent workers, as evidenced by their workmanship, shall be summarily relieved of their responsibilities in areas of incompetency. The Engineer shall reserve the right to determine the quality of workmanship of any workers and unqualified or incompetent workers shall refrain from work in areas not deemed satisfactory. Requests for relief of a workers shall be made through the normal channels of Architect, Contractor, etc.

D. The installation of all Heating, Ventilating and Air-Conditioning Systems (HVAC) by any Contractor shall be performed by a Licensed Contractor with Journeymen or Master Tradesmen

as defined under State Regulations and Code. This includes any Contractor installing HVAC systems, piping and ductwork.

E. All sheet metal, insulation and pipe fitting work shall be installed by workers normally engaged in this type work.

F. All automatic control systems shall be installed by workers normally engaged or employed in this type work.

G. All electrical work shall be accomplished by licensed contractors with Journeymen or Master Electrician as defined under State Regulations and Code. All applicable codes, utility company regulations, laws and permitting authority of the locality shall be fully complied with by the Contractor.

PART 9 - SUPERVISION OF WORK:

9.1 REQUIREMENTS

A. The Contractor shall personally supervise the work for which they are responsible or have a competent superintendent, approved by the Engineer, on the work at all times during progress with full authority to act on behalf of the Contractor.

PART 10 - CONDUCT OF WORKERS:

10.1 REQUIREMENTS

A. The Contractor shall be responsible for the conduct of all workers under their supervision. Misconduct on the part of any worker to the extent of creating a safety hazard, or endangering the lives and property of others, shall result in the prompt relief of that worker. The consumption of alcoholic beverages or other intoxicants, narcotics, barbiturates, hallucinogens or dehabilitating drugs on the job site is strictly forbidden.

PART 11 - COOPERATION AND COORDINATION WITH OTHER TRADES:

11.1 REQUIREMENTS

A. The Contractor shall give full cooperation to all other trades and shall furnish in writing with copies to the Engineer, any information necessary to permit the work of other trades to be installed satisfactorily and with the least possible interference or delay.

B. Where any work is to be installed in close proximity to, or will interfere with work of other trades, each shall cooperate in working out space conditions to make a satisfactory adjustment. If so directed by the Engineer, the Contractor shall prepare composite working drawings and sections at a suitable scale not less than ¼" = 1'-0", clearly indicating how their work is to be installed in relation to the work of other trades, or so as not to cause any interference with work

of other trades. Make the necessary changes in the work to correct the condition without extra charge.

C. The Contractor shall furnish to other trades, as required, all necessary templates, patterns, setting plans, and shop details for the proper installation of work and for the purpose of coordinating adjacent work.

PART 12 - GUARANTEES AND WARRANTIES:

12.1 REQUIREMENTS

A. The Contractor shall guarantee all equipment, apparatus, materials, performance, and workmanship entering into their Contract to the best of its respective kind and shall replace all parts at their own expense, which are proven defective for a minimum of two years in addition to the time frames outlined in the General Conditions of the Contract. The effective date of completion of the work shall be the date of the Engineer's Statement of Substantial Completion. Items of equipment which have longer guarantees, as called for in these Specifications, shall have warranties and guarantees completed in order, and shall be in effect at the time of final acceptance of the work by the Engineer. The Contractor shall present the Engineer with such warranties and guarantees at the time of final acceptance of the work. The Engineer shall then submit these warranties, etc. to the Owner. The Owner reserves the right to use equipment installed by the Contractor prior to date of final acceptance. Such use of equipment shall not invalidate the guarantee except that the Owner shall be liable for any damage to equipment during this period, due to negligence of their operator or other employees. Refer to other sections for any special or extra warranty requirements.

B. All compressors shall have five-year warranty - 5-year parts and labor.

C. All VFDs shall have two-year warranty – 2-year parts and labor.

D. Provide all warranty certificates to Owner. All warranties begin starting at the substantial completion date, submit warranty certificates accordingly.

PART 13 - COST BREAKDOWNS (SCHEDULE OF VALUES):

13.1 REQUIREMENTS

A. Within thirty (30) days after acceptance of the Contract, the Contractor shall furnish to the Engineer, one copy of a detailed cost breakdown on each respective area of work. These cost breakdowns shall be made in a format approved by the Engineer. Payments will not be made until satisfactory cost breakdowns are submitted.

B. The breakdown shall be minimally as follows. Material and labor shall be listed separately. Pay special attention to required withholding (minimum of ½ % of associated mechanical contract value installation scope) for startup, testing, documentation, acceptance, owner training, etc.:

1. Mechanical Shop Drawings
2. Motor Load Coordination with other subcontractors
3. Mechanical Record Drawings & Acceptance
4. Mechanical O&M Manuals & Acceptance
5. Mechanical Owner Training & Acceptance
6. Mechanical Startup, Testing, Management Plan, Documentation, Acceptance, Owner Training, etc.
7. Coordination Drawings
8. Mechanical Identification Materials & Labor
9. Insulation (Piping) Materials & Labor
10. Insulation (Ductwork) Materials & Labor
11. HVAC Piping Materials & Labor
12. HVAC Piping Testing, Cleaning, Documentation, Acceptance, etc.
13. HVAC Piping Purging, Flushing, Cleaning
14. Geothermal Materials & Labor
15. Geothermal Grouting Materials & Labor
16. Geothermal Flushing, Purging, Testing, Documentation, Site Survey Submittal, Acceptance, etc
17. Sheetmetal Equipment
18. GRDs Materials & Labor
19. Sheetmetal Materials & Labor
20. Sheetmetal Shop Fabrication
21. Filters and Racks Materials & Labor
22. Spare Filters
23. Heat Pump Equipment & Labor
24. Heat Pump Startup, Testing, Documentation, Training, Acceptance, etc.
25. Water to Water Heat Pump Equipment & Labor
26. Water to Water Heat Pump Startup, Testing, Documentation, Training, Acceptance, etc.
27. Dedicated Outside Air Handling Unit Equipment & Labor
28. Dedicated Outside Air Handling Unit Startup, Testing, Documentation, Training, Acceptance, etc.
29. Chemical Treatment Materials & Labor
30. Chemical Treatment Startup, Testing, Documentation, Training, Acceptance, etc
31. Controls Shop Drawings
32. Controls Materials & Labor
33. Controls Power Sub-Metering, Startup, Testing, Documentation, etc.
34. Controls Graphics
35. Controls Startup, Testing, Documentation, etc.
36. Controls Training and Acceptance
37. Test and Balance Materials & Labor
38. Test and Balance Initial Report, Final Report and Acceptance

PART 14 - CHANGES IN MECHANICAL WORK

14.1 REFER TO GENERAL AND SPECIAL CONDITIONS.

PART 15 - CLAIMS FOR EXTRA COST

15.1 REFER TO GENERAL AND SPECIAL CONDITIONS.

PART 16 - MATERIALS AND WORKMANSHIP

16.1 REQUIREMENTS

A. All equipment, materials and articles incorporated in the work shall be new and of comparable quality to that specified. Each Bidder/Proposer shall determine that the materials and/or equipment they propose to furnish can be brought into the building(s) and installed within the space available. In certain cases, it may be necessary to remove and replace walls, floors and/or ceilings and this work shall be the responsibility of the Contractor. All equipment shall be installed so that all parts are readily accessible for inspection, maintenance, replacement of filters, etc. Extra compensation will not be allowed for relocation of equipment for accessibility or for dismantling equipment to obtain entrance into the building(s). Insure, through coordination that no other Contractor seals off access to space required for equipment materials, etc.

B. Materials and equipment, where applicable, shall bear Underwriters' Laboratories label where such a standard has been established.

C. Use extreme care in the selection of equipment and its installation to ensure that noise and vibration are kept at a minimum. The Engineer's determination shall be final and corrections to such discrepancies shall be made at the cost of the Contractor.

D. Each length of pipe, fitting, trap, fixture and device used in the plumbing or drainage systems shall be stamped or indelibly marked with the weight or quality thereof and with the manufacturer's mark or name.

E. All equipment shall bear the manufacturer's name and address. All electrically operated equipment shall bear a data plate indicating required horsepower, voltage, phase and ampacity. Pumps shall have a data plate indicating horsepower, static pressure head and flow rate.

PART 17 - HAZARDOUS MATERIALS:

17.1 REQUIREMENTS

A. The Contractor is hereby advised that it is possible that asbestos and/or other hazardous materials are or were present in this building or site.

B. Any worker, occupant, visitor, inspector, etc., who encounters any material of whose content they are not certain shall promptly report the existence and location of that material to the Contractor and/or Owner. The Contractor shall, as a part of their work, ensure that their workers are aware of this potential and what they are to do in the event of suspicion. The

Contractor shall also keep uninformed persons from the premises during construction. Furthermore, the Contractor shall insure that no one comes near to or in contact with any such material or fumes therefrom until its content can be ascertained to be non-hazardous.

C. CMTA, Inc., Consulting Engineers, have no expertise in the determination of the presence of hazardous materials. Therefore, no attempt has been made by them to identify the existence or location of any such material. Furthermore, CMTA nor any affiliate thereof will neither offer nor make any recommendations relative to the removal, handling or disposal of such material.

D. If the work interfaces, connects or relates in any way with or to existing components which contain or bear any hazardous material, asbestos being one, then, it shall be the Contractor's sole responsibility to contact the Owner and so advise them immediately.

E. The Contractor by execution of the contract for any work and/or by the accomplishment of any work thereby agrees to bring no claim relative to hazardous materials for negligence, breach of contract, indemnity, or any other such item against CMTA, its principals, employees, agents or consultants. Also, the Contractor further agrees to defend, indemnify and hold CMTA, its principals, employees, agents and consultants, harmless from any such related claims which may be brought by any subcontractors, suppliers or any other third parties.

F. No asbestos or mercury containing materials shall be installed in this project.

PART 18 - COORDINATION DRAWINGS

18.1 REQUIREMENTS

A. Detailed coordination drawings shall be required for this project. A specific line-item shall be included on the schedule of values by each Trade for “preparation of coordination drawings”. The Construction Manager shall closely monitor progress and quality of the preparation of the electronic coordination drawings and may withhold pay requests as deemed appropriate.

B. Coordination Drawings shall be provided on this project by each Trade (Mechanical, Fire Protection, Electrical). Drawings shall be 30x42 sheet size and shall be at ¼” scale and shall match the drawing setup as included in the Architectural Drawings. The Architect and Engineer may supply electronic drawings files of the Contract Documents upon the Contractor’s request and release.

C. The Engineer’s Model is not without MEP/FP clashes. It is the responsibility of the Contractors to prepare fully coordinated drawings for construction. Any clashes should be resolved as part of the Coordination Effort at no additional cost.

D. The basis for the Coordination Drawings shall be the sheet metal ductwork fabrication shop drawings, all electrical feeder conduits and other conduits 2” and larger, heat pump system piping and other major components in the ceiling cavity. The Coordination Drawings shall be prepared by the Mechanical Contractor with cooperation of all the contractors. The Coordination Drawings shall indicate (1) systems above ceilings in finished areas, (2) systems supported from the structure in finished areas without ceilings, (3) systems in the mechanical

rooms, and (4) all wall, roof, floor penetrations. These drawings shall indicate all ductwork as double lined with bottom elevations noted.

E. The sheet metal fabrication shop drawings shall be completed in a timely manner so as not to conflict with construction schedule and phasing plan. At the Contractor's discretion, these drawings shall be completed in phases to correspond with the project construction work sequencing. The Mechanical Contractor shall furnish an electronic copy of these ductwork shop drawings to all other Trades, specifically the Fire Protection and Electrical and other Contractors as requested by the Construction Manager for the purpose of including other trades work on the Coordination Drawings.

F. Pre-Coordination Meetings with all necessary trades should be performed. During these meetings, the Contractors shall discuss locations/elevations where piping, conduits, cable path, etc will be installed with respect to the sheetmetal fabrication drawings and other trades. The sheetmetal ductwork and gravity piping systems shall be given the first priority. Within 30 days of the meeting, each Trade shall provide the Mechanical Contractor electronic drawings of all of their systems (with elevation noted), coordinated with the ductwork and other trades for them to incorporate into the Coordination Drawings. Coordination Meetings may be required so that all conflicts can be resolved between Trades. All conflicts shall be resolved between all Trades at the Construction and Coordination Meetings and the Mechanical Contractor shall then amend the Drawings to include the Final Coordinated Work.

G. It is realized that not all systems can be completely detailed. The coordination drawings shall include the following at a minimum:
   1. All supply/return/exhaust ductwork.
   2. All above slab sanitary and roof drainage piping.
   3. HVAC, fire protection and domestic water piping which are 2" in size and greater, excluding insulation.
   4. Electrical conduits which are 1.5" in size and greater.
   5. Cable tray and bridal ring paths.
   6. Multiple smaller piping/conduits hung on a common trapeze hanger.
   7. All wall, roof, floor penetrations.

H. After completion of the Final Coordination Drawings, a Final Review with the all Trades shall occur to provide any final comments and approval by all Trades. Other interim coordination meeting will be required to insure successful coordination drawings. Any additional coordination items will be updated by the Mechanical Contractor. The Final Approved Coordination Drawings shall be distributed electronically (on CD) to each Trade by the Mechanical Contractor. The Mechanical Contractor shall also furnish a complete 30x42 paper set of drawings to the jobsite main office and shall utilize them for updates of field conditions/deviations that occur during construction. Final Approved Coordination Drawings shall also be distributed to the Contractor, Owner, Architect and Engineer for their Records. This process shall be completed prior to starting any work.

I. Each Contractor shall insure that any deviations from the Coordination Drawings are recorded as they occur, in red erasable pencil on Coordination Drawings kept at the jobsite. Upon completion of a particular phase, the Mechanical Contractor shall incorporate all field deviations into the Coordination Drawings to be utilized as Record Drawings. The Engineer shall review the Record Documents from time to time to ensure compliance with this specification. Compliance shall be a contingency of final payment. Pay particular attention to

the location of under floor sanitary and water lines, shut-off valves, cleanouts and other appurtenances important to the maintenance and operation of Mechanical Systems. Also, pay particular attention to Deviations in the Control Systems and all exterior utilities. Keep information in a set of drawings set aside at the job site especially for this purpose. The Record Drawings shall be distributed electronically (on CD) to the Contractor, Owner, Architect and Engineer for their Records.

J. The contractor's final coordination drawings shall be coordinated with actual field conditions, as examined and verified by the contractor following completion of demolition. The contractor shall complete coordination drawings in phases as required to accommodate sequencing of construction, shop drawing review and approval, etc. as required for the contractor to maintain the construction schedule.

K. The mechanical contractor is responsible to the Construction Manager for the shop drawing layout of the following rooms and details:
   1. Concrete pads and foundations
   2. Equipment room layouts with actual equipment
   3. Roof layouts
   4. Trench locations and sizes
   5. Dimensioned floor drain locations
   6. Congested areas above ceilings adjacent to mechanical and electrical room
   7. Dimensioned ductwork shop drawings

PART 19 - TEMPORARY SERVICES

19.1 REQUIREMENTS

A. The Contractor shall arrange any temporary water, electrical and other services which may be required to accomplish the work. Refer also to General and Special Conditions.

B. All temporary services shall be removed by Contractor prior to acceptance of work.

PART 20 - SURVEY, MEASUREMENTS AND GRADE:

20.1 REQUIREMENTS

A. The Contractor shall lay out their work and be responsible for all necessary lines, levels, elevations and measurements. The Contractor must verify the figures shown on the Plans before laying out the work and will be held responsible for any error resulting from failure to do so.

B. The Contractor shall base all measurements, both horizontal and vertical from established bench marks. All work shall agree with these established lines and levels. Verify all measurements at the site and check the correctness of same as related to the work.

C. Should the Contractor discover any discrepancy between actual measurements and those indicated which prevents following good practice or the intent of the contract documents, the Contractor shall promptly notify the Engineer and shall not proceed with this work until the Contractor has received instructions from the Engineer on the disposition of the work.

PART 21 - PROTECTION OF EQUIPMENT

21.1 REQUIREMENTS

A. The Contractor shall be entirely responsible for all material and equipment they furnish in connection with their work and special care shall be taken to properly protect all parts thereof from damage during the construction period. Such protection shall be by a means acceptable to the Engineer. All piping, etc., shall be properly plugged or capped during construction in a manner approved by the Engineer. Equipment damaged stolen or vandalized while stored on site, either before or after installation, shall be repaired or replaced by the Contractor at their expense. All ductwork with open ends shall be covered with plastic during construction.

PART 22 - REQUIRED CLEARANCES FOR ELECTRICAL EQUIPMENT

22.1 REQUIREMENTS

A. The NEC has specific required clearances above, in front, and around electrical gear, panels etc. The Contractor shall not install any piping, ductwork, etc., in the required clearance. If any appurtenance is located in the NEC required clearance, it shall be relocated at no additional cost.

PART 23 - EQUIPMENT SUPPORT

23.1 REQUIREMENTS

A. Each piece of equipment, apparatus, piping, or conduit suspended from the ceiling or mounted above the floor level shall be provided with suitable structural support, pipe stand, platform or carrier in accordance with the best recognized practice. Such supporting or mounting means shall be provided by the Contractor for all equipment and piping. Exercise extreme care that structural members of building are not overloaded by such equipment. Provide any required additional bracing, cross members, angles, support, etc. Do not support items from roof/floor deck or bridging.

PART 24 - DUCT AND PIPE MOUNTING HEIGHTS

24.1 REQUIREMENTS

A. All exposed or concealed ductwork, piping, etc., shall be held as high as possible unless otherwise noted and coordinated with all other trades. Exposed piping and ductwork shall, insofar as possible, run perpendicular or parallel to the building structure.

PART 25 - BROKEN LINES AND PROTECTION AGAINST FREEZING

25.1 REQUIREMENTS

A. No conduits, piping, troughs, etc. carrying water or any other fluid subject to freezing shall be installed in any part of the building where danger of freezing may exist without adequate protection being given by the Contractor whether or not insulation is specified or indicated on the particular piping. All damages resulting from broken and/or leaking lines shall be replaced or repaired at the Contractor's own expense. If in doubt, contact the Engineer. Do not install piping across or near openings to the outside whether they are carrying static or moving fluids or not. Insulation on piping does not necessarily ensure that freezing will not occur.

PART 26 - WEATHERPROOFING

26.1 REQUIREMENTS

A. Where any work pierces waterproofing including waterproof concrete, the method of installation shall be as approved by the Architect and Engineer before work is performed. The Contractor shall furnish all necessary sleeves, caulking and flashing required to make openings permanently watertight.

B. Wherever work penetrates roofing, it shall be done in a manner that will not diminish or void the roofing guarantee or warranty in any way. Coordinate all such work with the roofing installer.

PART 27 - FINAL CONNECTIONS TO EQUIPMENT

27.1 REQUIREMENTS

A. The Contractor shall finally connect to mechanical services for any terminal equipment, kitchen equipment, etc., provided under this and other divisions of the work. Various equipment connections indicated are based upon “basis of design” equipment selections. Should alternate equipment be purchased by the Construction Manager, then this Contractor shall make the necessary provisions in the Bid for any and all differences. Change Orders shall not be considered for any differences due to alternate equipment purchase. Such connections shall be

made in strict accord with current codes, safety regulations and the equipment manufacturer's recommendations. If in doubt, contact the Engineer prior to installation.

PART 28 - ACCESSIBILITY

28.1 REQUIREMENTS

A. The Contractor shall be responsible for the sufficiency of the size of shafts and chases, the adequate clearance in double partitions and hung ceilings for the proper installation of their work. They shall cooperate with all others whose work is in the same space. Such spaces and clearances shall, however, be kept to the minimum size required.

B. The Contractor shall locate and install all equipment so that it may be serviced, and maintained as recommended by the manufacturer. Allow ready access and removal of the entire unit and/or parts such as valves, filters, fan belts, motors, prime shafts, etc.

C. Whether shown on the Plans or not, the Contractor shall provide in the Bid access panels for each concealed shut-off valve, motorized control damper, manual air damper or other device requiring service as shown on Engineer's Plans or as required. Locations of these panels shall be identified in sufficient time to be installed in the normal course of work. Change orders for access panels will not be accepted.

PART 29 - SCAFFOLDING, RIGGING AND HOISTING

29.1 REQUIREMENTS

A. The Contractor shall furnish all scaffolding, rigging, hoisting and services necessary for erection and delivery onto the premises of any equipment and apparatus furnished. All such temporary appurtenances shall be set up in strict accord with OSHA Standards and Requirements. Remove same from premises when no longer required.

PART 30 - CONCRETE WORK

30.1 REFER TO THE SCOPE OF THE GENERAL TRADES CONTRACTOR. REFER TO DIVISION 3 SPECIFICATIONS.

PART 31 - RESTORATION OF NEW OR EXISTING LANDSCAPING, PAVING, SURFACES, ETC.:

31.1 REQUIREMENTS

A. The Contractor shall at their expense restore to their original conditions all paving, curbing, surfaces, drainage ditches, structures, fences, landscaping, existing or new building surfaces and appurtenances, and any other items damaged or removed by their operations. Replacement and

repairs shall be in accordance with good construction practice and shall match materials employed in the original construction of the item and shall be to the satisfaction of the Owner and/or Engineer.

PART 32 - MAINTENANCE OF EXISTING UTILITIES AND LINES

32.1 REQUIREMENTS

A. The locations of all piping, conduits, cables, utilities and manholes existing, or otherwise, that comes within the contract construction site, shall be subject to continuous uninterrupted service with no other exception than the Owner of the utilities permission to interrupt same temporarily. Provide a seven (7) day written notice to Engineer, Architect and Owner prior to interrupting any utility service or line.

B. Known utilities and lines as available to the Engineer are shown on the Plans. However, it is additionally required that, prior to any excavation being performed, each Contractor ascertain and mark all utilities or lines that would be endangered by the excavation. Contractor shall bear costs of repairing damaged utilities.

C. 32.3 If utilities or lines occur in the earth within the construction site, the Contractor shall probe and locate the lines prior to machine excavation in the respective area.

D. Cutting into existing utilities and services shall be done in coordination with and as designated by the Owner of the utility. The Contractor shall work continuously to restore service(s) upon deliberate or accidental interruption, providing premium time and materials as needed without extra claim to the Owner.

E. The Contractor shall repair to the satisfaction of the Owner and Engineer, any surfaces or subsurface improvements damaged during the course of the work, unless such improvement is shown to be abandoned or removed.

F. Machine excavation shall not be permitted with ten feet of gas lines, fuel lines, electrical lines or lines carrying combustible and/or explosive materials. Hand excavate only in accord with utility company, agency or other applicable laws, standards or regulations.

G. Protect all new or existing lines from damage by traffic, etc. during construction. Repairs or replacement of such damage shall be at the sole expense of the party responsible.

H. Protect existing trees, indicated to remain with fencing or other approved method. Hold all new subsurface lines outside the drip line of trees, offsetting as necessary to protect root structures. Refer to planting or landscaping plans, or in their absence, consult with the Architect.

PART 33 - CLEANING

33.1 REQUIREMENTS

A. The Contractor shall, at all times, keep the area of their work presentable to the public and clean of rubbish and debris caused by their operations; and at the completion of the work, shall remove all rubbish, debris, all of their tools, equipment, temporary work and surplus materials from and about the premises, and shall leave the area clean and ready for use. If the Contractor does not attend to such cleaning upon request, the Engineer may cause cleaning to be done by others and charge the cost of same to the Contractor. The Contractor shall be responsible for all damage from fire which originates in, or is propagated by, accumulations of their rubbish or debris.

B. After completion of all work and before final acceptance of the work, the Contractor shall thoroughly clean all equipment and materials and shall remove all foreign matter such as grease, dirt, plaster, labels, stickers, etc., from the exterior of piping, equipment, fixtures and all other associated or adjacent fabrication.

C. Ductwork and piping shall be kept clean at all times. Ductwork stored on the job site shall be placed a minimum of 4” above the floor and shall be completely covered in plastic. Installed ductwork shall be protected with plastic. Do not install the ductwork if the building is not “dried-in”. If this is required, the entire lengths of duct shall be covered in plastic to protect. The Owner/Engineer shall periodically inspect that these procedures are followed. If deemed unacceptable, the Contractor shall be required to clean the duct system utilizing a NADCA certified Contractor.

PART 34 - TEMPORARY USE OF EQUIPMENT:

34.1 REQUIREMENTS

A. The permanent heating and plumbing equipment, when installed, may be used for temporary services, with the consent of the Owner and Engineer. Should the permanent systems be used for this purpose the Contractors shall make all temporary connections required at their expense. They shall also make any replacement required due to damage wear and tear, etc., leaving the same in "as new" condition.

B. Permission to use the permanent equipment does not relieve the Contractors from the responsibility for any damages to the building construction and/or equipment which might result because of its use.

C. Systems used during construction shall be cleaned per NADCA ACR 2006 guidelines from visible surface containments within the HVAC system including complete air distribution systems, air handling equipment and components and filters.

D. A pre-start-up conference shall be held with the Architect, Owner, Construction Manager and the Mechanical Contractor. Equipment shall not be started until after this meeting.

E. For Heat Pump Units during all phases of construction:
   1. At a minimum, four complete sets of filter media are required for each unit. In each unit, install two sets of filter media during construction (more shall be required if construction activities dictate more frequent changes). In each unit, install one set of filter media at substantial completion. Leave one set of filter media in boxes in appropriate mechanical room as a spare set for the Owner. All other filters shall be used by the Contractor during construction. Dispose of all construction filter media.
   2. On the outside of all return air openings install a minimum of two sets of fiberglass filter media, such as cheesecloth, to be utilized as pre-filters for the "construction" filters. Install first set upon start-up and then install second set when first set is dirty. Dispose of all dirty construction filters. Change filters as often as necessary to keep units from becoming dirty at no additional cost.
   3. At substantial completion of the project the entire unit shall be cleaned to present a like "new" unit for the Owner and all filters shall be replaced with new.

F. For Outside Air Units during all phases of construction:
   1. The outside air unit shall be made operational, tested, etc. as specified during construction by the Contractor. Four complete sets of filters are required for the unit; Install one set of filters during construction; the remaining install one set of filters at substantial completion. Leave the remaining filters in boxes in appropriate mechanical room as a spare set for the Owner. Dispose of all construction filters.
   2. On the outside of all exhaust air openings install a minimum of two sets of fiberglass filter media, such as cheesecloth, to be utilized as pre-filters for the "construction" filters. Install first set upon start-up and then install second set when first set is dirty. Dispose of all dirty construction filters. Change filters as often as necessary to keep units from becoming dirty at no additional cost.
   3. At substantial completion of the project the entire unit shall be cleaned to present a like "new" unit for the Owner and all filters shall be replaced with new.

PART 35 - NOISE, VIBRATION OR OSCILLATION

35.1 REQUIREMENTS

A. Noise levels from mechanical equipment and systems shall not exceed the following sound pressure levels / noise criteria per ASHRAE Guidelines and as follows:

B. Classrooms, Instructional Spaces and Conference Rooms – NC 30 or less

C. Offices & Gym – NC 35 or less

D. Public Areas, Corridors & Toilet Rooms – NC 40 or less

E. All work shall operate under all conditions of load without any sound or vibration which is objectionable in the opinion of the Engineer. In case of moving machinery, sound or vibration noticeable outside of room in which it is installed, or annoyingly noticeable inside its own room, or exceeds the noise criteria limits as scheduled, will be considered objectionable. Sound or vibration conditions considered objectionable by the Engineer shall be corrected in an approved manner by the Contractor at their expense.

F. All equipment subject to vibration and/or oscillation shall be mounted on vibration supports whether indicated or not suitable for the purpose of minimizing noise and vibration transmission, and shall be isolated from external connections such as piping, ducts, etc. by means of flexible connectors, vibration absorbers, or other approved means. Unitary equipment, such as small room heating units, small exhaust fans, etc., shall be rigidly braced and mounted to wall, floor or ceiling as required and tightly gasketed and sealed to mounting surface to prevent air leakage and to obtain quiet operation. Flush and surface mounted equipment such as diffusers, grilles, etc., shall be gasketed and affixed tightly to their mounting surface.

G. The Contractor shall provide supports for all equipment they furnish. Supports shall be liberally sized and adequate to carry the load of the equipment and the loads of attached equipment, piping, etc. All equipment shall be securely fastened to the structure either directly or indirectly through supporting members by means of bolts or equally effective means. If strength of supporting structural members is questionable, contact Engineer.

PART 36 - EQUIPMENT/CONTROLS STARTUP & VERIFICATION: (GC 12/8/25)

36.1 REQUIREMENTS

A. The Contractor shall include in the bid to provide equipment and controls startup and verification for ALL Mechanical Systems specified for this project.

B. A pre-start-up conference shall be held with the Architect, Engineer, Owner, Construction Manager, Mechanical Contractor, Electrical Contractor, Controls Contractor, Test and Balance Contractor, and the Manufacturer's providing startup services. The purpose of this meeting will be to discuss the goals, procedures, etc. for start-up

C. Specific line-items shall be included on the schedule of values by each Trade for "equipment and controls startup". This line-item value shall be approved by the Engineer. The Engineer, Owner and the Engineer's Field Inspector(s) shall closely monitor progress and quality of the equipment and controls startup and may withhold pay requests as deemed appropriate.

D. Specific startup/verification Specifications are included throughout the Mechanical Specifications. In general, as part of the verification process, equipment suppliers shall perform start-up by their factory authorized technicians, not third-party contractors, and shall complete and submit start-up reports/checklists. The Contractor shall have appropriate trades on site to correct all deficiencies noted by the factory representative. For each deficiency noted, documentation of corrective action (including date and time) shall be submitted to the Engineer and Owner. Where factory start-up is not specified for a particular piece of equipment or system, the Contractor shall be responsible to perform start-up. All information shall be completed by the Contractor and submitted to the Owner/Engineer prior to acceptance of the equipment.

E. Each subcontractor shall be responsible for their own completion of System Verification Checklists/Manufacturer's Checklists and the Commissioning Agent's pre-functional checklists as part of verification and start-up. Factory startup is required for all HVAC equipment. Unless noted otherwise, as part of the verification process, equipment suppliers shall perform start-up

by their factory authorized technicians and shall complete and submit start-up reports/checklists. This shall include the following:

F. Heat Pumps

G. Water-to-Water Heat Pump Unit

H. Outside Air Unit

I. Terminal Units

J. Variable Frequency Drives

K. Water Flow Meters/BTUH Meters

L. System Pumps

M. Except for the equipment specified in this Specification Section, the manufacturer's recommended startup procedures and checklists will be acceptable for use in the project. Where "manufacturer" startup is not specified, then this Contractor shall perform startup services in strict accordance with manufacturer's instructions. All startup/verification process shall be thoroughly documented by the Contractor and shall include the time and date when performed.

N. The Contractor shall "zip-tie" a start-up report to each piece of equipment in a clear plastic cover. Once start-up completion is verified by the Engineer the Contractor shall remove all reports and consolidate them into close-out documentation. The Contractor shall be responsible for completion of System Verification Checklist (SVC) / Manufacturer's Checklists. Furnish to the Testing Agent and Engineer. Sample checklists shall be submitted to the Engineer, Owner, and Testing Agent for approval.

PART 37 - PINSPECTION, APPROVALS AND TESTS

37.1 REQUIREMENTS

A. Before requesting a final review of the installation from the Architect and/or Engineer, each Contractor shall thoroughly inspect their installation to assure that the work is complete in every detail and that all requirements of the Contract Documents have been fulfilled. Failure to accomplish this may result in charges from the Architect and/or Engineer for unnecessary and undue work on their part.

B. The Contractor shall provide as a part of this Contract any required Agency inspection, licensed and qualified to provide such services. All costs incidental to the provisions of inspections shall be borne by the Contractor.

C. The Contractor shall advise each Inspecting Agency in writing, with an informational copy of the correspondence to the Architect and/or Engineer, when they anticipate commencing work. Failure of the Inspecting Agency to inspect the work in the stage following and submit the

related reports may result in the Contractor's having to expose concealed work not so inspected. Such exposure will be at the expense of the responsible Contractor.

D. Inspections shall be scheduled for rough-in as well as finished work. The rough-in inspections shall be divided into as many inspections as may be necessary to cover all roughing-in without fail. Report of each such Agency Inspection visit shall be submitted to the Architect, Engineer and the Contractor within three days of the inspection.

E. Approval by an Agency Inspector does not relieve the Contractor from the responsibilities of furnishing equipment having a quality of performance equivalent to the requirements set forth in these Plans and Specifications. All work under this contract is subject to the review of the Architect and/or Engineer, whose decision is binding.

F. Before final acceptance, the Contractor shall furnish the original and three (3) copies of the certificates of final approval by the Agency Inspectors to the Engineer with one copy of each to the appropriate government agencies, as applicable. Final payment for the work shall be contingent upon completion of this requirement.

PART 38 - ABOVE-CEILING AND FINAL PUNCH LISTS

38.1 REQUIREMENTS

A. The Contractor shall review each area and prepare and complete their own punch list for each of the subcontractors as required for the Project Schedule.

B. Seven (7) days notice shall be given to the Engineer and Commissioning Agent for review of above ceiling work that will be concealed by tile or other materials. Seven (7) days notice shall be given to the Engineer for review of below ceiling work and final inspection.

C. When all work from the Contractor's punch list is complete at each of the major Project Stages and prior to completing ceiling installations (or at the final punch list stage), the Contractor shall request that the Engineer develop a punch list. This request is to be made in writing seven (7) days prior to the proposed date. After all corrections have been made from the Engineer's punch list, the Contractor shall review and initial off on each item. This signed-off punch list shall be submitted to the Engineer. The Engineer shall return to the site once to review each punch list and all work prior to the ceilings being installed and at the final punch list review. The Contractor’s representative may be requested at the inspections.

D. If additional visits are required by the Engineer to review work not completed by this review, the Engineer shall be reimbursed directly by the Contractor by check or money order (due net 10 days from date of each additional visit) at a rate of $200.00 per hour for extra trips required to complete either of the above ceiling, below ceiling or final punch lists.

PART 39 - OPERATING INSTRUCTIONS AND TRAINING

39.1 REQUIREMENTS

A. Upon completion of all work and all tests, each Contractor shall furnish the necessary skilled labor and helpers for operating the systems and equipment for a period of one (1) day of eight (8) hours and as specified for other systems. During this period, instruct the Owner or their representatives fully in the operations, adjustment, and maintenance of all equipment furnished. Give at least seven (7) days written notice to the Owner, Architect and Engineer in advance of this training period. The Engineer may attend any such training sessions or operational demonstrations. The Contractor shall certify in writing to the Engineer that such demonstrations have taken place, noting the date, time and names of the Owner's representatives that were present.

B. Each Contractor shall video each training session and furnish the video via thumb-drive (3 sets required). Also, furnish three digital sets on thumb-drive and three complete bound sets for approval to the Engineer instructions for operating and maintaining all systems and equipment included in this contract. All instructions shall be submitted in draft, for approval, prior to final issue. Manufacturer's advertising literature or catalogs will not be acceptable for operating and maintenance instructions.

C. Each Contractor, in the above-mentioned instructions, shall include the maintenance schedule for the principal items of equipment furnished under this contract and a detailed, easy to read parts list and the name and address of the nearest source of supply.

D. Per Connecticut General Statutes, Title 10, Chapter 170, Section 10-231e, each Contractor shall provide to the Owner’s staff sufficient training and acceptance for the maintenance of all HVAC systems specifically regarding indoor air quality including geothermal heat pump units, dedicated outside air system, exhaust fans, filtration, etc and any inter-related systems.

PART 40 - RECORD DRAWINGS

40.1 REQUIREMENTS

A. The Contractor shall insure that any deviations from the Design are as they occur recorded in red, erasable pencil on record drawings kept at the jobsite. The Engineer shall review the record documents from time to time to ensure compliance with this specification. Compliance shall be a contingency of final payment. Pay particular attention to the location of water lines, shut-off valves, cleanouts and other appurtenances important to the maintenance and operation of Mechanical Systems. Also, pay particular attention to Deviations in the Control Systems and all exterior utilities. Keep information in a set of drawings set aside at the job site especially for this purpose and deliver to the Engineer upon completion of the work.

B. All underground utilities/piping installed as part of this project shall be surveyed by a land surveyor licensed in the State. This shall include underground geothermal piping mains and vertical bore locations. The survey shall include actual pipe depths to top of pipe every 100 feet

in length. The survey shall also include benchmarks dimensions relative to above grade, fixed structures.

C. The survey information shall be included in the closeout documentation.

PART 41 - COMMISSIONING - CONTRACTOR RESPONSIBILITIES:

A. Contractor shall assign representatives with expertise and authority to act on its behalf and shall schedule them to participate in and perform commissioning process activities including, but not limited to, the following:

B. Evaluate performance deficiencies identified in test reports and, in collaboration with entity responsible for system and equipment installation, recommend corrective action.

C. Cooperate with the CxA for resolution of issues recorded in the Issues Log.

D. Attend commissioning team meetings.

E. Integrate and coordinate commissioning process activities with construction schedule.

F. Complete electronic construction checklists as Work is completed and provide to the Commissioning Authority.

G. Review and accept commissioning process test procedures provided by the Commissioning Authority.

H. Complete commissioning process test procedures.

PART 42 - BUILDING ENVELOPE PRESSURE TESTING - CONTRACTOR RESPONSIBILITIES

42.1 REQUIREMENTS

A. Contractor shall assign representatives with expertise and authority to act on its behalf and shall schedule them to participate in and perform building envelope pressure testing process activities including, but not limited to, the following:

B. Provide a plan for sealing the mechanical systems to allow proper testing of the building envelope system.

C. Sealing of all mechanical system building envelope penetrations (ducts, louvers, etc.).

D. Cooperate with the CxA for monitoring the process.

E. Attend building envelope pressure testing coordination meetings.

PART 43 - HVAC DEMOLITION & SALVAGE

43.1 REQUIREMENTS

A. It is the intent of the project to completely remove all components of the existing HVAC system within the building whether specifically noted or otherwise. This project is considered a "renovate-as-new" project and therefore none of the existing systems will be reused as part of this project. The general scope of the HVAC system demolition is indicated on the drawings. Where HVAC units are removed, also remove all associated ductwork, branch piping, hangers, insulation, concrete pads, controls, etc. Contractor shall field verify existing conditions prior to bid.

B. Refer to the demolition drawings for general indication of equipment, piping and ductwork to be demolished. If other equipment, piping or ductwork is found during construction which is not indicated on the drawings, it must also be removed.

C. Remove all temperature controls, panels, accessories, etc. that are accessible or become accessible during construction that serves demolished systems. Remove all pneumatic control tubing, control wiring and conduits in the facility unless noted otherwise.

D. Unless otherwise indicated, the Contractor shall be responsible for the patching and repairing by qualified tradesmen of all holes, etc. in the ceiling, wall, roof and floors where HVAC equipment and systems are removed.

E. The Contractor shall have a licensed refrigerant recovery technician evacuate all refrigerants from all refrigeration equipment being removed in accordance with EPA guidelines and regulations. The Contractor shall take all necessary precautions to not accidentally vent refrigerants to the atmosphere. The refrigerant shall become the property of the Contractor.

F. It is the intent of this section to deliver to the Owner all components which may be economically reused by them. The Contractor shall make every effort to remove reusable components without damage including window air-conditioners, temperature control air compressors and DDC panels.

G. Components to be delivered to the Owner shall be specifically identified by the Owner's representative prior to beginning the demolition. The Contractor shall prepare a letter of transmittal of all salvaged items and obtain the Owner's signature and date of receipt.

PART 44 - CT HIGH PERFORMANCE BUILDINGS (CTHPB)

44.1 REQUIREMENTS

A. Contractor shall comply with all applicable submittals, criteria, procedures, requirements, materials and systems associated with the Connecticut High Performance Building Standard (CTHPB).

B. Refer to CTHBP Checklist and Specification Section 018113.23 – Sustainable Design Requirement for additional information.

PART 45 – LEED REQUIREMENTS

A. Comply with applicable LEED and project sustainability requirements associated with Division 23 work.

B. Provide documentation required to support LEED credits and prerequisites related to HVAC systems, including energy performance, water and energy metering coordination, enhanced commissioning, refrigerant management, indoor air quality, thermal comfort, acoustics, and renewable energy integration, as applicable.

C. Coordinate with the Contractor, Owner, Commissioning Authority, LEED consultant, and other trades to support LEED documentation, installation requirements, testing, and verification.

D. Provide HVAC systems, controls, and related components necessary to support project sustainability goals for ventilation, filtration, controllability, metering interface, and occupant comfort.

E. Participate in enhanced commissioning, testing, training, and corrective action activities required for Division 23 systems and related LEED compliance.

END OF SECTION

SECTION 230300 - SHOP DRAWINGS, MAINTENANCE MANUALS AND PARTS LISTS

PART 1 - GENERAL

1.1 REQUIREMENTS

A. The Contractor's attention is directed to the General and Special Conditions, COMMON WORK RESULTS FOR HVAC and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. Drawings and General Provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1. Refer Specification Section 019113 General Commissioning Requirements.
2. Refer to the Owner’s OPR for additional items related to as-builts and O&Ms.

C. The Contractor shall prepare and submit shop drawings, product data, certified equipment drawings, installation instructions, and operation and maintenance data for all plumbing systems and equipment in accordance with Division 01 requirements and the project submittal schedule.

D. Submittals shall be prioritized to support the construction schedule, including early submission of long-lead and critical-path equipment.

E. Provide all shop drawings and submittals in electronic/PDF format through proper channels. The Engineer’s comments will be returned in electronic format.

F. Submittal data shall include specification data including metal gauges, finishes, accessories, etc. Also, the submittal data shall include certified performance data, wiring diagrams, dimensional data, and a spare parts list. Submittal data shall be reviewed by the Engineer before any equipment or materials is ordered or any work is begun in the area requiring the equipment.

G. Submittal data shall include specification data including metal gauges, finishes, accessories, etc. Also, the submittal data shall include certified performance data, wiring diagrams, dimensional data, and a spare parts list. Submittal data shall be reviewed by the Engineer before any equipment or materials is ordered or any work is begun in the area requiring the equipment.

H. All submittal data shall have the stamp of approval of the Contractor submitting the data as well as the Construction Manager and the Architect to show that the drawings have been reviewed by the Contractor. Any drawings submitted without these stamps of approval may not be considered and will be returned for proper resubmission.

I. The Contractor shall make any corrections or changes required by the Engineer and shall re-submit for final review as outlined above.

J. It shall be noted that review of shop drawings by the Engineer applies only to conformance with the design concept of the project and general compliance with the information given in the

contract documents. In all cases, the Contractor alone shall be responsible for furnishing the proper quantity of equipment and/or materials required, for seeing that all equipment fits the available space in a satisfactory manner and that piping, electrical and all other connections are suitably located.

K. The Engineers review of shop drawings, schedules or other required submittal data shall not relieve the Contractor from responsibility for: adaptability of the item to the project; compliance with applicable codes, rules, regulations and information that pertains to fabrication and installation; dimensions and quantities; electrical characteristics; and coordination of the work with all other trades involved in this project.

L. Equipment shall not be ordered and no final rough-in connections, etc., shall be accomplished until reviewed equipment shop drawings are in the hands of the Contractor. It shall be the Contractor's responsibility to obtain reviewed shop drawings and to make all connections, etc. in the neatest and most workmanlike manner possible. The Contractor shall coordinate with all the other trades having any connections, roughing-in, etc. to the equipment.

M. Submittals for mechanical equipment shall include all relevant performance and construction data, including but not limited to flow rates, pressure ratings, materials, finishes, and accessories.

N. Colors for equipment in other than mechanical spaces shall be selected from the Manufacturer's standard and factory optional colors. Color samples shall be furnished with the shop drawing submission for such equipment.

O. All submittals for mechanical equipment shall include all information specified. This shall include air and water pressure drops, RPM, noise data, face velocities, horsepower, voltage motor type, steel or aluminum construction, and all accessories clearly marked.

P. All items listed in the schedules shall be submitted for review in a tabular form similar to the equipment schedule. All items submitted shall be designated with the same identifying tag as specified on each sheet.

Q. Any submittals received in an unorganized manner without options listed and with incomplete data will be returned for resubmittal.

R. Indicate compliance with CT High Performance Building Standards as applicable.

S. Indicate compliance with LEED v4.1 Standards as applicable.

PART 2 - SHOP DRAWINGS

2.1 REQUIREMENTS

A. Shop Drawings, descriptive literature, technical data and required schedules shall be submitted on the following:

(2.1.A.1) Air Filtration & Components

(2.1.A.2)	Chemical Treatment
(2.1.A.3)	Ductwork Accessories/Volume Dampers
(2.1.A.4)	Sheetmetal Standards
(2.1.A.5)	Exhaust Fans
(2.1.A.6)	HVAC Piping Valves and Fittings
(2.1.A.7)	Kitchen Hood, Exhaust fan
(2.1.A.8)	Firestopping
(2.1.A.9)	Geothermal Heat Pump Units
(2.1.A.10)	Geothermal Piping and Specialties
(2.1.A.11)	Insulation
(2.1.A.12)	Outside Air Handling Unit (and custom base rail curb)
(2.1.A.13)	Variable Air Volume Terminal Boxes
(2.1.A.14)	Pumps
(2.1.A.15)	Hydronic Specialties (Tanks, Air Separators, Filters)
(2.1.A.16)	Register, Grilles, Diffusers and Louvers
(2.1.A.17)	Temperature Controls
(2.1.A.18)	Unit Heaters
(2.1.A.19)	Variable Frequency Drives
(2.1.A.20)	Sound Attenuators
(2.1.A.21)	Automatic Smoke Vents
(2.1.A.22)	Geothermal Piping
(2.1.A.23)	Grout Mixture and Procedures
(2.1.A.24)	Written Flushing, Purging, Pressure, and Flow Testing Plan
(2.1.A.25)	Test and Balancing Plan, Procedure and Reports
(2.1.A.26)	Wellfield Shop Drawing indicating Layout and Sizing
(2.1.A.27)	Sheetmetal Shop Drawings
(2.1.A.28)	Piping Shop Drawings

2.2 SPECIAL NOTES

A. Upon substantial completion of the project, the Contractor shall deliver to the Engineers (in addition to the required Shop Drawings) three (3) complete copies of operation and maintenance instructions and parts lists for all items marked above. These documents shall include at least:

1. Detailed operating instructions
2. Detailed maintenance instructions including preventive maintenance schedules.
3. Addresses and phone numbers indicating where parts may be purchased.
4. Expanded parts drawings, parts lists, service manuals, schematics, wiring diagrams.
5. Master air filter list including equipment identification, filter size, filter quantity, and supplier contact information.

B. Shop drawings for the Control Systems shall include detailed, scaled plans and schematic diagrams indicating the function and operation of the system. Refer to Specification Section – AUTOMATIC TEMPERATURE CONTROLS FOR HAVC for additional requirements.

C. The Contractor shall submit project specific UL listed firestopping installation drawings to the Authority having jurisdiction.

PART 3 - EXECUTION

3.1 REQUIREMENTS

A. Upon substantial completion of the project, the Contractor shall submit to the Engineer a PDF version of the Certified Air and Hydronic Balance Report.

3.2 INSTALLATION

A. Installation shall comply with manufacturer's written instructions and applicable codes and authority having jurisdiction (AHJ) requirements.

3.3 USE OF APPROVED SUBMITTALS

A. All work shall be installed in accordance with reviewed submittals. Where discrepancies exist between the Contract Documents and reviewed submittals, the more stringent requirement shall govern. Notify the Engineer of such discrepancies prior to installation.

3.4 FIELD VERIFICATION

A. Verify field conditions, dimensions, and utility requirements prior to installation and fabrication.

B. Do not proceed with installation where conflicts exist until such conflicts are resolved.

3.5 COORDINATION

A. Coordinate installation of plumbing systems and equipment with other trades, including structural, architectural, mechanical, and electrical work.

B. Ensure proper access, service clearances, and routing prior to installation.

3.6 CLOSE OUT DOCUMENTS

A. Submit final, complete operation and maintenance manuals incorporating all approved submittals and field changes.

B. Manuals shall reflect as-installed conditions and include final equipment selections, settings, and configurations.

END OF SECTION

SECTION 230513 – COMMON MOTOR ELECTRICAL REQUIREMENTS FOR HVAC EQUIPMENT

PART 1 - GENERAL

1.1 REQUIREMENTS

A. The Contractor's attention is directed to the General and Special Conditions, COMMON WORK RESULTS FOR HVAC and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. Through coordination with other Contractors, Vendors and Suppliers associated with this Project, this Contractor shall insure a complete, 100% functional, tested, inspected and approved systems. Claims for additional cost or change orders will immediately be rejected. Refer to Specification Section – HVAC EQUIPMENT for additional requirements. All equipment shall be furnished for a single point electrical connection unless specifically excluded as a requirement.

C. Review the Specification Section – TEMPERATURE CONTROLS AND SEQUENCE OF OPERATIONS FOR HVAC to determine controls, including variable frequency drives, to be furnished.

D. Prior to ordering any materials or rough-in of any kind, the Mechanical Contractor shall be responsible for final coordination of all electrical requirements (i.e. voltage, phase, circuit breaker, wire sizing, etc.) with the Electrical Contractor. There will be no change in the Contract Amount for any discrepancies. A final coordination meeting shall be held with the Construction Manager, Mechanical Contractor, Electrical Contractor and their sub-contractors.

PART 2 - MOTORS

2.1 REQUIREMENTS

A. The following are basic requirements for simple or common motors. For special motors, more detailed and specific requirements are specified in the individual equipment specifications and drawing schedules.

B. Torque characteristics shall be sufficient to satisfactorily accelerate the driven loads.

C. Motor sizes shall be large enough so that the driven load will not require the motor to operate in the service factor range.

D. Motors shall be capable of frequency of starts as indicated by automatic control system and not less than five (5) evenly time spaced starts per hour for manually controlled motors.

E. Motors shall have a 1.15 service factor for poly-phase motors and 1.35 service factor for single phase motors.

F. Motors shall have a temperature rating for 40 deg C ambient environment with maximum 90 deg C temperature rise for continuous duty at full load with 1.15 service factor and Class B insulation.

G. Unless otherwise noted or required by application, motors shall confirm to NEMA Standard MG 1 (Table 12-10) for general purpose, continuous duty, horizontal, T-frame, single speed, design “A” or “B”. Utilize design "C" motors where required for high starting torque.

H. Motor frames shall be NEMA Standard No. 48 or 56. Use driven equipment (fans, pumps, etc.) manufacturer's standards to suit specific application.

I. Provide inverter rated motors where variable frequency drives are utilized. Motor shall be premium efficiency type with Class F insulation and shall conform to NEMA MG 1 parts 30 and 31. Inverter duty rated motors shall have a temperature rating for 40 deg C ambient environment with maximum of 105 deg C temperature rise.

J. Motor bearings shall be ball or roller bearings with inner and outer shaft seals. Bearings shall be re-greaseable, except permanently sealed where motor is normally inaccessible for regular maintenance. Bearings shall be designed to resist thrust loading where belt drives or other drives produce lateral or axial thrust in motor.

K. Motor enclosure type shall be open drip-proof motors for indoor use where satisfactorily housed or remotely located during operation. Enclosures shall be guarded drip-proof type motors where exposed to contact by employees or building occupants. Enclosure shall be weather protected Type I for outdoor use or Type II where not housed.

L. Provide built-in thermal overload protection and, where required, internal sensing device suitable for signaling and stopping motor at starter.

M. Provide energy efficient motors with a minimum efficiency in accordance with NEMA MG 1, Table 12-10 for 1800 rpm, enclosed motors. If efficiency not specified, motors shall have a minimum efficiency as listed below:

1 hp - 85.5%	5 hp – 89.5%	20 hp – 93.0%
1.5 hp – 86.5%	7.5 hp – 91.7%	25 hp – 93.6%
2 hp – 86.5%	10 hp – 91.7%	30 hp – 993.6%
3 hp – 89.5%	15 hp – 92.4%	40 hp – 94.1%

N. On the motor nameplate, indicate the full identification of manufacturer, ratings, characteristics, construction, special features and similar information.

PART 3 - MOTOR STARTERS

3.1 REQUIREMENTS

A. Provide motor starters where indicated on the mechanical equipment schedules or elsewhere in the Contract Documents.

B. Motor starters shall be NEMA style. Their sizing and installation shall be coordinated with the equipment manufacturer's requirements and in accordance with the National Electrical Code.

C. All starters shall be size 0 minimum. They shall be constructed and tested in accord with latest edition of NEMA standards. All starters shall be across-the-line magnetic type, unless indicated otherwise. On motors of 20 H.P. or greater rating, the supplier shall provide starters capable of limiting inrush currents. These shall be the reduced voltage open-transition type. Do not utilize closed transition starters unless specifically indicated.

D. Magnetic starters shall be furnished with the following characteristics and accessories as a minimum. See other sections of these specifications and mechanical schedules for further requirements.

E. Contacts shall be silver-alloy, double-break type except NEMA size 8 and 9 shall be single-break type. Contacts shall be replaceable without removal of wiring or removal of starter from enclosure. Number of contacts shall be as required for service indicated. Contacts shall be gravity dropout type, positive operation.

F. Coil voltage shall be 120 volts, A.C., 60 HZ or less, as required to suit control systems available voltages. Coils shall be of molded construction, except for size 8 and 9 which shall be hand wound. Provide coil clearing contact as required.

G. Provide control transformer of adequate K.V.A. as required on all starters with line-to-line voltages higher than 120 volts A.C. Provide fuse block and slow-blow fuse to protect control transformer per NEMA, N.E.C. and U.L.

H. Provide hand-off-auto selector switch in face of starter, wired into hand and off switch positions. Auto position (if needed) to be field wired as indicated for automatic control.

I. Provide NEMA Class 20 resettable overload relays, accurately sized to the motor nameplate rating of the motor served and the temperature differential between motor and controller. Overloads shall be easily replaceable, and resettable without opening enclosure, via a push button or similar means. Class 10 or Class 30 overloads may be used depending on type of motor duty encountered.

J. Provide at least one N.O. auxiliary contact (field-convertible to N.C. operation) with each starter. All starters shall have space for two additional single-pole contacts.

K. All starters shall be thru-wiring type.

L. Provide phase failure sensing relay to open starter coil circuit (on loss of one or more phases) on all three-phase starters controlling motors of 7½ H.P. or larger.

PART 4 - ELECTRICAL REQUIREMENTS FOR MECHANICAL EQUIPMENT

4.1 REQUIREMENTS

A. All mechanical equipment shall be provided for single point electrical connection unless noted otherwise.

B. The equipment manufacturer shall provide internally mounted fuses with his equipment, as required, to comply with the U.L. listing on the equipment name plate. (i.e., hermetically sealed compressors or equipment with name plate data that recommends or requires fuse protection.) See also, National Electrical Code, Article 440, Part C, and other applicable sections of the N.E.C.

C. It shall be the Contractor's responsibility to assure that all mechanical equipment requiring electrical connections be provided with all required proper wiring, electrical protective devices, disconnecting means and electro-mechanical starting units to properly match the mechanical equipment requirement.

D. Each separate contractor engaged for the project shall coordinate with all other trades to ensure all necessary equipment and labor is included for fully functioning mechanical systems, installed per Code and Project requirements.

E. Refrigeration condensing units with internal compressors shall be furnished with integral starter.

F. All interlock or other control wiring, unless specifically noted otherwise, is the responsibility of this Contractor.

G. All equipment shall be suitably enclosed. All enclosures for equipment shall be rated and approved for the environment in which it operates. (i.e., NEMA 1, NEMA 3R, NEMA 7, NEMA 12, etc.) Verify the requirement with the installation condition if not indicated on the plans.

H. Observe the following standards for manufacture of equipment and in selection of components: (1) Starters, control devices and assemblies - NEMA (I.E.C. style not acceptable), (2) Enclosures for electrical equipment – NEMA, (3) Enclosed switches – NEMA, (4) All electrical work, generally NFPA 70, (5) All electrical work in industrial occupancies - J.I.C. standards, (6) All electrical components and materials - U.L. listing required.

I. Where scheduled on the drawings, provide disconnect switches and contactors. Disconnect switches shall be fusible type or circuit breaker type.

PART 5 - REQUIREMENTS FOR MECHANICAL EQUIPMENT 3/4 H.P. OR LESS

5.1 REQUIREMENTS

A. This section describes requirements for small mechanical equipment such as VAV boxes, unit heaters, exhaust fans, heat pumps, cabinet heaters, DDC temperature control panels, condensate pumps, and in-line recirculating pumps.

B. Small equipment with motor(s) of 3/4 H.P., single phase or less are generally not required to be furnished with starter(s), unless otherwise noted. For such equipment, provide integral contactor or horsepower-rated relay where controlled by DDC controls, thermostat or other type of switch. Contactors or relays shall be as recommended by the manufacturer of the equipment.

C. Provide transformer within unit as required to provide low voltage A.C. for thermostat control.

D. Provide internal fusing for unit motor and other loads in fuse block or in-line fuse holder.

E. Where externally-mounted disconnecting means is required and would be impractical, unsightly or inappropriate in the judgment of the Engineer, disconnects shall be located within the unit. These disconnects may be fusible H.P.-rated snap switches or manual starters with overload elements, as required. Locate this and other electrical equipment within enclosure where easily accessible behind access panel or door on unit, and as acceptable to the electrical inspector or local authority having jurisdiction.

END OF SECTION

SECTION 230517 – SLEEVES AND SLEEVE SEALS FOR HVAC PIPING

PART 1 - GENERAL

1.1 REQUIREMENTS

A. The Contractor's attention is directed to the General and Special Conditions, COMMON WORK RESULTS FOR HVAC and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. The Contractor shall be responsible for all openings, sleeves, trenches, etc., that may be required in floors, roofs, ceilings, walls, etc., and shall coordinate all such work with the Construction Manager and all other trades. Coordinate with the Construction Manager, any openings which they are to provide before submitting a bid proposal in order to avoid conflict and disagreement during construction. Improperly located openings shall be reworked at the expense of the Contractor.

C. The Contractor shall plan their work ahead and shall place sleeves, frames or forms through all walls, floors and ceilings during the initial construction, where it is necessary for piping, ductwork, conduit, etc., to go through; however, when this is not done, the Contractor shall then do all cutting and patching required for the installation of their work, or pay other trades for doing this work when so directed by the Engineer. Any damage caused to the buildings by the workers of the responsible Contractor must be corrected or rectified at their own expense.

D. The Contractor shall notify other trades in due time where they will require openings or chases in new concrete or masonry. Set all concrete inserts and sleeves for their work. Failing to do this, Contractor shall cut openings for the work and patch same as required at their own expense.

E. the Contractor shall be responsible for properly shoring, bracing, supporting, etc., any existing and/or new construction to guard against cracking, settling, collapsing, displacing or weakening while openings are being made. Any damage occurring to the existing and/or new structures, due to failure to exercise proper precautions or due to action of the elements shall be promptly and properly corrected to the satisfaction of the Engineer.

F. All work improperly performed or not performed as required by the Mechanical Trades in this section, shall be corrected by the Construction Manager at the responsible Contractor’s expense.

PART 2 - SLEEVES

2.1 REQUIREMENTS

A. Cast iron or Schedule 40 steel sleeves shall be installed through all walls where pipe enters the building below grade. Sleeves shall be flush with each face of the wall and shall be sufficiently larger than the entering pipe to permit thorough caulking between pipe and sleeve for water proofing. Utilize “Link-Seal” at these locations.

B. In all cases, sleeves shall be at least two pipe sizes larger than nominal pipe diameter plus insulation.

C. Horizontal sleeves passing through exterior walls or where there is a possibility of water leakage and damage shall be caulked watertight. Utilize “Link-Seal” at these locations.

D. Vertical sleeves in roofs shall be flashed and counter flashed with lead (4 lb.) or 16 oz. copper and welded or soldered to piping, lapped over sleeve and properly weather sealed. Where sleeves pass through roof construction, sleeves shall extend minimum of 12" above the roof.

E. Sleeves through walls and floors shall be cut off flush with inside surface unless otherwise indicated.

PART 3 - CUTTING

3.1 REQUIREMENTS

A. All rectangular or special shaped openings in plaster, gypsum board or similar materials, shall be framed by means of plaster frames, casing beads, wood or metal angle members as required. The intent of this requirement is to provide smooth, even termination of wall, floor and ceiling finishes as well as to provide a fastening means for grilles, diffusers, louvers, etc.

B. The Mechanical Contractor shall coordinate all openings in masonry walls with the Construction Manager; and, unless otherwise indicated in the Contract Documents, shall provide lintels for all openings required for the mechanical work such as louvers, wall boxes, exhaust fans, etc.). Lintels shall be sized as follows:
   1. New Openings under 48" in width: Provide one 3½"x3½"x3/8" LLV steel angle for each 4" of masonry width. Lintel shall have 8" bearing on each end.
   2. New Openings over 48" in width: Consult with structural engineer.

C. No cutting is to be done at points or in a manner that will weaken the structure and unnecessary cutting must be avoided. If in doubt, contact the Engineer.

D. Pipe openings in slabs and walls shall be cut with core drill. Hammer devices will not be permitted. Edges of trenches and large openings shall be scribe cut with a masonry saw.

PART 4 - PATCHING AND REPAIRING

4.1 REQUIREMENTS

A. Patching and repairing made necessary by work performed under this Division shall be included as a part of the work and shall be done by skilled workers of the trade or trades for work cut or damaged. The work shall be performed in strict accordance with the provisions herein before specified to match adjacent surfaces and in a manner acceptable to the Engineer and Owner.

B. Where portions of existing sites, lawns, shrubs, paving, etc. are disturbed for installation of work of this Division, such items shall be repaired and/or replaced back to original or better condition to the satisfaction of the Engineer.

C. Piping and ductwork passing through floors, ceilings and walls in finished areas shall be fitted with chrome plated brass escutcheon trim pieces of sufficient outside diameter to amply cover the sleeved openings and an inside diameter to closely fit the pipe/duct around which it is installed.

D. Flanged metal collars shall be provided around all ducts, flues, pipes, etc. at all wall penetrations; both sides. Penetrations through any wall will require the installation of flanged collars. Openings shall not be any larger than 2” in any direction than the piping/duct passing through the wall. Openings larger than this requirement shall also be infilled to match adjacent construction. Fill void with insulation for sound reduction.

PART 5 - FIRESTOPPING

5.1 REQUIREMENTS

A. The Contractor shall submit project specific UL listed firestopping installation drawings to the local building inspectors for their approval as required. Acceptable manufacturers include Hilti, 3M, Metacaulk or equal. Coordinate firestopping systems with other trades.

B. All mechanical pipes and ducts penetrating fire rated floors and walls shall be firestopped by this Contractor. All firestopping products and assemblies installed shall be UL listed. Piping materials and ductwork gauges shall be as required for the UL listed assembly.

C. Where the installation of conduit, ducts, piping, etc. requires the penetration of fire or smoke rated walls, ceilings or floors, the space around such conduit, duct, pipe, etc., shall be tightly filled with an approved non-combustible fire insulating material satisfactory to maintain the rating integrity of the wall, floor or ceilings affected.

D. Where the installation of ductwork requires the penetration of non-rated floors, the space around the duct or pipe shall be tightly filled with an approved non-combustible material.

E. Provide shop drawings indicating penetration detail for each type of wall and floor construction. Shop drawings must be specific for each individual type of penetration (one-hour fire rated

gypsum wall board with insulated metal pipe penetration, etc.) Provide copies to the local building inspector.

F. The manufacturer of the firestopping materials shall provide on site training for the installing Contractor. The training session shall demonstrate to the Contractors the proper installation techniques for all the firestopping materials. Contact the Engineer prior to conducting this training session.

G. Firestopping materials include (but are not limited to) wraps, strips, caulks, moldable putties, restricting collars with steel hose clamps, damming materials, composite sheets, fire dam caulks, steel sleeves, etc.

H. The following indicates the 3M penetration detail for uninsulated pipe penetration of various wall and floor construction types:
   1. One- or two-hour fire rated concrete floor - 3M #5300-MPC8.
   2. One- or two-hour fire rated solid or block concrete wall - 3M #5300-MPC16 or 3M #5300 MPC26.
   3. One-hour fire rated gypsum wallboard - 3M #5300-MPC7.
   4. Two-hour fire rated gypsum wallboard - 3M #5300-MPC7.

I. The following indicates the 3M penetration detail for insulated pipe penetrations of various wall and floor construction types:
   1. One- or two-hour fire rated concrete floor - 3M #5300-IMP2.
   2. One- or two-hour concrete block wall - 3M #5300-IMP2.
   3. One-hour fire rated gypsum wallboard - 3M #5300-IMP4.
   4. Two-hour fire rated gypsum wallboard - 3M #IMP7.

J. HVAC ducts penetrating a one- or two-hour fire rated wall or floor shall be firestopped per 3M #5300-HVD1.

K. Multiple pipes penetrating fire rated floors and walls may be firestopped as a group. Submit UL listed details for specific applications if this method of firestopping is chosen.

END OF SECTION

SECTION 230519 – METERS AND GAUGES FOR HVAC PIPING

PART 1 - GENERAL

1.1 REQUIREMENTS

A. The Contractor's attention is directed to the General and Special Conditions, COMMON WORK RESULTS FOR HVAC and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. The Contractor shall include all thermometers, pressure gauges and/or compound gauges at the locations indicated. All thermometers, pressure gauges and/or compound gauges shall be provided with “gauge cocks or ball valves” to allow the gauge to be removed and replaced without shutting down system.

1.2 SUMMARY

A. This section includes the following types of meters and gauges
   1. Temperature gauges and fittings
   2. Pressure gauges and fittings

B. Meters and gauges furnished as part of factory-fabricated equipment are specified as part of equipment assembly in other Division 23 specifications.

1.3 QUALITY ASSURANCE

A. UL Compliance: Comply with applicable UL standards pertaining to meters and gauges.

B. ASME and ISA Compliance: Comply with applicable portions of ASME and Instrument Society of America (ISA) standards pertaining to construction and installation of meters and gauges.

1.4 SUBMITTALS

A. Shop Drawings, descriptive literature, technical data and required schedules shall be submitted on the following:
   1. Product Data for each type of thermometer and gauge
   2. Calibration Certificates
   3. Operation and Maintenance Manuals
   4. Instrument ranges and locations indicated on shop drawings

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Subject to compliance with requirements, provide products by one of the following or approved equal:
   1. Thermometers and Wells: Trerice, WIKA, Ashcroft, Winters
   2. Pressure Gauges: Trerice, WIKA, Ashcroft, Winters
   3. Test Plugs: Trerice, Sisco, Watts, Peterson Equipment Co

B. All instruments shall be factory calibrated.

C. All components shall be rated for system design pressure and temperature.

D. Install instruments to be readable from normal operating position.

E. Provide instruments compatible with building automation system where indicated.

2.2 THERMOMETERS

A. Type: Bimetal dial-type, adjustable angle, stainless steel case and stem.

B. Dial Size: Minimum 2-1/2-inch diameter (3-inch typical; 4-1/2-inch preferred in mechanical rooms).

C. Accuracy: ±1% of full scale.

D. Scale: Dual scale (°F/°C), permanently etched.

E. Range shall be selected for system served, 0°F–180°F for geothermal water

F. Stem Length: As required for proper immersion.

G. Provide thermometers installed in separable stainless steel wells for all piping applications. Direct immersion without wells is not permitted.

2.3 DIGITAL THERMOMETERS

A. Provide digital thermometers where indicated on drawings.

B. Range: -50°F to 300°F.

C. Accuracy: ±1% or ±1°F, whichever is greater.

D. Display: Minimum 3/8-inch LCD.

E. Power: Self-powered (solar) or battery as applicable.

2.4 THERMOMETER WELLS

A. Material: Brass or stainless steel.

B. Rating: Suitable for system design pressure and temperature.

C. Provide extension length to clear insulation.

D. Provide threaded cap with retaining chain.

2.5 PRESSURE GAUGES

A. Type: ASME B40.1, bourdon tube.

B. Case: Stainless steel with glass or polycarbonate lens.

C. Dial Size: Minimum 2-1/2-inch (4-1/2-inch preferred in mechanical rooms).

D. Connection: 1/4-inch NPT, bottom connection unless noted otherwise.

E. Accuracy: ±2% of full scale.

F. Range: Selected so normal operating pressure is approximately mid (0–100 psi unless noted otherwise)

G. Provide gauges rated for system design pressure.

2.6 PRESSURE GAUGE ACCESSORIES

A. Provide gauge cock or ball valve at each pressure gauge for isolation and removal.

B. Provide snubbers where required to prevent pulsation or vibration damage.

C. Provide siphons for steam service only.

2.7 TEST PLUGS

A. Provide test plugs with 1/4-inch NPT fitting to accept 1/8-inch OD temperature or pressure probes.

B. Body: Solid brass, nickel-plated, with dual self-sealing valve cores.

C. Core Material:
   1. Neoprene for temperatures up to 200°F.
   2. EPDM (Nordel) for temperatures between 200°F and 275°F.

D. Length:
   1. Minimum 3-inch length for insulated piping.

2. Minimum 1-1/2-inch length for uninsulated piping

E. Cap: Provide gasketed, color-coded cap with retaining strap.

F. Pressure Rating: Minimum 1000 psig at 140°F.

PART 3 - EXECUTION

3.1 THERMOMETER INSTALLATION

A. Install thermometers in locations and orientations to be readable from a standing position at floor level.

B. Install thermometers in piping using separable wells; direct immersion is not permitted.

C. Install thermometer wells in piping tees at locations indicated. Orient wells to ensure proper immersion and readability.

D. Fill wells with thermal conductive material (oil or graphite) and secure cap.

E. Provide extension lengths to clear insulation.

F. Instruments installed on hydronic systems shall not be installed at high points subject to air accumulation or low points subject to sediment unless specifically intended.

3.2 INSTALLATION OF PRESSURE GAUGES

A. Install pressure gauges in piping tees with gauge cock or ball valve for isolation.

B. Locate gauges for maximum readability from normal operating position.

C. Install gauges at a minimum at the following locations:.
1. Top of piping risers.
2. Additional locations indicated on drawings and schematics

D. Provide snubbers where required to prevent pulsation or vibration damage.

E. Do not install gauges directly on vibrating piping; provide remote mounting with flexible tubing where required.

F. Instruments installed on hydronic systems shall not be installed at high points subject to air accumulation or low points subject to sediment unless specifically intended.

3.3 INSTALLATION OF TEST PLUGS

A. Install test plugs in piping tees at locations indicated and where required for testing and balancing.

B. Locate test plugs for accessibility and readability.

C. Install test plugs adjacent to each location where temperature or pressure measurement is required by the controls or balancing specifications.

D. Ensure test plugs extend beyond insulation and provide access for probe insertion.

E. Secure caps after installation.

F. Provide test plugs at all hydronic equipment connections, coils, and major branch takeoffs unless otherwise indicated.

3.4 ADJUSTING AND CLEANING

A. Adjusting: Adjust faces of meters and gauges to proper angle for best visibility.

B. Cleaning: Clean windows of meters and gauges and factory-finished surfaces.

C. Replace cracked and broken windows and repair scratched and marred surfaces with manufacturer's touch-up paint.

3.5 CONNECTIONS

A. Install meters and gauges to allow adequate clearance for servicing, removal, and maintenance.

B. Coordinate final locations with piping, equipment, and insulation to ensure accessibility and proper operation.

C. Comply with Division 23 piping requirements for installation of associated piping, fittings, and specialties.

D. Coordinate final locations with controls contractor to ensure compatibility with BAS sensors and access for calibration.

END OF SECTION

SECTION 230523 – GENERAL DUTY VALVES FOR HVAC PIPING

PART 1 - GENERAL

1.1 RELATED SECTIONS

A. The Contractor's attention is directed to the General and Special Conditions, COMMON WORK RESULTS FOR HVAC and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

1.2 QUALITY ASSURANCE

A. Each Contractor shall provide all valves required to control, maintain and direct flow of all fluid systems indicated or specified. This shall include, but may not be limited to all valves of all types including balancing valves, air vents, drain valves, check valves, special valves for special systems, etc., for all Mechanical Systems.

B. The following type valves shall not be acceptable: Zinc, plastic, fiber or non-metallic.

C. Each type of valve shall be of one manufacturer, i.e., ball valves, one manufacturer, butterfly valves, one manufacturer, check valves, one manufacturer, etc.

D. All valves shall comply with applicable codes and standards, shall be new, and shall be rated for the intended service, pressure, and temperature.

E. Contractor shall provide colored tape on ceiling tile where valves are located above ceiling. Provide access panels where valves are located above hard ceiling.

1.3 STANDARDS

A. Valve Bodies, Shells and Seats: Factory-tested.

B. Standard for 125 psi and 150 psi saturated steam rated valve pressure containing parts: ASTM B62.

C. Standard for 200 psi and 300 psi valves with metallic seats: ASTM B61.

D. Iron Body Valves
   1. Pressure-containing parts: ASTM A126, Grade B.
   2. Face-to-face and end-to-end dimensions: ASME B16.10.
   3. Design, workmanship, materials, and testing: MSS SP-70 and MSS SP-71.

E. Butterfly valves: face-to-face and end-to-end dimensions shall conform to MSS SP-67.

F. Valve Stems: ASTM B371, Alloy C69400; ASTM B371, Alloy C65100H04 (rolled silicon brass); or other material equally resistant to dezincification.

G. Pressure Castings: Free of impregnating materials.

H. Manufacturer's name or trademark and working pressure stamped or cast into body.

1.4 JOB CONDITIONS

A. Coordinate the exact application and location of this work with the work of other trades prior to installation within various piping systems. Verify all positions and elevations. Provide additional offsets and section of piping as required to position valves for equipment clearance and accessibility as well as system and valve operational conditions.

B. Valve manufacturer verify indicated figure or model numbers so that selection meets required description and conditions specified. Specified data for valve shall take precedence over indicated figure or model number. Provide proper seat and seal material for applicable temperature, pressure and service indicated for each valve application.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS:

A. Subject to compliance with requirements, provide products by one of the following or approved equal: Nibco, Crane, Jenkins, Milwaukee, DeZurik, Armstrong, Bell & Gossett, Apollo, Watts, and Wilkins

2.2 HVAC HYDRONIC PIPING APPLICATIONS:

A. Gate Valve (2" and under): Use ball valves as specified.

B. Check Valves (2" and less): Check valve shall have bronze body, disc and hinge. Check valve shall be Y-pattern type horizontal swing, renewable disc and rated for 200 psi working pressure. Check valve shall be Nibco T-413 for threaded ends or Nibco S-413 for solder ends.

C. Check Valves (2½" and larger): Check valve shall have cast iron body and cast-iron bolted bonnet the disc and seat ring shall be bronze. Check valve shall be horizontal swing with renewable seat and disc. Valve shall be rated for 200 psi working pressure. Check valve shall be Nibco F-918 for flanged ends or Nibco T-918 for threaded ends. Threaded ends valve allowed for sizes 3" and less only.

D. Two Piece Ball Valves (2" and under): Ball valve shall have bronze body, ball and reinforced, watertight seat. Valve shall be two-piece construction. Valve shall be "full port" type. Valve handle shall only require quarter turn to go from full open to full close. The handle shall be removable with vinyl grip. Valve shall be rated for 250 degrees F water temperature and 200 psi working pressure. Ball valve shall be Nibco T-585 for threaded ends and Nibco S-585 for solder ends. Provide extended handles for all ball valves installed in insulated piping systems.

E. Ball Valves (2½"-3"): Ball valve shall have bronze body, ball and reinforced, watertight seat. Valve shall be "full port" type. Valve handle shall only require quarter turn to go from full open

to full close. The handle shall be removable with vinyl grip. Valve shall be rated for 250 degrees F water temperature and 200 psi working pressure. Ball valve shall be Nibco T-FP-600 for threaded ends and Nibco S-FP-600 for solder ends. Provide extended handles for all ball valves installed in insulated piping systems.

F. Butterfly Valve (4" and larger): Butterfly valves shall be lug-style or grooved-end type as required by piping system, with cast iron body, aluminum bronze or stainless steel disc, EPDM seat suitable for hydronic service, and extended neck for insulated piping. Valves shall be bubble-tight shutoff, rated for minimum 200 psi working pressure, and suitable for dead-end service where installed at equipment connections. Valves 4 inches and 5 inches shall have lever operators. Valves 6 inches and larger shall have gear operators. Provide chain-wheel operators for valves installed more than 8 feet above finished floor.

G. Strainers (2" and under): Watts 77S Series "Y" type strainer with cast iron body and threaded ends. Screen shall be 20 mesh stainless steel. Strainer shall be provided with cleanout plug and be rated for 200 psi working pressure.

H. Strainers (2½" and larger): Watts 77F Series "Y" type strainer with semi-steel body and flanged ends. Screen shall be 20 mesh stainless steel. Strainer shall be provided with bolted cleanout and be rated for 200 psi working pressure. Provide blowdown connection with valve and cap where strainers are installed at pump suction or where indicated.

I. Flexible Connection: Pumpsaver SMP or equal braided stainless-steel pump connector(s). Construction to be of annular corrugated stainless steel close-pitch hose with stainless steel overbraid. The corrugated metal hose, braid(s), and a stainless-steel ring-ferrule/band (material gauge not less than .048") must be integrally seal-welded using a 100% circumferential, full-penetration TIG weld. End fittings shall be flat-face plate steel flanges with 150# ANSI drilling and outside diameter. Fittings must be attached using a 100% circumferential TIG weld. Braided stainless steel pump connector(s) must be suitable for operating temperatures up to 850 degrees F. The rated working pressure of the braided metal hose must have a minimum 4:1 safety factor. Each braided stainless-steel pump connector shall be individually leak tested by the manufacturer using air-under-water or hydrostatic pressure. Flanged pump connectors shall be prepared for shipment using cut-to-length spacers, securely positioned between the flanges to prevent axial compression damage and maintain the manufactured length. Spacers must be removed prior to system start up.

J. Automatic Air Vent: Armstrong Model 79 automatic air vent for vertical mounting with brass body and polypropylene float. Vent to be rated for 150 psi working pressure and 240 degrees F working temperature. Pipe discharge to nearest floor drain.

K. Manual Air Vent: Armstrong Model 505A manual air vent with brass body. Install with 12" length of 1/4" soft copper discharge piping.

L. Vacuum Breakers: Watts #288A atmospheric type vacuum breaker with brass body. Vacuum breaker shall be rated for 210 degrees F and 125 psi working pressure and shall meet ASSE Standard 1001.

M. Hose Kits and Balance Valves: Refer to 23 3700 HVAC Equipment Specifications.

PART 3 - EXECUTION

3.1 GENERAL

A. Examine valve interior for cleanliness, freedom from foreign matter, and corrosion. Remove special packing materials, such as blocks, used to prevent disc movement during shipping and handling. Examine mating flange faces for conditions that might cause leakage. Check bolting for proper size, length, and material.

B. Operate valves in positions from fully open to fully closed. Examine guides and seats made accessible by such operations.

C. Examine threads on valve and mating pipe for form and cleanliness.

D. Verify that gasket is of proper size, that its material composition is suitable for service, and that it is free from defects and damage.

E. Do not attempt to repair defective valves; replace with new valves.

3.2 VALVE INSTALLATION

A. Valve installation shall meet the following:

1. Install valves with unions or flanges at each piece of equipment arranged to allow service, maintenance, and equipment removal without system shutdown.
2. Locate valves for easy access and provide separate support where necessary.
3. Install valves in horizontal piping with stem at or above center of pipe.
4. Install valves in position to allow full stem movement.
5. Install chain wheels on operators for all butterfly valves 6" and larger and more 8 foot above floor. Extend chains to 5 foot above finished floor.
6. Install check valves for proper direction of flow and as follows:
    a. Swing Check Valves: In horizontal position with hinge pin level.
    b. Valves: In horizontal or vertical position, between flanges.
    c. Lift Check Valves: With stem upright and plumb.
7. Adjust or replace valve packing after piping systems have been tested and put into service but before final adjusting and balancing. Replace valves if persistent leaking occurs.

3.3 GENERAL REQUIREMENTS FOR VALVE APPLICATIONS

A. If valve applications are not indicated, use the following:
1. Shutoff service, 2 inches and smaller: Ball valves.
2. Shutoff service, 2-1/2 inches and larger: Butterfly valves.
3. Equipment connections: Provide isolation valves at each piece of equipment to permit servicing or removal without draining the entire system.
4. Branch connections and risers: Provide shutoff valves where required for system isolation and balancing of phased shutdowns.
5. Pump discharge: Provide check valve and shutoff valve.

6. Pump suction: Provide shutoff valve and strainer where indicated or required by equipment manufacturer.
7. High points of piping systems: Provide automatic or manual air vents.
8. Low points of piping systems and bases of risers: Provide drain valves.
9. Butterfly valves used for dead-end service shall be lug-style valves rated for such service.
10. Throttling service shall be by balancing valves or control valves; butterfly and ball valves shall not be used for final balancing unless specifically indicated otherwise.

END OF SECTION

SECTION 230529 – HANGERS AND SUPPORTS FOR HVAC PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 REQUIREMENTS

A. The Contractor's attention is directed to the General and Special Conditions, COMMON WORK RESULTS FOR HVAC and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. This section includes, but is not limited to, furnishing and installing dampers, supports, anchors, and accessories for piping, ductwork, equipment, etc. Furnishing and installing shall be by each trade for the completion of their work.

C. Power driven anchors and expansion anchors shall be permitted only when permission is granted in writing by the Architect and Engineer.

PART 2 - MATERIALS AND EQUIPMENT

2.1 Hangers, Clamps, Attachments Schedule:

A. ACCEPTABLE MANUFACTURERS: Grinnell, Elcen, Fee & Mason or approved equal.
1. All hangers, clamps and attachments shall be manufactured products.
2. Pipe Rings (2-inch pipe and smaller) – adjustable swivel split ring or split pipe ring.
3. Pipe Clevis (2.-inch pipe and larger) – adjustable wrought clevis type.
4. Pipe Clevis (All pipe sizes) – steel clevis for insulated pipe.
5. Riser Clamps (All pipe sizes) – extension pipe or riser clamp.
6. Beam Clamps (All pipe sizes) – malleable beam clamp with extension piece.
7. Brackets (All pipe sizes) – medium weight steel brackets.
8. Concrete Inserts (All pipe sizes) – wrought or wedge type inserts.
9. Concrete Fasteners (All pipe sizes) – self-drilling concrete inserts.
10. Rod Attachments (All pipe sizes) – extension piece, rod coupling, forged steel turnbuckle
11. U-bolts (All pipe sizes) – standard u-bolt.
12. Welded Pipe Saddles (All pipe sizes) – pipe covering protection saddle sized for thickness of insulation.
13. Pipe Roll (All pipe sizes) – adjustable swivel pipe roll.
14. Protection Saddle (All pipe sizes) – 180-degree coverage, sheet metal pipe protection saddle.
15. Hanger Rods (All pipe sizes) – Steel, diameter of hanger threading.
16. Concrete Channel Inserts (All pipe sizes) – continuous heavy-duty slot inserts Unistrut.
17. Adjustable Spot Inserts (All pipe sizes) – continuous heavy-duty spot insert Unistrut.
18. Miscellaneous steel such as steel angles, rods, bars, channels, etc used in framing for supports, fabricated brackets, anchors, etc. shall confirm to ASTM A36

2.2 HANGER RODS:

A. Hanger rods or single rod hangers shall conform to the following:

PIPE SIZE	HANGER ROD DIAMETER STEEL PIPE	HANGER ROD DIAMETER COPPER, PLASTIC, HDPE PIPE
2” and smaller	3/8”	3/8”
2-1/2” through 3-5/8”	1/2”	1/2”
4” and 5”	5/8”	½”
6”	3/4”	5/8”
8” through 12”	7/8”	3/4”
14”	1”	7/8”

B. Rods for double-rod hangers may be reduced in size, but in no case shall the minimum rod diameter be less than 3/8 inch.

C. Hanger rods and accessories installed in interior dry locations shall have ASTM B633 electroplated zinc finish.

PART 3 - INSTALLATION

3.1 REQUIREMENTS

A. Unless otherwise specified, all supporting, hanging and anchoring of piping, ductwork, equipment, etc., shall be performed by each trade as is necessary for completion of the work and shall be as directed in the following paragraphs.

B. Supporting and hanging shall be done so that excessive load will not be placed on any one hanger or structural member and as required to allow for proper pitch and expansion of piping.

C. Hangers and supports shall be placed near joints, turns, and branches, with additional supports provided where required to prevent sagging or excessive movement.

D. For concrete construction, utilize adjustable concrete inserts for fasteners. Expansion anchors and power-driven devices may be used when approved in writing by the Architect/Engineer.

E. Utilize beam clamps for fastening to steel joists and beams and expansion anchors in masonry construction.

F. When piping is routed in joists, piping shall be top mounted on trapeze type hangers with each pipe individually clamped to trapeze hanger. Do not support piping or ductwork from bridging angles.

G. Trapeze hangers are not allowed, unless specifically approved by the Engineer.

H. Install all miscellaneous steel other than designed building structural members as required to

provide means of securing hangers, supports, etc., where piping does not pass directly below or cross steel joists.

I. Piping shall not be supported by the equipment to which it is connected. Support all piping so as to remove any load or stress from the equipment.

J. Where piping, etc., is routed vertically, approved riser clamps, brackets or other means shall be utilized at approximately 10'-0" center to center minimum and an approved adjustable base stand or fitting on concrete support base shall be utilized at the base of the vertical run.

K. Where piping is routed along walls, knee braced angle frames, etc. pipe brackets with saddles, clamps, and rollers mounted on structural brackets fastened to walls or columns shall be used.

L. Support all ceiling hung equipment with approved vibration isolators.

M. Where copper tubing is specified, hangers shall be of copper clad type when piping is uninsulated.

N. All insulated piping shall be supported with clevis type and pipe roll hangers. Hangers shall be sized to allow the pipe insulation to pass through the hangers. Install insulation protection saddles at all hanger locations. Welded pipe saddles shall be installed at all hangers on piping 5" and larger. The pipe saddles shall be sized for the thickness of insulation used. Hangers shall fit snugly around outside of insulation saddles.

O. Under no conditions will perforated band iron or steel wire driven hangers be permitted.

P. Support steel and copper piping at a minimum of eight (8) foot intervals for piping 3" and smaller and ten (10) foot intervals for larger piping. Provide additional support at end of the branches and change of direction.

Q. Support plastic pipe at intervals at a minimum of six (6) foot intervals for piping 4" and smaller; support a minimum of eight (8) foot intervals for larger piping. Smaller plastic piping systems, 2" and smaller, supports shall not to exceed four (4) feet. Support all piping at the end of the branches and at the change of direction and shall be installed as to permit freedom of movement. Vertical piping shall be supported at their bases and all upward movement shall not be restricted. Hangers shall be at least one (1) inch wide and shall not compress, distort, cut or abrade the piping to allow free movement at all times. In addition, all piping installation shall conform to manufacturer's installation instructions.

R. All pipes shall be supported in a neat and workmanlike manner and wherever possible, parallel runs of horizontal piping shall be grouped together on hangers. Vertical risers shall be supported at each floor line with approved steel pipe riser clamps. Spacing of pipe supports shall not exceed eight (8) foot intervals for pipes 3” and smaller and ten (10) foot intervals on all other piping. (continued) Small vertical pipes (1” and less) shall be bracketed to walls, structural members, etc. at four (4) foot intervals so as to prevent vibration or damage by occupants. Reference 230529 for additional piping support requirements.

S. Ensure that all bolts and nuts are tightened.

END OF SECTION

SECTION 230548 - VIBRATION AND SEISMIC CONTROLS FOR HVAC

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
1. Elastomeric isolation pads.
2. Elastomeric isolation mounts.
3. Restrained elastomeric isolation mounts.
4. Open-spring isolators.
5. Housed-spring isolators.
6. Restrained-spring isolators.
7. Housed-restrained-spring isolators.
8. Pipe-riser resilient supports.
9. Resilient pipe guides.
10. Air-spring isolators.
11. Restrained-air-spring isolators.
12. Elastomeric hangers.
13. Spring hangers.
14. Snubbers.
15. Restraint channel bracings.
16. Restraint cables.
17. Seismic-restraint accessories.
18. Mechanical anchor bolts.
19. Adhesive anchor bolts.
20. Vibration isolation equipment bases.
21. Restrained isolation roof-curb rails.

1.3 DEFINITIONS

A. IBC: International Building Code.

B. ICC-ES: ICC-Evaluation Service.

C. OSHPD: Office of Statewide Health Planning & Development (for the State of California).

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product:
   1. Include rated load, rated deflection, and overload capacity for each vibration isolation device.
   2. Illustrate and indicate style, material, strength, fastening provision, and finish for each type and size of vibration isolation device and seismic-restraint component required.
      a. See Evaluations for a discussion on seismic-restraint capacities and rating services.
      b. Tabulate types and sizes of seismic restraints, complete with report numbers and rated strength in tension and shear as evaluated by an evaluation service member of ICC-ES, OSHPD, or an agency acceptable to authorities having jurisdiction.
      c. Annotate to indicate application of each product submitted and compliance with requirements.
   3. Interlocking Snubbers: Include ratings for horizontal, vertical, and combined loads.
   4. Elastomeric Isolation Pads: Include vertical weight ratings, physical sizes and depth associated with each size of water source heat pump.

B. Shop Drawings:
   1. Detail fabrication and assembly of equipment bases. Detail fabrication including anchorages and attachments to structure and to supported equipment. Include adjustable motor bases, rails, and frames for equipment mounting.
   2. Vibration Isolation Base Details: Detail fabrication including anchorages and attachments to structure and to supported equipment. Include adjustable motor bases, rails, and frames for equipment mounting.

C. Delegated-Design Submittal: For each vibration isolation and seismic-restraint device.
   1. Include design calculations and details for selecting vibration isolators, seismic restraints, and vibration isolation bases complying with performance requirements, design criteria, and analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
   2. Design Calculations: Calculate static and dynamic loading due to equipment weight, operation, and seismic and wind forces required to select vibration isolators and seismic and wind restraints and for designing vibration isolation bases.
      a. Coordinate design calculations with wind load calculations required for equipment mounted outdoors. Comply with requirements in other Sections for equipment mounted outdoors.
   3. Riser Supports: Include riser diagrams and calculations showing anticipated expansion and contraction at each support point, initial and final loads on building structure, spring deflection changes, and seismic loads. Include certification that riser system was examined for excessive stress and that none exists.
   4. Seismic and Wind-Restraint Details:
      a. Design Analysis: To support selection and arrangement of seismic and wind restraints. Include calculations of combined tensile and shear loads.
      b. Details: Indicate fabrication and arrangement. Detail attachments of restraints to the restrained items and to the structure. Show attachment locations, methods, and spacings. Identify components, list their strengths, and indicate directions and values of forces transmitted to the structure during seismic events. Indicate association with vibration isolation devices.

c. Coordinate seismic-restraint and vibration isolation details with wind-restraint details required for equipment mounted outdoors. Comply with requirements in other Sections for equipment mounted outdoors.
d. Preapproval and Evaluation Documentation: By an evaluation service member of ICC-ES, OSHPD, or an agency acceptable to authorities having jurisdiction, showing maximum ratings of restraint items and the basis for approval (tests or calculations).

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Show coordination of vibration isolation device installation and seismic bracing for HVAC piping and equipment with other systems and equipment in the vicinity, including other supports and restraints, if any.

B. Welding certificates.

C. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For restrained-air-spring mounts to include in operation and maintenance manuals.

1.7 QUALITY ASSURANCE

A. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910.7 and that is acceptable to authorities having jurisdiction.

B. Provide vibration isolation for major equipment as scheduled or specified herein, and furnish all additional isolation devices, supports, and installation measures required for associated piping, ductwork, and incidental components as necessary to achieve the specified vibration and noise control performance.

C. Comply with seismic-restraint requirements in the IBC unless requirements in this Section are more stringent.

D. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

E. Seismic-restraint devices shall have horizontal and vertical load testing and analysis and shall bear anchorage preapproval OPA number from OSHPD, preapproval by ICC-ES, or preapproval by another agency acceptable to authorities having jurisdiction, showing maximum seismic-restraint ratings. Ratings based on independent testing are preferred to ratings based on calculations. If preapproved ratings are unavailable, submittals based on independent testing are

preferred. Calculations (including combining shear and tensile loads) to support seismic-restraint designs must be signed and sealed by a qualified professional engineer.

PART 2 - PRODUCTS

2.1 See Editing Instruction No. 1 in the Evaluations for cautions about named manufacturers and products. For an explanation of options and Contractor's product selection procedures, see Section 016000 "Product Requirements."

2.2 PERFORMANCE REQUIREMENTS

A. Wind-Restraint Loading:
1. Basic Wind Speed: 130 Miles per Hour.
2. Building Classification Category: III.
3. Minimum 10 lb/sq. ft. multiplied by maximum area of HVAC component projected on vertical plane normal to wind direction, and 45 degrees either side of normal.

B. Seismic-Restraint Loading:
1. Site Class as Defined in the IBC: E.
2. Assigned Seismic Use Group or Building Category as Defined in the IBC: III.
   a. Component Importance Factor: 1.0
   b. Component Response Modification Factor: 2.5
   c. Component Amplification Factor: 2.5.
3. Rated strengths, features, and applications shall be as defined in reports by an evaluation service member of ICC-ES, OSHPD or an agency acceptable to authorities having jurisdiction.
   a. Structural Safety Factor: Allowable strength in tension, shear, and pullout force of components shall be at least four times the maximum seismic forces to which they are subjected.

2.3 ELASTOMERIC ISOLATION PADS

A. Elastomeric Isolation Pads: To be used for all water source heat pumps.
1. Acceptable manufacturers: Mason Industries, Vibro-Acoustics, Kinetics Noise Control, or approved equal.
2. Fabrication: Single or multiple layers of sufficient durometer stiffness for uniform loading over pad area.
3. Size: Factory or field cut to match requirements of supported equipment.
4. Pad Material: Oil and water resistant with elastomeric properties.
5. Surface Pattern: Ribbed or Waffle pattern.
6. Infused nonwoven cotton or synthetic fibers.
7. Load-bearing metal plates adhered to pads.
8. Sandwich-Core Material: Resilient and elastomeric.
   a. Surface Pattern: Ribbed or Waffle pattern.
   b. Infused nonwoven cotton or synthetic fibers.

2.4 OPEN-SPRING ISOLATORS

A. Freestanding, Laterally Stable, Open-Spring Isolators:.
   1. Manufacturers: Subject to compliance with requirements, provide products by Mason Industries; Amber/Booth Company; Kinetics Noise Control; Vibration Eliminator Co., Inc.; or approved equal.
   2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
   3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
   4. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
   5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
   6. Baseplates: Factory-drilled steel plate for bolting to structure with an elastomeric isolator pad attached to the underside. Baseplates shall limit floor load to 500 psig
   7. Top Plate and Adjustment Bolt: Threaded top plate with adjustment bolt and cap screw to fasten and level equipment.

2.5 HOUSED-SPRING ISOLATORS

A. Freestanding, Laterally Stable, Open-Spring Isolators in Two-Part Telescoping Housing:
   1. Manufacturers: Subject to compliance with requirements, provide products by Mason Industries; Amber/Booth Company; Kinetics Noise Control; Vibration Eliminator Co., Inc.; or approved equal.
   2. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
   3. Minimum Additional Travel: 50 percent of the required deflection at rated load.
   4. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
   5. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
   6. Two-Part Telescoping Housing: A steel top and bottom frame separated by an elastomeric material and enclosing the spring isolators.
      a. Drilled base housing for bolting to structure with an elastomeric isolator pad attached to the underside. Bases shall limit floor load to 500 psig.
      b. Top housing with leveling bolt and threaded mounting holes and internal leveling device, elastomeric pad.

2.6 PIPE-RISER RESILIENT SUPPORT

A. Description: All-directional, acoustical pipe anchor consisting of two steel tubes separated by a minimum 1/2-inch thick neoprene.
   1. Vertical-Limit Stops: Steel and neoprene vertical-limit stops arranged to prevent vertical travel in both directions.
   2. Maximum Load Per Support: 500 psig on isolation material providing equal isolation in all directions.

2.7 RESILIENT PIPE GUIDES

A. Description: Telescopic arrangement of two steel tubes or post and sleeve arrangement separated by a minimum 1/2-inch- thick neoprene.
   1. Factory-Set Height Guide with Shear Pin: Shear pin shall be removable and reinsertable to allow for selection of pipe movement. Guides shall be capable of motion to meet location requirements.

2.8 ELASTOMERIC HANGERS

A. Elastomeric Mount in a Steel Frame with Upper and Lower Steel Hanger Rods:
   1. Manufacturers: Subject to compliance with requirements, provide products by Mason Industries; Kinetics Noise Control; Vibration Eliminator Co., Inc.; Amber/Booth Company; Acoustical & Vibration Specialties; or approved equal.
   2. Frame: Steel, fabricated with a connection for an upper threaded hanger rod and an opening on the underside to allow for a maximum of 30 degrees of angular lower hanger-rod misalignment without binding or reducing isolation efficiency.
   3. Dampening Element: Molded, oil-resistant rubber, neoprene, or other elastomeric material with a projecting bushing for the underside opening preventing steel to steel contact.

2.9 SPRING HANGERS

A. Combination Coil-Spring and Elastomeric-Insert Hanger with Spring and Insert in Compression:
   1. Manufacturers: Subject to compliance with requirements, provide products by Mason Industries; Kinetics Noise Control; Vibration Eliminator Co., Inc.; Amber/Booth Company; Acoustical & Vibration Specialties; or approved equal.
   2. Frame: Steel, fabricated for connection to threaded hanger rods and to allow for a maximum of 30 degrees of angular hanger-rod misalignment without binding or reducing isolation efficiency.
   3. Outside Spring Diameter: Not less than 80 percent of the compressed height of the spring at rated load.
   4. Minimum Additional Travel: 50 percent of the required deflection at rated load.
   5. Lateral Stiffness: More than 80 percent of rated vertical stiffness.
   6. Overload Capacity: Support 200 percent of rated load, fully compressed, without deformation or failure.
   7. Elastomeric Element: Molded, oil-resistant rubber or neoprene. Steel-washer-reinforced cup to support spring and bushing projecting through bottom of frame.
   8. Adjustable Vertical Stop: Steel washer with neoprene washer "up-stop" on lower threaded rod.
   9. Self-centering hanger-rod cap to ensure concentricity between hanger rod and support spring coil.

2.10 SNUBBERS

A. Description: Factory fabricated using welded structural-steel shapes and plates, anchor bolts, and replaceable resilient isolation washers and bushings.
   1. Anchor bolts for attaching to concrete shall be seismic-rated, drill-in, and stud-wedge or female-wedge type.
   2. Resilient Isolation Washers and Bushings: Oil- and water-resistant neoprene.
   3. Maximum 1/4-inch air gap, and minimum 1/4-inch thick resilient cushion.

2.11 RESTRAINT CHANNEL BRACINGS

A. Description: MFMA-4, shop- or field-fabricated bracing assembly made of slotted steel channels with accessories for attachment to braced component at one end and to building structure at the other end and other matching components and with corrosion-resistant coating; rated in tension, compression, and torsion forces.

2.12 RESTRAINT CABLES

A. Restraint Cables: ASTM A 603 galvanized steel cables. End connections made of steel assemblies with thimbles, brackets, swivel, and bolts designed for restraining cable service; with a minimum of two clamping bolts for cable engagement.

2.13 SEISMIC-RESTRAINT ACCESSORIES

A. Hanger-Rod Stiffener: Steel tube or steel slotted-support-system sleeve with internally bolted connections or Reinforcing steel angle clamped to hanger rod.

B. Hinged and Swivel Brace Attachments: Multifunctional steel connectors for attaching hangers to rigid channel bracings and restraint cables.

C. Bushings for Floor-Mounted Equipment Anchor Bolts: Neoprene bushings designed for rigid equipment mountings, and matched to type and size of anchor bolts and studs.

D. Bushing Assemblies for Wall-Mounted Equipment Anchorage: Assemblies of neoprene elements and steel sleeves designed for rigid equipment mountings, and matched to type and size of attachment devices used.

E. Resilient Isolation Washers and Bushings: One-piece, molded, oil- and water-resistant neoprene, with a flat washer face.

2.14 VIBRATION ISOLATION EQUIPMENT BASES – (END-SUCTION PUMPS)

A. Manufacturers: Subject to compliance with requirements, provide products by Mason Industries; Kinetics Noise Control; Vibration Eliminator Co., Inc.; Amber/Booth Company; Spring Air Systems; or approved equal.

B. Concrete Inertia Base: Factory-fabricated welded, structural-steel bases and rails ready for placement of cast-in-place concrete.
   1. Design Requirements: Lowest possible mounting height with not less than 1-inch clearance above the floor. Include equipment anchor bolts and auxiliary motor slide bases or rails.

      a. Include supports for suction and discharge elbows for pumps.
   2. Structural Steel: Steel shapes, plates, and bars complying with ASTM A 36/A 36M. Bases shall have shape to accommodate supported equipment.
   3. Support Brackets: Factory-welded steel brackets on frame for outrigger isolation mountings and to provide for anchor bolts and equipment support.
   4. Fabrication: Fabricate steel templates to hold equipment anchor-bolt sleeves and anchors in place during placement of concrete. Obtain anchor-bolt templates from supported equipment manufacturer.

2.15 RESTRAINED ISOLATION ROOF-CURB RAILS – (DOAS-1)

A. Manufacturers: Subject to compliance with requirements, provide products by Mason Industries, Kinetics Noise Control, Amber/Booth Company, Cambridgeport Air Systems or approved equal.

B. Curb mounted rooftop units shall be isolated on 12-inch high roof top spring isolated noise control curb consisting of galvanized curb sections with integral vertical and laterally restrained isolators formed to fit the contractor-supplied rooftop equipment.

C. Description: Factory-assembled, fully enclosed, insulated, air- and watertight curb rail designed to resiliently support equipment and to withstand seismic and wind forces.

D. Upper Frame: The upper frame shall provide continuous support for equipment and shall be captive to resiliently resist seismic and wind forces.

E. Lower Support Assembly: The lower support assembly shall be formed sheet metal section containing adjustable and removable steel springs that support the upper frame. The lower support assembly shall have a means for attaching to building structure and a wood nailer for attaching roof materials, and shall be insulated with a minimum of 2 inches of rigid, glass-fiber insulation on inside of assembly. Adjustable, restrained-spring isolators shall be mounted on elastomeric vibration isolation pads and shall have access ports, for level adjustment, with removable waterproof covers at all isolator locations. Isolators shall be located so they are accessible for adjustment at any time during the life of the installation without interfering with the integrity of the roof.

F. The isolation springs shall be of the vertical and laterally restrained type. The springs shall be designed to be laterally stable and properly selected to provide minimum specified deflection with 50% additional travel to solid. Isolation springs shall be powder coated for corrosion resistance and have a minimum static spring deflection of 2”. Spring selection shall be based on actual equipment operating weight, including accessories, coil sections, and all attached components supported by the curb.

G. Snubber Bushings: All-directional, elastomeric snubber bushings at least 1/4 inch thick.

H. Water Seal: Galvanized sheet metal with EPDM seals at corners, attached to upper support frame, extending down past wood nailer of lower support assembly, and counterflashed over roof materials.

I. Curb shall match the pitch of the roof (0.25"/1' pitch)

J. Curb rails shall provide continuous support in accordance with rooftop unit manufacturer's requirements and shall be coordinated with the equipment base rail configuration.

K. The curb shall include a coordinated weather proof piping and conduit penetration enclosure to match the rooftop unit.

L. All acoustic installation hardware shall be provided by the isolation curb manufacturer.

M. Spring isolators shall be selected for uniform deflection under the actual operating load of the unit, and the curb assembly shall be designed to avoid metal-to-metal contact between the supported equipment and building structure.

N. Curb shall be factory assembled, tested, and rated for the scheduled unit loads.

O. All steel components shall be galvanized, coated, or otherwise protected against corrosion for exterior rooftop service.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and equipment to receive vibration isolation and seismic and wind control devices for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 VIBRATION ISOLATION SCHEDULE

A. Provide vibration isolation for HVAC equipment, piping, and ductwork as indicated below. Where specific equipment is not listed, provide vibration isolation in accordance with the manufacturer's recommendations and as required to prevent transmission of objectionable vibration to the building structure.

B. Minimum vibration isolation requirements shall be as follows:
   1. End-Suction Pumps: Provide concrete inertia base with open-spring isolators with 1" static deflection. Provide flexible pipe connectors at pump suction and discharge connections. Support suction and discharge piping independently of pump casing. Coordinate inertia base size with pump and motor assembly.

2. Floor-Mounted Pumps, Base-Mounted Equipment, and Similar Rotating Equipment: Provide open-spring isolators, housed-spring isolators, or restrained-spring isolators, as required for equipment location and seismic/wind restraint requirements. Isolators shall be rated for 1.5” static deflection, with concrete inertia base for end suction types.
3. Inline Pumps: Provide spring hangers for suspended inline pumps. Where inline pumps are floor-supported or pipe-mounted, provide resilient supports or spring isolators with 1.5” static deflection. Do not support pump weight from adjoining piping unless specifically permitted by pump manufacturer.
4. Water Source Heat Pumps / Heat Pumps: Provide elastomeric isolation pads beneath unit support rails or factory-recommended mounting points. Pads shall be sized for uniform loading and selected based on actual unit operating weight and minimum for 0.75” deflection.
5. Horizontal Heat Pumps Above Ceiling: Provide spring hangers or elastomeric hangers at each support point rated for 0.75” static deflection. Provide flexible duct connectors at supply and return connections and flexible piping connections where hard-piped hydronic connections are provided. Maintain required service clearances and access.
6. Ceiling-Suspended Fans, Inline Exhaust Fans, and Cabinet Fans: Provide spring hangers or elastomeric hangers at each hanger rod rated for 0.75” static deflection. Provide flexible duct connectors at inlet and discharge connections. Where fans are located above noise-sensitive spaces, provide spring hangers.
7. Roof-Mounted Exhaust Fans: Provide factory-fabricated vibration isolation roof curb, spring-isolated curb, or elastomeric isolation curb suitable for exterior service. Isolator assembly shall be restrained for wind and seismic loads. Coordinate curb with roof construction, fan base, and flashing requirements. Elastomeric curb isolation pad installed between roof mounted equipment and supporting curb. Minimum 0.5" thick elastomeric layer. Minimum 1.75" elastomeric layer width. Nominal 40-60 durometer neoprene or high density compressed molded fiberglass individually coated with moisture impervious membrane. Elastomeric layer surface finish shall allow a weather proofed seal at top and bottom joint. Isolation layer shall be adhered to support curb and equipment with mastic adhesive without need of rigid connection. Assembly shall be sealed weather tight at all joints with silicone caulk. Kinetics KIP-RT or similar.
8. Roof-Mounted DOAS Units: Provide restrained spring isolation roof curb rails unless otherwise indicated. Spring deflection shall be selected based on actual operating weight of the unit, including accessories, coils, filters, energy recovery sections, and attached components. Isolators shall be rated for 2.5" static deflection internal steel springs for each fan within unit, with neoprene isolators for the casing.
9. Piping Connected to Vibration-Isolated Equipment: Provide spring hangers or resilient supports for piping within 50 pipe diameters of vibration-isolated equipment, unless otherwise indicated. First three pipe supports adjacent to pumps, heat pumps, chillers, air-handling units, terminal boxes, air separators and other rotating equipment shall be isolated. Provide flexible connectors at equipment connections where required. All piping inside equipment room and a minimum of 50' from connection to equipment shall be vibration isolated.
10. Hydronic Piping Mains and Branches: Provide resilient inserts or isolation pads at pipe supports where piping is supported from or attached to noise-sensitive structure. Provide seismic restraints independent of vibration isolation devices unless isolator assembly is rated for combined vibration and seismic restraint.
11. Ductwork Connected to Vibration-Isolated Equipment: Provide flexible duct connectors at fan, AHU, DOAS, heat pump, and exhaust fan connections. Support ductwork independently so equipment casings are not loaded by duct weight.

12. Ductwork Above Noise-Sensitive Spaces: Provide resilient hangers or neoprene isolation inserts where ductwork is subject to vibration from fans, terminal units, or equipment connections.
13. Seismic and Wind Restraints: Provide restrained isolators, snubbers, cables, braces, or other restraint devices where required by code, equipment location, and delegated design. Restraints shall not short-circuit vibration isolation during normal operation.
14. VAV Boxes / EVAV Boxes: Provide flexible duct connectors at inlet and discharge connections where recommended by the manufacturer or where required to prevent vibration transmission. Support boxes independently from ductwork. Provide neoprene isolation washers and resilient inserts.
15. Provide Air Separators, Expansion Tanks, Dirt Separators, and Similar Hydronic Accessories: Provide resilient pads or neoprene isolation washers at floor-mounted supports where connected to vibration-isolated piping or equipment. For suspended units, provide elastomeric hangers or spring hangers where installed near pumps or vibration-isolated equipment. Support accessories independently of connected piping unless specifically permitted by the manufacturer.
16. Cabinet Unit Heaters, Ceiling-Mounted Electric Unit Heaters, and Similar Terminal Heating Equipment: Provide neoprene isolation washers, resilient inserts, or elastomeric hanger elements at mounting points where equipment is suspended from structure or mounted to walls/ceilings. Support units independently of ductwork, piping, conduit, and ceiling systems. Where units include integral fans, provide vibration isolation suitable for the fan/motor assembly and prevent metal-to-metal contact between unit casing, mounting brackets, and building structure. For ceiling-mounted units above noise-sensitive spaces, provide elastomeric hangers or spring hangers as required to prevent objectionable vibration transmission.

C. Isolation type, static deflection, and restraint requirements shall be confirmed by the vibration isolation manufacturer based on actual equipment weight, speed, operating characteristics, support configuration, and project seismic/wind design criteria.

D. Do not install rigid connections across vibration isolation assemblies. Maintain clearance around isolators, snubbers, anchor bolts, piping, conduit, and ductwork to prevent metal-to-metal contact during normal operation

3.3 APPLICATIONS

A. Multiple Pipe Supports: Secure pipes to trapeze member with clamps approved for application by an evaluation service member of ICC-ES, OSHPD, an agency acceptable to authorities having jurisdiction.

B. Hanger-Rod Stiffeners: Install hanger-rod stiffeners where indicated or scheduled on Drawings to receive them and where required to prevent buckling of hanger rods due to seismic forces.

C. Strength of Support and Seismic-Restraint Assemblies: Where not indicated, select sizes of components so strength is adequate to carry present and future static and seismic loads within specified loading limits.

3.4 VIBRATION CONTROL AND SEISMIC-RESTRAINT DEVICE INSTALLATION

A. Coordinate the location of embedded connection hardware with supported equipment attachment and mounting points and with requirements for concrete reinforcement and formwork specified in Section 033000 "Cast-in-Place Concrete" and Section 033053 "Miscellaneous Cast-in-Place Concrete."

B. Installation of vibration isolators must not cause any change of position of equipment, piping, or ductwork resulting in stresses or misalignment.

C. Equipment Restraints:
   1. Install seismic snubbers on HVAC equipment mounted on vibration isolators. Locate snubbers as close as possible to vibration isolators and bolt to equipment base and supporting structure.
   2. Install resilient bolt isolation washers on equipment anchor bolts where clearance between anchor and adjacent surface exceeds 0.125 inch .
   3. Install seismic-restraint devices using methods approved by an evaluation service member of ICC-ES, OSHPD, an agency acceptable to authorities having jurisdiction that provides required submittals for component.

D. Piping Restraints:
   1. Comply with requirements in MSS SP-127.
   2. Space lateral supports a maximum of 40 feet o.c., and longitudinal supports a maximum of 80 feet o.c.
   3. Brace a change of direction longer than 12 feet.

E. Install cables so they do not bend across edges of adjacent equipment or building structure.

F. Install seismic-restraint devices using methods approved by an evaluation service member of ICC-ES, OSHPD, an agency acceptable to authorities having jurisdiction that provides required submittals for component.

G. Install bushing assemblies for anchor bolts for floor-mounted equipment, arranged to provide resilient media between anchor bolt and mounting hole in concrete base.

H. Install bushing assemblies for mounting bolts for wall-mounted equipment, arranged to provide resilient media where equipment or equipment-mounting channels are attached to wall.

I. Attachment to Structure: If specific attachment is not indicated, anchor bracing to structure at flanges of beams, at upper truss chords of bar joists, or at concrete members.

J. Drilled-in Anchors:
   1. Identify position of reinforcing steel and other embedded items prior to drilling holes for anchors. Do not damage existing reinforcing or embedded items during coring or drilling. Notify the structural engineer if reinforcing steel or other embedded items are encountered during drilling. Locate and avoid prestressed tendons, electrical and telecommunications conduit, and gas lines.
   2. Do not drill holes in concrete or masonry until concrete, mortar, or grout has achieved full design strength.

3. Wedge Anchors: Protect threads from damage during anchor installation. Heavy-duty sleeve anchors shall be installed with sleeve fully engaged in the structural element to which anchor is to be fastened.
4. Adhesive Anchors: Clean holes to remove loose material and drilling dust prior to installation of adhesive. Place adhesive in holes proceeding from the bottom of the hole and progressing toward the surface in such a manner as to avoid introduction of air pockets in the adhesive.
5. Set anchors to manufacturer's recommended torque, using a torque wrench.
6. Install zinc-coated steel anchors for interior and stainless-steel anchors for exterior applications.

3.5 ACCOMMODATION OF DIFFERENTIAL SEISMIC MOTION

A. Install flexible connections in piping where they cross seismic joints, where adjacent sections or branches are supported by different structural elements, and where the connections terminate with connection to equipment that is anchored to a different structural element from the one supporting the connections as they approach equipment. Comply with requirements in Section 232113 "Hydronic Piping" for piping flexible connections.

3.6 FIELD QUALITY CONTROL

A. Testing Agency: Engage a qualified testing agency to perform tests and inspections.

B. Perform tests and inspections.

C. Tests and Inspections:
1. Provide evidence of recent calibration of test equipment by a testing agency acceptable to authorities having jurisdiction.
2. Schedule test with Owner, through Architect, before connecting anchorage device to restrained component (unless postconnection testing has been approved), and with at least seven days' advance notice.
3. Obtain Architect's approval before transmitting test loads to structure. Provide temporary load-spreading members.
4. Test at least [**four**] <**Insert number**> of each type and size of installed anchors and fasteners selected by Architect.
5. Test to 90 percent of rated proof load of device.
6. Measure isolator restraint clearance.
7. Measure isolator deflection.
8. Verify snubber minimum clearances.
9. Test and adjust restrained-air-spring isolator controls and safeties.

D. Remove and replace malfunctioning units and retest as specified above.

E. Prepare test and inspection reports.

3.7 ADJUSTING

A. Adjust isolators after piping system is at operating weight.

B. Adjust limit stops on restrained-spring isolators to mount equipment at normal operating height. After equipment installation is complete, adjust limit stops so they are out of contact during normal operation.

3.8 VIBRATION ISOLATION EQUIPMENT BASES INSTALLATION

A. Coordinate the location of embedded connection hardware with supported equipment attachment and mounting points and with requirements for concrete reinforcement and formwork specified in [**Section 033000 "Cast-in-Place Concrete."**] [**Section 033053, "Miscellaneous Cast-in-Place Concrete."**]

END OF SECTION

SECTION 230553 – IDENTIFICATION FOR HVAC PIPING AND EQUIPMENT

PART 1 - GENERAL

1.1 RELATED INFORMATION

A. The Contractor's attention is directed to the General and Special Conditions, COMMON WORK RESULTS FOR HVAC and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

PART 2 - MATERIALS AND PRODUCTS

2.1 TAGS AND CHARTS

A. Provide and install on appropriate valves on the mechanical system a valve tag made of bronze or baked phenolic tag fitted to each valve so that it cannot be removed. Each tag shall be embossed with an identifier. Valve numbering scheme shall be coordinated with the Engineer and reflected in Record Documents. Identifiers include bypass valves, normally open/normally closed valves, zone isolation, etc.

B. Provide in the operation manual valve tag information indicating valve identifier, the valves service, normal position and its location.

C. All emergency shutoff valves shall be identified with a permanent engraved tag hung from the valve with 1-inch high lettering. Emergency shutoff valves shall be identified as any valve whose closure could create an emergency condition in the facility (i.e. water, domestic hot water, main HVAC valves, etc.).

D. Label all control panels, BAS panels, and control devices with system served and panel designation consistent with control drawings.

E. Provide piping and duct identification in accordance with ANSI A13.1-2015 and SMACNA standards.

2.2 PIPING IDENTIFICATION

A. All piping installed shall be identified according to the chart hereinafter specified. Provide stenciled markers and arrows indicating direction of flow on all piping installed under this contract. Markers and arrows shall be painted on the piping using machine cut stencils. All letters shall be sprayed using fast drying lacquer paint. All markers and arrows shall be properly oriented so that descriptive name may be easily read from the floor. Piping shall be identified on twelve (12) foot centers. All piping shall be minimally identified once above all

room ceilings and where it passes thru walls or floors. At the Contractor's option, Setmark or equivalent manufactured marking system may be substituted for field marking.

B. Identify piping at:
1. Each valve and equipment connection
2. Changes in direction
3. Pipe penetrations
4. At each floor level
5. Adjacent to access points

C. Provide markers on outside of insulation. Provide protective covering or adhesive suitable for insulation jacket.

D. The following table describes the size of the color field and size of the identification letters which shall be used for pipes of different outside pipe diameters.

Outside Diameter	Label Length	Letter Size
¾" – 1 ¼"	8"	½"
1 ½" – 2"	8"	¾"
2 ½" – 6"	12"	1 ¼"
8" – 10"	24"	2 ½"
Over 10"	24"	3 ½"

E. The following chart describes the pipe service and label identification which shall be used for various pipes.

PIPE	ABBREVIATION
Geothermal Supply	G.S.
Geothermal Return	G.R.
Condensate	C.D.

F. Provide color coding of piping systems in accordance with ASME A13.1. Submit color chart for Engineer review prior to installation

2.3 EQUIPMENT IDENTIFICATION:

A. Unless otherwise specified, all equipment shall be identified. The titles shall be short and concise and abbreviations may be used as long as the meaning is clear. In finished rooms and mechanical rooms, equipment shall be identified neatly and conspicuously with engraved black lamacoid plates (or equivalent) with 1" high white letters on the front of each piece of equipment.

B. A. Provide color-coded markers:
1. Red – Fire dampers
2. Yellow – Control valves
3. Blue – Control dampers

C. Provide legend in O&M manuals. All heat pumps shall have the room numbers served, electrical panel number and circuit number identified on the lamacoid plate. Coordinate with the Electrical Contractor.

D. All VAVs and EVAVs shall be identified with neck size and room served with lamacoid plate.

E. All mechanical equipment, pumps, VFDs, Outside Air Units, electric unit heaters shall have the, electrical panel number and circuit number identified on the lamacoid plate. Coordinate with the Electrical Contractor.

2.4 DUCTWORK IDENTIFICATION:

A. All ductwork shall be identified as to the service of the duct and direction of flow. Include equipment designator on SA & RA ductwork. The letters shall be at least two inches high and the flow arrow shall be at least six inches long. The letters and flow arrow shall be made by precut stencils and black oil base paint with aerosol can. Concealed ducts also need to be identified.

B. Use pre-printed, self-adhesive pipe markers with integral arrows (Setmark or equal). Field painting shall not be used unless specifically approved.

C. Ductwork shall be labeled a minimum of 12-foot centers.

D.

DUCTWORK		ABBREVIATION
1.	Supply Air Ductwork	SA + Equipment Identifier
2.	Return Air Ductwork	RA + Equipment Identifier
3.	Exhaust Air Ductwork	EA + Equipment Identifier
4.	Outside Air Ductwork	OA + Equipment Identifier
5.	Kitchen Exhaust Air Ductwork	KEA + Equipment Identifier
6.	Art Exhaust Air Ductwork	ART EA

2.5 ACCESS THROUGH LAY-IN CEILINGS

A. Mark at each location of the lay-in ceiling panel, on T-bar, which is nearest access to equipment, valves, dampers, etc., with flexible vinyl tape with pressure sensitive adhesive backing and printed markings (P-touch labels) with name of scheduled device (i.e. - VAV, valve, damper, etc...). Coordinate labeling (device name, type, etc.) with Owner.

2.6 RECORD DRAWINGS AND CLOSEOUT

A. Provide valve schedules, tag lists, and identification directories in O&M manuals and Record Drawings.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install identification after completion of insulation and painting.

B. Coordinate identification with other trades for visibility and access.

C. Replace damaged or illegible identification.

END OF SECTION

SECTION 230700 – HVAC INSULATION FOR EQUIPMENT, DUCTWORK, AND PIPING

PART 1 - GENERAL

1.1 RELATED SECTIONS

A. The Contractor's attention is directed to the General and Special Conditions, COMMON WORK RESULTS FOR HVAC and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. Work under this section shall include all labor, equipment, accessories, materials and services required to furnish and install all insulation, fittings and finishes for all mechanical systems specified herein and/or as indicated.

C. Application of insulation materials shall be performed in accordance with manufacturer's written recommendations. Where thickness of insulation is not specified, use applicable thickness recommended by manufacturer for specific use.

D. Insulation shall be installed by a company regularly engaged in the application of insulation and any work deemed unacceptable by the Engineer shall be removed and properly installed at the expense of the Contractor.

E. Insulation thicknesses shall comply with the latest version of ASHRAE 90.1 and IECC at a minimum.

F. Insulation shall comply with UL GREENGUARD which provides independent third party, Indoor Air Quality (IAQ) certification of products for emissions of respirable particles and Volatile Organic Compounds (VOC's), including formaldehyde and other specific product related pollutants. Certification is based upon criteria used by EPA, OSHA, and WHO.

G. All insulation materials shall be installed per the latest edition of the National Commercial and Industrial Insulation Standards.

H. The Contractor shall photograph any installations prior to concealment. This includes duct risers in chases.

PART 2 - MANUFACTURERS

2.1 ACCEPTABLE MANUFACTURERS

A. Johns Manville, Keene Corp., Knauf, Owens-Corning, Armstrong, Armacell World Industries.

PART 3 - MATERIALS

3.1 STANDARDS

A. Insulations, jackets, facings, adhesives, mastics, tapes, fitting materials, etc. shall have composite fire and smoke hazard ratings as tested by ASTM E-84, NFPA 255 and UL 723 procedures not exceeding Flame Spread 25, Smoke Developed 50 and Fuel Contributed 50.

B. All products and their packaging shall bear a label indicating above requirements are not exceeded.

C. Fiber glass pipe insulation shall meet the requirement of the Greenguard Gold level standard.

D. Products shall not contain formaldehyde, asbestos, lead, mercury, or mercury compounds. Products shall be Certified UL GREEGUARD Gold or Indoor Advantage Gold.

E. Insulation materials applied to carbon steel shall be Mass Load Corrosion Rate (MLCR) tested per ASTM 1617.

F. Foam insulation materials shall not use CFC or HCFC blowing agents in the manufacturing process.

G. All insulation installed outdoors or in exposed locations shall be provided with UV-resistant, weatherproof jacketing. Provide aluminum jacket or PVC jacketing with sealed seams.

H. Basis-of-Design Product: Subject to compliance with requirements, provide Knauf Insulation; Earthwool 1000 Degree Pipe Insulation with ECOSE Technology or Earthwool Redi-Klad 1000 Degree Pipe Insulation with ECOSE Technology. Type I, 850 Deg F (454 Deg C) or Type IV 1000 Deg F (528 Deg C)

I. Materials: Glass Mineral Wool bonded with a thermosetting resin. EPD Certified by UL Environment, UL/ULC Classified for Earthwool Pipe; FHC 25/50 per ASTM E 84 for Redi-Klad. Living Building Challenge - Declare Red List Free for Redi-Klad Pipe; or unjacketed Earthwool Pipe only. Comply with ASTM 585, ASTM C 411, ASTM C795, and ASTM C 547, Type I, and Type IV, with factory-applied ASJ+-SSL+ or ASJ-SSL.

J. Glass Mineral Wool Blanket Insulation: Glass Mineral Wool bonded with a thermosetting resin. Comply with ASTM C 553, Types I, II, and III, ASTM C 1136 Type II, and ASTM C 1290, Type I. UL/ULC Classified FSK, FHC 25/50 per ASTM E 84 for PSK only. UL GREENGUARD Gold Certified and UL Environment Validated to be formaldehyde free. Product shall contain no polybrominated diphenyl ethers (PBDE) such as Penta-BDE, Octa-BDE or Deca-BDE. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article. Basis-of-Design Product: Subject to compliance with requirements, provide Knauf Insulation; Atmosphere Duct Wrap with ECOSE Technology.

K. Glass Mineral Wool Board Insulation: Glass Mineral Wool bonded with a thermosetting resin. UL/ULC Classified per UL 723 for unfaced, ASJ, ASJ+ and FSK; FHC 25/50 per ASTM E 84 for PSK only. Comply with ASTM C 612, Type IA or Type IB. UL GREENGUARD Gold and Verified by UL Environment to be formaldehyde free. Living Building Challenge – Declare

Red List Free. For duct and plenum applications, provide insulation with factory-applied ASJ, with factory-applied ASJ+ jacket. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article. Basis-of-Design Product: Subject to compliance with requirements, provide Knauf Insulation; Earthwool Insulation Board with ECOSE Technology.

L. Glass Mineral Wool Pipe and Tank Insulation: Glass Mineral Wool bonded with a thermosetting resin. Semi-rigid board material with factory-applied ASJ complying with ASTM C 1393, Type II or Type IIIA Category 2, or with properties similar to ASTM C 612, Type IB. Nominal density is 2.5 lb./cu. ft. (40 kg/cu. m) or more. Thermal conductivity (k-value) at 100 deg F (55 deg C) is 0.29 Btu x in. /h x sq. ft. x deg F (0.042 W/m x C) or less. Factory-applied jacket requirements are specified in "Factory-Applied Jackets" Article. Basis-of-Design Product: Subject to compliance with requirements, provide Knauf Insulation; Earthwool Pipe and Tank Insulation with ECOSE Technology or Kwik-Flex Pipe and Tank Insulation.

3.2 APPLICATION REQUIREMENTS

A. Insulation shall be applied on clean, dry surfaces in a neat and workmanlike manner reflecting the best current practices in the trade. Insulation shall not be applied to piping, ductwork or equipment until tested, inspected and released for insulation.

B. Where more than one thickness of insulation is required, joints (both longitudinal and transverse) shall be staggered.

C. Do not insulate access doors, fire/smoke dampers, or equipment requiring service clearance. Terminate insulation neatly at these locations and maintain access.

D. Insulate all hydronic specialties including strainers, air separators, and accessories where connected piping is insulated.

E. All insulation shall be continuous through walls, ceiling openings and sleeves. However, insulation shall be broken through fire walls. All covered pipe and ductwork are to be located a sufficient distance from walls, other pipe, ductwork and other obstacles to permit the application of the full thickness of insulation specified. If necessary, extra fittings and pipe are to be used. No noticeable deformation of insulation or discontinuity of vapor seal, where required, will be accepted. Coordinate work with plumbers, pipe fitters, etc. to assure hanger locations agree with location of insulation inserts.

F. Existing and/or new insulation removed and/or damaged during course of construction shall be repaired or replaced as directed by the Engineer.

G. Vapor barrier jackets shall be applied with a continuous unbroken vapor seal. Do not use staples thru the jacket. NO EXCEPTIONS!

H. All piping and ductwork operating below ambient dew point shall be insulated with a continuous vapor barrier system. All seams, penetrations, and terminations shall be sealed vapor-tight.

I. All insulation shall be installed with joints butted firmly together.

J. The Contractor shall insure that all insulation (piping, ductwork, equipment, etc.) is completely continuous along all conduits, equipment, connection routes, etc. carrying cold fluids (air, water, other) and that condensation can, in no way, collect in or on the insulation, equipment, conduits, etc. Any such occurrence of condensation collection and/or damage therefrom shall be repaired solely at the expense of the Contractor.

3.3 PIPING SYSTEMS

A. All HVAC piping systems shall be insulated entirely in accordance with the specifications list herein.

B. Seal insulation and jacket at all points where insulation terminates at unions, flanges, valves and equipment. This applies to hot water lines only as cold-water lines require continuous insulation and vapor barrier.

C. Pipe insulation shall extend around valve bodies to above drain pans in hydronic equipment over is, etc. to insure no condensation drip or collection.

D. Valves, flanges and unions shall only be insulated when installed on piping whose surface temperature will be at or below the dew point temperature of the ambient air.

E. Insulation shall not extend through fire and smoke walls. Pack sleeve at fire and smoke wall with approved fire retardant packing similar to mineral wool.

F. Metal insulation shields and inserts are required at all pipe hangers where the piping is insulated. Metal shields shall be constructed of galvanized steel, formed to a 180 ° arc. Insulation shields shall be the following size:

Pipe Size	Shield Gauge	Shield Length
2” and less	20	12”
2 ½”- 4”	18	12”
5”- 10”	16	18”
Over 10”	14	24”

G. Insulated pipes 2” in diameter and larger shall be additionally supported with wood inserts of sufficient compressive strength to carry the weight of the pipe and fluid. Inserts shall extend beyond extend beyond the hanger and shall be at least 6” in length.

H. Provide premolded PVC insulated fitting covers on all pipe fittings, flanges, valves and pipe terminations. Fittings shall be insulated by applying the proper factory precut insulation insert to the pipe fitting. The ends of the insulation insert shall be tucked snugly into the throat of the fitting and the edges adjacent to the pipe insulation tufted and tucked in, fully insulating the pipe fitting. The proper thickness of insulation must be applied to keep the jacket temperature less than 150°F. An approved vapor retarder mastic compatible with the PVC shall be applied around the edges of the adjoining pipe insulation and on the fitting cover throat overlap seam. The PVC fitting cover shall then be applied and secured with pressure sensitive tape along the

circumferential edges. The tape shall extend over the adjacent pipe insulation and have an overlap on itself at least 2" on the downward side. On fittings where the operating temperature is below 50°F, two or more layers of the insulation inserts shall be applied with the first layer being secured with a few wrappings of fiber glass yarn to eliminate voids. One additional insert shall be used for each additional 1" of pipe insulation above 1-1/2". All joints shall be fully sealed.

3.4 PIPE INSULATION MATERIAL

A. Insulation shall be Owens-Corning model 25ASJ/SSL or approved equivalent fiberglass pipe insulation with an all service jacket. The insulation shall be a heavy density, pipe insulation with a K factor not exceeding 0.27 Btu per inch/h.ft² °F at 75°F mean temperature. The insulation shall be wrapped with a vapor barrier jacket. The jacket shall have an inside foil surface with self sealing lap and a water vapor permeability of 0.02 perm/inch. All circumferential joints shall be vapor sealed with butt strips. All insulation shall be installed in strict accordance with the manufacturer's recommendations. The following pipes shall be insulated with the thickness of insulation as noted.

B. Geothermal Heat Pump Piping
   1. 1-1/2" thick on all metallic piping

C. Condensate Drain Lines
   1. 1/2" thick.

3.5 DUCTWORK SYSTEMS

A. Duct sizes indicated are the net free area inside clear dimensions.

B. Duct insulation shall extend completely to all registers, grilles, diffusers, and louver outlets, etc., to insure no condensation drip or collection.

C. External insulation for supply and outside air ductwork: Owens/Corning, All Service Fiberglass Duct Wrap, "Faced Duct Wrap - Type 100" or approved equivalent, 2" thick fiberglass duct wrap, factory laminated to a reinforced foil kraft vapor barrier facing (FRK) with a 2" stapling flange at one edge. The installed R value shall be a minimum of 6.0. Flame spread 25, smoke developed 50, vapor barrier performance 0.02 perms per inch.
   1. Insulate all supply ductwork for all heat pump units (VHP/HHP) for the entire project.
   2. Insulate return air ductwork for all heat pump units (VHP/HHP) located in the Main Mechanical Room, in the Gymnasium Platform and Kitchen & Cafeterias units. No other return air ductwork locations require insulation for heat pump units (VHP/HHP).
   3. Outside air supply ductwork downstream of OA unit (under positive pressure) and exhaust air ductwork upstream of OA unit (under negative pressure) **does not** require insulation unless noted otherwise. All other duct including louver plenums requires installation per the above.
   4. Insulate all negative pressure exhaust air ductwork.

D. Internal duct liner: Duct liner shall be 1" thick fiber-free, black, flexible, closed-cell, non-particulating, formaldehyde-free elastomeric insulation (AP Armaflex FS Duct Liner or equal) K=0.27 BTU in./hr. ft^2 °F @ 75°F. Install per manufacturer's instruction using manufacturer's accessories and products including low VOC spray contact adhesive. Provide and install duct liner only where indicated.
   1. The first 10 feet of supply and return ductwork for heat pump units (VHP/HHP), shall utilize 1-1/2" thick liner (R-6.0) in lieu of duct wrap for insulating and acoustic requirements. For all other applications, utilize 1" thick liner for acoustic requirements as noted on the drawings.
   2. Utilize 1" thick duct liner for all transfer ducts and assemblies.

3.6 OUTDOOR DUCT INSULATION AND JACKETING

A. All ductwork located outdoors, in unconditioned penthouses, or otherwise exposed to weather, UV radiation, or mechanical damage shall be provided with a complete weatherproof insulation and jacketing system.

B. Insulation shall be minimum 2-inch thick rigid board or duct wrap as specified herein, suitable for exterior applications, and installed with a continuous vapor-retarder system.

C. Provide factory-applied or field-applied aluminum jacketing over all exterior duct insulation. Aluminum jacketing shall be minimum 0.016-inch thick, stucco embossed, with factory-applied moisture barrier. All longitudinal and circumferential seams shall be lapped, sealed, and secured with stainless steel bands or screws in accordance with manufacturer's recommendations.

D. All seams, penetrations, terminations, and joints shall be fully sealed watertight. Provide sealant compatible with jacketing and insulation system to prevent water intrusion.

E. Insulation system shall be installed to prevent water infiltration, air gaps, and sagging. All horizontal duct surfaces shall be installed with positive drainage to shed water.

F. Provide additional protection at locations subject to physical damage, including but not limited to roof level, low elevations, and areas near access paths. Protection shall include thicker jacketing, reinforcing bands, or metal shields as required.

G. Terminate insulation and jacketing neatly at duct connections, dampers, access doors, and equipment, maintaining weatherproof integrity while allowing full operation and maintenance access.

H. All exterior insulation systems shall be capable of withstanding wind, rain, snow, and UV exposure without degradation for the life of the system.

I. Contractor shall repair or replace any insulation or jacketing system that exhibits water intrusion, deterioration, or failure during the warranty period at no additional cost to the Owner.

3.7 MECHANICAL EQUIPMENT

A. Air separator, expansion, and storage tanks:
   1. Owens-Corning "Thermal Insulating Wool - Type II" or approved equivalent. Insulation shall be constructed of non-combustible, flexible wool. Insulation shall be 2" thick. K = 0.24 Btu in/hr.fr² °F @ 100°F. Insulation shall be attached in strict accordance with the manufacturer's recommendations. All insulation shall be jacketed with 6 oz. canvas with fire retardant lagging.

B. For tanks, pumps, and equipment, Armacell engineered foam may be used. Total insulation thickness of 2". K=0.27 Btu in/hr ft^2 °F @ 75 °F. Install per manufacturer's instructions utilizing black adhesive (low voc) with a minimum of 2" insulating tape.

C. Insulate pump volutes as part of the piping system as referenced in Part 5.

END OF SECTION

SECTION 230995 – TESTING, ADJUSTING, AND BALANCING FOR HVAC

PART 1 - GENERAL

1.1 RELATED SECTIONS

A. The Contractor's attention is directed to the General and Special Conditions, 230100 COMMON WORK RESULTS FOR HVAC, and 019113 GENERAL COMMISSIONING REQUIREMENTS and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

1.2 GENERAL REQUIREMENTS

A. The Engineer, or authorized representative, shall be notified by the Contractor two weeks in advance of any tests called for in these Specifications or required by others.

B. Only after written approval, signed by the Engineer, shall the Contractor apply insulation or paint or allow the work to be furred-in. This written approval, however, does not relieve the Contractor of the responsibilities for any failure during the guarantee period. The expense of all tests shall be borne by the Contractor, along with all temporary equipment, materials, gauges, etc. required for tests.

C. Prior to the commencement of any Testing, Adjusting, and Balancing (TAB) activities, the Contractor shall coordinate and conduct a TAB coordination meeting. The meeting shall include the Commissioning Authority (CxA), TAB Contractor, Automatic Temperature Controls (ATC) Contractor, Mechanical Contractor, Plumbing Contractor, Construction Manager (CM), and the Engineer of Record. The purpose of the meeting shall be to review TAB procedures, system readiness, documentation requirements, scheduling, access/logistics, and coordination with controls and commissioning activities. TAB work shall not begin until this meeting has been completed and all parties are in agreement with the testing approach.

1.3 SYSTEM READINESS FOR TAB

A. The following must be completed prior to the start of TAB scope:
   1. All equipment shall be installed, started, and operating in accordance with manufacturer requirements.
   2. All ductwork and piping systems shall be complete, leak tested, and insulated.
   3. All controls shall be installed, calibrated, and fully operational.
   4. All balancing dampers, control valves, and access doors shall be installed and accessible.
   5. All filters shall be installed and clean.
   6. Hydronic systems shall be flushed, filled, vented, and free of air.
   7. Temperature control systems shall be fully functional and operating in normal mode prior to the start of testing, adjusting, and balancing.

PART 2 - TESTING REQUIREMENTS

2.1 PIPING TESTS

A. Piping shall be tested before being insulated or concealed in any manner. Where leaks or defects develop, required corrections shall be made and tests repeated until systems are proven satisfactory.

B. Water piping systems shall be subjected to a hydrostatic test of one hundred fifty pounds. The system shall be proven tight after a twenty-four (24) hour test.

C. Thermometers and gauges shall be checked for accuracy (+/-5%). If instruments prove defective, they shall be replaced.

D. Any leaks or imperfections found shall be corrected and a new test run until satisfactory results are obtained. The cost of repair or restoration of surfaces damaged by leaks in any system shall be borne by the Contractor.

E. Measured water flow rates (GPM) and associated pressure drops shall be within (+/-5%) of the design values. Adjustments shall be made as necessary to achieve this tolerance.

2.2 HEATING, VENTILATING AND AIR CONDITIONING TESTING:

A. The test and balance of this system shall be by a Contractor who employs only the services of a certified AABC or independent NEBB firm whose sole business is to perform test and balance services. The Test and Balance contractor shall report all deficiencies to the Engineer.

B. Mechanical Contractor shall provide all start-up documents to Test and Balance Contractor prior to any test and balance services.

C. All motors, bearings, etc. shall be checked and lubricated as required during start-up procedures. All automatic, pressure regulating and control valves shall be adjusted. Excessive noise or vibration shall be eliminated.

D. System balancing, where required, shall be performed only by persons skilled in this work. The system shall be balanced as often as necessary to obtain desired system operation and results.

E. All fan belts shall be adjusted for proper operation of fans.

F. Testing shall occur after completion of installing the ceiling systems.

G. All deficiencies observed by the Test and Balance Contractor shall be reported immediately to the Engineer and Mechanical Contractor. Accuracy shall be within (+/-5%).

H. Refer to Specification Section GROUND-LOOP HEAT-PUMP PIPING and Specification Section TEMPERATURE CONTROLS AND SEQUENCE OF OPERATIONS FOR HVAC for additional requirements.

I. Provide a preliminary test report to the Engineer immediately after the system is air balanced, or any initial phases are balanced. This report may be hand written. Any systems that are not found to operate within the design tolerances by the Test and Balance Contractor shall be immediately be reported to the Engineer via telephone call to attempt to determine a resolution while the Test and Balance Contractor is still on site. Additional compensation will not be accepted for additional trips.

J. Anticipate visiting the site again after the Engineer has reviewed the report. The Engineer may request up to two (2) additional site visits for onsite troubleshooting where additional measurements may be required.

K. For the purpose of placing the Heating, Ventilating and Air Conditioning systems in operation according to design conditions and certifying same, final testing and balancing shall be performed in complete accordance with AABC Standards for Total System Balance, 7th Edition, for air and hydronic systems as published by the Associated Air Balance Council.

L. The following systems shall be tested and balanced:
1. The supply, return, outside and exhaust air duct systems associated with the OA unit and heat pumps. Provide static pressure profiles thru each system. Static pressure profiles shall include all sections from the return duct inlet and supply duct outlet of the heat pump and air handling units. Show accurate representation of units.
2. Balance all air terminal units and airflow dampers to setpoints indicated on the drawings.
3. The outside air system is designed with a high level of diversity. All terminal units and airflow dampers will need to be grouped and set to minimum flows while other groups are balanced. Refer to Control Sequences on the drawings and refer to the airflow schematic. TAB Contractor shall simulate diversified operating conditions as required to verify system performance under minimum, maximum, and part-load conditions.
4. Outside and exhaust air in each room to within 5% of design air flow rate.
    a. Outside air quantities shall be verified using approved measurement methods (flow hood, pitot traverse, or airflow station), and coordinated with control sequences.
5. Heat pump total air flow and discharge and inlet pressures. Coordinate minimum damper setpoints with ATC contractor for heat pump units with motorized volume dampers.
6. Determine and record heat pump geothermal heat exchanger pressure loss and compare to submittal data to verify flow exceeds minimum.
7. Hydronic and domestic pumps total water flow.
8. Balance heat pump chiller loop, circulating pump and associated coil air flows.
9. Verify calibrations of the duct static pressure and water pressure sensors for all systems and field determine minimum and maximum setpoints.
10. Balance each geothermal wellfield row.
11. Balance each heat pump unit and adjust ECM motor to design airflow. Record inlet and outlet static pressure, including filters. Measure outside air flow at each heat pump and space.
12. Verify operation of all variable speed drives (VFDs/ECMs) and confirm minimum and maximum speeds correspond to design conditions.
13. Balance all supply and return air grilles to within 10% of design air flow rate.
14. Balance all exhaust air and ventilation fans and record inlet static pressure including kitchen exhaust fan.

M. The flushing and purging of the geothermal system shall be witnessed and approved. Refer to Specification Section GROUND-LOOP HEAT-PUMP PIPING and Specification Section HVAC WATER TREATMENT, CLEANING FILLING, AND PURGING for additional requirements.

N. Balance the water flow rate of each domestic hot water recirculating pump. Set the flow rate for each balancing valve in the recirculating hot water system. If flow rates are not indicated, contact the engineer for each balance valve GPM (+/-5%).
   1. Hydronic systems shall be balanced using calibrated balancing valves and flow measurement devices. Circuit setters shall be set, locked, and recorded.

O. Determine and record water flow rate of each geothermal circulating pump. Estimate flows based on pump curves and pressure loss.
   1. Hydronic systems shall be balanced using calibrated balancing valves and flow measurement devices. Circuit setters shall be set, locked, and recorded.

P. Upon completion of TAB, all balancing dampers and valves shall be marked, locked, and recorded in final report.

Q. TAB Contractor shall coordinate with ATC Contractor to verify and document all control setpoints, sequences, and sensor calibrations required to achieve design flows and system operation.

R. Instruments used for testing and balancing of air and hydronic systems shall have been calibrated within a period of six months prior to balancing. All final test analysis reports shall include a letter of certification listing instrumentation used and last date of calibration.

S. Test and Balance agency shall provide sizing of fan or motor sheaves required for proper balance. The Mechanical Contractor shall purchase and install all sheaves and belts as required. This includes new and existing equipment.

T. Complete test reports shall be submitted to the Consulting Engineer prior to final acceptance of the project. Preliminary test reports shall be submitted when requested.

U. The Contractor shall provide and coordinate work to provide sufficient time before final completion date so that tests and balancing can be accomplished and provide immediate labor and tools to make corrections when required without undue delay.

V. The Contractor shall put all heating, ventilating and air conditioning systems and equipment into full operation and shall continue the operation of same during each working day of testing and balancing.

W. The Test and Balance Contractor shall be present during the Engineer’s final inspection of the building, or a separate project review date. The Engineer may request confirmation of the air balance report by asking for new measurements to be taken at that time. Any information in the test and balance report may be asked to be reconfirmed.

X. The Mechanical Contractor shall promptly correct all deficiencies identified by the TAB Contractor at no additional cost. TAB shall not be considered complete until all deficiencies are resolved and verified.

Y. TAB shall be performed in full coordination with commissioning activities. TAB results shall be used to support functional performance testing and final system acceptance. Systems not meeting design intent shall be rebalanced and corrected at no additional cost.

END OF SECTION

SECTION 231203 - AUTOMATIC SMOKE VENTS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

B. Refer Specification Section 019113 General Commissioning Requirements.

1.2 SUMMARY

A. Work Included: Provide factory-fabricated double-leaf automatic smoke vents.

B. Smoke vents shall be provided in accordance with IBC Section 910 and NFPA 204 where required.

C. Coordinate vent sizing, spacing, and location with code analysis and fire protection design.

D. provide manual release mechanisms required by code or AHJ.

E. Where indicated or required, coordinate with Division 26/28 to provide interface with fire alarm system for monitoring and/or remote release.

1.3 QUALITY ASSURANCE

A. Manufacturer: A minimum of 5 years' experience manufacturing similar products.

B. Installer: A minimum of 2 years' experience installing similar products.

C. Manufacturer's Quality System: Registered to ISO 9001 Quality Standards including in-house engineering for product design activities.

1.4 DELIVERY, STORAGE AND HANDLING

A. Deliver products in manufacturer's original packaging. Store materials in a dry, protected, well-vented area. Inspect product upon receipt and report damaged material immediately to the delivering carrier and note such damage on the carrier's freight bill of lading.

1.5 WARRANTY

A. Manufacturer's Warranty: Provide manufacturer's standard warranty. Materials shall be free of defects in material and workmanship for a period of five years from the date of purchase. Should

a part fail to function in normal use within this period, the manufacturer shall furnish a new part at no charge.

1.6 SUBMITTALS

A. Product Data: Manufacturer's data for each type of smoke vent.

B. Shop Drawings: Indicate size, layout, curb details, and integration with roofing system.

C. Certifications: UL listing and compliance with applicable codes.

D. Operation and Maintenance Data: Include reset instructions and maintenance requirements.

PART 2 - PRODUCTS

2.1 MANUFACTURER

A. Acceptable manufacturers are Bilco, Babcock-Davis, Wasco

B. Basis-of-Design Manufacturer: Type ACDSV Double-Leaf Automatic Roof Fire Vent by The BILCO Company, P.O. Box 1203, New Haven, CT 06505, 1-800-366-6530, Fax: 1-203-535-1582, Web: www.bilco.com.

C. Acceptable manufacturers shall provide products that meet or exceed the performance, construction, and operation of the basis-of-design.

2.2 AUTOMATIC ROOF FIRE VENT

A. Furnish and install where indicated on plans: metal fire vent Type ACDSV, refer to drawings for size and location of vents. Length denotes hinge side. Any roof fire vent shall be double leaf. The roof fire vent shall be preassembled from the manufacturer.

B. Performance characteristics:
   1. Vent(s) shall be UL listed.
   2. Covers shall be reinforced to support a minimum live load of 40 psf (195 kg/m^2) with a maximum deflection of 1/150th of the span or 90 psf (439 kg/m^2) wind uplift.
   3. Corrosion resistant gas springs shall open the vent covers simultaneously when latch is manually released or when heat breaks the UL listed fusible link. Opening shall be in a controlled manner to avoid damage to surrounding roof surfaces.
   4. Entire roof fire vent shall be weathertight with fully welded corner joints on cover and curb.
   5. Latch mechanisms shall hold the covers in the closed position without overstressing the fusible link and withstand 90 psf (439 kg/m^2) wind uplift forces acting on the cover.

6. Latch operation: When heat parts the UL listed fusible link, the latch shall release instantaneously, allowing vent covers to open. The latch shall be designed for easy resetting, after a fire or test, so that the covers cannot be latched closed unless the mechanism has been reset properly. The manufacturer shall provide instructions for resetting the latch with each unit.
7. Sound Transmission Rating: Vent(s) shall carry STC-50 and OITC 46 sound ratings.
8. ISO 140-18 Rainfall Sound Rating – 37.5 db.

C. Covers: Shall be 14-gauge (1.9mm) galvannealed steel with a 5-3/4" (146mm) beaded flange with formed reinforcing members.

D. Gasket: Dual EPDM gaskets shall be permanently adhered to the underside of the covers.

E. Cover insulation: Shall be mineral wool of 4" (102mm) in thickness, fully covered and protected by a 12-gauge (2.75mm) galvanneal steel liner.

F. Curb: Shall be 12" (305mm) in height and of 10-gauge (3.5mm) galvannealed steel with a fixed center channel. Curb shall be formed with a 6-7/8" (175mm) flange with 7/16" (11mm) holes provided for securing to roof deck. The curb shall be equipped with integral metal capflashing of 14-gauge (1.9mm) galvannealed steel and feature the Bil-Clip® flashing system, including stamped tabs, 6" (153mm) on center, to be bent inward to hold single-ply roofing membrane securely in place.

G. Curb insulation: Shall be 4" (102mm) mineral wool insulation, fully enclosed by a 10-gauge (3.5mm) galvannealed steel liner.

H. Lifting mechanisms: Corrosion resistant gas springs open covers automatically against a 10 lb/ft^2 ($49Kg/m^2$) snow/wind load. Gas springs shall have built in dampers to assure a controlled rate of opening and automatically lock the covers in the fully open position. A release mechanism shall be provided to allow the covers to be closed.

I. Latch mechanism: Shall be the BILCO Thermolatch® II positive hold/release mechanism with a separate latching point for each cover controlled by a single UL listed 165°F (74°C) fusible link. Fusible link shall be curb mounted on a non-hinged end to allow the latching mechanism to be easily reset from the roof level.

J. Hardware: Corrosion resistant gas springs and hot dip galvanized steel stop cables. All other hardware is zinc plated/chromate sealed.

K. Finish: Factory finish shall be alkyd base red oxide primer.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine substrates and openings for compliance with requirements for installation tolerances and other conditions affecting performance. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install products in strict accordance with manufacturer's instructions and approved submittals. Locate units' level, plumb, and in proper alignment with adjacent work.
   1. Test units for proper function and adjust until proper operation is achieved.
   2. Test fusible link and install replacement fusible link after testing.
   3. Repair finishes damaged during installation.
   4. Restore finishes so no evidence remains of corrective work.

B. Coordinate installation with roofing, structural, and fire alarm systems. Installation shall maintain roof warranty and structural integrity.

C. Coordinate with roofing manufacturer for warranty compliance.

D. Installation shall not void roof warranty.

3.3 ADJUSTING AND CLEANING

A. Clean exposed surfaces using methods acceptable to the manufacturer which will not damage finish.

3.4 FIELD QUALITY CONTROL

A. Test operation of each smoke vent in presence of Owner, Engineer, and AHJ where required.

B. Verify proper release, full opening, and reset capability.

C. Replace fusible links after testing.

END OF SECTION

SECTION 232200 – HVAC PIPING

PART 1 - GENERAL

1.1 RELATED SECTIONS

A. The Contractor's attention is directed to the General and Special Conditions, COMMON WORK RESULTS FOR HVAC and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. Each Contractor's attention is also directed to Specification Section HANGERS AND SUPPORTS FOR HVAC PIPING AND EQUIPMENT, HVAC INSULATION FOR EQUIPMENT, DUCTWORK, AND PIPING, HVAC WATER TREATMENT, CLEANING, FILLING AND PURGING.

1.2 GENERAL REQUIREMENTS

A. Unless otherwise indicated, all materials shall be new and of the best grade and quality for the type specified.

B. Where piping is not indicated on the plans, but is obviously or apparently required, contact the Engineer prior to submission of the bid.

C. All piping shall be capped or plugged during erection as required to keep clean and debris and moisture free.

D. Equipment Connections: Piping shall be installed so that no strain is imposed on equipment connections. Align piping with equipment connections without forcing, and provide offsets or flexibility as required. Final connections shall be made only after equipment is set and properly aligned.

E. The piping indicated shall be installed complete and shall be of the size indicated. When a pipe size is not indicated, the Contractor shall request the pipe size from the Engineer. Where a section of piping is not indicated but is obviously required for completion of the system, the Contractor shall provide same at no additional cost to the project.

F. All piping shall be installed straight and true, parallel or perpendicular to the building construction. Piping shall be installed so as to allow for expansion without damage to the building finishes, structure, pipe, equipment, etc., use offsets, U-bends or expansion joints as required. No mitered joints or field fabricated pipe bends shall be accepted. Pipe shall clear all windows, doors, louvers and other building openings.

G. All pipes shall be supported in a neat and workmanlike manner and wherever possible, parallel runs of horizontal piping shall be grouped together on hangers. Vertical risers shall be supported at each floor line with approved steel pipe riser clamps. Spacing of pipe supports shall not exceed eight (8) foot intervals for pipes 3" and smaller and ten (10) foot intervals on all other piping. Small vertical pipes (1" and less) shall be bracketed to walls, structural members, etc. at four (4) foot intervals so as to prevent vibration or damage by occupants. Reference 230529 for additional piping support requirements.

H. Insulated piping shall be supported on a rigid insulation block at each hanger so as to prevent crushing of insulation by hangers. Hangers shall pass completely around the insulation jacket and a steel protective saddle shall be applied to prevent compression of the insulation. Refer to Specification Section HVAC INSULATION, EQUIPMENT, DUCTWORK AND PIPING.

I. The use of wire or perforated metal to support pipes will not be permitted. Hanging pipes from other pipes shall not be permitted.

J. In metal buildings or buildings with light gauge trusses, support piping with standard pipe hangers with C-clamp connection to main structural members (not purlins), use angle steel cross pieces between main structural members where required to provide rigid support.

K. Where piping rests directly on a hanger, clip, bracket or other means of support, the support element shall be of the same material as the pipe, (e.g., copper to copper, ferrous to ferrous, etc.) or shall be electrically isolated one from the other so as to prevent pipe damage by electrolysis. Pay particular attention and do not allow copper pipe to rest on ferrous structural members, equipment, etc. without electrolytic isolation. This includes temporary support required during Construction.

L. In general, piping shall be installed concealed except in mechanical rooms, etc. unless otherwise indicated, and shall be installed underground or beneath concrete slabs only where indicated. All lines at ceilings shall be held as high as possible and shall run so as to avoid conflicts with other trades, and to facilitate the Owner's use and maintenance. Location of pipe in interior partitions shall be carefully coordinated with whoever will construct the partitions after the piping is in place. Where exposed risers occur, they shall be kept as close to walls as possible.

M. Pipe shall be cut accurately to measurements established at the building by the Contractor and worked into place without springing or forcing. All pipes shall be reamed to full pipe diameter before joining and before assembling. All lengths of pipe shall be set vertically and tapped with a hammer to remove scale and dust and inspected to ensure that no foreign matter is lodged therein.

N. All hot and cold-water piping shall be kept a sufficient distance apart so as to prevent heat transfer between them. Cold water piping shall also be kept apart from refrigerant hot gas lines.

O. Piping carrying water or other fluids subject to freezing shall not be installed in locations subject to freezing. If in doubt, consult Engineer.

P. Pay particular attention to conflict of piping with other work. Do not install until conflict is resolved. If in doubt, consult Engineer.

Q. Piping materials in each system shall, to the extent practicable, be of the same material. Frequent changes of material (for example, from copper to steel) shall be avoided and in no case shall be accomplished without use of insulating unions and permission of the Engineers.

R. Dielectric unions shall be provided at all connections of dissimilar materials.

S. Nipples shall be of the same material, composition and weight classification as pipe with which installed.

T. Eccentric reducers shall be used where required to permit proper drainage and venting of pipe lines; bushings shall not be permitted.

U. High points of closed loop chilled / hot water (2-pipe system) and geothermal systems shall have manual air vents as required unless automatic air vents are specifically indicated. Pipe to suitable drainage point.
   1. Manual air vents shall be installed at all high points not otherwise vented through equipment.
   2. Drain valves shall be installed at all low points and at each isolated section of piping.

V. Drain valves shall be provided at all drainage points on pipes. Drain valves shall be ½" size ball valves with 3/4" hose thread end and vacuum breaker. Label each drain valve.

W. Plastic piping or any material with a flame and smoke spread rating not approved for plenum use shall not be permitted.

X. Non-metallic piping shall be installed in strict accordance with the manufacturer's instructions. If no such instructions are available, consult Engineer.

Y. When running any type of pipe below a footing, perpendicular to the footing, the area underneath the footing and in the zone of influence shall be backfilled with concrete. The zone of influence is the area within a 45-degree angle projecting down from the top edge of footing on all sides of the footing.

Z. When running any type of pipe below a footing, parallel to the footing, the area underneath the zone of influence shall be backfilled with 4” of crushed stone or sand bedding under the pipe. Each pipe section shall be anchored into unexcavated earth on both ends with deadman anchor system. The remainder of the trench in the zone of influence shall be backfilled with cementitious flowable fill. The zone of influence is the area within a 45-degree angle projecting down from the top edge of the footing on all sides of the footing.

AA. Piping for all drainage systems shall be installed to permit flow, trapping, and venting in accord with current codes and best practice.

BB. Prior to final connection to equipment, all piping shall be inspected and verified clean and free of debris.

1.3 PIPE JOINING METHODS

A. Copper Solder Joints
   1. Clean tube and fittings and ream pipe ends prior to joining.
   2. Use lead-free solder (95/5 or approved equal) and compatible flux.
   3. Install in accordance with ASTM B828.
   4. Do not use soldered joints for pipe sizes larger than manufacturer recommendations or where otherwise restricted.
   5. Mitered joints, field-fabricated bends, or use of unapproved fittings is prohibited.

B. Copper Press-Connect Joints
   1. Use only manufacturer-approved press tools and jaws.
   2. Install in accordance with ASTM B1029 and manufacturer requirements.
   3. Provide fittings with factory-installed sealing elements suitable for temperature and fluid.
   4. Clearly identify press fittings prior to installation; mixed systems are not permitted without Engineer approval.
   5. Mitered joints, field-fabricated bends, or use of unapproved fittings is prohibited

C. Steel Threaded Joints
   1. Permitted for pipe sizes 2 inches and smaller unless otherwise indicated.
   2. Threads shall be clean-cut and full depth.
   3. Apply thread sealant suitable for service.

D. Steel Grooved Joints
   1. Install grooved couplings in accordance with manufacturer’s instructions.
   2. All grooved components shall be from a single manufacturer.
   3. Gaskets shall be suitable for system temperature and fluid.

E. Steel Welded Joints
   1. Perform welding in accordance with ASME B31.9.
   2. Welders shall be qualified for the procedures used.

F. All press-connect fittings and valves within a system shall be of the same manufacturer unless otherwise approved by the Engineer.

G. Do not mix joining systems within the same piping system without Engineer approval.

H. Provide unions or flanges at equipment to allow removal without cutting pipe.

I. Install piping so that joints are accessible for inspection and maintenance.

J. Apply approved pipe dope for service intended to all male threaded joints. The dope shall be listed for intended use.

PART 2 - MATERIALS

2.1 UNIONS, FLANGES AND WELDED TEES

A. Screwed unions, soldered unions or bolted flanges shall be provided as required to permit removal of equipment, valves and piping accessories from the piping system. Keep adequate clearances for coil removal, rodding, tube replacement, motor lubrication, filter replacement, etc. Flanged joints shall be assembled with appropriate flanges, gaskets and bolting. The clearance between flange faces shall be such that the connections can be gasketed and bolted tight without imposing undue strain on the piping system.

B. Dielectric insulating unions or couplings shall be used wherever the adjoining materials being connected are of dissimilar metals such as connections between copper and steel pipe.

C. Tee connections for welded pipe shall be assembled with welding fittings. Where the size of the side outlet is such that a different connection technique than on the run is required, a weldolet, sockolet, or threadolet type fitting may be used for the branch in place of reducing tees only where the branch is 2/3 the run size or smaller.

D. Weld-o-let, thread-o-let and T-drill branch connections are acceptable.

PART 3 - SPECIFICATIONS STANDARDS

3.1 REQUIREMENTS

A. All piping and material shall be new and shall conform to the following minimum applicable standards:
   1. Steel Pipe: ASTM A53/A53M.
   2. Copper Tube: Type K, L, or M; ASTM B88. Type DWV copper tube; ASTM B306.
   3. Wrought Steel Butt-Welding Fittings: ASME B16.9.
   4. Cast Copper Alloy Solder Joint Pressure Fittings and Wrought Copper Fittings: ASME B16.18 and ASME B16.22.
   5. Cast Copper Alloy Solder Joint Drainage Fittings (DWV): ASME B16.23.

B. Install piping to allow access to valves, strainers, coils, and equipment service points. Do not route piping in a manner that obstructs access to serviceable components.

PART 4 - PITCH OF PIPING

4.1 REQUIREMENTS

A. All piping systems shall be installed so as to drain to a low point. Certain minimum pitches shall be required for this drainage. For proper flow and/or for proper operation, the following pitches shall be required:

B. Condensate Drain Lines from Cooling Equipment:
   1. Install condensate drain piping with a continuous downward pitch of not less than 1/4 inch per foot in the direction of flow. Do not allow sags, traps (unless required), or standing water in piping.
   2. Provide traps at each cooling coil or unit as required by the equipment manufacturer and static pressure conditions. Coordinate trap depth with fan pressure.
   3. Route condensate piping to approved drainage locations as indicated. Where not indicated, coordinate with Engineer. Discharge shall be visible where practical.
   4. Provide cleanouts at changes in direction and at intervals required for maintenance.
   5. Condensate piping shall not be directly connected to sanitary systems without an approved air gap or trap primer arrangement in accordance with plumbing code.
   6. Support condensate piping at intervals sufficient to prevent sagging and maintain required pitch.
   7. Insulate condensate piping where subject to sweating or where installed in concealed spaces that could result in damage to building finishes.
   8. Where condensate pumps are required, coordinate electrical power, controls, and alarm connections.

C. All Other Lines: Provide ample pitch to a low point to allow 100 percent drainage of the system.

PART 5 - HVAC PIPING APPLICATIONS

5.1 HVAC HYDRONIC PIPING

A. System Types:
   1. Geothermal Heat Pump Water
   2. Condensate Piping

5.2 INTERIOR GEOTHERMAL HEAT PUMP LOOP PIPING

1. 2” and Smaller: Type "L" hard copper tubing with wrought copper fittings and 95/5 solder or Type “L” hard copper tubing with copper mechanical fittings.
2. 2-1/2” and Larger: Schedule 40 black steel pipe with screwed or grooved fittings or Type “L” hard copper tubing with wrought copper fittings and 95/5 solder or Type “L” hard copper tubing with copper mechanical fittings.
3. Type “L” copper with mechanical press-connect couplings and fittings with 125# rating manufactured by Apollo Xpress, Viega Propress, or equal. Install gaskets as recommended by the manufacturer. Piping system shall be rated for minimum of 220 degrees F water temperature. System to confirm to ASME B16.18 or B16.22 seals and press fittings shall incorporate multiple leak path design
4. Schedule 40 Victaulic 107/W07 or approved mechanical grooved pipe couplings and fittings with a minimum 125# rating. Install gaskets as recommended by the manufacturer. Piping system shall be rated for minimum of 250 degrees F water temperature. Mechanical grooved piping may <u>not</u> be used if system water temperature exceeds 250ºF. All grooved components must be of one manufacturer.

B. Condensate Drain Lines: Type "M" copper tubing with sweat fittings and 95/5 solder.
   1. Type M copper tubing shall be permitted for condensate piping only and shall not be used for hydronic or geothermal heat pump loop piping.

C. Exterior Geothermal Piping: Refer to Specification Section – GEOTHERMAL (EARTH COUPLED) LOOP PIPING SYSTEM.

D. Air Vent Discharge Lines: Type "L" soft copper; wrought copper fittings, 95/5 solder. Pipe to a suitable drainage location.

END OF SECTION

SECTION 232500 – HVAC WATER TREATMENT, CLEANING, FILLING, AND PURGING

PART 1 - GENERAL

1.1 RELATED SECTIONS

A. The Contractor's attention is directed to the General and Special Conditions, COMMON WORK RESULTS FOR HVAC and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. Review the Specification Section – COMMON WORK RESULTS FOR HVAC. List and provide all documentations called for therein.

C. Refer Specification Section 019113 General Commissioning Requirements.

1.2 REQUIREMENTS

A. Through coordination with other Contractors, Vendors and Suppliers associated with this Project, this Contractor shall ensure a complete, 100% functional, tested, inspected and approved systems. Claims for additional cost or change orders will immediately be rejected.

B. The water treatment company shall employ qualified service technicians experienced in the installation, monitoring, and maintenance of closed-loop hydronic and geothermal systems. Technicians assigned to this Project shall have a minimum of three (3) years of field experience with closed-loop water treatment programs and shall be trained in chemical handling, system sampling, and analysis procedures.

C. The water treatment company shall maintain local or regional service capability and shall provide on-site technical support for system cleaning, flushing, filling, purging, initial treatment, and follow-up service. The company shall be capable of responding to service requests within 48 hours during the warranty period.

D. All water quality testing and analysis shall be performed by a certified laboratory or by the water treatment company using recognized industry-standard testing procedures and calibrated equipment. Test methods shall be consistent with applicable standards such as ASTM, AWWA, or other recognized industry practices.

E. The water treatment company shall demonstrate specific experience with closed-loop geothermal heat pump systems. Experience limited to open cooling tower or boiler water treatment programs shall not be considered sufficient. Provide documentation of at least three (3) similar projects of comparable size and complexity utilizing closed-loop geothermal or hydronic systems.

F. Provide a water treatment program for the closed loop geothermal piping systems. It is the Contractor's responsibility to contact the Engineer 2 weeks in advance to any treatments performed on the systems. It is the Engineer's discretion whether or not this process should be monitored after notification.

G. A pre-installation meeting shall be held with the Construction Manager, Engineer, Mechanical Contractor, Pipe Fitter Foreman, Geothermal Contractor and Chemical Treatment Contractor to discuss goals and expectations for cleaning, flushing, purging and chemical treatment.

H. Chemicals, equipment, testing services, and chemical application shall be supplied by a single water treatment company for undivided responsibility. The water treatment company shall be a recognized specialist, active in the field of commercial/industrial water treatment for at least 5 years. The water treatment company shall have regional water analysis laboratories, service department, and full-time representatives located within the trading area of the job site or facility.

I. Furnish initial supply of the closed loop chemicals for each system. This contractor shall retest the systems after 3, 6 and 12 months to verify the proper dosage is in each system. Provide all closed loop chemicals and anti-freeze for the first year. Each system's water shall be tested for proper chemical parameters, clarity, and biological activity. If needed, provide chemical addition. Provide any laboratory and technical assistance required to achieve a successful program.

J. As a condition of acceptance and project closeout, a summary of water quality and treatment shall be provided in writing to the Owner and/or Engineer after the water treatment services have been completed. The closeout documentation shall include dates for warranty testing.

K. Water quality for HVAC systems shall minimize corrosion, scale buildup, and biological growth for optimum efficiency of HVAC equipment without creating a hazard to operating personnel or the environment. Base HVAC water treatment on quality of water available at Project site, HVAC system equipment material characteristics and functional performance characteristics, operating personnel capabilities, and requirements and guidelines of authorities having jurisdiction.

L. The water treatment contractor shall include all labor, materials, chemicals, testing, and service required to maintain the specified water quality for a period of one (1) year from date of Substantial Completion. All costs associated with this service shall be included in the base bid.

M. Provide a minimum of three (3) scheduled service visits at approximately 3, 6, and 12 months after system startup. Additional visits shall be provided as required to maintain system water quality within specified limits.

N. At each service visit, perform system inspection, field testing, and adjustment of chemical treatment as required. Provide and install all additional chemicals necessary to maintain specified water quality. No additional compensation shall be provided for corrective chemical additions.

O. Provide a written service report after each visit documenting test results, system condition, chemical levels, and any corrective actions taken. Reports shall be submitted to the Owner and Engineer within five (5) business days of each visit.

P. Provide emergency service response during the warranty period for any system found to be outside specified water quality limits or exhibiting biological growth, corrosion, or fouling. Respond to service calls within 48 hours and take immediate corrective action to restore system to compliance.

Q. Failure to maintain system water quality within specified limits shall require additional service visits, testing, flushing, or chemical treatment as necessary at no additional cost to the Owner.

R. Water Quality Minimum Performance Requirements:
1. Closed Loop Geothermal systems shall maintain a pH value within 8.0 – 10.0.
2. Total Aerobic Plate Count - Maintain a maximum value of 1000 organisms/ml.
3. Total Anaerobic Plate Count - Maintain a maximum value of 100 organisms/ml.
4. Nitrate Reducers - Maintain a maximum value of 100 organisms/ml.
5. Sulfate reducers - Maintain a maximum value of 0 organisms/ml.
6. Iron Bacteria - Maintain a maximum value of 0 organisms/ml.

1.3 SUBMITTALS

A. Provide the following as part of submittal and closeout documentation:
1. Water treatment program submittal
2. Chemical product data and SDS
3. Anti-freeze certification and concentration report
4. Lab test reports
5. Field test reports
6. Start-up / initial treatment report
7. 3, 6, and 12 month service reports
8. Final closeout letter stating system meets spec requirements
9. Fill/purge log with dates, pressures, flow rates, glycol %, and air removal confirmation

PART 2 - CLEANING AND FLUSHING

2.1 HYDRONIC PIPING

A. This project consists of the following Hydronic Piping Loops
1. Closed Loop Geothermal System (Interior)
2. Closed Loop (Earth Coupled) Geothermal System (Exterior)

B. There are several precautions which must be observed during its installation. This contractor is advised to read all of the manufacturer’s instructions prior to commencing the installation. This cleaning and flushing of the systems must be accomplished. Refer to Specification Section HVAC EQUIPMENT for geothermal system requirements.

C. All water circulating systems for the project shall be thoroughly cleaned before placing in operation to rid the system of dirt, piping compound, mill scale, oil and any and all other material foreign to the water. During construction, extreme care shall be exercised to prevent all dirt and other foreign matter from entering the pipe or other parts of the system. Pipe stored on the project shall have the open ends capped and equipment shall have all openings fully

protected. Before erection, each piece of pipe, fitting or valve shall be visually examined and all dirt removed.

D. All piping systems shall be flushed with clean water at high velocity to remove construction debris, including dirt, sand, pipe shavings, and foreign material. Flushing shall be performed with loop filter in operation until system fluid is visibly clean.

E. Interior steel piping systems shall be chemically cleaned to remove oils, mill scale, pipe compounds, and installation-related contaminants.

F. Chemical cleaning shall be performed using an alkaline cleaner compatible with system materials and recommended by the water treatment contractor. Trisodium phosphate or equal may be used where appropriate.

G. Buried HDPE geothermal piping and system components not suitable for chemical cleaning shall be isolated or bypassed during chemical cleaning operations.

H. Following chemical cleaning, the system shall be thoroughly flushed until all cleaning solution, debris, and residue are removed.

I. After flushing is complete, clean all strainers, filters, dirt separators, and pump suction diffusers prior to proceeding with purging and final treatment.

PART 3 - CLOSED LOOP CHEMICAL TREATMENT

3.1 REQUIREMENTS

A. Provide a 3/4" valved and capped port for injection of the closed loop chemicals into the system. Also, provide a bypass chemical pot feeder for each loop.

B. Prior to final treatment, the system shall be flushed and purged until free of debris and air in accordance with Part 4 of this Section. Interior steel piping shall be chemically cleaned as specified. Buried HDPE piping and components not suitable for chemical cleaning shall be isolated or bypassed.

C. After flushing, purging, and chemical cleaning (where applicable), treat the system with biocide as required to control biological activity. Biocide shall be applied at manufacturer-recommended dosage.

D. Following biocide treatment, charge the system with final propylene glycol solution including corrosion inhibitor package suitable for mixed-material closed-loop systems.

E. After final fill, perform microbiological testing. If bacteria counts exceed specified limits, repeat treatment until acceptable levels are achieved.

F. Final treated fluid shall remain in the system for operation and shall not be diluted or replaced without approval of the water treatment contractor.

3.2 LOOP FILTER

A. Provide and utilize system loop filter during all flushing, cleaning, and purging operations. Filter shall be installed at the mechanical room in a location that allows full system flow through the filter.

B. Filter shall be sized for full purge flow and capable of removing fine construction debris, including dirt, sand, pipe scale, and plastic shavings.

C. Operate filter continuously during flushing and purging operations until system fluid is clean and free of visible debris.

D. Clean filter elements as required to maintain flow. Minimum of three (3) full cleanings shall be performed during flushing and purging operations.

E. After completion of flushing and prior to final fill and chemical treatment, filter shall be cleaned and left in place (if permanent) or removed (if temporary), as indicated on the Drawings.

F. Failure to utilize loop filtration or failure to achieve clean system fluid shall require re-flushing at no additional cost.

PART 4 - SYSTEM FILLING & PURGING PLAN

4.1 REQUIREMENTS

A. All piping circuits originate from mechanical pump room. System consists of heat pump mains and branch circuits plus 10 wellfield circuits.

B. Temporarily connect the supply and return piping in the mechanical pump room at the purge valve location and close main line valve to isolate the building from the wellfield. Note that central filter pump can be used, after initial purging and for maintenance, as the purge pump (Wellfield in reverse direction). Refer to drawings for additional information.

C. The interior piping and the wellfield shall be purged individually. The building purging pump is capable of purging the interior loop purging after the system has been purged.

D. Test source water before filling. Contractor shall account for hardness, chlorides, iron, manganese, pH, conductivity, etc. Contractor shall submit treatment recommendations based on actual fill water.

E. Purging shall not be considered complete until all of the following conditions are met:
   1. System is free of visible air. No air discharge, surging, or intermittent flow shall be observed at purge connections.
   2. System pressure is stable and does not fluctuate during operation of the purge pump.
   3. Minimum purge velocity has been achieved in each circuit in accordance with specified requirements.
   4. Purging has been maintained for a sufficient duration to ensure complete air removal from all piping, coils, and equipment.

5. All strainers, filters, dirt separators, and pump suction diffusers have been cleaned after flushing and purging operations.
6. No visible debris, sediment, or discoloration is present in system fluid.
7. System fluid is clear and acceptable for final treatment as determined by the Engineer or water treatment provider.
8. System has been filled to final operating pressure, vented, and left in a stable condition. Final system pressure shall be set, recorded, and submitted as part of closeout documentation.
9. Any system not meeting the above criteria shall be re-flushed and re-purged at no additional cost until acceptable conditions are achieved.

F. Provide sample valves / test ports at each main closed loop or at pump room headers. Install in locations accessible for future testing.

G. Piping shall be pressure tested and accepted prior to final cleaning, filling, glycol addition, and treatment.

H. Obtain a minimum flow based on 2 to 3 fps in each circuit as indicated on the plans. Refer to plans for additional information.

I. This procedure shall be carried out a minimum of three times to ensure entrained air is removed.

J. Clean pump suction diffusers, strainers, Y-strainers, dirt separators, and filter baskets after flushing and again at final acceptance.

K. Provide permanent side-stream or full-flow loop filter as indicated in schedules and plans. Coordinate with water treatment and flushing requirements.

L. The water treatment contractor shall perform and document the following:
1. Test source water prior to filling and base treatment program on actual water quality.
2. Provide written post-flush report confirming system is clean and free of debris.
3. Provide final water chemistry report verifying compliance with specified requirements.
4. Verify glycol concentration using calibrated refractometer and document results.
5. Provide bacteria analysis report demonstrating compliance with specified limits.
6. Provide written service reports for all required follow-up visits (3, 6, and 12 months).

M. System shall not be considered complete until a final written certification is submitted stating that the system has been:
1. Cleaned, flushed, and purged in accordance with the Contract Documents.
2. Chemically treated and filled to the specified glycol concentration.
3. Tested and verified to meet all water quality requirements.
4. Left fully operational, stable, and ready for normal service.

N. Final treatment/fill/purge to be complete and acceptance shall occur before equipment startup and TAB/commissioning.

O. Failure to provide required documentation or meet specified conditions shall require corrective action and re-testing at no additional cost.

4.2 FINAL TREATMENT SEQUENCE

A. After flushing, chemical cleaning (where applicable), and purging are complete, and system is free of debris and air, initiate final chemical treatment.

B. Add biocide as required to eliminate biological contamination. Biocide shall be added at manufacturer-recommended dosage and shall remain in the system unless otherwise directed by the water treatment contractor.

C. Following biocide treatment, charge system with final propylene glycol solution including corrosion inhibitor package.

D. After final fill, test system water to confirm compliance with specified chemical and microbiological limits. Adjust treatment as required.

E. System shall not be placed into permanent operation until final water chemistry has been verified and accepted.

END OF SECTION

SECTION 232923 – VARIABLE FREQUENCY DRIVES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

B. Refer Specification Section 019113 General Commissioning Requirements.

1.2 GENERAL INFORMATION

A. The Contractor's attention is directed to the General and Special Conditions, General Conditions-Mechanical, and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified herein.

1.3 WARRANTY

A. Provide manufacturer’s standard warranty for Variable Frequency Drives; however, warranty period shall be not less than two (2) years from the date of VFD start-up. Warranty shall include parts and labor. Warranty labor shall be provided by the Manufacturer or authorized local service representative.

1.4 SUBMITTALS

A. Submit product data for each VFD including:
   1. Manufacturer’s catalog data and technical specifications.
   2. Dimensional drawings and enclosure details.
   3. Wiring diagrams, including power and control connections.
   4. Point-to-point terminal diagrams.
   5. BACnet integration details and point list.
   6. Short circuit current rating (SCCR) documentation.
   7. Harmonic mitigation data demonstrating compliance with project requirements.

B. Submit operation and maintenance manuals including:
   1. Installation instructions.
   2. Startup procedures.
   3. Maintenance requirements.
   4. Replacement parts list.
   5. Warranty Information

C. Submit factory startup report and commissioning documentation.

PART 2 - PRODUCTS

2.1 VARIABLE FREQUENCY DRIVES

A. General

1. Furnish Variable Frequency Drives for control of variable torque loads having the capacity indicated on the mechanical plan equipment schedules and features detailed below. All VFD units furnished shall be the product of a single manufacturer. Mechanical Contractor shall carefully review field constraints for mounting of new drives and shall coordinate requirements with Electrical Contractor before submitting VFD for Engineer approval.
2. VFDs shall be furnished by the Mechanical Contractor for wiring by the Electrical Contractor.
3. Note on equipment schedule which units shall have a NEMA 1 enclosure. All VFDs that are installed outside shall have a NEMA 3R enclosure. Provide output filters is required due to the distance that VFD is installed from the equipment served.
4. Provide all VFDs with BACNET MSTP or IP interface with type of protocol finalized during submittal phase.
5. If required due to distance of VFD from fan/pump being served, provide input/output filters as required by VFD Manufacturer for full operation of VFD. The Mechanical Contractor shall determine if the furnished VFDs require this protection.
6. The Mechanical Contractor shall carefully review any physical constraints for mounting of VFDs and access/service clearance in the MERs.
7. All VFDS shall be rated for 65 kAIC at a minimum.
8. The variable frequency AC drive shall convert 3 phase, 60 Hz input power to an adjustable AC frequency and voltage for controlling the speed of AC induction motors. The control scheme shall closely approximate actual sine wave current utilizing 6-pulse technology. The output voltage is to vary proportionally with the output frequency to maintain a constant Volts/Hertz value up to 66 Hz.
9. The VFD units shall be designed to control variable torque motors using a transistorized PWM inverter section. The inverter shall use Insulated Gate Bipolar Transistors (IGBT); standard bipolar transistors will not be accepted. Carrier frequency (switching rate) of the IGBT shall be adjustable between 3-12 kHz.
10. The submittal package for VFDs shall include detailed dimensional drawings, technical data sheets, and compliance to IEEE 519.
11. Furnish with O&M Manuals the address of the manufacturer's closest parts stocking location is to be provided with the VFD shipment.
12. VFD drive units shall be powered from scheduled 3 phase sources, with a voltage tolerance of -/+10%, 60 Hertz (+/- 2 Hz). VFD drive units shall be capable of operating in an ambient condition with a temperature range of 0 - 40oC with a relative humidity of 5 to 90% (noncondensing).
13. VFDs shall be provided as factory-assembled, factory-wired, and factory-tested units including enclosure, disconnect, bypass (where specified), reactors, control devices, and accessories. Field-assembled components will not be accepted unless specifically approved by the Engineer.
14. Motors controlled by VFDs shall be suitable for inverter-duty operation. Coordinate motor insulation system and construction with VFD output characteristics. Where motor lead lengths, motor construction, or application require protection from reflected wave voltage, provide dv/dt filters, load reactors, or sine wave filters as recommended by the VFD manufacturer. All required protection devices shall be included as part of the VFD package.

15. Provide VFDs with integral DC bus choke or minimum 5 percent AC line reactor. Where required to meet project electrical system power quality requirements, provide additional harmonic mitigation equipment including passive filters, active filters, or low harmonic drives as recommended by the manufacturer. Harmonic mitigation required for a complete and compliant installation shall be included in the base bid.
16. VFD assemblies shall have a minimum SCCR as indicated, but not less than 65 kA, and shall be fully UL listed and labeled as a complete assembly. SCCR shall be based on the combination of all internal components and the overcurrent protective device provided.
17. Coordinate all control interfaces with the Temperature Controls Contractor. Provide all required communication modules, licenses, and programming necessary for full integration with the Building Automation System. Where BACnet communication is provided, include all points required for monitoring and control as indicated on the drawings and sequences. Hardwired control points shall be provided where required for safe and reliable operation.

B. Manufacturers: Subject to compliance with requirements, provide Variable Frequency Drives manufactured by one of the following: ABB; Danfoss; Yaskawa; Eaton; Schneider Electric; Toshiba; or approved equal. All VFDs provided under this Section shall be of a single manufacturer unless otherwise approved by the Engineer.

C. VFD Operating Characteristics
1. The VFD units shall have a minimum full-load rating correlating with the full-load amp motor ratings of the associated motor(s) being controlled. It is the responsibility of the Mechanical Contractor to coordinate verify motor full load motor amperage.
2. The VFD units shall be capable of operation at 110% load for one minute.
3. The VFD units shall operate at a minimum full-load efficiency of 97% at rated load and speed.
4. The VFD units shall have a minimum kW/kVa power factor of 95% at rated load and frequency and throughout the speed range of operation.
5. The variable frequency drive shall have the operating characteristics below:
    a. +/- 0.6 Hz frequency regulation with analog speed command, 0oC to 40oC ambient.
    b. 0 to 66 Hz operating frequency range.
    c. Active current limit function to provide nominal 110% torque for one minute.
    d. Bus discharge to 50V maximum within 60 seconds or less per NEMA and NFPA standards.

D. VFD Features
1. VFD shall include the following features:
    a. DC bus choke or input line filters.
    b. DC bus capacitor.
    c. Full-wave diode bridge rectifier to supply fixed DC bus voltage.
    d. Auto restart after power loss or fault (minimum 3 times).
    e. Loss-of-power ride through for at least 15 milliseconds.
    f. Lockable door-mounted power disconnect switch with fast acting input fusing. Switch shall function in both the drive mode and bypass mode. A door-mounted, locking circuit breaker may be substituted for the disconnect switch and input fusing.
    g. Ground fault protection.
    h. Solid State motor thermal overloads.
    i. Output short protection.
    j. Over-current protection.
    k. Over-temperature protection.

l. Over-voltage and under-voltage protection.
m. Phase loss protection.
n. Transient surge protection.
o. Critical frequency rejection.
p. Short circuit protection.
q. Power semiconductor protection.
r. Output Contactors.
s. 120 Volt Control Transformer.
t. Minimum 5% AC Input Line Reactor
u. Manual bypass section and (3) isolation contactors
v. Common run stop feature
w. Run permissive circuit
x. VFDs shall be UL listed and labeled
y. Assembly shall comply with NEC requirements
z. Enclosure rating per installation location
aa. Components factory assembled and tested

2. Provide the following VFD Remote Control/Monitoring Options:
   a. Drive "stop/start" from remote EMS contact closure.
   b. VFD "Run" status output contact.
   c. "Fault" dry contact for remote annunciation at EMS of drive fault status.
   d. Isolated signal conditioner card to receive floating 4-20 ma speed control signal from EMS.
   e. Percent motor speed shall be provided to EMS by a proportional 4-20 ma signal generated by the VFD.
   f. Power input rate (kW) to VFD shall be provided to EMS by a proportional 4-20 ma signal generated by the VFD. Amperage will not be accepted. True power reading is required.

E. Drive Diagnostics
   1. The following faults are to be displayed on the drive front panel:
      a. Overcurrent.
      b. Ground fault.
      c. Undervoltage.
      d. Overvoltage.
      e. Overtemperature.
      f. Semiconductor fault (each leg).

F. Local Drive Operator Control
   1. A drive operator control panel shall be mounted on the front of the enclosure and shall include the following functions:
      a. Hand/Off/Auto selector switch.
      b. Manual bypass including Drive/Off/Bypass manual selector switch and contactors as required to permit operation of the motor while the VFD is taken offline for service.
      c. Auto/Manual speed switch and potentiometer.

G. Local Drive Parameter Monitoring
   1. The following drive-mounted displays are to be provided on the enclosure:
      a. Digital display of drive output frequency and power.
      b. Drive run pilot light.
      c. Drive output current or % load.

H. Drive Parameter Adjustment
   1. The following set-up adjustments are to be provided as a minimum:
      a. Minimum speed (frequency 0-60 Hz).
      b. Maximum speed (frequency 40-66 Hz).
      c. Acceleration rate (0.4-50 seconds for 0-60 Hz).
      d. Deceleration rate (0.4-50 seconds for 0-60 Hz).
      e. Adjustable Volts/Hertz.

PART 3 - EXECUTION

3.1 VFD FIELD SERVICES

A. VFD Manufacturer or (authorized local service representative) of the VFD unit shall provide a factory-trained service representative for start-up service. The factory-trained representative shall perform the procedures in the Start-up, Operation and Maintenance manual provided by the VFD manufacturer.

B. Start-up services shall be provided at the request and convenience of the Owner. The start-up services shall be performed when the ATC/EMS Subcontractor is present at the site. This will enable complete check-out of all EMS/VFD interfaces. The VFD start-up technician may, at his discretion, do the VFD start-up adjustments on a separate occasion when the ATC/EMS Subcontractor is not present. But he must then return for final check-out when the ATC/EMS Subcontractor is prepared for the interface checkout. As part of the Start-up services, the VFD Technician shall identify any 'nuisance' frequencies and shall lock these out.

C. After the above services have been performed, the same factory-trained will provide up to four hours of on-site training for Owner personnel. Provide operating or instruction manuals, training in equipment operation, and troubleshooting of the VFD drive unit.

D. The Contractor shall submit a VFD start-up report to the Engineer at the conclusion of his work. The standardized report shall note the status of all adjustable parameters. The report shall also note if there are any deficiencies in the installation of associated materials and equipment by the Electrical Subcontractor or ATC/EMS Subcontractor.

3.2 CONTRACTOR RESPONSIBILITIES

A. Contractor shall coordinate with electrical characteristics of the project.

B. Where required to meet project power quality requirements, provide harmonic mitigation components as recommended by manufacturer.

C. Harmonic mitigation shall be included in base bid where required for compliant operation.

3.3 INSTALLATION

A. Install VFDs in accordance with manufacturer's written instructions and applicable codes.

B. Coordinate mounting location to provide required working clearances, ventilation, and access for service.

C. Verify environmental conditions are within manufacturer's allowable limits prior to installation.

D. Coordinate conduit entry locations and power/control wiring with Electrical Contractor.

E. Verify motor nameplate data and cable lengths prior to startup and provide required filters where applicable.

3.4 FIELD QUALITY CONTROL

A. Verify proper installation, wiring, and grounding prior to energization.

B. Verify correct motor rotation and proper operation in both drive and bypass modes.

C. Verify all protective functions including overload, phase loss, over/under voltage, and fault reporting.

D. Verify proper response to BAS commands and feedback signals.

E. Confirm all adjustable parameters are set in accordance with manufacturer recommendations and project requirements.

END OF SECTION

SECTION 233200 - SHEET METAL

PART 1 - GENERAL

1.1 RELATED SECTIONS

A. The Contractor's attention is directed to the General and Special Conditions, COMMON WORK RESULTS FOR HVAC, HVAC INSULATION FOR EQUIPMENT, DUCTWORK, AND PIPING and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

1.2 GENERAL REQUIREMENTS

B. This branch of the work includes all materials, labor and accessories for the fabrication and installation of all sheet metal work as shown on the drawings and/or as specified herein. Where construction methods for various items are not indicated on the drawings or specified herein, all such work shall be fabricated and installed in accordance with the recommended methods outlined in the latest edition of SMACNA's Duct Manual and Sheet Metal Construction for Low Velocity Ventilating and Air Conditioning Systems. All equipment furnished by manufacturers shall be installed in strict accord with their recommended methods.

C. Ductwork shall be kept clean at all times. Ductwork stored on the job site shall be placed a minimum of 4” above the floor and shall be completely covered in plastic. Installed ductwork shall be protected with plastic. Do not install the ductwork if the building is not “dried-in”. If this is required, the entire lengths of duct shall be covered in plastic to protect. The Owner/Engineer shall periodically inspect that these procedures are followed. If deemed unacceptable, the Contractor shall be required to clean the duct system utilizing a NADCA certified Contractor.

D. Provide coordinated shop drawings indicating duct routing, elevations, sizes, fittings, access door locations, dampers, and coordination with structure and other trades prior to fabrication.

E. Prior to purchase and fabrication of ductwork (shop fabricated or manufactured), the Contractor shall coordinate installations with new conditions. Notify the Engineer if there are any discrepancies for resolution.

F. Provide a SMACNA duct cleanliness level “C” per the latest SMACNA standards.

G. Ductwork shall be constructed to meet SMACNA Leakage Class 6 for low pressure systems and Leakage Class 3 for medium and high pressure systems unless otherwise indicated.

H. Provide seismic bracing for ductwork in accordance with IBC, ASCE 7, and SMACNA Seismic Restraint Manual. Coordinate with Section 230548.

I. Flexible duct shall be fully extended, supported at maximum 3'-0" intervals, with maximum sag of 1/2" per foot. Compression of duct is not permitted. Flexible duct shall only be installed in one

change of direction. Flexible duct shall not be installed above hard ceilings except for final connections to diffusers, registers, and grilles.

PART 2 - LOW VELOCITY DUCTWORK

2.1 CONCEALED DUCTWORK HEAT PUMP UNITS

A. Ductwork, plenums and other appurtenances shall be constructed of one of the following: Steel sheets, zinc coated, Federal Specification 00-S-775, Type I, Class E & ASTM A93-59T with G-90 zinc coating. Aluminum alloy sheets 3003, Federal Specification AA-A-359, Temper H-14.

B. Ductwork, plenums and other appurtenances shall be constructed of the materials of the minimum weights or gauges as required by the latest SMACNA 2" W.G. Standard and per the following table. When gauge thickness differs, the heavier gauge shall be selected. The below table shall serve as a minimum. Penetrations through fire rated walls/floors require heavier gauges to meet UL listed penetrations.

Rectangular Width	Duct Gauge
3-12 inches	26 Ga.
13-30 inches	24 Ga.
31-54 inches	22 Ga.
55-84 inches	20 Ga.

C. All ductwork connections, fittings, joints, etc., shall be sealed. Seal with high velocity, smooth-textured, water-based duct sealant. Sealant shall be UL 181B-M listed, UL 723 classified, NFPA 90A & 90B compliant, permanently flexible, non-flammable, and rated to 15" wg. Apply per manufacturer's recommendations. Contractors shall insure no exposed sharp edges or burrs on ductwork.

D. Duct dimensions indicated are required inside clear dimensions. Plan duct layouts for adequate insulation and fitting clearance.

E. All angular turns shall be made with the radius of the center line of the duct equivalent to 1.5 times the width of the duct.

F. Cross-break all ducts where either cross-sectional dimension is 18" or larger.

G. Ducts shall be hung by angles, rods, 18 ga. minimum straps, trapezes, etc., in accordance with SMACNA's recommended practices. There shall be no less than one set of hangers for each section of ductwork. Where ductwork contains filter sections, coils, fans or other equipment or items, such equipment or items shall be hung independently of ductwork with rods or angles. Do not suspend ducts from purlins or other weak structural members where no additional weight may be applied. If in doubt, consult the Structural Engineer.

H. Double turning vanes shall be installed in square turns and/or where indicated.

I. Provide a “high efficiency” type take-off with round damper (Flexmaster STOD-B03 or approved equal) for all round duct branches from a rectangular main to a GRD. Refer to the detail on the drawings for all installation requirements.

J. Air volume dampers shall be installed in each duct branch takeoffs and/or where indicated, whichever is more stringent. All such dampers shall be accessible without damage to finishes or insulation and shall be provided where required for proper system balance.

K. Unless otherwise dimensioned on the drawings, all diffusers, registers and grilles shall be located aesthetically and symmetrically with respect to lighting, ceiling patterns, doors, masonry bond, etc. Locate all supply, return and exhaust diffusers and grilles in the locations shown on the architectural reflected ceiling plan.

L. The interior surface of the ductwork connecting to return/exhaust air grilles shall be painted flat black. The ductwork shall be painted a minimum of 24" starting from the grille.

M. Provide approved flexible connectors at inlet and outlet of each item of heating and cooling equipment whether indicated or not. Install so as to facilitate removal of equipment as well as for vibration and noise control.

N. All fans and other vibrating equipment shall be suspended by independent vibration isolators.

O. Miscellaneous accessories such as test openings with covers, latches, hardware, locking devices, etc., shall be installed as recommended by SMACNA and/or as indicated. Test openings shall be placed at the inlet and discharge of all centrifugal fans, VAV boxes, fan sections of air handling units, at the end and middle of all main trunk ducts and where indicated. All such openings shall be readily accessible without damage to finishes.

P. The Sheet Metal Contractor shall furnish qualified labor to assist the Air Balancing Contractor during testing and balancing of the system.

Q. Insulated Flexible Air Duct: Thermaflex G-KM or equal. Flexible air duct shall be one (1) inch thick fiberglass insulation with CPE liner permanently bonded to a coated spring steel wire helix supporting a fiberglass scrim and fiberglass insulating blanket. Flexible air duct shall be listed under UL Standard 181 as a Class I flexible air duct complying with NFPA 90A and 90B. Maximum flame spread = 25 and maximum smoke developed = 50. Minimum insulating value is R-6.0. Flexible duct shall be used only for GRD runouts and no section shall be more than five feet in length.

R. Flexible Connectors: Duro-Dyne, Ventfabrics, Inc., U.S. Rubber or equivalent; conforming to NFPA No. 90A; neoprene coated glass fabric; 20 oz. for low velocity ducts secured with snap lock.

S. Turning Vanes: Fabricated as recommended by SMACNA: noiseless when in place without mounting projections in ducts. All turning vanes shall be double blade type.

T. Access Doors in Ductwork: Flexmaster TBSM, Air Balance, Vent Products or equal. Access doors for rectangular ducts shall be 16"x16" where possible. Otherwise install as large an access door as height permits by 16" in length. Door shall be 2” thick double-wall insulated with continuous hinge and cam lock.

Provide in ducts where indicated or where required for servicing equipment whether indicated or not. Provide a hinged access door in duct adjacent to all fire, smoke and control dampers for the purpose of determining position. Access doors shall also be provided on each side of duct coils and downstream side of VAV boxes and CAV boxes. Provide access doors at all duct-mounted sensors, airflow measuring stations, and control devices.

U. Architectural Access Doors in Ceilings or Walls: Refer to General Trades Package and Specification Section 083113.

V. Provide fire dampers, smoke dampers, and combination fire/smoke dampers as required by code and as indicated on drawings. Dampers shall comply with UL 555 and UL 555S. Dampers located in systems with fans operating during fire conditions shall be dynamic rated for the system operating pressure and velocity. Provide factory sleeves, breakaway connections, and installation in accordance with UL listings and SMACNA requirements.

W. Volume Dampers (Rectangular): Ruskin MD35 or Air Balance, Pottorff, rectangular volume dampers. Frames shall be 18-gauge galvanized steel. Blades shall be opposed blade 18-gauge galvanized steel with triple crimped blades on 6” centers. Linkage shall be concealed in jamb. Bearings shall be ½” nylon. Maximum single section size shall be 48" wide and 72" high. Provide with Ventfabrics 1" high elevated dial regulator to avoid damper handle from conflicting with duct insulation. Provide permanent mark on dial regulator to mark air balance point. Security Architectural Access Doors in Ceilings or Walls: Provide Kees SSAP Panel, Cesco, Milcor or equal. Panels shall be 24”x24” in size and constructed with 12-gauge steel for door and frame. Provide with primer finish to accept specified finish. Door shall include key-operated cylinder dead bolt lock (coordinate cylinders and keys with Owner to match facility standards) and concealed continuous pivoting rod hinge. Door shall open 175 degrees. For masonry construction, furnish frames with adjustable metal masonry anchors and straps. For fire rated units, provide manufacturer’s standard insulated flush panel/doors with continuous piano hinge and self-closing mechanism. The Contractor shall include all required access doors in the bid and shall coordinate with the General Contractor prior to the bid to insure a complete project.

X. Volume Dampers (Round): Ruskin MDR525 or Air Balance, Pottorff round volume dampers. Dampers shall be butterfly type consisting of circular blade mounted to axle. Frames shall be 22-gauge steel and 5" long. Damper blades shall be 20 gauge crimped galvanized steel. Axle shall be 3/8"x5” square plated steel. Bearing shall be 3/8” nylon. Provide with Ventfabrics 1" high elevated dial regulator to avoid damper handle from conflicting with duct insulation. Provide permanent mark on dial regulator to mark air balance point.

Y. Pressure-Independent Constant Airflow Regulator / Automatic Balancing Damper: Provide factory-calibrated, pressure-independent constant airflow regulators for air quantities indicated on the drawings. Dampers shall automatically maintain preset airflow within plus or minus 10 percent over the manufacturer’s rated operating pressure range, minimum 0.2 to 1.0 inches w.g., unless otherwise scheduled. Units shall be self-contained mechanical type requiring no electric or pneumatic power and shall be suitable for supply, return, or exhaust air service as applicable. Casing shall be galvanized steel sized for round duct installation and shall include integral airflow adjustment scale, locking device, and permanent label indicating setpoint. Units shall be field adjustable within the manufacturer’s published airflow range and shall maintain the adjusted setpoint after locking. Provide access to all constant airflow regulators for inspection, adjustment, and replacement. Coordinate straight duct requirements, access, and installation limitations with manufacturer’s

recommendations. Where pressure-independent constant airflow regulators are indicated, separate manual balancing dampers at the same location are not required unless noted otherwise. Provide TROX, Nailor, Ruskin, Greenheck, ALDES, or approved equal.

Z. Motor Driven Smoke Dampers – Air Foil Blade: Provide Ruskin SD60 smoke damper where required by the locations of smoke partitions or as shown on the plans, whichever is more stringent. Other acceptable manufacturers are Air Balance or Pottorff. All smoke dampers shall be three inches larger than HVAC duct in each direction. Frame shall be a minimum of 18-gauge galvanized steel formed into a structural hat channel shaper with tabbed corners for reinforcement. The blade shall be airfoil shaped, constructed of a dual skinned galvanized steel, 14-gauge equivalent thickness, on 6" maximum centers. Bearings shall be stainless steel sleeve turning in an extruded hole in the frame. Jamb seal shall be stainless steel flexible metal compression type. Each smoke damper shall be classified by Underwriters Laboratories as a Leakage Rated Damper for use in smoke control systems under the latest version of UL555S, and bear a UL label attesting to same. As part of the UL qualification, dampers shall have demonstrated a capacity to operate (to open and close under HVAC system operating conditions) with pressures of at least the maximum possible of the HVAC system in the closed position, and the system maximum duct air velocity in the open position. In addition to the leakage ratings already specified herein, the dampers and their actuators shall be qualified under UL555S to an elevated temperature of 350 degrees F. Appropriate electric actuators shall be installed by the damper manufacturer. Refer to building fire alarm and controls for exact type. Actuator to be mounted outside of air stream. The pressure drop shall not be greater than .16" wg @ 2500 FPM when tested by an independent laboratory. Provide factory supplied caulked sleeve, gauge as required to meet manufacturer UL installation requirements.

AA. Motor Driven Control Dampers – Outdoor Rated Air Foil Blade: Provide outdoor-rated control dampers with airfoil blades for outside air and exhaust ductwork exposed to weather, basis of design Ruskin CD60, or approved equal by Air Balance or Pottorff. Damper frame shall be minimum 16-gauge galvanized steel. Blades shall be one-piece airfoil type, minimum 16-gauge equivalent galvanized steel, with blade and jamb seals suitable for low-leakage outdoor service. Bearings, jamb seals, linkage, and hardware shall be stainless steel or other corrosion-resistant materials suitable for exposed outdoor installation. Dampers shall be suitable for operation at a minimum duct velocity of 2000 FPM and at the maximum scheduled system pressure.

PART 3 - HIGH VELOCITY DUCTWORK

4.1 CONCEALED OUTSIDE AIR AND EXHAUST DUCTWORK

A. High pressure/velocity ductwork shall be utilized for all supply ductwork between air handling units and VAV/CAV boxes. Provide Eastern Sheet Metal Model “CB” or equal takeoff fitting for each VAV/CAV branch. Straight tees are not allowed.

B. All round ductwork for systems above 2” W.G. shall be Eastern Sheet Metal, United McGill or Semco or equal as required by the latest SMACNA.

C. Ductwork shall be spiral, lock-seam construction fabricated from galvanized steel meeting ASTM-527 standard. Coordinate with General Contractor. Ductwork shall be constructed of the following minimum gauges:

Rectangular Width	Duct Gauge
3-12 inches	24 Ga,
13-30 inches	22 Ga.
31-54 inches	20 Ga.
55-84 inches	18 Ga.

D. Duct dimensions indicated are required inside clear dimensions.

E. All ductwork connections, fittings, joints, etc., shall be sealed. Seal with high velocity, smooth-textured, water-based duct sealant. Sealant shall be UL 181B-M listed, UL 723 classified, NFPA 90A & 90B compliant, permanently flexible, non-flammable, and rated to 15”wg. Apply per manufacturer's recommendations.

F. Ductwork shall be installed per the latest SMACNA Manuals, whichever is applicable. Note duct penetrations through UL listed assemblies may require heavier gauges.

G. All hanger straps shall be 18 ga. minimum with reinforcement angles. Maximum hanger spacing shall not exceed SMACNA requirements and shall be reduced where required to prevent sagging or deflection.

H. Miscellaneous accessories such as test openings with covers, latches, hardware, locking devices, etc., shall be installed as recommended by SMACNA or the duct manufacturer, and/or as indicated. Test openings shall be placed at the discharge of all air handling units and at the end and middle of all main trunk ducts and where indicated. All such openings shall be readily accessible without damage to finishes.

I. Whether indicated or not, provide code approved, full sized fire dampers at all locations where ductwork penetrates fire rated floors and walls. Fire stop rating shall meet or exceed the rating of the wall. Provide an approved access panels at each fire damper located and sized so as to allow hand reset of each fire damper. All such fire dampers and access panels shall be readily accessible without damage to finishes. Refer to Architectural Plans for locations of fire rated walls. Where access doors are installed in insulated ductwork, the access door shall be the insulated type. Install dampers with sleeves, breakaway connections, and clearances in accordance with UL listing and SMACNA requirements.

J. Flexible Connectors: Duro-Dyne, Ventfabrics, Inc., U.S. Rubber or equivalent; conforming to NFPA No. 90A; neoprene coated glass fabric. Provide flexible connectors at inlet and outlet of air handling equipment to accommodate a minimum of three times the operating pressure of the system.

K. Pressure Relief Doors: Provide a pressure relief door in the supply air ductwork at each air handling unit. It shall be sized to relieve the duct air pressure below the rated pressure construction of the ductwork and above the working pressure of the fan. The supply air relief door shall be Ruskin PRD18 or equal. Provide a vacuum relief door in the return air ductwork at each return air fan. It shall be located where shown on the drawings. It shall be sized to relieve the duct vacuum below the rated construction of the ductwork and above the working negative pressure of the fan. The return air relief door shall be Ruskin NRD18 or equal. Automatic fan shutdown upon damper

closure shall not be an acceptable protection for either overpressure or vacuum conditions. All duct relief dampers shall be of the automatic resetting type.

L. Architectural Access Doors in Ceilings or Walls: Refer to General Trades Package and Specification Section 083113. Provide access doors at all fire dampers, smoke dampers, combination dampers, duct detectors, airflow stations, and control devices.

M. Access Doors; In Ductwork: All access doors in round or oval high velocity ductwork shall be screw and gasketed type. Screws shall be maximum 4 inches on centers. Security Architectural Access Doors in Ceilings or Walls:

Provide Kees SSAP Panel, Cesco, Milcor or equal. Panels shall be 24”x24” in size and constructed with 12-gauge steel for door and frame. Provide with primer finish to accept specified finish. Door shall include key-operated cylinder dead bolt lock (coordinate cylinders and keys with Owner to match facility standards) and concealed continuous pivoting rod hinge. Door shall open 175 degrees. For masonry construction, furnish frames with adjustable metal masonry anchors and straps. For fire rated units, provide manufacturer’s standard insulated flush panel/doors with continuous piano hinge and self-closing mechanism. The Contractor shall include all required access doors in the bid and shall coordinate with the General Contractor prior to the bid to insure a complete project. Access door sizes shall be as follows:

DUCT DIAMETER	OPENING SIZE
3-4 inches	4"x10"
5-6 inches	6"x10"
7-24 inches	10"x16"
26-36 inches	16"x16"
Over 36 inches	16"x22"

N. Motor Driven Smoke Dampers – Air Foil Blade: Provide Ruskin SD60 smoke damper where required by the locations of smoke partitions or as shown on the plans, whichever is more stringent. Other acceptable manufacturers are Air Balance or Pottorff. All smoke dampers shall be three inches larger than HVAC duct in each direction. Frame shall be a minimum of 18-gauge galvanized steel formed into a structural hat channel shaper with tabbed corners for reinforcement. The blade shall be airfoil shaped, constructed of a dual skinned galvanized steel, 14-gauge equivalent thickness, on 6" maximum centers. Bearings shall be stainless steel sleeve turning in an extruded hole in the frame. Jamb seal shall be stainless steel flexible metal compression type. Each smoke damper shall be classified by Underwriters Laboratories as a Leakage Rated Damper for use in smoke control systems under the latest version of UL555S, and bear a UL label attesting to same. As part of the UL qualification, dampers shall have demonstrated a capacity to operate (to open and close under HVAC system operating conditions) with pressures of at least the maximum possible of the HVAC system in the closed position, and the system maximum duct air velocity in the open position. In addition to the leakage ratings already specified herein, the dampers and their actuators shall be qualified under UL555S to an elevated temperature of 350 degrees F. Appropriate electric actuators shall be installed by the damper manufacturer. Refer to building fire alarm and controls for exact type. Actuator to be mounted outside of air stream. The pressure drop shall not be greater than .16" wg @ 2500 FPM when tested by an independent laboratory.

O. Provide factory supplied caulked sleeve, gauge as required to meet manufacturer UL installation requirements.

PART 4 – EXPOSED DUCTWORK

4.1 EXPOSED DOUBLE WALL SPIRAL INSULATED DUCTWORK

A. Provide factory-fabricated, round, double-wall insulated spiral ductwork for exposed locations indicated to receive field-applied paint finish.

B. Inner and outer duct walls shall be constructed of galvanized steel sheets conforming to ASTM A653, lock-forming quality, with minimum G90 zinc coating. Inner duct wall shall be solid galvanized steel. Outer duct wall shall be smooth galvanized steel suitable for field preparation and painting by Division 09. Where required for compatibility with specified paint systems, provide paint-grip outer shell.

C. Double-wall round spiral ductwork and fittings shall be constructed to SMACNA standards for medium-pressure service and shall be rated for a minimum positive pressure class of 6 inches w.g. Inner liner, outer shell, joints, reinforcements, and fittings shall be of thickness required by SMACNA for the size, pressure class, and installation conditions indicated. Where construction options differ, provide heavier construction.

D. Provide 1-inch thick fiberglass insulation between duct walls unless otherwise indicated. Insulation shall comply with ASTM C1071 and NAIMA AH124 and shall have maximum flame spread and smoke developed ratings of 25 and 50, respectively. Insulation shall be securely retained and protected against erosion, settling, delamination, and displacement.

E. Inner liner shall be continuous solid metal construction. Outer shell shall be continuous metal construction. Fittings, taps, elbows, reducers, tees, branches, and accessories shall be double-wall construction matching straight ductwork in material, insulation thickness, pressure class, and appearance.

F. All ductwork connections, fittings, joints, seams, and appurtenances shall be sealed in accordance with SMACNA Seal Class A. Sealant shall be UL 181 listed, UL 723 classified, NFPA 90A and 90B compliant, permanently flexible, nonflammable, and suitable for the pressure class specified. Contractor shall ensure there are no exposed sharp edges or burrs on ductwork.

G. Duct dimensions indicated are required clear inside dimensions of the inner liner. Plan duct layouts for adequate insulation thickness, fitting allowance, support spacing, and coordination with adjacent construction.

H. Elbows and fittings shall be constructed in accordance with SMACNA. Elbows shall be long-radius type where practical unless indicated otherwise or limited by available space. Segmented fittings shall be reinforced as required to prevent breathing, vibration, and visible deformation.

I. Ducts shall be supported by rods, trapezes, bands, or other approved means in accordance with SMACNA recommended practices. There shall be no fewer than one set of supports for each section of ductwork. Supports shall be installed to prevent sagging, vibration, and visible misalignment. Do not suspend ducts from structural members not intended to support imposed loads.

J. Exposed ductwork shall be installed true to line and level with consistent joint spacing and uniform alignment. Exterior surfaces shall be smooth and suitable for field-applied paint finish and shall be

free of dents, scratches, ripples, oil residue, labels, sealant smears, and other imperfections visible through paint.

K. Provide access doors, test openings, balancing dampers, and miscellaneous duct accessories where indicated, where required by SMACNA, and where required for operation, balancing, and service. Accessories in exposed ductwork shall match adjacent duct construction and appearance.

L. Coordinate final surface preparation, primer compatibility, and finish requirements with Division 09. Remove temporary labels and markings from exposed surfaces prior to painting.

M. Subject to compliance with requirements, provide products by Spiral Manufacturing, Sheet Metal Connectors, Inc. (SMC), Semco, Lindab, or approved equal.

PART 5 – OUTDOOR EXPOSED DUCTWORK

5.1 DUCTWORK SYSTEMS

A. Provide outdoor ductwork systems that are fully weatherproof, UV-resistant, and suitable for continuous exterior exposure.

B. Outdoor ductwork shall be designed to prevent air leakage, water infiltration, condensation, and degradation due to environmental exposure.

C. Coordinate all outdoor duct routing, supports, and penetrations with architectural, structural, and roofing systems.

5.2 MATERIALS AND CONSTRUCTION

A. Ductwork shall be constructed of the following materials:
   1. Galvanized steel, minimum G90 coating, with protective exterior coating system.
   2. Aluminum duct (3003 alloy) may be used where indicated or for corrosion-prone environments.
   3. Where exposed to coastal or corrosive environments, provide aluminum or stainless steel ductwork.

B. Duct construction shall comply with SMACNA HVAC Duct Construction Standards for the applicable pressure class, with a minimum construction of:
   1. High pressure: 6” WG minimum

C. Reinforcement, seams, and joints shall be suitable for exterior exposure and shall prevent oil-canning, vibration, and deformation.

5.3 SEALING AND WATERPROOFING

A. All duct joints, seams, and penetrations shall be sealed watertight

B. Sealant shall be:
   1. UL 181 listed
   2. UV-resistant and weatherproof
   3. Suitable for exterior applications and temperature extremes

C. Apply sealant continuously at all longitudinal seams, transverse joints, and duct penetrations.

D. Provide additional external waterproofing (mastic or approved coating) at all joints exposed to weather.

5.4 DRAINAGE AND SLOPE

A. Outdoor ductwork shall be installed to prevent water accumulation. Horizontal ductwork shall be sloped a minimum of 1/8 inch per foot toward designated drain locations where condensation or water intrusion may occur. Provide drain connections at low points where required to ensure proper removal of accumulated moisture.

5.5 SUPPORTS AND ROOF CURBS

A. Support ductwork on roof curbs, sleepers, or structural steel supports. All supports shall be hot-dip galvanized or otherwise corrosion resistant, provide a minimum of 6 inches clearance above the roof surface, and be coordinated with the roofing system to maintain the roof warranty. Wood blocking in contact with roofing shall be pressure-treated. Do not support ductwork directly on the roofing membrane.

5.6 PENETRATIONS AND FLASHING

A. All roof and wall penetrations shall be fully flashed and sealed watertight. Coordinate all flashing systems with the roofing contractor to ensure compatibility with the roofing assembly. Provide counterflashing and pitch pockets where required to maintain a continuous weatherproof installation.

5.7 ACCESS DOORS

A. Access doors shall be double-wall insulated, gasketed, weatherproof, and constructed of materials matching the duct construction. Provide hinged access doors with corrosion-resistant hardware. Install access doors in a manner that prevents water intrusion and maintains the integrity of the duct system and insulation.

5.8 FINISHES

A. Exterior ductwork and jacketing shall be suitable for continuous exposure without additional protection unless otherwise indicated. Where ductwork is exposed to view, coordinate finish and color with the Architect. Provide factory-applied or field-applied coating systems where required for corrosion protection or aesthetic purposes. All outdoor ductwork shall be insulated and jacketed in

accordance with Section 230700. Jacketing shall be aluminum or stainless steel, fully weatherproof and UV resistant.

PART 6 - AIR LEAKAGE TESTING

6.1 DUCTWORK SYSTEMS

A. It is the intent of this section to ensure the ductwork installed has minimal air leakage. Air leakage testing shall be accomplished by an AABC certified company. Refer to the Test & Balance specifications. Whenever the systems are being leak tested by the Test & Balance Contractor, a representative from the Mechanical Contractor shall be present to assist.

B. Carefully select the ductwork construction requirements and the type of duct sealant to be used as required to meet the leakage allowances. The sheet metal duct pressure classification is a minimum only. The Contractor shall select the appropriate sheet metal pressure classification, duct sealant class and duct sealant materials to meet the project air leakage allowances.

C. The entire outside and exhaust air ductwork system shall be tested with some exceptions. On the outside air systems, the ductwork upstream of the VAV boxes shall be tested. Cap the duct at the inlet to the VAV box.

D. All exhaust air sheet metal ductwork associated with the outside air system shall be tested. Flexible ductwork shall not be tested. Cap the main duct prior to the central equipment fan connection. Also cap the branch ducts which serve the diffusers, after the round branch air volume with sheet metal caps. Seal caps well to damper to avoid air loss at this location. This air loss, from the caps, is included in the noted leakage rate.

E. A duct pre-installation conference shall be held prior to the installation of the ductwork. Present should be the Owner, Design Team, Test & Balance Contractor, General Contractor, Mechanical Contractor, Sheet Metal Contractor and Insulation Contractor. At this meeting, the Contractor shall advise all of the duct materials and sealant materials to be used to meet the air leakage allowances.

F. It is the intent to test ductwork systems to minimize leakage. The duct systems which will require testing are as follows:
   1. All outside supply systems.
   2. All exhaust systems.
   3. All kitchen exhaust system.
   4. The low-pressure heat pump supply & return ductwork on units 5 ton and larger.

G. Do not insulate the supply air systems prior to testing.

H. The maximum allowable leakage for outside air, return air, and exhaust air duct systems shall not exceed 5 percent of system design airflow when tested at the pressures indicated. Outside air systems shall be tested at 2.0 inches w.g. Return air and exhaust air systems shall be tested at 1.5 inches w.g.

I. The noted allowable leakage rate is the total allowable. It shall include leakage associated with the following:

1. All ductwork as described in above paragraphs.
2. Access doors
3. Volume dampers
4. Relief air doors
5. Smoke dampers
6. End caps used to seal ducts

J. If any duct system fails a test, the Contractor shall reseal the system. It shall than be retested until the duct system meets the leakage allotment at no additional cost to the Owner.

K. The Contractor shall provide and complete a duct pressure testing record sheet for each test performed.

L. The Contractor shall pretest each duct section in advance of the final witnessed tests. Upon completion of the pretests, the Contractor shall notify the Design Team and Cx that final testing can be scheduled.

PART 7 - SPECIALTY DUCTWORK

7.1 RANGE HOOD EXHAUST DUCT

A. Grease duct shall be welded liquid-tight carbon steel, minimum 16 gauge, or stainless steel, minimum 18 gauge, in accordance with IMC and NFPA 96 with liquid tight continuous external weld of all seams and joints where exposed. Where ducts are concealed, they shall be constructed of 16-gauge carbon steel with liquid-tight continuous weld of all seams and joints. Inside laps on duct joints shall project in a direction against the air flow. Provide and install per IMC 506.3.1.1.

B. Ducts shall be so constructed and sloped as to provide suitable drainage of water/grease to a collection point.

C. Hand holes for inspection and cleaning purposes, equipped with tight fitting sliding or swinging doors and latches, shall be provided in horizontal sections of exhaust ducts. Such openings shall be at the sides of the horizontal run in order to prevent dripping of residue. Spacing of such openings shall not exceed 20 feet and shall be located at all offsets. Openings shall have a minimum dimension of 20" in width with a height equivalent to the duct height minus one inch.

D. At the base of each vertical riser, a residue trap shall be provided with provisions for cleanout.

E. The Contractor shall install the kitchen rangehood exhaust duct systems and maintain the minimum code required clearances to combustibles. Provide UL listed and approved enclosure system of fire wraps/blankets installed per the manufacturer’s instructions from the second floor to the roof deck, preventing the use of a fire damper and to achieve the clearance to combustibles requirements.

F. At the Contractor’s option, a UL2221 Pre-manufactured Duct System equal to Metal Fab 3G shall be acceptable. Duct shall have a stainless-steel inner liner, aluminized outer liner and three-inch liner to maintain fire rating and comply with requirements of clearance to combustibles.

G. Shop drawings of the kitchen rangehood exhaust ductwork shall be made and submitted to the appropriate reviewing agency. Any fees associated with this submittal shall be borne by this Contractor.

7.2 DRYER VENT AND KILN DUCTWORK

H. All dryer ducting shall be a minimum of 4" in diameter. Kiln ductwork minimum of 6” diameter.

I. Kiln and dryer vent ductwork shall be rigid metal 20-gauge aluminum duct. Duct joints shall be installed so that the male end of the duct points in the direction of the airflow. Joints shall be secured with metal tape (not duct tape). Do not use rivets or screws in the joints or anywhere else in the duct as these will incur lint collection.

J. For dryer venting, length of concealed rigid metal ducting shall not exceed the allowable length of 25 feet. Deduct 5 feet from the allowable length for every 90-degree elbow and 2.5 feet for every 45-degree fitting per IMC requirements. These lengths may vary per local codes and dryer manufacturer’s recommendations. Provide a complete, working in-line booster fan system, including power, if the maximum allowable duct length is exceeded.

K. Flexible transition hose connection at the dryer shall be the aluminum flexible duct type. Do not use the plastic or vinyl.

L. Termination of kiln and dryer venting shall be to the exterior with a proper hood or roof jack equipped with a backdraft damper. Hood/jack shall be painted with suitable exterior grade paint and color per the Owner’s direction. Small orifice metal screening shall not be part of the hood or roof jack as this will trap lint and block the opening. The hood opening shall point down and maintain a minimum of 12 inches of clearance between the bottom of the hood and the ground or other obstruction.

END OF SECTION

SECTION 233700 - HVAC EQUIPMENT

PART 1 - GENERAL

1.1 RELATED SECTIONS

A. The Contractor's attention is directed to the General and Special Conditions, COMMON WORK RESULTS FOR HVAC and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. Provide all HVAC equipment complete and in proper operating condition, installed where indicated, connected, and placed in operation in strict accordance with the manufacturer's written instructions and recommendations. Coordinate electrical characteristics, power connections, and disconnect means with Division 26. Equipment shall be factory finished and, where applicable, factory insulated. Electrical equipment shall be listed and labeled by UL or another nationally recognized testing laboratory where such listing standards exist.

C. Provide all manufacturer's standard warranties and any additional warranties required by the Contract Documents. Warranty periods shall begin at Substantial Completion unless otherwise indicated. Refer to Section 230100/Common Work Results for HVAC for additional warranty requirements.

D. Refer to Specification Section COMMON WORK RESULTS FOR HVAC for minimum required Schedule of Values breakdown.

E. Review the Specification Section for SHOP DRAWINGS, OPERATION AND MAINTENANCE MANUALS, AND SPARE PARTS, and provide all documentation required therein.

F. Each Contractor shall be responsible for completion of system verification checklists, manufacturer's pre-start and start-up checklists, and all documentation required by the Contract Documents. Refer to Section 230100/Common Work Results for HVAC and Section 019113 General Commissioning Requirements for additional requirements.

G. Where required by the manufacturer or Contract Documents, equipment start-up shall be performed by the manufacturer's factory-authorized representative, and written start-up documentation shall be submitted. Unless otherwise specified, this requirement applies to the following equipment furnished under this Section:
   1. Geothermal Heat Pumps Units
      a. Vertical
      b. Horizontal
   2. Outside Air Unit
   3. Variable Air Volume Terminal Boxes
   4. Exhaust Variable Volume Terminal Boxes
   5. Electric Unit Heaters

6. Exhaust Fans

H. All HVAC equipment shall comply with the latest provisions of ASHRAE Standard 90.1 and all provisions of the International Energy Conservation Code 2021.

I. Verify that all equipment proposed for this Project can be installed in the space allocated, connected as indicated, placed into operation, and serviced without removing permanent construction unless specifically indicated otherwise. Coordinate required service clearances, access, lifting requirements, and electrical disconnect means with all trades. Provide factory-mounted disconnect switches where scheduled or where available as a standard manufacturer option; otherwise coordinate field-provided disconnects with Division 26 in accordance with NEC requirements.

J. Determine from the Bid Documents the date of completion of this project and ensure that equipment delivery schedules can be met so as to allow this completion date to be met.

K. Through coordination with other Contractors, Vendors and Suppliers associated with this Project, this Contractor shall ensure a complete, 100% functional, wired, tested, inspected and approved systems. Claims for additional cost or change orders will immediately be rejected. Refer to Specification Section – COMMON MOTOR ELECTRICAL REQUIREMENTS FOR HVAC EQUIPMENT for additional requirements. All equipment shall be furnished for a single point electrical connection along with factory or integral disconnect switch unless specifically indicated otherwise. Field disconnects maybe acceptable, upon coordination with Division 26, and accepted by owner and engineer.

L. Review the Specification Section – TEMPERATURE CONTROLS AND SEQUENCE OF OPERATIONS FOR HVAC to determine controls, including variable frequency drives, to be furnished. Where manufacturer's temperature controls are specified, they shall be in full compliance with NFPA 90A including automatic smoke shut down and interlocked provisions. Controls must be compatible with BAS and provide all points necessary for monitoring, control, and alarms and coordinate control transformers, relays, safeties, and interface devices.

1.2 SUBMITTALS

A. Submit certified performance data for each scheduled unit including scheduled capacity, entering and leaving conditions where applicable, airflow, external static pressure, sound data, electrical data, efficiency ratings, and operating limitations.

B. Submit manufacturer's product data and technical specifications for each unit and accessory describing materials of construction, components, factory options, controls, safeties, and accessories.

C. Submit shop drawings indicating overall dimensions as well as installation, operation and service clearances. Indicate lift points and recommendations and center of gravity. Indicate unit shipping, installation and operating weights including dimensions.

D. Submit electrical characteristics including voltage, phase, MCA, MOCP, disconnect provisions, power connection locations, control connection points, and manufacturer's recommended

overcurrent protection. Submit sequence of operation, control diagrams, wiring diagrams, safety interlocks, and start-up instructions.

E. Submit operation and maintenance data including manufacturer's descriptive literature, installation instructions, operating instructions, maintenance procedures, recommended spare parts list, troubleshooting information, start-up forms, and wiring/control diagrams.

F. Submit controls interface requirements and BACnet points list where manufacturer-provided controls are furnished.

G. Submit manufacturer start-up reports and warranty documentation at project closeout.

1.3 DELIVERY, STORAGE AND HANDLING

A. Deliver, store, protect, and handle products per manufacturer's recommendations.

B. Comply with manufacturers installation instructions for rigging, unloading and transporting units.

C. Protect units from physical damage, dirt, dust, moisture, and weather during storage and installation. Leave factory shipping covers, seals, and protective wrappings in place until installation. Replace damaged equipment or components at no additional cost.

PART 2 - PRODUCTS

2.1 GEOTHERMAL HEAT PUMPS

A. Acceptable manufacturers shall be Daikin, Johnson Controls/York, Trane, Bosch/FHP, and WaterFurnace, subject to compliance with the Contract Documents.

B. Provide one fully coordinated mockup installation of one typical horizontal unit and one typical vertical unit, including unit supports, condensate piping, piping package/hose kit, controls interface, access clearances, filter arrangement, and associated appurtenances. Mockups shall be reviewed by the Engineer prior to proceeding with remaining installations.

C. Furnished equipment shall fit within the space allocated on the Drawings and shall maintain all required service and removal clearances. Any additional coordination, trim, supports, offsets, or accessories required due to manufacturer-specific dimensions or access requirements shall be provided at no additional cost to the Owner.

D. Equipment shall be specifically designed for applications within conditioned interior areas. Capacities shall be rated in accordance with AHRI for geothermal applications. Equipment shall be ETL/UL/NRTL approved. All equipment shall have decals and labels to aid in servicing and indicate caution areas.

E. Equipment shall be completely factory assembled and tested, piped, internally wired, and factory charged with the manufacturer's standard refrigerant, which shall be R-32 or R-454B

unless otherwise approved. Units shall be specifically listed and labeled for use with the furnished refrigerant and shall comply with all applicable requirements for A2L refrigerants, including factory labeling, charge limitations, and safety provisions. Threaded female water inlet and outlet connections, condensate connection, duct collars where applicable, and all safety controls shall be furnished and factory installed.

F. Provide a terminal strip with clearly identified screw terminals for control wiring. Units shall include a factory-installed condensate overflow safety device that disables cooling operation and/or compressor operation upon high condensate level. Provide factory-installed control interface provisions to allow BAS enable/disable, occupancy control, alarm indication, and other external interlocks as indicated.

G. Cabinets shall be constructed of galvanized steel with factory-applied finish. Interior surfaces exposed to the air stream shall be insulated with minimum 1/2-inch fiberglass or closed-cell insulation, securely adhered, protected against erosion, and complying with applicable flame spread and smoke-developed requirements. Provide removable access panels for service of filters, motor, blower assembly, compressor, controls, and drain pan.

H. The drain pan shall be constructed of stainless steel and insulated to prevent sweating. The bottom of the drain pan shall be sloped on two planes which will direct the condensate to the drain connection. When the unit is installed per the manufacturer's instructions, the drain pan shall be tested as follows: (1) Temporarily plug the drain pan, (2) fill the drain pan with 2" of water or the maximum allowed by the drain pan depth, whichever is smaller, (3) remove the temporary plug and verify the drain pan removes the water within 3 minutes.

I. Compressors shall be high-efficiency, hermetically sealed type, scroll where available or as scheduled, with internal vibration isolation and overload protection. Provide factory sound attenuation features including sound blankets where available as standard for the scheduled unit configuration. Units with multiple compressors shall be furnished where indicated on the Drawings.

J. The air-to-refrigerant heat exchanger shall be constructed of staggered copper tubes with die formed corrugated aluminum fins mechanically bonded to the tubes. The air-to-refrigerant heat exchanger shall have a working pressure rating of 400 PSIG. Multiple compressor equipment shall provide a single air-to-refrigerant heat exchanger for each compressor.

K. The water-to-refrigerant heat exchanger shall be of a high quality co-axial coil for maximum heat transfer and insulated to prevent condensation at low temperatures. The copper coil shall be fluted to enhance heat transfer and minimize fouling and scaling. The coil shall have a working pressure of 600 psig on the refrigerant side and 400 psig on the water side.

L. Reversing valve shall be manufacturer's standard pilot-operated type suitable for heat pump service.

M. Refrigerant tubing shall be constructed of copper. All low temperature refrigerant lines shall be insulated with an elastomeric insulation that has a 3/8" thick wall, flame spread rating of less than 25 and smoke density rating of less than 50, as tested in accordance with ASTM-84. The elastomeric insulation shall have a UL 94V-5 rating.

N. The equipment shall be provided with a thermal expansion valve. This device shall allow operation of the equipment in the range of 25 to 110º F entering fluid temperatures and 45 to 90º F entering air temperatures. The equipment shall only operate with one variable (enter water temperature, entering air temperature, cfm or gpm) at an extreme condition. All other variables must be within the nominal range of operation.

O. The equipment shall be provided with factory supplied high and low pressure Schrader ports for easy refrigerant pressure or temperature testing.

P. Fan and motor arrangement shall be as scheduled. Motors shall have permanently lubricated bearings and internal thermal overload protection. Horizontal units shall be field-convertible for discharge arrangement where scheduled or where indicated by the Drawings. Fan and motor assemblies shall be removable for service without disassembly of the entire unit casing. Where ECM or programmable motors are provided, furnish all required manufacturer tools or interfaces necessary for startup and balancing.

Q. A factory tested and installed control box shall contain all necessary devices to allow heating and cooling operation of the equipment to occur. These devices shall be as follows: (1) 24 Vac, energy limiting class II transformer. (2) Blower motor controller shall be a 24 Vac relay. (3) Compressor controller shall be a 24 Vac contactor. All three-phase operated equipment shall have a contactor that interrupts all three-phases providing power to the compressor. (4) Electrically operated safety lockout relay. This device shall prevent operation and anti-short cycling of the compressor during adverse conditions of operation. This device may be reset by either a remote thermostat or momentary interruption of power. (5) High pressure switch shall protect the compressor against operation at refrigerant system pressures in excess of 395 PSIG. (6) Low pressure switch shall prevent compressor operation underneath low charge or catastrophic loss of charge situations.

R. The Contractor shall completely assemble an Air Filter System for each unit and install ready to use. Heat pumps 4 tons and smaller require one 24” X 24” air filter system (one 24 X 24 filter). Heat pumps 5 tons through 10 tons require one 48” X 24” air filter system (two 24 X 24 filters). Heat pumps larger than 10 tons require one 72” x 48” air filter system (Six 24 X 24 filters). See plans for sizes and quantities. Refer to Specification Section GENERAL PROVISIONS – MECHANICAL for Temporary Use of Equipment Requirements and filter quantities.
   1. Side Access Filter Housing: Housings shall accommodate required quantity of 24” X 24” X 2” deep flat filters as noted above. Housings shall be factory assembled, have one hinged access door with quick access latches (operable without special tools), and be constructed on 18 gauge aluminized steel minimum.
   2. Filters shall be MERV 13, pleated and disposable. Provide 24” x 24” x 2” thick with an initial pressure drop shall be 0.30” at 500 fpm face velocity. Each filter shall consist of a non-woven cotton and synthetic fabric media, media support grid and enclosing frame. The filter shall be listed by Underwriters’ Laboratories as Class 2.
   3. Hose kits and piping package shall be as scheduled on the drawings. Single piece hose kits shall be provided for hose kits that are 1-1/2” or less in size. Two piece hose kits shall be provided for hose kits that are 2” and larger in size. Hose kits shall be the pipe runout size, not heat pump connection sizes. No exceptions!
      a. Provide a factory-assembled hose kit/piping package for supply and return connections for each heat pump. Kits shall be line sized. Kits submitted as the size of the heat pump connection are not acceptable. Kits may be mounted in any direction and shall not require straight sections of pipe either upstream or

downstream for proper operation. All hoses shall be equipped with end connections at terminal unit and shall be 24" long. All end connections shall be either permanently crimped swivel ends or butt welded to carbon steel end fittings to meet stated pressure ratings. Operational temperature shall be rated from fluid freezing to 200 degrees F. Minimum burst pressure shall be four times the working pressure. Furnish with field flushing connection fitting. Up to 1-1/4" shall be reinforced, fire retardant EPDM rubber, bonded to the inside wall of braiding. 1 ½" and larger shall be a corrugated type 321 stainless steel tube.

b. Each supply side (water inlet) hose kit/piping package shall include a single piece Y - valve body for sizes up to 1-1/2" and shall be constructed of hot forged brass with threaded inlets and outlets. 2" and larger sizes shall be two-piece and constructed of ductile iron with threaded inlets and outlets. All valve bodies are suitable for a minimum of 400 PSIG working pressure. Include single pressure/temperature test ports for verifying the pressure differential and system temperature. Include full flow design ball valve with blow out stems for shut off. Strainer shall be Y-type configuration furnished with hose connector blow down valve. Strainer screen shall be stainless steel mesh and easily accessible for cleaning without disconnecting hoses. All valves shall be labeled with flow direction, manufacturer and model number, unit tagging.

c. Each return side (water outlet) hose kit/piping package shall include a single piece Y - valve body for sizes up to 1-1/2" and shall be constructed of hot forged brass with threaded inlets and outlets. 2" and larger sizes shall be two-piece and constructed of ductile iron with threaded inlets and outlets. All valve bodies are suitable for a minimum of 400 PSIG working pressure. Include single pressure/temperature test ports for verifying the pressure differential and system temperature. Include full flow design ball valve with blow out proof stems for shut off. All valves shall be labeled with flow direction, manufacturer and model number, unit tagging. Include automatic flow control valves which shall be factory set to rated flow and shall automatically control the flow to within 10% of the rated value subject to the operating parameters of 2-80 psid, fluid freezing to 225°F, 2-7 fps. Also provide a three-wire, two-way, two-position control valve with actuator. Actuator shall be field installed by the ATC contractor.

S. Prior to utilization of equipment, start-up service shall be performed by factory authorized representative. Refer to Specification Section GENERAL PROVISIONS – MECHANICAL for additional requirements.

T. Provide factory-mounted disconnect switch where scheduled or where available as a standard option. Provide alarm/status contacts or communications gateway where indicated for BAS integration.

U. Coordinate condensate drain connection configuration, trap requirements, cleanouts, and overflow shutdown with the Drawings and manufacturer's recommendations.

V. Units shall meet or exceed the scheduled capacities, entering water temperatures, airflow, sound performance, and electrical characteristics indicated on the Drawings.

W. Units shall be selected for low sound operation suitable for school occupancy. Submit sound power data or octave band sound data for each scheduled unit.

X. Provide all factory-mounted sensors, safeties, relays, and interface components required for BAS monitoring, alarm reporting, occupancy control, and shutdown interlocks as indicated.

Y. Units shall be installable and serviceable within the spaces indicated without removing permanent construction. Filters, blower, motor, compressor, drain pan, control box, and valves shall remain accessible.

Z. Provide eight (8) hours of onsite training for this system. All training shall occur after building completion. Systems shall function properly and O&M staff shall be able to operate the system prior to turnover.

2.2 SEMI-CUSTOM DEDICATED OUTSIDE AIR UNITS (OUTDOOR TYPE):

A. Acceptable manufacturers shall be Innovent, Trane, AAON, and Valent, subject to compliance with the Contract Documents.

B. Dedicated Outdoor Air Units shall be capable of providing the scheduled airflows and capacities and shall be furnished with the components indicated on the Drawings and specified herein, including but not limited to supply fan sections, exhaust fan sections, VFDs, energy recovery wheel, dampers, packaged reversible heat pump system, face and bypass damper section, filter sections, and drain pans.

C. Provide factory built and factory tested air handling units of sizes, capacities and configurations as scheduled and as specified herein. Unit layout shall be dual path, providing one path for outside air with all components arranged in series as specified and providing one path for exhaust air with all components arranged in series as specified.

D. Units shall be furnished without a stand-alone factory-programmed building automation package unless specifically indicated otherwise. Manufacturer shall provide all factory-mounted safeties, internal operating controls, unit-mounted devices, and control interface components required for proper operation of the unit and refrigeration system. The Temperature Controls Contractor shall furnish and install all field control devices, actuators, sensors, interlocks, and BAS integration required by the sequence of operation. BACnet/IP interface to the building automation system shall be provided by the Temperature Controls Contractor unless specifically noted otherwise.

E. Alternate manufacturers seeking approval shall provide a pre-bid unit submittal to receive consideration. In requesting approval, alternate manufacturers shall provide three reference installations that have been in operation for a minimum of 5 years located within 300 miles of the jobsite for the engineer to contact. The reference installations shall be of similar application, design, features and construction to the specified equipment for this project and of equal capacity to the largest unit on this project. For each reference installation, provide an owner contact name, phone number, the equipment submittal for the unit(s), the manufacturer's representative and the date of installation.

F. Project is based on the specified equipment. Any additional re-engineering or installation costs associated with using alternate manufacturer's equipment shall be borne by the installing contractor.

G. Quality Assurance:
1. The unit shall be specifically designed, manufactured and tested for specialized energy recovery duty. Field assembled or modified standard commercial grade equipment shall not be accepted.
2. The product, including cabinet design, materials and major components, shall have a proven record of satisfactory use in installations of the specific application of this project for a minimum of 5 years.
3. Where a standard of quality is specified for a major component, provide one of the acceptable manufacturers and models specified herein.
4. NFPA Compliance. Units and components shall be designed, fabricated and installed in compliance with NFPA 90A.
5. UL Compliance. Electrical components used shall be listed and labeled by a nationally recognized testing laboratory.
6. NEMA Compliance. All motors shall comply with applicable NEMA standards.
7. AMCA Compliance. Fans shall be certified to bear the AMCA seal for air and acoustic performance per Standards 210 and 310. Dampers shall be tested and rated according to Standard 500D.
8. Air-to-air energy recovery components shall be tested in accordance with AHRI 1060. Complete unit shall be listed and labeled by ETL, UL, or another nationally recognized testing laboratory for the application and refrigerant provided. Unit listing shall comply with applicable safety standards for the furnished equipment and refrigerant.
9. Casings, panels, and frames, shall meet AHRI-1350 CB-1 requirements.

H. Duct connections shall be located as shown on the drawings. Duct connection sizes shall not have a higher face velocity or different aspect ratio than the specified unit. Air tunnels shall be arranged as shown on the drawings. Unit height and width shall not be less than the specified unit height and width.

I. Cabinet Performance:
1. Base Deflection. Design structural base to limit deflection to ¼” in length and width when rigging the unit according to manufacturer recommendations. Provide engineering calculations demonstrating compliance with this requirement.
2. Cabinet Deflection. Construct cabinet to limit deflection of the walls and roof to L/250 at 8" w.c. static pressure, or 1.5 times the maximum static pressure within the unit at design conditions, whichever is lower. Deflection ratings for panels only shall not be accepted.
3. Floor Deflection: Maximum floor deflection shall be L/500 (L=span in inches) when subjected to an 800 lb/sq ft. point load. Provide test data demonstrating compliance with this requirement.
4. Casing Air Leakage. Maximum casing leakage shall meet SMACNA duct leakage class (DLC) rating of 5.0. Provide calculations demonstrating compliance with this requirement.
5. Thermal Performance. All interior walls, floor, and ceiling shall be double wall and insulated with polyurethane injected foam insulation having a minimum R- value of 6.3 - 7.1/inch. Fiberglass or non-injected foam insulation is not acceptable and will be rejected.
6. Casing Insertion Loss (Acoustic rating). The panel insertion loss, per octave band, shall not be less than the following:

Frequency (Hz):	100	125	250	500	1000	2000	4000	8000
Insertion Loss (dB):	24	16	30	32	33	34	63	60

J. Base shall be constructed of welded 10 ga. structural steel G channel perimeter and C channel cross members with integral lifting lugs. Units without a welded structural steel base that utilize lifting provisions near the top of the cabinet shall be unacceptable. Bolted bases shall not be acceptable. Coat base exterior with 2 part epoxy primer and urethane modified enamel topcoat. Removable lifting lugs shall be provided. Weep holes shall be provided in base channels. Base height shall be a minimum of 8" to facilitate proper trapping of drains.

K. Frame shall be constructed of structural tube members designed to support flush-mounted double-wall panels. Vertical frame members shall be easily removable without the use of specialty tools or torches for replacement of large internal components. Welded frame shall not be accepted unless all internal components can be easily removed without cutting any welds. A closed-cell polyvinyl foam gasket with a thickness of 3/16” or greater shall be applied between all frame members and panels, providing a thermal break between the panels and the structural frame. Units without a structural tube frame shall be unacceptable. Frame Material: Extruded 6063 Aluminum Tube

L. Floor shall be 2” thick double-wall, foam injected panel construction for optimal support strength. Floor shall be a fastener free design, bonded to the unit base with a structural adhesive. All seams shall be finished with an adhesive sealant providing a watertight floor system. Use of tack welding, caulk or screws penetrating the entire floor panel anywhere in the floor shall not be accepted. The floor shall have a smooth and flat walk-on surface. A minimum 1" lip shall be provided around all floor penetrations. Walk-on grating shall be provided over all accessible floor mounted duct connections. Paneled floor shall be constructed of a minimum of .063" 5052-H32 mill-finished aluminum walk on surface and 22 gauge galvanized steel underside surface. 0.072” 3003-H22 mill-finished aluminum tread plate shall be provided over the foam-injected double wall floor.

M. Wall and Ceiling Panels shall have non-load bearing, fully removable, heavy gauge 2" double-wall panels which fully encapsulate the injected foam insulation. No individual panel shall exceed 36” width. Panel edges utilizing PVC edge wrappers to cover the insulation shall not be accepted. Panels shall be manufactured with an integral thermal break. Exterior Materials: Exterior skin shall be 5052-H32 mill-finished aluminum. Interior Materials: Interior skin shall be 5052-H32 mill-finished aluminum

N. Insulation shall be a product of a manufacturer specializing in insulating materials. All walls, floor, and ceiling shall be double wall and insulated with polyurethane injected foam insulation. Provide a data sheet from the insulation manufacturer confirming an R-value of 6.3 - 7.1 per inch. No insulation shall be exposed to the airstream. Non-injected foam board insulation or air handler manufacturer produced insulating material shall not be accepted. Fiberglass, mineral wool, and non-injected foam board insulation shall not be accepted.

O. Access Doors. Provide double wall doors with the same insulation and inner/outer wall material as the wall panels. Doors shall have an integral aluminum frame and shall be mounted into the structural frame of the unit. Door openings cut into casing panels shall not be accepted. Doors shall be full height (up to 72”) with industrial continuous stainless steel hinges. Bi-directional compression latches with integral roller cam and hex-screw locking assembly shall be provided. An EPDM type door gasket shall be provided in accordance with ASTM D 2000. Supply and exhaust airstreams shall not be covered by a single door. Access panels in lieu of access doors shall not be accepted. Rain gutters shall be provided over all access doors that are not the full

height of the unit casing. All doors that open with pressure shall be provided with a pressure relief safety latch. Access doors shall be provided for sections requiring routine maintenance.

P. Weather hoods: Provide weather hoods with expanded aluminum bird screens over all exposed inlets and outlets. Hoods may ship loose for installation in the field.

Q. Provide roof with standing seam construction which allows removal of individual sections for inspection purposes without removal of the entire roof. A double wall foam injected panel shall be provided below the roof liner creating 3 layers of metal between the conditioned air tunnel and ambient air. Pitch roof with sufficient slope to ensure water drainage. Units over 137" wide require double sloped roof designs. Roof overhang to be provided around complete perimeter of the unit. No penetrations shall be made through the roof unless specifically approved by the unit manufacturer and fully weatherproofed.

R. Energy Recovery Wheel:
   1. General: Energy recovery wheels shall be desiccant coated rotary air-to-air heat exchangers meeting the performance as listed in equipment schedules.
   2. Flame and Smoke Test and Rating: Energy Recovery Wheels shall have a flame-spread rating of 25 or less and smoke-developed rating of 50 or less as tested in accordance with ASTM E84.
   3. Energy Recovery Wheel Construction:
      a. Energy recovery wheels shall be manufactured of corrugated aluminum treated for corrosion resistance and shall include ion exchange resin desiccant to adsorb and transfer humidity in the vapor phase while avoiding adsorption and transfer of typical ambient non-water vapor molecules.
      b. The aluminum element and desiccant shall be treated with an EPA registered bacteriostatic agent capable of inhibiting growth or reproduction of bacteria on the wheel. Wheels shall be capable of cleaning by soft brush, vacuum-cleaner or low-pressure compressed air.
      c. Wheel surfaces shall be smooth to provide consistent seal gap between the wheel face and the cassette seal ring for the multi-pass seal.
      d. Wheels of more than 60 inches in diameter shall be of segmented construction with the wound element cut into pie shapes which are bolted together to form the wheel. Each pie shaped element shall be held in place by a structural encasement formed of corrosion resistant coated steel which surrounds the cut pie segments. Pies sections shall not require tuning or threaded tie-rods to adjust for out of roundness of the wheel.
      e. The encased pie segments shall be bolted to the hub, to each other and to the periphery rim. Each joint shall be sealed with high grade weather resistant low vapor emitting caulking to prevent air from bypassing the element.
   4. The cassette of the rotary heat exchanger shall have a built-in adjustable purge section providing a minimum cross contamination of exhaust air to the supply air. The purge angle and purge air volume shall be determined by the manufacturer considering the air face velocity, the wheel rotational speed and the differential air pressure between the entering outside air and the entering exhaust air streams at the respective wheel face. (See the air handling unit schedule for the value of the differential air pressure or use 3.0 inches w.c. for design purposes)
   5. The cassette frame shall be constructed of 11 gauge heavy wall welded tube to ensure rigidity and stability. Galvanized block-off and casing side panels shall be included to

form as unitized cassette. Side panels shall be removable to provide access to the wheel for future replacement. Removable motor compartment access panels shall be provided.

6. Cassettes for sizes 2400 and larger shall be shipped in split sections after factory assembly and mechanical testing. The bottom frame shall include the drive motor, drive belt and, half of the wheel pre-assembled to the hub. The hub shall be shaft/bearing mounted to the frame. The top frame shall include the other half of the wheel pre-assembled and suspended within the frame. Both sections shall include shipping restraints to be removed at the time of field assembly. Double ball bearing rollers shall be mounted on the frame to run against the wheel flange in order to maintain the seal gap and prevent wheel deflection against differential air pressure between the supply air and the exhaust air tunnels of up to 10 inches w.c.
7. Purge: The cassette shall be complete with an adjustable built-in purge section to limit carry-over of exhaust air to the supply air stream to 0.04% when operated under design conditions. The purge plate shall be mounted to a pivot and locked into position by secure fasteners for quick field adjustment. A multi-pass seal shall be installed on the swing arm similar to the seals described below. (Please see purge swing arm field adjustment instructions to ensure it is installed in a manner consistent with the factory warranty.) Rotation of the wheel shall be in the direction from the return air through the purge to the supply air side.
8. Seals: The supply and exhaust air stream shall be isolated from each other by means of adjustable multi-pass seals secured to the cassette panels and air separator tube. Multi-pass seals shall consist of a non-contact four or eight finger labyrinth seal. The selection of the seal shall be based on the differential pressure between the supply air plenum and the return plenum as measured in proximity to the wheel face. Multi-pass seals shall be installed with a 2 mm gap between the seal and the wheel flange.
9. Connections: The cassette casing shall include blank turned-in flanges to permit field attachment to air handler bulkheads. The heat wheel cassette shall be securely attached to the floor or raised section and the AHU bulkheads.
10. Corrosion resistant coating: All non-galvanized metal parts exposed to the air streams shall be painted with one coat of primer and one coat of corrosion resistant paint.
11. Wheel support and bearings: The energy recovery wheel shall be shaft mounted and supported by externally mounted pillow block ball bearings supported by the cassette frame. The pillow block bearings shall be provided with a grease fitting. The pillow block bearings shall be mounted to allow convenient service and replacement without the removal of the energy recovery wheel from the cassette.
12. Wheel drive system: The wheel shall be driven by a V-belt installed around the outside of the wheel. A gear motor, pulley and belt tensioner shall be installed and sized to drive the wheel through its complete speed range (1/4-20 rpm) for all seasons and speed control sequences. The gear-motor shall be VFD-rated for variable speed operation. The gear-motor is to be rated for 460/3/60 (480/3/60) power supply. The gear-motor shall be factory mounted in the bottom section of the cassette. The removable gear-motor service access cover shall be mounted in the Return Air section of the cassette.
13. Markings: The manufacturer shall include decals or other markings to indicate the direction of rotation.
14. Acceptable Manufacturers. Provide enthalpy wheel from Seibu Giken or approved equal provided that it meets or exceeds all requirements of this specification.

S. Fan Sections: Supply Blower; Exhaust Blower;

1. Standard of Quality. Fans shall be Greenheck APH, Twin City EPQN, or Cook model PLC with construction details as specified below.

2. Wheel. The fan wheel shall be non-overloading centrifugal type. Wheel shall be statically and dynamically balanced to balance grade G6.3 per ANSI S2.19.
    a. Wheel shall be manufactured with a minimum of 12 continuously welded aluminum airfoil blades to move the blade pass frequency into the mid-octave bands.
    b. The entire wheel shall be constructed of aluminum to reduce the rotational weight of the wheel and reduce vibration. Blades shall be constructed of 6063-T5 extruded aluminum to ensure precision blade tolerances, improve efficiency and reduce vibration. Wheel hubs shall be cast of 319 aluminum alloy.
    c. Fan wheel shall not require finish coating.
    d. The wheel and fan inlet shall be carefully matched and shall have precise running tolerances for maximum performance and operating efficiency.
3. Construction. Plenum fans shall be of the unhoused direct drive centrifugal type.
    a. Fan plate shall be aerodynamically designed with high-efficiency inlet, engineered to reduce incoming air turbulence.
    b. Panels and framework shall be constructed of heavy gauge, precision laser cut and die formed ASTM A-569 low carbon steel to provide a rigid structure to support the motor, shaft, bearings and wheel and reduce low frequency vibration.
    c. After fabrication, all carbon steel components shall be cleaned and chemically treated by a phosphatizing process to ensure proper removal of grease, oil, scale, etc. Panels and framework shall be coated with a minimum of 2-4 mils of Permatector (Polyester Urethane), electrostatically applied and baked. Finish color shall be RAL 7023, concrete grey. Coating shall exceed 1,000-hour salt spray under ASTM B117 test method. No uncoated steel fan parts shall be allowed.
    d. Supply fan steel parts shall be coated with Hi-Pro Polyester urethane powder coating or 2 part epoxy primer and urethane modified enamel topcoat.
    e. Exhaust fan steel parts shall be coated with Hi-Pro Polyester urethane powder coating or 2 part epoxy primer and urethane modified enamel topcoat.
4. Motor. Motors shall meet or exceed EISA (Energy Independence and Security Act) efficiencies. Motors shall be 3-phase NEMA T-frame, 60 Hz, with RPM as scheduled.
    a. Enclosure shall be Totally Enclosed Fan Cooled (TEFC).
    b. Supply motors housing shall be cast iron.
    c. Exhaust motors housing shall be cast iron.
    d. Service factor shall be 1.15.
    e. Insulation shall be Class F.
    f. Supply fan motors shall be variable frequency drive (VFD) compatible.
    g. Exhaust fan motors shall be variable frequency drive (VFD) compatible.
    h. Supply motors 10 HP and larger shall be provided with shaft grounding rings.
    i. Exhaust motors 10 HP and larger shall be provided with shaft grounding rings.
5. Performance. Conform to ANSI/AMCA Standards 210 and 300. Fans shall be tested in accordance with AMCA Publications 211 and 311 in an AMCA accredited laboratory and certified for air and sound performance. Fans shall be licensed to bear the AMCA ratings seal for air performance (AMCA 210) and sound performance (AMCA 300).
    a. Fan brake horsepower shall not exceed the scheduled brake horsepower at the total static pressure and airflow scheduled.
    b. Provide the number of fans scheduled, no exceptions.
    c. Fan motors shall be selected to run at no more than 70 Hz at design conditions.
6. Mounting. Blower and motor shall be mounted on a unitary isolation base.
    a. Structural steel fan/motor base shall be designed by the manufacturer to properly support the fan/motor assembly to mitigate vibration.

b. 1” deflection housed seismic rated spring isolators shall be provided.
c. Fan inlets shall be connected to a double wall foam injected plenum wall.
d. Fans shall be connected to the plenum wall with canvas flex connectors with edge caps.

7. Variable Frequency Drives: Provide variable speed drive for all plenum fans. VFDs shall be factory provided and factory installed. See Electrical section of this unit specification for more VFD requirements.
8. Refer to Specification Section – ELECTRIC MOTORS, ETC. for more requirements. Fan sections controlled by variable frequency drives and shall be factory installed. Refer to Specification Section - CONTROLS for all VFD specification requirements.

T. Integral Reversible Water-Source Heat Pump System
1. Air/Refrigerant Coil. Provide fully interlaced coil rated in accordance with AHRI 410-2001 with 0.016" thick seamless copper tubes, stainless steel casing, and 0.006" thick aluminum fins. Maximum face velocity is 500 FPM. Each coil shall be water immersion tested to 450 PSI prior to shipment.
   a. Air/Refrigerant Coil Coatings: Electrofin E-Coat.
2. Cooling Coil Drain Pan. All cooling coils shall be provided with Stainless Steel IAQ drain pans that begin at the entering air side of the coil face and extend a minimum of 12” past the leaving air side of the coil face. Entire underside of the drain pan, including the piping run to the casing exterior, shall be coated with no less than 2” of spray foam insulation to ensure no sweating occurs below. Walk-on stainless steel supports spaced a maximum of 6" apart shall be provided to allow full access to the manifold without damage to the drain pan. Drain pans without this feature shall not be accepted. The drain pan shall be sloped in a minimum of 2 directions to ensure proper drainage.
3. Hot Gas Reheat Coil. Provide coil rated in accordance with AHRI 410-2001 with 0.016" thick copper tubes, stainless steel casing, and rippled aluminum plate fin secondary surface with a thickness of 0.008". Provide factory modulating control valve for temperature control. Each coil shall be water immersion tested to 450 PSI prior to shipment.
   a. Hot Gas Reheat Coil Coatings: Electrofin E-Coat.
4. Integral water source heat pump section: Provide integral water source heat pump system factory piped, wired, charged, and tested. Entire heat pump section shall be assembled by the unit manufacturer. Mounting a different manufacturer's heat pump in the casing is not acceptable.
   a. Refer to the schedule for the minimum EER requirements, minimum number of circuits, and minimum number of compressors. Equipment not meeting these requirements will be rejected.
   b. Integral water source heat pump consisting of: scroll compressors, mounted on RIS vibration isolators, air-refrigerant coil, water-refrigerant coil, 4-way reversing valve, suction accumulator, reversible flow filter-drier and sump heaters. Water flow valves, valve actuators, and interlocks shall be provided but shall be installed by others.
   c. Heat pump section shall be fully designed, listed, and labeled for use with R-32 or R-454B refrigerant and shall include all factory-furnished A2L refrigerant safety provisions, labels, charge compliance measures, and control interlocks required by the manufacturer and applicable codes
   d. Heat pump section shall be factory piped, wired, tested, and charged with the manufacturer’s standard refrigerant, which shall be R-32 or R-454B.

e. Provide coaxial water to refrigerant heat exchangers. Brazed plate heat exchangers are not acceptable and will be rejected.
f. The compressors shall provide modulating control from 100% down to 10% of the full refrigeration system capacity. Staged control is not acceptable and will be rejected. Hot gas bypass is not an acceptable method of capacity control and will be rejected. Provide factory modulating head pressure control valve (3-way) shall be provided to keep system operational and optimize efficiency of the compressors.

5. Water Piping Requirements: The heat pump manufacturer is responsible for the following water piping:
a. A strainer factory mounted at each water/refrigerant heat exchanger inlet.
b. P/T ports factory mounted on both sides of the water/refrigerant heat exchanger.
c. A flow switch factory mounted on the leaving water side of the water/refrigerant heat exchanger.
d. The manufacturer shall provide a modulating head pressure control valve for each heat pump circuit. The valve(s) will be shipped loose for field installation and wiring.

U. Outside Air Dampers shall be manufactured by Greenheck, Ruskin, or T.A. Morrison or approved equal. Dampers shall meet or exceed the following construction and ratings.
1. Frame Material:0.125" thick aluminum with thermal break, 5" x 1" hat channel; Blade Material: 0.063" thick extruded aluminum; Blade Type: Polyurethane insulated airfoil with thermal break; Linkage: Plated steel concealed in the jamb (out of airstream). Plastic and/or gear driven linkages shall not be allowed; Axle Material: Minimum 1/2" plated steel; Axle Bearings: Dual bearing with Acetal (synthetic) inner sleeve, flanged outer bearing; Blade Seals: Silicone; Jamb seals: Silicone
2. Ratings. AMCA Class 1A rated at 1” w.c. and Class 1 up to 4-10” w.c. with AMCA certified performance for pressure drop and leakage per AMCA 500-1D, Test Figures 5.2, 5.3, and 5.5. Dampers shall be IECC compliant. Velocity Limit: Suitable for use to 4000 feet per minute; Leakage: 3 cfm/sq. ft (AMCA Class 1A); Temperature Range: -70 deg F to 200 deg F; Pressure Limit: Suitable for use to 8" w.c.; Thermal Efficiency Ratio: 94.1%
3. Shall be equipped with 2-position actuator

V. Exhaust Air Dampers shall be manufactured by Greenheck, Ruskin, or T.A. Morrison or approved equal. Dampers shall meet or exceed the following construction and ratings.
1. Frame Material:0.125" thick aluminum with thermal break, 5" x 1" hat channel; Blade Material: 0.063" thick extruded aluminum; Blade Type: Polyurethane insulated airfoil with thermal break; Linkage: Plated steel concealed in the jamb (out of airstream). Plastic and/or gear driven linkages shall not be allowed; Axle Material: Minimum 1/2" plated steel; Axle Bearings: Dual bearing with Acetal (synthetic) inner sleeve, flanged outer bearing; Blade Seals: Silicone; Jamb seals: Silicone
2. Ratings. AMCA Class 1A rated at 1” w.c. and Class 1 up to 4-10” w.c. with AMCA certified performance for pressure drop and leakage per AMCA 500-1D, Test Figures 5.2, 5.3, and 5.5. Dampers shall be IECC compliant. Velocity Limit: Suitable for use to 4000 feet per minute; Leakage: 3 cfm/sq. ft (AMCA Class 1A); Temperature Range: -70 deg F to 200 deg F; Pressure Limit: Suitable for use to 8" w.c.; Thermal Efficiency Ratio: 94.1%
3. Shall be equipped with 2-position actuator

W. Outside Air Pleated Filter. Refer to Specification Section GENERAL PROVISIONS – MECHANICAL for Temporary Use of Equipment Requirements and filter quantities. Provide a flat bank or V-bank filter section as shown on the unit drawing and as follows:
   1. Depth and Rating: 2" MERV-8
   2. Location: Mount filters immediately downstream of the outside air inlet.
   3. Rack: Mount in shared rack with cartridge filters
   4. Face Velocity: Provide filters sized for 500 fpm maximum face velocity, but no higher than the scheduled value.
   5. Filters shall be rated per U.L. standard 900.
   6. Filter Pressure Monitoring. Magnahelic pressure gauges shall be provided across all filter racks. A rain/sun shield shall be provided.

X. High Efficiency Cartridge Filter. Refer to Specification Section GENERAL PROVISIONS – MECHANICAL for Temporary Use of Equipment Requirements and filter quantities. Provide a flat bank or V-bank filter section as shown on the unit drawing and as follows:
   1. Depth and Rating. Provide 4" MERV-14 cartridge filters
   2. Location: Mount in a shared rack with the pre-filter, immediately downstream of the OA inlet, or in the supply airstream if shown on the unit drawing.
   3. Rack: Provide a galvanized steel front access rack. Front access racks shall include filter clips and be gasketed.
   4. Face Velocity: Provide filters sized for 500 fpm maximum face velocity, but no higher than the scheduled value.
   5. Filters shall be rated per U.L. standard 900.
   6. Filter Pressure Monitoring. Magnahelic pressure gauges shall be provided across all filter racks. A rain/sun shield shall be provided.

Y. Return Air Pleated Filter. Refer to Specification Section GENERAL PROVISIONS – MECHANICAL for Temporary Use of Equipment Requirements and filter quantities. Provide a flat bank or V-bank filter section as shown on the unit drawing and as follows:
   1. Depth and Rating: 2" MERV-13
   2. Location: Mount filters immediately downstream of the return air inlet.
   3. Rack: Provide a galvanized steel front access rack. Front access racks shall include filter clips and be gasketed.
   4. Face Velocity: Provide filters sized for 500 fpm maximum face velocity, but no higher than the scheduled value.
   5. Filters shall be rated per U.L. standard 900.
   6. Filter Pressure Monitoring. Magnahelic pressure gauges shall be provided across all filter racks. A rain/sun shield shall be provided.

Z. Modulating Outdoor/Exhaust Control Dampers
   1. Modulating Control Dampers: Outside air and exhaust air dampers intended for proportional control and installed in exposed outdoor ductwork shall be heavy-duty, low-leakage, insulated airfoil type, specifically rated for outdoor service and operation under the full system static pressure and velocity developed by the associated fan. Dampers shall be AMCA certified for air performance, leakage, and pressure drop and shall be suitable for continuous outdoor exposure, including rain, snow, wind, temperature extremes, and UV exposure. Damper assembly shall be designed for operation at not less than 12 inches w.c. differential static pressure and velocities up to 4000 fpm, unless scheduled otherwise. Damper frames shall be thermally broken extruded aluminum, minimum 0.125-inch thick, with stainless steel jamb hardware and corrosion-resistant

fasteners. Blades shall be insulated airfoil aluminum construction with mechanically retained seals. Provide silicone or EPDM blade edge seals and jamb seals suitable for outdoor service and low leakage performance. Linkage shall be concealed in the jamb and out of the airstream. Bearings shall be corrosion-resistant and suitable for high-cycle modulating service. Damper shall have a maximum leakage rate of 4 cfm/sf at 1 in. w.c. and shall be tested in accordance with AMCA 500-D. Damper shall be suitable for mounting in exposed outdoor ductwork and for modulation under full fan shutoff pressure.

2. Actuators: Modulating dampers shall be furnished with factory-mounted or field-mounted electronic direct-coupled actuators as indicated by the controls documents. Actuators shall be specifically listed or rated for exposed outdoor installation and shall be provided with a NEMA 1 or NEMA 4X enclosure, weatherproof housing, or manufacturer's approved outdoor protective enclosure as required for the installation. Actuator shall be selected based on the damper manufacturer's published torque requirements at the scheduled maximum differential pressure, with not less than 25 percent additional torque margin. Actuator shall be suitable for high-pressure, low-leakage damper service and capable of tight shutoff against the maximum specified differential pressure. Provide spring return where required by sequence or fail-safe position. Actuators shall include adjustable end stops, manual override, and visible position indication. All external hardware, mounting brackets, and linkage components shall be corrosion-resistant and suitable for outdoor rooftop exposure.
3. Airflow Measuring Device: Provide an airflow measuring device in the outdoor/exhaust airstream where indicated, suitable for the maximum system velocity and pressure, factory calibrated, and furnished for full integration with the BAS to allow monitoring and control of airflow.
4. Controls Compatibility: Modulating damper actuators shall be fully compatible with the Temperature Controls Contractor's BAS. Coordinate actuator voltage, control signal, fail position, spring return requirements, auxiliary switches, and control wiring requirements with the controls drawings and sequence of operation. Refer to section 250000.

AA. Combination Fire/Smoke Dampers
1. Dampers shall be low-leakage, dynamic-rated combination fire/smoke dampers, listed and labeled in accordance with UL 555 and UL 555S, and installed in accordance with NFPA 90A and the manufacturer's listing. Dampers shall be suitable for the maximum system velocity and pressure differential at the installed location. Provide actuators, sleeves, retaining angles, breakaway connections, access doors, and accessories required for a complete installation.
2. Actuators for combination fire/smoke dampers shall be listed for fire/smoke damper service, shall be suitable for the installed pressure conditions, and shall be provided with end switches and auxiliary contacts for monitoring and interlock functions.
3. Coordinate damper operation with the fire alarm system, smoke control sequence, duct smoke detectors, and BAS/ATC system as indicated in the Contract Documents.

BB. Prior to Owner use and final acceptance, start-up service shall be performed by the manufacturer's factory-authorized representative. Utilize startup sheets included in the Specification Section GENERAL PROVISIONS - MECHANICAL. Refer to Specification Section GENERAL PROVISIONS – MECHANICAL for additional requirements.

CC. Provide eight hours of onsite training for this system. Training shall occur after the system is fully operational and prior to turnover. Owner's operating staff shall be instructed in startup, shutdown, seasonal operation, alarms, routine maintenance, and troubleshooting.

DD. Provide manufacturer's standard warranty for the complete unit and all components for not less than one year from Substantial Completion unless longer warranty periods are specified elsewhere in the Contract Documents. Warranty shall include repair or replacement of components failing due to defects in materials or workmanship. Routine maintenance items such as filters and belts are excluded.

EE. Compressor Warranty: Provide a five-year non-prorated parts warranty for compressors commencing at Substantial Completion unless otherwise required by the Contract Documents.

2.3 VARIABLE AIR VOLUME TERMINAL BOXES (SUPPLY AND EXHAUST):

A. Acceptable Manufacturers: Titus, Price, Nailor Industries, Trane, Carrier, Johnson Controls/York, ETI.

B. Terminals shall be certified by AHRI and bear the AHRI 880 seal.

C. Provide single-duct pressure-independent supply VAV terminal units for ventilation air service only. Units shall deliver ventilation air either directly to the space or to the return of the associated heat pump, as indicated on the Drawings. Supply VAV terminal units shall be controlled through the BAS demand control ventilation sequence in response to associated CO2 sensors and shall modulate between the minimum and maximum airflow values indicated on the Drawings and in the controls schedules. Reheat coils are not permitted unless specifically indicated otherwise.

D. Provide pressure-independent exhaust air VAV (EVAV) terminal units for maintenance of minimum required exhaust airflow from toilet rooms, janitor closets, and similar exhaust spaces. Exhaust VAV terminal units shall maintain the airflow values indicated on the Drawings and shall be suitable for pressure-independent operation over the full range of expected system pressures.

E. Terminals shall be constructed of not less than 22 gauge galvanized steel, able to withstand a 125 hour salt spray test per ASTM B-117. The terminal casing shall be mechanically assembled (spot-welded casings are not acceptable). Terminal shall include control enclosure and hanger brackets. The terminal shall be provided with a removable bottom access panel. Unit shall have right or left hand access to controls(refer to drawings). Maintain clearance as required by code and indicated on the drawings.

F. Casing shall be insulated with minimum 1-inch fiberglass insulation complying with ASTM C1071, ASTM C665, UL 181 erosion requirements, and maximum flame spread/smoke-developed rating of 25/50 per ASTM E84, UL 723, and NFPA 90A. Insulation shall be foil faced and protected so that no raw insulation edges are exposed to the airstream. Raw insulation edges at discharge openings shall be covered with metal liner or nosing; sealant-only treatment is not acceptable. Insulation shall comply with ASTM C1136 for resistance to mold, mildew, and humidity. At an inlet velocity of 2000 fpm, pressure drop across the basic terminal shall not exceed 0.08 inch w.g.

G. Terminal units shall be double-wall construction with insulation fully encapsulated behind a minimum 26-gauge galvanized steel inner liner. No insulation shall be exposed to the airstream. All wire penetrations through the casing shall be protected with grommets.

H. The primary air valve shall consist of a minimum 22 gauge cylindrical body that includes embossment rings for rigidity. The damper blade shall be connected to a solid shaft by means of an integral molded sleeve which does not require screw or bolt fasteners. The shaft shall be manufactured of a low thermal conducting composite material, and include a molded damper position indicator visible from the exterior of the unit. The damper shall pivot in self lubricating bearings. The damper actuator shall be mounted on the exterior of the terminal for ease of service. The valve assembly shall include internal mechanical stops for both full open and closed positions. The damper blade seal shall be secured without use of adhesives. The air valve leakage shall not exceed 1% of maximum inlet rated airflow at 3" W.G. inlet pressure.

I. The differential pressure airflow sensor shall traverse the duct along two perpendicular diameters. Cylindrically shaped inlets shall utilize the equal cross sectional area or log-linear traverse method. Single axis sensor shall not be acceptable. A minimum of 12 total pressure sensing points shall be utilized. The total pressure inputs shall be averaged using a pressure chamber located at the center of the sensor. A sensor that delivers the differential pressure signal from one end of the sensor is not acceptable. The sensor shall output an amplified differential pressure signal that is at least 2.5 times the equivalent velocity pressure signal obtained from a conventional pitot tube. The sensor shall develop a differential pressure of 0.03" W.G. at an air velocity of 450 FPM or less. Brass balancing taps and airflow calibration charts shall be provided for field airflow measurements. Terminal shall have access door for inspection and cleaning.

J. Terminal units shall be furnished for integration with the building automation system. Supply VAV terminals shall modulate in accordance with the demand control ventilation sequence in response to associated space CO2 sensors, occupancy inputs, and minimum/maximum airflow setpoints indicated on the Drawings and in the Sequence of Operations. Exhaust VAV terminals shall maintain the scheduled exhaust airflows indicated on the Drawings

K. Provide terminal units with factory-mounted damper actuator and airflow sensor. Provide units suitable for integration with the specified temperature controls system, with controller furnished factory-mounted or by the Temperature Controls Contractor as required by the Controls Section.

L. Terminal units shall be capable of stable operation at the full range of scheduled airflow setpoints, including minimum ventilation and maximum design airflow. Submit certified performance data, sound data, and pressure drop data for each scheduled terminal.Submit radiated and discharge sound power levels in accordance with AHRI 880 for each scheduled terminal.

M. Provide two hours of onsite training for this system after the system is fully operational and prior to turnover. Training shall include terminal operation, BAS interface, airflow setpoint adjustment, maintenance access, and troubleshooting.

2.4 KITCHEN RANGE HOOD EXHAUST SYSTEMS:

A. Type I Exhaust Hood – GREASE LADEN VAPORS: Refer to the Food Service Plans and Specifications.

B. Type II Exhaust Hood – NON-GREASE LADEN VAPORS: Refer to the Food Service Plans and Specifications.

2.5 KITCHEN HOOD EXHAUST FAN

A. Acceptable Manufacturers: Twin City, Greenheck, Cook.

B. Fans shall be direct-drive upblast centrifugal roof exhaust type as scheduled.

C. Type 1 grease hood exhaust fan shall be listed for restaurant exhaust service and shall be UL 762 listed for grease removal and suitable for use with the specified hoods.

D. Provide Type 1 hood exhaust fan with motor enclosure, grease containment/grease box, and all accessories required for listed restaurant exhaust service.

E. Type 2 Hood Exhaust Fans serving Type 2 hood shall be suitable for heat, steam, and non-grease exhaust service and shall be matched to the hood and duct system indicated.

F. Type 1 requirements apply only to fans serving grease exhaust systems. Type 2 requirements apply only to fans serving non-grease hood exhaust systems.

G. Fans shall have aluminum housing, backward-inclined centrifugal wheel, and motor mounted on vibration isolation.

H. Disconnect Switch: Where scheduled, a NEMA 3R disconnect switch shall be supplied with wiring leading from the motor to the junction box (TEFC motors).

I. Accessories: Refer to the drawings for additional requirements.

J. Coordinate fan operation, shutdown, interlocks, and fire suppression interfaces with the Food Service Drawings and Specifications and with the hood manufacturer.

K. Provide a complete hood control system for each hood system, including exhaust fan(s), makeup air VAV box(es), remote control panel, heat sensor interlocks, starters, relays, fusing, and all power/control wiring between indoor and outdoor equipment for a complete operational system. System shall be arranged for single-point connection to a weatherproof control panel unless specifically indicated otherwise. Provide individual disconnect means for each motor. Outdoor control panels shall be NEMA 3R, rain-tight.

L. A recessed stainless steel rangehood remote control panel shall be furnished in location indicated on the drawings. Switches shall be furnished and labeled as follows:
   1. Switch #1 - On/Off – All Hood Lights
   2. Switch #2 - On/Auto – Grease Hood Exhaust Fan (interlock with makeup air VAV boxes)

3. Fan Status Indicator Light
4. Trouble Indicator Light
5. Fire System Trip Indicator Light

M. With Switch #2 in the "ON" position the grease hood exhaust fan and makeup air VAV boxes shall operate continuously. With Switch #2 in the Auto Mode, automatic heat sensors in the hood exhaust collars (one per collar) shall energize the exhaust fan & makeup air VAV boxes when cooking operations occur; with an adjustable set-point of 70 to 85 degrees F. This adjustable controller shall be installed within the rangehood remote control panel and set to 85 degrees F, but not accessible from the face of the panel.

N. Hood supply and exhaust systems shall have final air balance supervised by the hood manufacturer or manufacturer's factory-authorized personnel to obtain maximum performance. Submit air balance report to the Engineer stating final exhaust and supply fan CFM.

O. Fans shall be AMCA certified for air and sound performance.

P. Prior to utilization of equipment, start-up service shall be performed by factory authorized representative. Refer to Specification Section GENERAL PROVISIONS – MECHANICAL for additional requirements.

Q. Through coordination with other Contractors, Vendors and Suppliers associated with this Project, this Contractor shall ensure a complete, 100% functional, tested, inspected and approved system. Refer to Specification Section - ELECTRIC MOTORS, ETC. for additional requirements.

2.6 ELECTRIC UNIT HEATERS

A. Wall-Recessed Cabinet Heaters
1. Acceptable Manufacturers: Indeeco, Markel, QMark, Berko, or approved equal.
2. Units shall be wall-reccessed cabinet unit heaters of sizes and capacities as scheduled, factory assembled and factory tested, with steel cabinet, electric resistance heating elements, and discharge air arrangement as scheduled.
3. Provide with electric resistance heating elements, automatic fan delay, automatic reset thermal cutout, and integral high-limit protection.
4. Provide ECM fan motor and filter arrangement as scheduled, minimum MERV 13 where filter is provided.
5. Controls shall consist of a local line-voltage wall thermostat. Unit shall operate as a standalone heater and shall not require BAS interface unless specifically indicated otherwise.
6. Provide disconnecting means where required by code or where scheduled. Coordinate electrical characteristics and power connection requirements with Division 26.
7. Units shall be UL listed and labeled and installed in accordance with manufacturer's written instructions.

B. Ceiling Mounted Heaters
1. Acceptable Manufacturers: Indeeco, Markel, QMark, Berko, or approved equal.

2. Provide factory-assembled, ceiling-mounted electric fan-forced unit heaters of capacities and arrangements scheduled. Units shall be flat, surface-mounted or recessed-mounted as indicated on the Drawings.
3. Units shall include steel cabinet, electric resistance heating elements automatic fan delay, automatic reset thermal cutout, and integral high-limit protection.
4. Provide ECM fan motor and filter arrangement as scheduled, minimum MERV 13 where filter is provided.
5. Controls shall be by local line-voltage wall thermostat. Units shall operate as standalone heaters and shall not require BAS interface unless specifically indicated otherwise.
6. Units shall be UL listed and labeled and installed in accordance with manufacturer's written instructions.

C. Industrial Suspended Heaters
1. Acceptable Manufacturers: QMark MUH Series, Indeeco, Markel, Berko, or approved equal.
2. Provide factory-assembled industrial suspended electric unit heaters of capacities and arrangements scheduled, suitable for horizontal or vertical discharge as indicated on the Drawings.
3. Units shall include steel cabinet, electric resistance heating elements, totally enclosed fan motor, adjustable discharge louvers, integral fan delay, automatic reset thermal protection, and manual reset high-limit protection.
4. Controls shall be by local line-voltage wall thermostat. Units shall operate as standalone heaters and shall not require BAS interface unless specifically indicated otherwise.
5. Provide wall, ceiling, or suspended mounting brackets as required for a complete installation. Provide disconnecting means where required by code or where scheduled.
6. Units shall be UL listed and labeled and installed in accordance with manufacturer's written instructions.

2.7 AIR SEPARATOR

A. Basis of Design: Bell & Gossett Rolairtrol Model R-8F. Acceptable manufacturers shall be Bell & Gossett or approved equal.

B. Provide centrifugal air separator with integral strainer for closed-loop heating and chilled water systems. Separator shall be designed and constructed in accordance with ASME Section VIII, Division 1, with carbon steel body and baffle and 304 stainless steel strainer. Unit shall be rated for minimum 125 psig working pressure and 350 degrees F maximum operating temperature. Separator shall have a minimum Cv of 1020 and be selected for 790 GPM with maximum pressure drop of 1.38 feet. Separator may be provided with flanged, grooved, threaded, or other piping connection type as required for the piping system and installation conditions. Furnish removable strainer, factory-coated exterior, and all trim and accessories required for a complete installation.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify that required utilities, supports, housekeeping pads, curbs, openings, and service clearances are in place and ready for equipment installation.

B. Beginning of installation shall constitute acceptance of existing conditions and substrates as suitable for proper equipment installation.

3.2 INSTALLATION – UNITARY EQUIPMENT

A. Install equipment in accordance with manufacturer's written instructions, approved submittals, and the Contract Documents.

B. Locate equipment as indicated, level and shim equipment as required, and anchor or support from structure in accordance with manufacturer's recommendations and code requirements.

C. Protect equipment from dirt, dust, moisture, and physical damage during the balance of construction.

D. Verify hose kit orientation, valve package accessibility, condensate trap installation, and overflow shutdown operation for each water-source heat pump.

E. Install vibration isolation devices, seismic restraints, and flexible duct/piping/electrical connections as specified and as required for a complete installation.

F. Verify minimum and maximum airflow settings for all VAV and EVAV terminals and coordinate final setpoints with the approved controls sequences and balancing report

G. Verify that all equipment is installed with required service clearances and access for filter replacement, coil cleaning, valve service, drain pan cleaning, motor service, and controls access.

H. Coordinate point-to-point verification, actuator checkout, sensor calibration, and sequence testing with the Temperature Controls Contractor.

I. For hydronic or water-connected equipment, provide shutoff valves, balancing devices, vents, drains, unions, and accessories as required by the Drawings and related piping Sections. Where vents are concealed and not readily accessible, extend vent connections to an accessible location.

J. Provide condensate drain piping for all equipment requiring drainage. Install traps, cleanouts, auxiliary drains, and overflow safeties in accordance with manufacturer's written instructions and the Drawings. Route condensate to the nearest approved drain location.

K. Submit manufacturer startup reports, field checkout reports, and deficiency/correction logs prior to Substantial Completion.

3.3 INSTALLATION

A. The Mechanical Contractor shall coordinate all installation requirements including unloading, rigging, hoisting, supports, field wiring, piping, ductwork, controls, field assembly, and all other work required for a complete installation.

B. Manufacturer shall furnish all gasketing, sealants, hardware, splice materials, and accessories required for field assembly of multi-section equipment.

C. The Mechanical Contractor shall verify that the following items have been completed prior to scheduling the DOAS manufacturer's final inspection and start up:
   1. All spring-isolated components have had their shipping restraints removed and the components have been leveled.
   2. On all field-joined units, that all interconnections have been completed, i.e., electrical and control wiring, piping, casing joints, bolting, welding, etc.
   3. All hydronic piping connections have been completed and hydrostatically tested and all water flow rates have been set in accordance with the capacities scheduled on the Drawings.
   4. All ductwork connections have been completed and all ductwork has been pressure tested for its intended service.
   5. All power wiring, including motor starters and disconnects, serving the unit has been completed.
   6. All automatic temperature controls, safeties, actuators, sensors, and interlocks have been installed and verified complete.
   7. All dampers are fully operational.
   8. All shipping materials have been removed.
   9. All (clean) filter media has been installed in the units.
   10. Condensate drains, traps, and overflow safeties have been installed and verified operational.
   11. Duct connections to large air-handling equipment shall be flared/transitioned as indicated on the Drawings and coordinated with the equipment manufacturer.

D. The Mechanical Contractor shall level all unit sections in accordance with the unit manufacturer’s instructions. The Mechanical Contractor shall provide and install all necessary permanent shim material to ensure individual sections and entire assembled units are level.

E. Coordinate point-to-point verification, actuator checkout, sensor calibration, and sequence testing with the Temperature Controls Contractor.

F. Verify that all equipment is installed with required service clearances and access for filter replacement, coil cleaning, valve service, drain pan cleaning, motor service, and controls access.

G. After the Mechanical Contractor has provided all water and steam piping connections, ductwork connections, and field control wiring, and Electrical Contractor has provided all the field power wiring, the Mechanical Contractor shall inspect the installation. The Mechanical Contractor shall then perform startup of the equipment.

H. The Automatic Temperature Control (Building Direct Digital Control) Contractor shall present at the job site at the time of the equipment start up.

I. The Mechanical Contractor, shall perform the following tests and services and submit a report outlining the results:
   1. Record date, time, and person(s) performing service.
   2. Lubricate all moving parts.
   3. Check all motor and starter power lugs and tighten as required.
   4. Verify all electrical power connections.
   5. Conduct a start up inspection per the AHU manufacturer's recommendations.
   6. Record fan motor voltage and amperage readings.
   7. Check fan rotation and spin wheel to verify that rotation is free and does not rub or bind.
   8. Check fan for excessive vibration.
   9. Check coupling for proper alignment.
   10. Remove all foreign loose material in ductwork leading to and from the fan and in the fan itself.
   11. Disengage all shipping fasteners on vibration isolation equipment.
   12. Check safety guards to ensure they are properly secured.
   13. Secure all access doors to the fan, the unit and the ductwork.
   14. Switch electrical supply "on" and allow fan to reach full speed.
   15. Physically check each fan at start up and shut down to ensure no abnormal or problem conditions exist.
   16. Check entering and leaving air temperatures (dry bulb and wet bulb) and simultaneously record entering and leaving chilled water temperatures and flow, steam pressures and flow, and outside air temperature.
   17. Verify proper condensate drainage and overflow shutdown operation.
   18. Verify all safeties, alarms, status points, and BAS integration points.
   19. Verify VAV and EVAV airflow modulation and control response.
   20. Verify hood exhaust and makeup air interlocks and automatic heat-sensor operation.
   21. Verify water-source heat pump enable/disable, safeties, and control interlocks.

J. Flush piping systems and clean strainers.

K. Submit manufacturer startup reports, field checkout reports, and deficiency/correction logs prior to Substantial Completion.

3.4 GREASE DUCT LEAKAGE TESTING:

A. Prior to the use or concealment of any portion of the duct system, a duct leakage test shall be performed in the presence of the Code Official. Ducts shall be considered concealed where installed in shafts or covered by coatings or wraps that prevent the ductwork from being visually inspected on all sides. The Contractor shall be responsible to provide the necessary equipment and perform the duct leakage test. A light test or an approved equivalent test method shall be performed to determine that all welded and brazed joints are liquid tight. A light test shall be performed by passing a lamp having a power rating of not less than 100 watts through the entire section of the ductwork to be tested. The lamp shall be open so as to emit light equally in all directions perpendicular to the duct walls. A test shall be performed for the entire duct system, including the hood-to-duct connection. The Contractor, Owner, Architect, Engineer, Test and Balance Contractor and the Equipment Manufacturer shall all be present during the Code Official Inspection(s).

B. Prior to the Code Official Inspection(s), the Contractor and the Equipment Manufacturer shall perform a pre-test on all duct systems to include a flashlight test of the ductwork. Any deficiencies shall be corrected and re-tested prior to the formal inspection(s) by the Code Official.

3.5 HOOD PERFORMANCE TESTING

A. Performance test(s) shall be conducted by the Contractor and witnessed by the Code Official upon completion and before final approval of the installation of the ventilation system serving the commercial kitchen appliances. The test(s) shall verify the rate of exhaust airflow and makeup airflow as required as well as the proper operation of the system. The Contractor shall be responsible to provide the necessary equipment and perform the test including 45 second white smoke candles. The test(s) shall emulate actual cooking conditions with all appliances in operation. The test(s) shall also include validation of the automatic controls systems. The Contractor, Owner, Architect, Engineer, Test and Balance Contractor and the Equipment Manufacturer shall all be present during the Code Official Inspection(s).

B. Prior to the Code Official Inspection(s), the Contractor and the Equipment Manufacturer shall perform pre-test(s) on all hood systems to include smoke bomb testing with 45 second white smoke candles. The pre-test(s) shall emulate actual cooking conditions with all appliances in operation. The test(s) shall also include validation of the automatic controls systems. Any deficiencies shall be corrected and re-tested prior to the formal inspection(s) by the Code Official.

C. Provide four hours of onsite training for the kitchen hood exhaust and control system after building completion and prior to turnover. System shall be fully functional and Owner’s operating staff shall be instructed in normal operation, automatic mode, emergency operation, fire system interfaces, and troubleshooting.

3.6 CLEANING

A. After construction is complete, including painting, clean exposed equipment surfaces. Vacuum clean coils, fan sections, drain pans, and accessible cabinet interiors.

B. Touch-up marred or scratched surfaces of factory-finished cabinets, using finish materials available from manufacturer.

C. Install new final filters after substantial completion activities are complete and prior to Owner occupancy or certificate of occupancy, whichever occurs first.

END OF SECTION

SECTION 233723 - HVAC PUMPS

PART 1 - GENERAL

1.1 RELATED SECTIONS

A. The Contractor's attention is directed to the General and Special Conditions, GENERAL PROVISIONS - MECHANICAL and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. Electric motors shall be furnished with the pumps and shall be of the size and type scheduled or otherwise specified. All motors shall be UL labeled and shall comply with applicable NEMA standard. Motors to be high efficiency type. Refer to Specification Section – ELECTRIC MOTORS, ETC.

1.2 GENERAL REQUIREMENTS

A. Shop drawings shall be submitted as required and shall include complete pump specifications, installation and start-up instructions, current and accurate pump performance curves with the selection points clearly indicated, maintenance data and spare parts lists.

B. Pumps shall be factory tested, cleaned and painted prior to shipment. Size, type, capacity and electrical characteristics are listed in the pump schedule.

C. Insofar as possible, all pumps shall be by the same manufacturer.

D. Submit manufacturer’s product data for each pump type specified, including:
   1. Construction materials and dimensions
   2. Motor data (HP, voltage, phase, enclosure)
   3. Performance ratings and limits
   4. List of standard and optional accessories

E. For condensate pumps, include reservoir capacity, flow rate, head capacity, electrical requirements, and control features.

F. Pumps shall be selected to operate within the Preferred Operating Region (POR) as defined by ANSI/HI 9.6.3.1 and shall not exceed 110% of Best Efficiency Point (BEP) at design conditions.

PART 2 - PUMP TYPES

2.1 PERMANENTLY LUBRICATED INLINE PUMPS

A. Permanently Lubricated Inline Pumps shall be Series PL as manufactured by Bell & Gossett or equal by Taco, Armstrong, Patterson.

B. The pumps shall be of the horizontal permanently lubricated type, specifically designed for quiet operation. Suitable for 225 degrees F operation at 150 PSIG working pressure.

C. Pumps shall be suitable for variable flow operation where scheduled and shall be compatible with variable frequency drives or ECM motors.

D. Coordinate control sequences, safeties, and interlocks with Division 23 controls.

E. The pumps shall have a solid high-strength alloy steel shaft supported by XL11 permanently lubricated sealed precision bearings. Bearings are to be permanently oil lubricated. Pump shaft shall connect to a non-metallic noryl impeller.

F. Pump shall have integral stainless-steel face plate and double-sided stainless-steel neck rings for increased life and seasonal start-up capabilities.

G. Pump volute shall be of cast bronze. The connection style on bronze pumps shall be flanged with isolation valves.

H. The motor shall be isolated from circulating fluid through use of a carbon/silicone seal attached on a stainless-steel shaft sleeve.

I. Motors shall be of an Open Drip-Proof design and shall be non-overloading at any point on the pump curve. Motors shall be UL listed.

J. Pump shall be of a maintenance free design and be capable of operating in variable speed (varying voltage) applications.

2.2 CLOSED COUPLED INLINE PUMPS

A. Closed Coupled Inline Pump shall be Series e90 as manufactured by Bell & Gossett or equal by Taco, Armstrong, Patterson.

B. The pumps shall be of a vertical or horizontal installation type specifically designed for quiet operation. Suitable for 225° F operation at 175 PSIG working pressure. The pump shall be single stage, vertical split case design, all bronze construction. The pump internals shall be capable of being serviced without disturbing piping connections.

C. Pumps shall be suitable for variable flow operation where scheduled and shall be compatible with variable frequency drives or ECM motors.

D. Coordinate control sequences, safeties, and interlocks with Division 23 controls.

E. The pumps shall have a solid SAE1045 steel shaft that is integral to the motor. A non-ferrous shaft sleeve shall be employed to completely cover the wetted area under the seal.

F. The motor bearings shall support the shaft via heavy-duty grease lubricated ball bearings.

G. Pump shall be equipped with a mechanical seal assembly. Seal assembly shall have a brass housing, BUNA bellows and seat gasket, stainless steel spring, and be of a carbon ceramic design with the carbon face rotating against a stationary ceramic face.

H. Pump shaft shall connect to a brass impeller. Impeller shall be hydraulically and dynamically balanced, keyed to the shaft and secured by a locking caps crew or nut.

I. Pump should be designed to allow for true back pull-out access to the pump's working components for ease of maintenance.

J. Pump volute shall be of cast iron design for heating systems or cast brass for domestic water systems. The connection style on cast iron and bronze pumps shall be flanged. Volute shall include gauge ports at nozzles.

K. Motors shall meet scheduled horsepower, speed, voltage, and enclosure design. Motors shall have heavy-duty grease lubricated ball bearings to offset the additional bearing loads associated with the closed coupled pump design. Motors shall be non-overloading at any point on the pump curve and shall meet NEMA specifications.

L. Pump shall be of a maintainable design and for ease of maintenance should use machine fit parts and not press fit components.

M. Each pump shall be factory tested and name-plated before shipment.

N. Pumps shall conform to ANSI/HI 9.6.3.1 standard for Preferred Operating Region (POR).

O. Where pumps are variable flow, provide ECM motors for fractional horsepower applications where available.

2.3 CONDENSATE PUMPS

A. Condensate pumps shall be factory-assembled, automatic, electrically operated units suitable for removal of condensate from cooling coils, fan coil units, heat pumps, and similar equipment.

B. Pumps shall consist of a corrosion-resistant reservoir, pump, motor, float switch, check valve, and discharge connection, all contained within a compact housing.

C. Reservoir shall be constructed of high-impact, corrosion-resistant plastic with a removable cover for inspection and cleaning.

D. Pump shall be centrifugal type with thermally protected motor, suitable for continuous duty. Motor shall be 115V, single phase unless otherwise indicated.

E. Unit shall include an integral float switch to automatically start and stop pump operation based on liquid level. Provide integral high-level safety switch for alarm and/or equipment shutdown interlock.

F. Provide factory-installed check valve on discharge piping connection.

G. Maximum sound level shall not exceed 45 dBA at 3 feet.

H. Acceptable Manufacturers:
1. Little Giant (VCMA Series or approved equal)
2. DiversiTech (CP Series)
3. Hartell

I. Coordinate pump capacity and head with system requirements. Minimum capacity shall be 65 GPH at 1 ft head unless noted otherwise.

J. Provide flexible discharge tubing and route to nearest approved drain location. Coordinate with Division 22.

2.4 END SUCTION BASE MOUNTED PUMPS

A. End Suction Base Mounted Pumps shall be Series e1510 as manufactured by Bell & Gossett or equal by Taco, Armstrong, Patterson.

B. Pumps shall be base mounted, single stage, end suction design with a foot mounted volute to allow servicing of the impeller and bearing assembly without disturbing piping connection. Pump volute shall be Class 30 cast iron with integrally cast pedestal support feet. The impeller shall be cast bronze enclosed type, dynamically balanced, keyed to the shaft and secured by a locking caps crew.

C. The liquid cavity shall be sealed off at the pump shaft by an internally-flushed mechanical seal with ceramic seal seat and carbon seal ring, suitable for continuous operation at 225°F. A replaceable bronze shaft sleeve shall completely cover the wetted area under the seal.

D. Baseplate shall be of structural steel or fabricated steel channel with fully enclosed sides and ends, and securely welded cross members. Grouting area shall be fully open. A flexible type, center dropout design coupler, capable of absorbing torsional vibration, shall be employed between the pump and motor. Coupler shall be shielded by a coupler guard securely fastened to the base. Coupler shall allow for removal of pump's wetted end without disturbing pump volute or movement of the pump's motor and electrical connections.

E. Provide all pumps with neoprene couplers. EPDM shall not be acceptable.

F. Pumps shall be suitable for variable flow operation where scheduled and shall be compatible with variable frequency drives.

G. Coordinate control sequences, safeties, and interlocks with Division 23 controls.

H. Pump Accessories -
   1. Isolation valves at suction and discharge.
   2. Check valve and balancing valve at discharge.
   3. Y-strainer with blowdown at suction.
   4. Flexible pipe connectors at pump connections.
   5. Pressure/temperature gauge ports at suction and discharge.
   6. Air vent at high point of pump casing where applicable.

I. High efficiency motor shall meet NEMA specifications and shall be of the size, voltage and enclosure called for on the plans. Pump and motor shall be factory aligned, and shall be realigned by contractor after installation. Each pump shall be factory tested per Hydraulic Institute standards. It shall then be thoroughly cleaned and painted with at least one coat of high-grade machinery enamel prior to shipment.

J. Provide shaft guard with slotted window. Guard to be removable. Guard to meet ANSI B15.1, Section 8 and OSHA 1910.219 requirements.

K. Align pump and motor shafts and piping connections after setting them on foundations, after grout has been set and foundation bolts have been tightened, and after piping connections have been made.

L. Comply with pump and coupling manufacturers' written instructions.

M. A qualified representative of the pump supplier shall perform the pump alignment prior to start-up of any base mounted separately coupled pump. Adjust alignment of pump and motor shafts for angular and parallel alignment by 1 of 2 methods specified in the H.I.'s Standards for Centrifugal, Rotary & Reciprocating Pumps, "Instructions for Installation, Operation and Maintenance."

N. After alignment is correct, tighten foundation bolts evenly but not too firmly. Fill base plate completely with non-shrink, nonmetallic grout, with metal blocks and shims or wedges in place. After grout has cured, fully tighten foundation bolts.

O. Alignment Tolerances: According to manufacturer's recommendations, but no more than + .005” in the parallel and angular planes. Provide written report to Engineer and Owner from pump supplier indicating alignment procedure and readings from each pump installation

PART 3 – EXECUTION

A. START UP AND COMMISSIONING
   1. Provide manufacturer’s authorized startup for all base-mounted pumps.
   2. Verify rotation, laser alignment, and performance.
   3. Submit startup report to Engineer.
   4. Include manufacturer’s installation instructions, maintenance procedures, and spare parts lists.

END OF SECTION

SECTION 233725 – DIFFUSERS, REGISTERS, GRILLES, & LOUVERS

PART 1 - GENERAL

1.1 RELATED SECTIONS

A. The Contractor's attention is directed to the General and Special Conditions, COMMON WORK RESULTS FOR HVAC and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. Coordinate with Section 23200 SHEET METAL, Section 230995 – TESTING, ADJUSTING, AND BALANCING FOR HVAC, and Section 230553 – IDENTIFICATION FOR HVAC PIPING AND EQUIPMENT.

1.2 SUBMITTALS

A. A. Submit product data for all registers, grilles, diffusers, and louvers including dimensions, materials, finishes, mounting details, and performance data.

B. Submit a complete room-by-room air distribution schedule indicating:
1. Device tag matching drawings.
2. Airflow (CFM).
3. Throw, spread, and drop.
4. Pressure loss.
5. Noise criteria (NC).
6. Mounting height and ceiling type.

C. Performance data shall be based on published manufacturer test data in accordance with ASHRAE 70.

D. Submit color samples for Architect selection.

1.3 QUALITY ASSURANCE

A. Performance ratings shall be based on tests conducted in accordance with ASHRAE Standard 70.

B. Sound ratings shall be based on AHRI 885.

C. Devices shall be selected to meet scheduled airflow, throw, and noise criteria without excessive balancing damper throttling.

PART 2 - PRODUCTS

2.1 REGISTERS, GRILLES AND DIFFUSERS

A. Acceptable R, G & D manufacturers are Titus, Metal Aire, Nailor Industries, Price Industries or Tuttle & Bailey, or approved equal. Shop drawings shall identify and list all characteristics of each device exactly as scheduled herein. Finishes shall be selected by the Architect. If Architect elects not to select color, all colors shall be white. Factory color samples shall be submitted with shop drawings.

B. General Requirements
   1. Provide factory-fabricated devices of steel or aluminum construction.
   2. Devices shall be suitable for the intended application (supply, return, or exhaust).
   3. Provide opposed blade dampers on all supply, return, and exhaust sidewall grilles unless otherwise indicated.
   4. Dampers shall be accessible from face of device unless otherwise approved.
   5. Provide air extractors or equalizing grids where required for performance.

C. Construction
   1. Supply diffusers: Multi-cone, plaque, slot, or linear type as scheduled.
   2. Return/exhaust grilles: Fixed blade, eggcrate, or perforated face as scheduled.
   3. Frames shall be compatible with ceiling systems (lay-in, surface mount, or hard ceiling).
   4. Provide gasketed edges where installed in critical spaces.

D. Finish
   1. Finish shall be factory-applied baked enamel.
   2. Color as selected by Architect. If no selection is made, provide white.

E. Accessories
   1. Plenum boxes for diffusers where required.
   2. Insulated plenums for supply air devices.
   3. Volume control dampers.
   4. Border types compatible with ceiling system.
   5. Blade Scoops as scheduled

2.2 LOUVERS

A. Acceptable louver manufacturers are Ruskin, Greenheck, United Enertech, Arrow or approved equal. Shop drawings shall identify and list all characteristics of each device exactly as scheduled herein.

B. General Requirements
   1. Louvers shall be extruded aluminum construction unless otherwise indicated.
   2. Provide stationary drainable blade type for exterior applications.
   3. Provide bird screens on all exterior louvers.
   4. Provide insect screens where indicated.

C. Performance
   1. Maximum face velocity: 400 fpm for intake louvers unless otherwise indicated.
   2. Maximum pressure drop: 0.10 in. w.g. unless otherwise noted.
   3. Minimum free area: 45%.
   4. Louvers shall be tested in accordance with AMCA 500-L.

D. Accessories
   1. Extended sills.
   2. Blank-off panels where required.
   3. Flanges and mounting frames.
   4. Drain pans.

E. Finish:
   1. Factory-applied fluoropolymer or baked enamel finish.
   2. Color as selected by Architect.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install devices level, aligned, and securely fastened in accordance with manufacturer's instructions.

B. Coordinate installation with ceiling systems and architectural finishes.

C. Install opposed blade dampers and ensure accessibility for balancing.

D. Seal duct connections airtight.

3.2 ADUJSTING

A. Adjust devices during TAB to achieve scheduled airflow and performance.

B. Replace any devices that cannot meet performance requirements.

3.3 PROTECTION

A. Protect devices from damage and contamination during construction.

B. Clean all devices prior to acceptance.

END OF SECTION

SECTION 250000 – AUTOMATIC TEMPERATURE CONTROLS FOR HVAC

PART 1 - GENERAL

1.1 RELATED SECTIONS

A. The Contractor's attention is directed to the General and Special Conditions, 230100 COMMON WORK RESULTS FOR HVAC, and 019113 GENERAL COMMISSIONING REQUIREMENTS and to all other Contract Documents as they apply to this branch of the work. Attention is also directed to all other sections of the Contract Documents which affect the work of this section and which are hereby made a part of the work specified in this section.

B. Refer to Division 22, 23, and 26 along with Division 1 specifications.

1.2 BUILDING AUTOMATION SYSTEM SCOPE AND REQUIREMENTS

A. Sequences of Operation, Control Diagrams and Points Lists are located on the drawings.

B. The controls system for this project shall be a web-based digital controls system. All controllers, control interface hardware, services, installation, warranty, training, etc., shall be included as hereinafter specified. The system shall utilize a network controller and “unitary" controllers. Including such minor details not specifically mentioned or shown, as may be necessary for the complete operation of the system.

C. The Temperature Control Contractor (TCC) shall furnish all labor, materials, equipment, and service necessary for a complete and operating Building Automation System (BAS), utilizing Web Based Direct Digital Controls. All labor, materials, tools, equipment, software, software licenses, software configurations and database entries, interfaces, wiring, tubing, installation, labeling, engineering, calibration, documentation, samples, submittals, testing, commissioning, training services, permits and licenses, transportation, shipping, handling, administration, supervision, management, insurance, temporary protection, cleaning, cutting and patching, warranties, services, and items, even though these may not be specifically mentioned shall be included for the complete, fully functional and commissioned temperature controls system.

D. The TCC shall provide all items, articles, materials, devices, operations or methods listed, mentioned or scheduled on the drawings including all labor, materials, equipment and incidentals necessary and required for their completion to provide a complete and operating temperature control system. This will include connecting to any mechanical equipment furnished with a control interface device and contacting the equipment suppliers and/or manufacturers for information for the proper interface to the equipment being furnished.

E. These apparatuses shall consist of, but not limited to, all necessary thermostats, sensing devices, valves, automatic dampers, damper motors, actuators, (coordinate with automatic dampers, valves, and damper motors furnished with HVAC equipment), and with the necessary accessories for the complete control of all equipment hereinafter specified.

F. Control sequences are specified in this section and on the drawings. Provide all points, sensors, and control equipment required to perform sequences described. Coordinate all dampers with the sheet metal contractor and equipment provider. It is the responsibility of the control contractor to ensure all required dampers in the sequence of operations are provided.

G. Include all required DDC panels with power wiring and cabling for the operation of the controls system. Refer to Electrical Division Specifications for additional requirements.

H. Include complete dashboard, programming, graphics, and display as indicated herein and included on drawings.

I. Accepted Manufacturer's: Trane, Automated Logic. Alerton, Zenergy
   1. Basis of design manufacturer shall be ABS (Alerton)
   2. School Facility Operator shall be able to upload, download, monitor, trend, control and program every input and output in DDC system using existing Alerton control system software and operator workstations. A link to the operator workstation will not be accepted.
   3. DDC system shall interface with the existing Alerton control system to adhere to The School District graphic and programming standards already in-place.
   4. Provide a building automation system to allow all objects as defined by ASHRAE Standard SPC-135A/95 to be sent to the existing School Wide Alerton control system.

J. Controls Contractor shall also include infrastructure as follows
   1. Include all infrastructure necessary to implement the web-based controls system as described in the specifications, including all hardware, servers, required proprietary or non-proprietary software.

K. Web interface software shall support 16 users simultaneously.
   1. PDF control drawings, sequences of operation and control devices shall be loaded on the web server.
   2. All controllers shall be BACnet. Proprietary controllers shall not be used for controlling of any equipment.
   3. Provide programming tools for setting up and modifying web server.

L. The TCC shall have an established working relationship with the control manufacturer of not less than five years and shall have prior approval from the Owner and are the only allowed supplier and/or installing contractor. The TCC shall have a local office within 100 miles of the project site and provide service and/or replacement parts within a 24-hour notification of a control failure.

M. A mandatory pre-installation meeting shall occur prior to the TCC beginning any work on site. This meeting shall be attended minimally by the Construction Manager, mechanical contractor superintendent, TCC superintendent, Owner, Design Team, and Commissioning Agent. The purpose of the meeting is to have the controls installer communicate their understanding of the system design and how the system is intended operate to the Engineer and get the Engineer's input and agreement. The agreement between the TCC and the mechanical engineer is to be thoroughly documented by the TCC for later reference.

N. The installation shall comply with the Local Authorities and State Fire Marshal code requirements, including normal operating and smoke mode functions (where applicable). The

installation shall comply with the requirements of the NEC, NFPA, UL and the Building Codes, including referenced mechanical, electrical, energy codes, etc.

O. The TCC shall list the following cost breakdowns, material and labor, on the official project schedule of values:
   1. Controls Shop Drawings
   2. Controls Materials & Labor
   3. Controls Power Sub-Metering, Startup, Testing, Documentation, etc.
   4. Controls Graphics
   5. Controls Startup, Testing, Documentation, etc.
   6. Controls Training and Acceptance

PART 2 - SYSTEM REQUIREMENTS

2.1 GENERAL

A. All labeling for this system shall utilize actual final room names and numbers. The room names and numbers on the Contract Documents may not be the Owner's exact requirements. Coordinate with the Owner to ensure compliance.

B. Include in the bid for the Controls Contractor to perform additional 40 on-site hours of on-site programming, adjustments, modifications, etc. as requested by the Engineer during the warranty period after the date of substantial completion for the project.

C. All points of user interface shall be on standard PCs that do not require the purchase of any special software from the control's manufacturer for use as a building operation terminal. The primary point of interface on these PCs will be a standard Web Browser.

D. The intent of this specification is to provide a peer-to-peer networked, stand-alone, distributed control system integrated utilizing ANSI/ASHRAE Standard 135-2001 BACnet, LON Works technology, OBIX TCP/IP, MODBUS, OPC, and other open and proprietary communication protocols in one open, interoperable system

E. The TCC shall connect to any mechanical and electrical (power monitoring) equipment furnished with a control interface device. The TCC shall contact the equipment suppliers and/or manufacturers for information for the proper interface to the equipment being furnished. All points not provided with the equipment control interface are the responsibility of the TCC.

F. The operating system shall be based on a distributed control system in accordance with specifications. All building controllers, application controllers and all input/output devices shall communicate via BACnet MS/TP communication protocol. Network controller shall communicate via BACnet over Ethernet (IP).

G. The TCC contractor shall provide access to the system from a location determined by the Owner and from the Consulting Engineer's office (CMTA, Inc.). This shall include remote access requirements, set-up, passwords and any software necessary to access the BAS system.

H. The TCC shall all have access to various types of WEB browsers (i.e. Netscape, IE, etc.), which shall be included for access to the Direct Digital Control (DDC) system via the Owner's Wide Area Network (WAN) and/or Local Area Network (LAN).

I. The TCC shall be responsible for coordination with the Owner's IT staff to ensure that their system will perform in the Owner's environment without disruption to any of the other activities taking place on that WAN/LAN.

J. The Facility Management Control system (FMCS) shall be comprised of a network of interoperable, stand-alone digital controllers, a computer system, graphical user interface software, printers, network devices and other devices as specified herein.

K. The installed system shall provide secure password access to all features, functions and data contained in the overall FMCS.

PART 3 - SPECIAL PROJECTS

3.1 REQUIREMENTS

A. The controls system shall consist of a new Network Controller (UNC) with a standalone network backbone. All new unitary controllers will be connected to the new UNC. Provide a dual data drop at the new UNC located within the main mechanical room and at other locations as indicated on the plans. Prior to the bid, coordinate this scope with the appropriate sub-contractor(s)/vendor(s) to insure a complete, working system.

B. It will be the responsibility of the TCC to implement this project onto the school district/town master B.M.S. with no damage to the existing projects. Any computer connected to the WAN, utilizing a web browser and having the proper password shall be able to communicate with the Owner's DDC system.

C. System shall include Network and Unitary controllers.

D. The control system shall include a facility management system described as follows:

1. The Facility Management and Control System (FMCS) shall be comprised of Network Area Controller or Controllers (NAC) within each facility. The NAC shall connect to the owner's local or wide area network, depending on configuration. Access to the system, either locally in each building, or remotely from a central site or sites, shall be accomplished through standard Web browsers, via the Internet and/or local area network. Each NAC shall communicate to LonMark/LonTalk (IDC) and/or BACnet (IBC) controllers and other open and legacy protocol systems/devices provided under Mechanical Division or Electrical Division.
2. The Facility Management and Control System (FMCS) as provided in the Division shall be based on the Niagara Framework (or "Niagara"), a Java based framework developed by Tridium. Niagara provides an open automation infrastructure that integrates diverse systems and devices (regardless of manufacturer, communication standard or software) into a unified platform that can be easily managed in real time over the internet using a

standard Web browser. Systems not developed on the Niagara-Framework platform are unacceptable.

PART 4 - SUBMITTALS

4.1 REQUIREMENTS

A. The TCC shall not start the project installation until the shop drawing submittals have been reviewed by the Engineer. Submittals shall include custom graphics template and floor plans to be used for this project.

B. Submittals shall include hardware, end devices, ancillary control components, a written operating sequence, unitary control wiring, building floor plans showing communication cabling and labels as well as logic flow diagrams. All submittals shall be provided on paper and electronically in PDF format.

C. Submittals shall contain one control drawing per specified system and equipment. Drawing shall include point descriptors (DI, DO, AI, AO), addressing, and point names. Each point names shall be unique (within a system and between systems). For example, the point named for the mixed air temperature for AHU #1, AHU #2, and AHU #3 shall not be MAT but should be named AHU#1MAT, AHU#2MAT, and AHU#3MAT. The point names should be logical and consistent between systems and AHU's. The abbreviation or short hand notation (e.g., MAT) shall be clearly defined in writing by the TCC.

D. Control diagrams shall identify: System being controlled (attach abbreviated control logic text, all digital points, analog points, virtual points, all functions (logic, math, and control) within control loop, legend for graphical icons or symbols, definition of variables or point names and detailed electric connections to all control devices and sensors.

E. Points list shall include all physical input/output. Points list shall be provided in both hard copy and in electronic format and shall include: Name, address, engineering units, high and low alarm values and alarm differentials for return to normal condition, default value to be used when the normal controlling value is not reporting, message and alarm reporting as specified, identification of all adjustable points and description of all points.

F. Submittals shall contain floor plans depicting DDC control devices (control units, network devices, LAN interface devices, and power transformers as well as static pressure sensor in duct and temperature sensors in rooms) in relation to mechanical rooms, HVAC equipment, and building footprint.

G. Submittals shall contain DDC system architecture diagram indicating schematic location of all control units, workstations, LAN Interface devices, gateways, etc. Indicate address and type for each control unit, Indicate protocol, baud rate, and type of LAN per control unit.

H. Electrical wiring diagrams shall include motor start, control, and safety circuits and detailed digital interface panel control point termination diagrams with all wire numbers and terminal block numbers identified. Indicate all required electrical wiring. Provide panel termination

drawings on separate drawings. Clearly differentiate between portions of wiring that are existing, factory-installed and portions to be field-installed.

I. Show all electric connections of the controls system to equipment furnished by others complete to terminal points identified with manufacturer's terminal recommendations.

J. TCC shall provide one complete drawing that shows the control-wiring interface with equipment provided by others.

K. Submittals shall include project specific graphic screens for each system including a picture of the screen with a list of the variables to be placed on the screen.

L. Submittals shall include complete dashboard graphics and equipment.

M. Submittals shall include TCC's hardware checkout sheets and test reports.

N. Submittals shall include the agenda for approval by the engineer and owner of the specified training periods. See training section for requirements.

O. Provide complete panel drawings that are:
   1. Clearly labeled and schematic or drawn to scale.
   2. Show the internal and external component arrangement so that the operators can identify the components by their position if the labels come off.
   3. Wiring access routes shall also be identified so that Class 1 wiring is separated from Class 2 and 3 and so high voltage wiring is segregated from low voltage wiring.
   4. Complete identification of all control devices (manufacturer's type, number, and function).
   5. Provide details for labeling all wiring, control devices, and controllers.
   6. Material and equipment descriptive material such as catalog cuts, diagrams, performance curves, and other data to demonstrate conformance with specifications shall be provided.

P. Include room schedule including a separate line for each terminal unit, heat pump, etc. indicating location and address.

Q. Include control valve schedules including a separate line for each valve provided under this section and a column for each of the valve attributes: code number, configuration, fail position, pipe size, valve size, body configuration, close-off pressure, capacity, valve Cv, design pressure, and actuator type.

R. Include control damper schedule including a separate line for each damper provided under this section and a column for each of the damper attributes, including: code number, fail position, damper type, damper operator, duct size, damper size, mounting, and actuator type.

PART 5 - O&M MANUALS AND CLOSEOUT DOCUMENTS:

5.1 RELATED SECTIONS

A. Refer to Mechanical Specification Section 230300– SHOP DRAWINGS, MAINTENANCE MANUALS, AND PARTS LIST for additional requirements.

5.2 REQUIREMENTS

A. Operating instructions, maintenance procedures, parts and repair manuals shall be supplied. Repair manuals shall include detailed instructions in the setup, calibration, repair and maintenance of all equipment furnished. Also supplied with these manuals will be a complete parts listing of all devices supplied which is to include part numbers and model numbers of all parts and component parts along with exploded views of devices.

B. All as built drawings (wiring diagrams, flowcharts, floor plans, etc.) shall also be supplied to the owner electronically in PDF format.

C. System specific wiring, control diagrams, sequence of operation and points lists shall be as installed in each control panel. This means as-built drawings, not design (submittal) drawings.

D. Supply all software necessary for configuration of, modification, editing or communicating to any of the unitary devices. Software shall be capable of uploading and down-loading the entire unitary data base or any part of the automated system for backup or archiving.

E. Supply one copy of the software programming manual (hard copy and PDF format). The manual shall describe all furnished software. The manual shall be oriented to programmers and shall describe calling requirements, data exchange requirements, data file requirements, and other information necessary to enable proper integration, loading, testing, and program execution.

F. Provide a Bill of Materials with each schematic drawing. List all devices/equipment and match to schematic and actual field labeling. Provide quantity, manufacturer, actual product ordering number, description, size, accuracy, operating ranges (voltage, temperature, pressure, etc.), input/output parameters, etc.

G. Maintenance manual shall include copies of signed-off acceptance test forms, commissioning reports, start-up reports, etc.

H. The TCC shall turn over to owner two (2) sets of computerized back-ups of the complete temperature control system.

PART 6 - WARRANTY & SOFTWARE LICENSES

6.1 REQUIREMENTS

A. Labor and materials for the control system specified shall be warranted free from defects for a period of 24 months after substantial completion and acceptance. Control system failures during the warranty period shall be adjusted, repaired, or replaced at no additional cost or reduction in service to the Owner.

B. The TCC shall respond to the Owner's request for warranty service within 24 hours during normal business hours. The TCC shall respond to the Owner's request for Emergency service (defined as life-threatening or creating the potential to cause property damage) during the warranty period within 4 hours.

C. The TCC shall provide technical phone support to the owner during the warranty period for warranty related issues and for two years after the warranty period. If the technical support location of the TCC is outside of the toll-free calling area for the customer, the TCC shall have a toll-free number or accept collect calls for the purpose of providing technical support.

D. During the warranty period, standard parts for the DDC system shall arrive at the facility within 48 hours of placing an order. Non-standard parts (requiring re-manufacturing or ordering from another supplier) shall be shipped within 96 hours.

E. Operator workstation software, project-specific software, graphic software, database software, and firmware updates which resolve known software deficiencies as identified by the TCC shall be provided and correctly installed at no charge during the warranty period.

F. Provide licensed electronic copies of all software for each workstation, laptop, server. This includes, but is not limited to: project graphic images (editing/modifying/creating), project database, trouble-shooting and debugging programs, project-specific programming code and all other software required to operate and modify the programming code (including software at system level, primary control units, secondary control units, and all communication software). Any hardware devices (cables, protection devices) required to operate the software/hardware shall also be provided.

G. All additional licensing needed for this project shall be supplied by TCC. Software license shall not expire or utilize any sort of protection hardware device for its use. In any case owner shall be free to direct the modification of any software license, regardless of supplier to allow open access to all controllers. Owner shall hold the software and firmware licensing. Software license shall not expire or utilize any sort of protection hardware device for its use.

H. System software shall be the latest version available with upgrades provided at the end of the warranty period, and shall be fully licensed to the Owner for the entire system. Supply all software necessary for configuration of, modification, editing or communicating to any of the unitary devices. Software shall be capable of uploading and down-loading the entire unitary data base or any part of the automated system for backup or archiving.

I. Facility Management Software:
   1. The Owner shall sign a copy of the manufacturer's standard software and firmware licensing agreement as a condition of this contract. Such license shall grant use of all programs and application software to Owner as defined by the manufacturer's license agreement, but shall protect manufacturer's rights to disclosure of trade secrets contained within such software.
   2. It is the owner's express goal to implement an open system that will allow products from various suppliers to be integrated into a unified system in order to provide flexibility for expansion, maintenance, and service of the system. The Owner shall be the named license holder of all software associated with any and all incremental work on the project(s). In addition, the Owner shall receive ownership of all job specific configuration documentation, data files, and application-level software developed for the project. This shall include all custom, job specific software code and documentation for all configuration and programming that is generated for a given project and/or configured for use with the NAC, FMCS Server(s), and any related LAN / WAN / Intranet and Internet connected routers and devices.
   3. Any and all required IDs and passwords for access to any component or software program shall be provided to the owner. The owner shall determine which organizations to be named in the SI organization ID ("orgid") of all software licenses. Owner shall be free to direct the modification of the "orgid" in any software license, regardless of supplier, by Tridium Inc.

PART 7 - TRAINING

7.1 REQUIREMENTS

A. A formal on-site "Hands On" training session shall be conducted for the owner's maintenance personnel. This shall be a minimum of five (5) sessions at six (6) hour each to train the staff on setup, operation, and maintenance of all system(s) and/or devices. This will be at a time and location selected by the Owner at any time within the project construction or warranty period. All training materials and books shall be provided. All sessions shall be given by the manufacturer's "factory" technical representative. (This is defined as someone other than the installing contractor's representative.) All expenses are to be provided by the TCC. All training sessions shall be scheduled at Owner's request.

B. TCC shall conduct training courses for designated personnel in operation and maintenance of system. Training shall be oriented to specific system being installed under his contract and shall be digitally recorded and submitted on flash drive by the TCC.

C. Training shall be a mix of, test exercises, and actual keyboard entry and screen viewing at the operator's terminal. A curriculum shall be discussed and implemented based on the level of expertise of the employees. Hands-on experience and problem solving shall be emphasized.

D. If during any training session, the trainer/owner finds more than three (3) items that need repair, the training session will be immediately terminated. The session will be rescheduled for another date. The re-scheduled training session will be carried out at no additional cost to the Owner.

E. The training shall be oriented to making the owner self-sufficient in the day-to-day use and operation of the DDC system.

F. Additionally, the training shall include:
1. System start-up, shutdowns, power outage and restart routines, alarms, security levels, changing setpoints, changing schedules and other parameters, overrides, freeze protection, manual operation, return to automatic operation, and resetting equipment.
2. All screens shall be discussed, allowing time for questions.
3. Information specifically focused on showing the owner methods of troubleshooting the mechanical systems using the DDC.
4. Use of laptop and hand-held operator interface device, if applicable.
5. Creating, modifying, viewing, downloading, and reloading, trend logs.
6. Remote access to the system.
7. The other training sessions shall be oriented toward answering specific questions from Owner's staff.
8. The trainer must be well grounded in both DDC system operation and in mechanical systems service and shall be the programmer.

PART 8 - COMMISSIONING & VERIFICATION, FUNCTIONAL PERFORMANCE TESTING & CHECKLISTS

8.1 REQUIREMENTS

A. 100% compliance with the requirements of this section is a condition of the Owner's acceptance and start of the warranty period.

B. The TCC shall be responsible for completion of (1) their hardware checkout sheets and test reports, (2) Point-by-point confirmations of ALL points – this includes visual inspection of installed components, and (3) sequence of operation confirmation.

C. This documentation and process shall be complete, approved and accepted by Engineer and Owner prior to acceptance. This information shall be documented as completed. A copy shall be delivered to the Engineer and Owner and included in the O&M manuals. Each subcontractor shall be responsible for completion of their own System Verification Checklists/Manufacturer's Checklists. Sample checklists shall be submitted to the Engineer and Testing Agent for approval.

D. Air and water balancing shall be completed (and discrepancies resolved) before the TCC's final system check and before the acceptance test to be conducted in the presence of the Engineer.

E. Refer to Mechanical Specification Section – COMMON WORK RESULTS FOR HVAC for additional information and requirements.

PART 9 - WIRE MANAGEMENT, ELECTRICAL POWER, ETC

9.1 RELATED SECTIONS

A. Refer to 260010 – GENERAL REQUIREMENTS FOR ELECTRICAL SYSTEMS and 260500 – COMMON WORK RESULTS FOR ELECTRICAL SYSTEMS section of this specification for additional requirements.

9.2 REQUIREMENTS

A. Electrical work required for system interlock and installation of the temperature control system shall be included in the bid and installed per all applicable codes. Coordinate with other trades as required for installation of a complete system.

B. All wiring and cabling in tunnels, crawlspaces, mechanical and electrical rooms shall be in conduit or MC cable. No wiring or conduit can be exposed to view in any other area. Conceal all wiring and cabling in conduit (or MC Cable) in wall from thermostats or other controls devices to above ceiling. Install conduit in wall from wall thermostats to above ceiling for cabling. Route wiring directly to cable tray from control points above the ceiling. Rough-in for control devices shall be in compliance with the requirements of the ELECTRICAL SPECIFICATIONS.

C. Any power for controls shall be fed from dedicated circuits in emergency electrical panels, when provided for a project, and shall not be obtained from receptacles, lighting, or equipment circuits. Unitary control power may be obtained from the equipment served. If power is obtained from the equipment served, the power may not be interrupted to the electronics if the equipment is off for any reason.

D. The TCC shall be responsible for the power source to any control panels, unitary controllers, etc. on any controlled equipment and all other control power requirements. This includes circuit breakers, wiring, conduit, etc. installed in strict accordance with NEC. The TCC may contract with the electrical contractor for the power wiring installation.

E. Prior to installation, ensure coordination with all trades, that appropriate clearances (36” minimum) as required by the N.E.C. are maintained at all control panels, including unitary controllers for VAV terminals, heat pumps, etc.

F. The TCC shall provide all CAT6 cabling network cabling for a complete system. This shall include cabling to the Owner’s data drop. The main system data drop will be provided by others.

G. All control circuits within the electrical panels shall be marked to indicate equipment served.

H. The TCC shall perform all temperature control interlock wiring. This shall include control valves, dampers, thermostats, indoor/outdoor HVAC systems, etc. Electrical work required for system interlock and installation of the temperature control system shall be included in the bid

and installed per all applicable codes. Coordinate with other trades as required for installation of a complete system.

I. The TCC shall be responsible for any power required for the unitary controls or control panels. This includes circuit breakers, wiring, conduit, etc. installed in strict accordance with NEC. The TCC may contract with the electrical contractor for the power wiring installation.

J. Provide one duplex outlet mounted inside the control panel and separately fused with a non-time delay fuse at 15 A at any panel location containing electronic control components. This receptacle may be served from the control panel 120 VAC power source.

K. All wiring shall be continuous runs. Any junctions must be made in metal enclosure.

L. Grounding terminals shall be color coded green and yellow and shall be compatible with the other specialty terminals specified above and shall mount on the same DIN rail system. Units shall be arranged so that the wiring connected to them is grounded to the enclosure via the mounting rail. These terminals shall be provided for grounding cable shields at the points where the cables enter a control panel and terminate on the control panel terminal strip. Terminals shall be Entrelec M 4/5.3A. PI or equivalent by Weidmuller, Phoenix, or Allen Bradley.

M. Contractor shall insure control panels have an identification label stating the "Certification Agency" such as UL, CE, etc. or a label of certification for each control panel by a Professional Engineer (P.E.) stating that the design of the control panel was under their direct supervisory control. Include with shop drawings.

N. An electrical contractor licensed by the State of Connecticut with a licensed Master Electrician and a licensed on-site electrician can install the electrical wiring for lighting controls systems or Building Automation Systems (BAS).

PART 10 - CABLING

10.1 RELATED SECTIONS

A. Refer to 260010 – GENERAL REQUIREMENTS FOR ELECTRICAL SYSTEMS and 260500 – COMMON WORK RESULTS FOR ELECTRICAL SYSTEMS section of this specification for additional requirements.

10.2 REQUIREMENTS

A. All control wiring shall be installed in a wire management system to include cable trays, bridle rings, & conduits. No exceptions! Coordinate with electrical contractor to insure a complete wire management system.

B. Acceptable cable manufacturers are Belden, West Penn or Alpha.

C. A complete cabling system shall be furnished and installed, which shall adhere to the highest workmanlike standard of quality and appearance. Cabling shall be installed square with building lines and contained within a wire management system.

D. All sizing of cabling shall be according to manufacturer's recommendations, but shall be a minimum of 18 AWG.

E. Furnish a floor plan of the building indicating communication cable labeling and routing as well as addresses and branch wiring from the unitary devices. All cabling shall be labeled on both ends. The type, size and label of all cabling shall be indicated on submittal floor plan drawings.

F. Wall space temperature sensor cabling (from the sensor to the unitary controller) shall be a minimum of two conductor communicating type.

G. All cabling shall be stranded. "NO" solid conductors will be accepted. All cabling shall be 100% shielded with appropriate drain wire and insulation.

H. All cable connections shall be continuous run (including shield). Any junctions must be made in a metal enclosure, connections must be soldered, taped and the metal enclosure must be mechanically attached to the nearest ground. No wire nuts or crimped connections will be accepted. Note location of junction boxes on the as built floor plans. All cabling networking unitary controllers, and other networked equipment, shall be in soldered.

I. All shields must be terminated as per manufacturer's recommendation. Shield termination requirements by the manufacturer must be provided with submittals.

J. Wireless controllers are not approved unless specifically mentioned in the sequence of operations or noted on plans.

PART 11 - SYSTEM SOFTWARE

11.1 RELATED SECTIONS

A. System software will be the latest version available with upgrades provided for full warranty period, and shall be fully licensed to the owner for all network controllers and servers. Refer to WARRANTY section of this specification for additional requirements.

11.2 REQUIREMENTS

A. The BAS shall include trend logging screens accessible from tabs on the home page for building utilities usage.

B. System software shall, at a minimum, provide:
   1. Monitor and supervise all control points.
   2. Add new points and edit system database.
   3. Change control setpoints, timing parameters and loop tuning of PID coefficients in all control loops in all control units.

4. Enter programmed start/stop schedules.
5. View alarm and messages.
6. Modify existing control logic (or sequence of operation) in all control units.
7. Upload/Download programs, databases, control parameters, etc.
8. Modify graphic screens.

C. Sequence of operation programming methodology - The application software shall be user programmable. Application programming shall be (1) Line type programming that uses text programming in a language similar to BASIC or FORTRAN, or (2) graphical block programming - The method of programming shall be by manipulation of graphic icon "blocks." Each block represents a subroutine containing the programming necessary to execute the function of the device that the block represents.

D. Unitary Control Unit Database Archiving - The host software shall provide capability to upload sequence of operation, database, and other control parameters from each controller. Uploaded programs shall be retained on hard disk for system backup. Programs may be modified using Editor functions, and downloaded to individual controllers as desired. Downloading of databases shall not interrupt other multi-tasked functions that are ongoing.

E. Third Party Software Packages - The host software shall provide the capacity to run third party software packages for word processing, spreadsheets, or database management programs. Use of third-party software shall not suspend operation of background tasks of multi-tasking operating system, such as alarm logging, and report generation.

PART 12 - OPEN, INTEROPERABLE, INTEGRATED ARCHITECTURES

12.1 GENERAL INFORMATION

A. The intent of this specification is to provide a peer-to-peer networked, stand-alone, distributed control system with the capability to integrate ANSI/ASHRAE Standard 135-2001 BACnet, Lon Works technology, MODBUS, OPC, and other open and proprietary communication protocols in one open, interoperable system.

12.2 REQUIREMENTS

A. The supplied computer software shall employ object-oriented technology (OOT) for representation of all data and control devices within the system. In addition, adherence to industry standards including ANSI / ASHRAE™ Standard 135-2001, BACnet and LonMark to assure interoperability between all system components is required. For each Lon Works device that does not have LonMark certification, the device supplier must provide an XIF file and a resource file for the device. For each BACnet device, the device supplier must provide a PICS document showing the installed device’s compliance level. Minimum compliance shall support the ability to support data read and write functionality and those features as specified. Physical connection of BACnet devices shall be via Ethernet (BACnet Ethernet/IP,) and/or RS-485 (BACnet MSTP) as specified.

B. All components and controllers supplied under this Division shall be true “peer-to-peer” communicating devices. Components or controllers requiring “polling” by a host to pass data shall not be acceptable.

C. The supplied system must incorporate the ability to access all data using standard Web browsers without requiring proprietary operator interface and configuration programs. An Open Database Connectivity (ODBC) or Structured Query Language (SQL) compliant server database is required for all system database parameter storage. This data shall reside on a supplier-installed server for all database access. Systems requiring proprietary database and user interface programs shall not be acceptable.

D. A hierarchical topology is required to assure reasonable system response times and to manage the flow and sharing of data without unduly burdening the customer’s internal Intranet network. Systems employing a “flat” single tiered architecture shall not be acceptable.
   1. Maximum acceptable response time from any alarm occurrence (at the point of origin) to the point of annunciation shall not exceed 5 seconds for network connected user interfaces.
   2. Maximum acceptable response time from any alarm occurrence (at the point of origin) to the point of annunciation shall not exceed 60 seconds for remote or dial-up connected user interfaces.

PART 13 - NETWORKS

13.1 REQUIREMENTS

A. The Local Area Network (LAN) shall be a minimum 100 Megabits/sec Ethernet network supporting BACnet, Java, XML, HTTP, and SOAP for maximum flexibility for integration of building data with enterprise information systems and providing support for multiple Network Area Controllers (NACs), user workstations and, if specified, a local server.

B. Local area network minimum physical and media access requirements:
   1. Ethernet; IEEE standard 802.3
   2. Cable; 100 Base-T, UTP-8 wire, category 6
   3. Minimum throughput; 100 Mbps.

PART 14 - NETWORK ACCESS

14.1 REQUIREMENTS

A. For Local Area Network installations, provide access to the LAN from a remote location, via the Internet. The Owner shall provide a connection to the Internet to enable this access via high speed cable modem, asynchronous digital subscriber line (ADSL) modem, ISDN line, T1 Line or via the customer’s Intranet to a corporate server providing access to an Internet Service Provider (ISP). Customer agrees to pay monthly access charges for connection and ISP.

B. The Network Area Controller (NAC) shall provide the interface between the LAN or WAN and the field control devices, and provide global supervisory control functions over the control

devices connected to the NAC. It shall be capable of executing application control programs to provide:

1. Calendar functions
2. Scheduling
3. Trending
4. Alarm monitoring and routing
5. Time synchronization
6. Integration of Lon Works controller data, BACnet controller data, and any device connected through an optional software driver installed in the NAC
7. Network Management functions for all Lon Works based devices

PART 15 - GRAPHICAL USER INTERFACE SOFTWARE

15.1 REQUIREMENTS

A. Provide PC based work station, Intel multiple core, 3 GHz minimum utilizing solid-state hard drive and 8 GB ram; Include 24" minimum monitor.

B. The GUI shall operate on Microsoft Windows XP Professional.

C. The GUI shall employ browser-like functionality for ease of navigation. It shall include a tree view (similar to Windows Explorer) for quick viewing of, and access to, the hierarchical structure of the database. In addition, menu-pull downs, and toolbars shall employ buttons, commands and navigation to permit the operator to perform tasks with a minimum knowledge of the HVAC Control System and basic computing skills. These shall include, but are not limited to, forward/backward buttons, home button, and a context sensitive locator line (similar to a URL line), that displays the location and the selected object identification.

D. Real-Time Displays. The GUI, shall at a minimum, support the following graphical features and functions:

1. Graphic screens shall be developed using any drawing package capable of generating a GIF, BMP, or JPG file format. Use of proprietary graphic file formats shall not be acceptable. In addition to, or in lieu of a graphic background, the GUI shall support the use of scanned pictures.
2. Graphic screens shall have the capability to contain objects for text, real-time values, animation, color spectrum objects, logs, graphs, HTML or XML document links, schedule objects, hyperlinks to other URL’s, and links to other graphic screens.
3. Graphics shall support layering and each graphic object shall be configurable for assignment to a layer. A minimum of six layers shall be supported.
4. Modifying common application objects, such as schedules, calendars, and set points shall be accomplished in a graphical manner.
    a. Schedule times will be adjusted using a graphical slider, without requiring any keyboard entry from the operator.
    b. Holidays shall be set by using a graphical calendar without requiring any keyboard entry from the operator.
5. Commands to start and stop binary objects shall be done by right-clicking the selected object and selecting the appropriate command from the pop-up menu. No entry of text shall be required.

6. Adjustments to analog objects, such as set points, shall be done by right-clicking the selected object and using a graphical slider to adjust the value. No entry of text shall be required.

E. System Configuration. At a minimum, the GUI shall permit the operator to perform the following tasks, with proper password access:
1. Create, delete or modify control strategies.
2. Add/delete objects to the system.
3. Tune control loops through the adjustment of control loop parameters.
4. Enable or disable control strategies.
5. Generate hard copy records or control strategies on a printer.
6. Select points to be alarmable and define the alarm state.
7. Select points to be trended over a period of time and initiate the recording of values automatically.

F. On-Line Help. Provide a context sensitive, on-line help system to assist the operator in operation and editing of the system. On-line help shall be available for all applications and shall provide the relevant data for that particular screen. Additional help information shall be available through the use of hypertext. All system documentation and help files shall be in HTML format.

G. Security. Each operator shall be required to log on to that system with a user name and password in order to view, edit, add, or delete data. System security shall be selectable for each operator. The system administrator shall have the ability to set passwords and security levels for all other operators. Each operator password shall be able to restrict the operators' access for viewing and/or changing each system application, full screen editor, and object. Each operator shall automatically be logged off of the system if no keyboard or mouse activity is detected. This auto log-off time shall be set per operator password. All system security data shall be stored in an encrypted format.

H. System Diagnostics. The system shall automatically monitor the operation of all workstations, printers, modems, network connections, building management panels, and controllers. The failure of any device shall be annunciated to the operator.

I. Alarm Console
1. The system will be provided with a dedicated alarm window or console. This window will notify the operator of an alarm condition, and allow the operator to view details of the alarm and acknowledge the alarm. The use of the Alarm Console can be enabled or disabled by the system administrator.
2. When the Alarm Console is enabled, a separate alarm notification window will supersede all other windows on the desktop and shall not be capable of being minimized or closed by the operator. This window will notify the operator of new alarms and un-acknowledged alarms. Alarm notification windows or banners that can be minimized or closed by the operator shall not be acceptable.

PART 16 - WEB BROWSER CLIENTS

16.1 FEATURES AND USER EXPERIENCE

A. The system shall be capable of supporting an unlimited number of clients using a standard Web browser such as Internet Explorer™ or Netscape Navigator™. Systems requiring additional software (to enable a standard Web browser) to be resident on the client machine, or manufacture-specific browsers shall not be acceptable.

B. The Web browser software shall run on any operating system and system configuration that is supported by the Web browser. Systems that require specific machine requirements in terms of processor speed, memory, etc., in order to allow the Web browser to function with the FMCS, shall not be acceptable.

C. The Web browser shall provide the same view of the system, in terms of graphics, schedules, calendars, logs, etc., and provide the same interface methodology as is provided by the Graphical User Interface. Systems that require different views or that require different means of interacting with objects such as schedules, or logs, shall not be permitted.

D. The Web browser client shall support at a minimum, the following functions:
   1. User log-on identification and password shall be required. If an unauthorized user attempts access, a blank web page shall be displayed. Security using Java authentication and encryption techniques to prevent unauthorized access shall be implemented.
   2. Graphical screens developed for the GUI shall be the same screens used for the Web browser client. Any animated graphical objects supported by the GUI shall be supported by the Web browser interface.
   3. HTML programming shall not be required to display system graphics or data on a Web page. HTML editing of the Web page shall be allowed if the user desires a specific look or format.
   4. Storage of the graphical screens shall be in the Network Area Controller (NAC), without requiring any graphics to be stored on the client machine. Systems that require graphics storage on each client are not acceptable.
   5. Real-time values displayed on a Web page shall update automatically without requiring a manual “refresh” of the Web page.
   6. Users shall have administrator-defined access privileges. Depending on the access privileges assigned, the user shall be able to perform the following:
      a. Modify common application objects, such as schedules, calendars, and set points in a graphical manner.
      b. Schedule times will be adjusted using a graphical slider, without requiring any keyboard entry from the operator.
      c. Holidays shall be set by using a graphical calendar, without requiring any keyboard entry from the operator.
      d. Commands to start and stop binary objects shall be done by right-clicking the selected object and selecting the appropriate command from the pop-up menu. No entry of text shall be required.
      e. View logs and charts
      f. View and acknowledge alarms
      g. Setup and execute SQL queries on log and archive information

7. The system shall provide the capability to specify a user's (as determined by the log-on user identification) home page. Provide the ability to limit a specific user to just their defined home page. From the home page, links to other views, or pages in the system shall be possible, if allowed by the system administrator.
8. Graphic screens on the Web Browser client shall support hypertext links to other locations on the Internet or on Intranet sites, by specifying the Uniform Resource Locator (URL) for the desired link.

PART 17 - NETWORK CONTROLLER (UNC):

17.1 ESSENTIALS AND USER ACCESS OVERVIEW

A. All controllers shall be properly labeled. Controller shall meet the requirements of UL512 and be arc flash compliant.

B. The Network Controller shall be web-based and communicate BACnet IP. It shall issue all time schedules, summer/winter commands, customized trending, holiday scheduling, alarm handling, clock or other shared commands to all unitary controllers within the building network. If for any reason communications between the unitary(s) and the Network Controller is lost, the unitary(s) shall operate in a stand-alone manner (in day operation) until communications is restored. It shall also operate in the "summer" or "winter" mode as last commanded.

C. The Network Controller shall be integrated and interoperable with the facility infrastructure and include user access to all system data locally over the Local Area Network (LAN) / Wide Area Network (WAN) within the building and remotely by a standard Web Browser over the Internet. Any computer connected to the network, utilizing a web browser and having the proper password.

D. The Network Controller shall be a fully user-programmable, supervisory controller. It shall monitor the network of distributed unitary controllers, provide global strategy and direction, and communicate on a peer-to-peer basis with other Network Controllers.

E. The Network Controller shall have battery back-up to allow a minimum of seven days of operation. The Network Controller shall be composed of one or more independent, stand-alone, microprocessor to manage the network strategies described in Application software section. The network controller shall have ample memory to support its operating system, database and programming requirements. The operating system of the Network Controller shall manage the input and output communications signals to allow distributed unitary controllers to share real and virtual point information and allow central monitoring and alarms. The database and custom programming routines of the Network Controller shall be editable from a single operator station.

F. The Network Controller shall be remotely monitored via the internet. Additionally, it shall include automatic emailing and texting out alarms, gathering alarms, reports and logs, programming and downloading database.

G. The Network Controller shall continually check the status of all processor and memory circuits. If a failure is detected, the controller shall:

1. Assume a predetermined failure mode.
2. Emit an alarm.
3. Display card failure identification.

H. Under no circumstance shall more than 75% of the total number of sensor and control points be connected through a single Network Controller. Each DDC system component shall provide for the future addition of at least 20% of each type of the number of sensor and control points connected to that component including a minimum of one universal input and one universal output.

PART 18 - UNITARY CONTROLLER

18.1 INSTALLATION, CONFIGURATION, AND REQUIREMENTS

A. Unless otherwise specified, each piece of equipment shall have its own Unitary Controller (i.e., heat pump, DOAS, etc.). The Unitary Controller for each piece of equipment shall be mounted on the wall near the side of the unit unless shown otherwise. The Unitary Controller for all other equipment shall be mounted in a panel and properly labeled.

B. The Outside Air Unit shall have its own Unitary Controller mounted where shown on the drawings. If an installation location is not clear, the Contractor shall notify the Engineer for clarification prior to installation.

C. Unitary Controllers used in conditioned ambient shall be mounted in dust-proof enclosures, and shall be rated for operation at 32 degrees F to 120 degrees F. All Unitary Controllers shall have an RJ-11 or similar type connection for monitoring or programming access by room or local equipment level with access to any unitary within the network without modification.

D. Control panels shall be constructed by a UL approved panel manufacturer. The standard used shall be UL508A. All proper labels are to be attached. Panel shall meet the requirements of UL512 and be arc flash compliant panels.

E. Unitary Controllers utilized in the network shall have full stand-alone capability including time of day and holiday scheduling as well as all energy management functions such as optimal start/stop, duty cycling, etc. The terminal unit Unitary Controllers may be pre-programmed with the project specific sequence of operation as specified for the application. Any re-programming of the electronics shall be performed on location using a portable personal computer with appropriate software or through the Network Controller. The entire unitary data base shall have the capability of being backed up and or downloaded locally.

F. All points to have a unique digital input to the BAS system. The use of digital point count expanders is not an acceptable replacement to digital inputs to the unitary controller. The conversion of a single universal input channel to accept up to multiple voltage free contacts such as relay contacts, auxiliary starter contacts, differential pressure switches, etc. is not acceptable.

G. Unitary Controllers shall communicate via BACnet MSTP or LonMark/LonTalk communication protocol. A BACnet Protocol Implementation Conformance Statement (PICS)

shall be provided for each Unitary Controller that will communicate on the BACnet MS/TP Bus.

H. All Unitary Controllers shall be fully application programmable. All control sequences within or programmed into the unitary controller shall be stored in non-volatile memory, which is not dependent upon the presence of a battery shall be retained.

I. Unitary Controllers shall have a 20% spare point capacity to be provided for all applications.

J. The Unitary Controller for equipment shall be mounted in a panel and properly labeled. Prior to installation, insure through coordination with all trades, that appropriate clearances (36" minimum) as required by the N.E.C. are maintained at all control panels, including unitary controllers for equipment, etc.

K. After a power failure, the Unitary Controller shall operate the control application using the current setpoints and configuration. Reverting to default or factory setpoints are not acceptable.

PART 19 - SENSORS AND MISCELLANEOUS DEVICES

19.1 SENSOR RESOLUTION

A. All temperature sensors shall have a minimum resolution - ±0.36 °F over range of 32 to 116 °F (0 to 47 °C); ± 0.19 °F at 72 °F (22 °C). Sensor stability shall be 0.24 degrees over a year period. Space sensors shall be tested and accurate to within 0.75 degrees F. Outside air, water and duct sensors shall be tested and accurate to within 0.5 degrees F.

19.2 SPACE SENSORS AND THERMOSTATS:

1. Refer to the drawings for proper type and location.
2. All thermostat and sensors shall be provided with temperature indication, unless otherwise noted.
3. Programmed set-point shall be locally adjustable limited to 2 degrees above set-point and 2 degrees below set-point for supervised areas.
4. Unsupervised areas shall have non-adjustable set-point.
5. Generally, thermostats/sensors shall be installed 54" above the finished floor if accessible by side wheel chair access.
6. Where thermostats/sensors are to be mounted next to a light switch, install at the same height as the light switch.
7. Sensors in hallways, vestibules, stairways, restrooms and locker rooms shall utilize a stainless-steel surface mount temperature sensor installed on an interior wall or partition (2"x4" stainless steel blank plate). Care must be taken in the installation of these sensors to ensure proper insulation from the wall temperatures in order to properly sense space temperature.
8. If there is a question consult engineer prior to rough-in.

19.3 WATER SENSORS

A. Temperature sensors for water lines are to be the well type. Wells are to be threaded brass (same manufacturer as the temperature sensor) with the sensor coated with a heat transfer compound. Strap on sensors will not be acceptable.

19.4 OUTDOOR AIR SENSOR

A. The outdoor air sensor will be installed on the north wall in the shade as not to be affected by sunlight, building ventilation or weather. This location shall be indicated on the control drawings. Installation in outside air ductwork or louvers is not acceptable. If not installed to provide "accurate" temperature readings, it shall be relocated (at the TCC's expense) until a suitable location is found.

19.5 MIXED AIR SENSORS

A. These sensors shall be bendable averaging, type made of copper or aluminum elements. In unit ventilators, these sensors shall be at least five (5) feet in length and installed in the discharge air of the unit. For Air Handling Units, Outside Air Units, etc. the sensors shall be at least 20 feet in length.

19.6 DISCHARGE AIR AND DUCT ROOM RETURN AIR SENSORS

A. Shall be rigid insertion type. In all applications, care shall be taken to ensure that the sensors are securely mounted as not to allow any vibration and installed in such a manner as to indicate the truest possible temperature.

19.7 FREEZE/LOW-LIMIT THERMOSTAT

A. Provide a freeze/low-limit thermostat in each Air Handling Unit, Outside Air Unit, etc. with a water coil for freeze protection. These devices shall be the manual reset type. This device shall be wired by using a normally closed contact in series with the motor starting circuit and a normally open set of contacts as an input to the unitary controller. The element shall be constructed of copper and be at least 20 feet in length. It shall be installed serpentine across the air leaving the coil. Each application should be closely evaluated before installation. The device shall sense the lowest temperature by any one-foot section of its element.

19.8 HUMIDITY SENSORS

A. These devices shall be 100% solid state, linear and temperature compensated with a 0-100% RH range. The response time shall be a minimum of 30 seconds for a 60% change. They shall have a 1% accuracy between 0% - 90% RH - Do not submit products that do not meet this range. The output of the device shall utilize a 0-10 VDC signal. The device shall use a power supply of 24 VAC or VDC. Duct mounted sensors shall have at least 4" insertion probe with a 16-gauge steel enclosure. NIST traceable certification shall be provided to the Engineer as part of

the shop drawings. For wall mounted sensors the enclosure shall be polystyrene plastic mounted next to and at the same height as the temperature sensor in that area. Both shall have the same appearance. Annual calibration shall be required for 5 years after substantial completion by the TCC.

19.9 COMBINATION TEMPERATURE/HUMIDITY SENSORS

A. All temperature sensors shall have a minimum resolution of - ±0.36 °F over range of 32 to 116 °F (0 to 47 °C); ± 0.19 °F at 72 °F (22 °C). Sensor stability shall be 0.24 degrees over a year period. Space sensors shall be tested and accurate to within 0.75 degrees F. The humidity sensing device shall be 100% solid state, linear and temperature compensated with a 0-100% RH range. The response time shall be a minimum of 30 seconds for a 60% change. They shall have a minimum of 3% accuracy minimum accuracy of ± 3% at 10 to 90% RH. RH non-condensing and maximum hysteresis +/_1.5% RH.– Do not submit products that do not meet this range. The output of the device must utilize a 0-10 VDC or 4-20mA signal as required. The device must use a power supply of 24 VAC or VDC. Duct mounted sensors shall have at least 4" insertion probe with a 16 gauge steel enclosure. NIST traceable certification shall be provided to the Engineer as part of the shop drawings. For wall mounted sensors the enclosure shall be polystyrene plastic mounted next to and at the same height as the temperature sensor in that area. Both shall have the same appearance. Provide protective cages in fitness and common areas.

19.10 LOW PRESSURE TRANSDUCERS

A. These devises shall be 100% solid state, linear and temperature compensated. Accuracy shall be no less than plus or minus 1% of its full range. Linearity, repeatability and hysteresis shall be no less that plus or minus 0.1%. All pressure sensors shall utilize output averaging/output clipping to adjust and stabilize any fluctuations in the output. The output of the device shall utilize a 0 - 10 VDC signal. The device shall use a power supply of 24 VAC or VDC. The enclosure 16-gauge steel. For sensing internal static pressure of air handling ducts utilize sensors with a rage of 0 to 5 inches water column. For sensing building static pressures (building compared to atmospheric) utilize a sensor with a range of -0.25 to +0.25 inches water column.

B. Provide down duct static pressure sensors at locations shown drawing. Final sensor location shall be subject to adjustment during startup and TAB based on actual field conditions and system operation. Contractor shall include all labor, materials, wiring, conduit modifications, and controls work required to relocate the sensor as necessary for proper system control at no additional cost.

19.11 RELAYS

A. Relays for starting and stopping fractional horsepower motors shall be rated as follows:
   1. 1/4 horsepower motors or less use 15 ampere rated relays,
   2. 1/3 horsepower motors use 20 ampere rated relays,
   3. 1/2 horsepower motors use 30 ampere rated relays,
   4. Relays used for pilot duty service shall be rated at a minimum of 10 amperes.

5. Provide auxiliary pilot duty relays on motor starters as required for control function.
6. Do not install control and status relays in packaged equipment control panel enclosures containing Class 1 starters.

19.12 FLOW SWITCHES

A. Flow switches utilizing differential pressure type switches, UL listed, Vent 1 type enclosure.

19.13 OA HANDLERS

A. The Outside Air Unit shall be provided with a D.A.P. (differential air pressure) switch across each the supply fan to provide fan status for each air handler.

19.14 SMOKE SHUTDOWN

A. All OA units, Heat Pump Units, etc. with fans of greater than 2,000 CFM serving more than one space are required to have smoke shutdown safeties as required by the Building Code. These smoke detectors shall have a set of auxiliary contracts wired to a dedicated input of the Unitary to provide status of the smoke detector. All units must be provided with a current sensor to provide fan status for each air handler. For projects with Outside Air (OA) units, any system fire alarm activation shall shutdown all OA units. Coordinate with the Fire Alarm Contractor to insure a complete, code compliant installation.

19.15 CURRENT SENSING DEVICES

A. Veris Industries model Hx08 Series and H701 or equal. All current sensors shall be capable of alarming to the BAS for belt losses, pump coupling shear or other mechanical failure on loads.

19.16 SINGLE DIRECTION WATER FLOW METER

A. Onicon Model F-1200 series dual turbine insertion flow meter. 50:1 turn down with 2% accuracy with 0.4 to 20 fps range. Install flow meter with sufficient pipe diameters as recommended by manufacturer. Provide factory authorized start-up verification of operation and calibration. Provide with remote display where indicated.

19.17 BI-DIRECTIONAL WATER FLOW METER

A. Onicon Model FB-1200 series dual turbine insertion flow meter. 50:1 turn down with 2% accuracy with 0.4 to 20 fps range. Install flow meter with sufficient pipe diameters as recommended by manufacturer. Provide factory authorized start-up verification of operation and calibration. Provide with remote display where indicated.

19.18 POTABLE WATER FLOW METER

A. Neptune domestic water meter suitable for potable water service, with integral register mounted on meter body and pulse output for remote monitoring. Provide factory calibrated meter/register assembly with dry contact pulse transmitter and all accessories required for a complete installation. Install meter with sufficient straight pipe diameters as recommended by manufacturer. Provide remote register/display where indicated.

19.19 BTU METER

A. Provide and install ONICON System -10 MTU Meter system, including F-3200 in line electromagnetic flow meter, supply and return temperature sensors and wells and control panel. The entire system shall be factory calibrated and programmed for particular system where installed (geothermal system and 2-pipe system) and shall be re-programmable at the control panel keypad. Furnish a certificate of calibration for each BTU meter. Interface the control panel into the DDC controls system to obtain energy totals, flow rates, temperatures (supply and return) for trending. Install flow meter with sufficient pipe diameters as recommended by manufacturer. Provide factory authorized start-up verification of operation and calibration. Provide with remote display where indicated.

19.20 TRANSFORMERS/POWER SUPPLIES

A. Shall be UL listed, Class 2, current-limiting type (or over-current protection). Unit output shall match connected requirements included current output at a 50% safety factor. Units shall operate between 0 degrees C to 50 degrees; UL recognized.

19.21 DIFFERENTIAL PRESSURE TRANSMITTERS

A. Provide Rosemount (ITT Bell & Gossett ST-102R) or Johnson Controls Setra DPT 2302-050-V field mounted differential pressure sensor transmitters as indicated on the plans. Range shall be 0-25 psig. Accuracy shall be .025% full span.

B. Locate differential pressure sensors in locations shown on drawing for pump speed control. Final location shall be subject to adjustment during startup and TAB to ensure the sensor reads a stable and representative differential pressure at the hydraulically critical point. Contractor shall include all required labor and materials to relocate the sensor at no additional cost.

19.22 CARBON DIOXIDE SENSORS/ TRANSMITTERS

A. This sensor shall be electronic non-dispersive infrared (NDIR) type, diffusion sampling with LED or LCD display.
   1. Measurement Range 0-2000/5000 ppm (programmable)
   2. Accuracy ±30 ppm ±2% of measured value*
   3. Repeatability ±20 ppm ±1% of measured value
   4. Response Time <60 seconds for 90% step change
   5. Input Power 20 to 30VDC/24VAC; 100mA max.

6. Analog Output 4-20mA, (clipped & capped)/0-5VDC/0-10VDC (selectable)
7. Operating Temperature Range 0° to 50°C (32° to 122°F)
8. 5-year calibration interval (recommended)
9. Low ambient sensitivity

19.23 WEATHER STATION HOUSING

A. Provide Kele Model A21 Outdoor Aspirated Humidity/Temperature housing. NEMA 3R enclosure is painted white to reduce the effect of radiation, and the enclosure has a lockable latch for security. The outdoor air sensor will be installed on the north wall in the shade as not to be affected by sunlight, building ventilation or weather. This location shall be indicated on the control drawings. Installation in outside air ductwork or louvers is not acceptable. If not installed to provide "accurate" temperature readings, it shall be relocated (at the TCC's expense) until a suitable location is found.

PART 20 - DAMPERS AND ACTUATORS

20.1 TECHNICAL REQUIREMENTS AND INSTALLATION GUIDELINES

A. Unless otherwise specified, valves shall be furnished and sized by the TCC. The valves are to provide the required capacity and the close off rating shall be in excess of the system pressures encountered (minimum 40 psi differential). Proportioning-type valve bodies shall be packed type with throttling type inner valve (quick close plug shall not be acceptable). Proportional type valves to be rated at 125 psi static pressure. Modulating control valves shall be selected within a 3-5 psig pressure drop range. Two position control valves (open/close) shall be line size.

B. Dampers for various units requiring field mounting shall be tight closing, "ultra-low leakage", opposed blade with side and edge seals. They shall be sized and furnished under this section. Installation of dampers shall be by the sheet metal contractor, coordinated by the TCC. Frames shall be no less than 16-gauge galvanized steel and furnished with mounting holes for duct mounting. Damper blades shall be no less than 14-gauge galvanized steel with maximum blade width of 8 inches. Blades shall be secured to 1/2-inch zinc plated axles and hardware with nylon bearings. Provide thrust bearings at the end of each blade. All dampers shall have end switches to positively prove damper position.

C. All damper and valve actuators shall be fail-safe spring return type with sufficient force to operate the dampers or valves under all normal operating conditions. They shall return to the normally open position upon a loss of power. Exceptions to the spring return applications are (1) face and bypass actuators, (2) boiler 3-way loop mixing valves, (2) boiler room seasonal changeover valves. Actuators for fan coil units, terminal units, etc. shall fail in the last position.

D. "ALL" Actuators shall be of the same manufacturer and have internal feedback circuitry to provide a positive action to insure proper positioning of the damper or valve through the entire sequence. Actuators shall have an adjustable starting point to accurately set the range of travel to the output of the controller. All actuators shall also utilize the same input signal (6-9 VDC, 2-10 VDC, 4-20 MA) in order to maintain some consistency in the control application.

E. Actuators may be factory installed. If not, factory installed, they shall be installed as per instructions by the terminal equipment manufacturer.

F. Locations mounted above ceiling shall be marked on ceiling grid.

G. Install damper motors on the outside of the duct in warm areas where possible, not in air stream or locations exposed to outdoor conditions.

H. For outdoor actuator installation, provide electric actuators with NEMA 4 or 4X enclosure, externally mounted and sized for the required torque under maximum operating conditions. Coordinate actuator control, end switches, and fail position with the BMS and DOAS-1 control sequence.

PART 21 - VARIABLE FREQUENCY DRIVES (VFDs)

21.1 TECHNICAL SPECIFICATIONS AND REQUIREMENTS

A. The work includes all labor, materials, and related items to completely furnish and install, start up and test, and place into service the Variable Frequency Drives (VFDs) indicated and scheduled on the Drawings and described in the Specifications.

B. VFDs shall be as manufactured by ABB, Graham/Danfoss, or Square D. All VFDs for the project shall be by the same manufacturer (no exceptions). Coordinate VFD with equipment requiring variable speed drives. Refer to drawings for schedule.

C. VFDs shall be consist of a pulse width modulated (PWM) inverter designed for use on a standard NEMA Design B induction motor.

D. The VFD shall be capable of operation form AC voltage in two rages 208–240 VAC ± 10%, or 380–480 VAC ± 10%. 50/60 HZ operation, ± 2 hertz.

E. The VFD enclosure shall be rated UL type 1 and shall be UL listed as a plenum rated, suitable operating conditions: $0 – 40^0$ C continuous. Drives that have thermal cut out circuits, or that cannot operate continuously at 40^0 C shall not be acceptable. Altitude 0 to 3300 feet above sea level, up to 95% humidity, non-condensing.

F. The VFD shall produce an adjustable AC voltage/frequency output for step less motor speed control utilizing sine wave coded Pulse Width Modulation (PWM) The Drive shall provide automatic power factor correction and a .98 displacement power factor by incorporating a full wave diode bridge rectifier. The VFD shall have an overload rating of 110% of nominal rated current for 1 minute out of every 10 minutes of operation, which is an acceptable overload for centrifugal loads.

G. The VFD shall include a built-in first environment RFI/EMI filter and be CE and UL labeled. It shall also meet the CE requirement of EN61800-3 which provides an actual test procedure that shows that the VFD is immune from RFI/EMI interference and at the same time does not emit RFI/EMI noise that would interfere with other sensitive equipment near the VFD.

H. The VFD shall include as a minimum a 5% dual DC link or AC line reactor for a clean harmonic signature, which aides in complying with IEEE-519-1992 recommended levels. The VFD manufacturer and representative shall assist in ensuring that the VFD's applied meet IEEE-519-1992 by completing a computer aided Harmonic Analysis of the complete system.

I. The VFD shall include as a standard a built-in digital keypad/display panel. This panel shall provide "Hand" off "Auto" selection, and a manual speed adjustment via up and down arrows. All faults and warnings shall be provided in "Plain English" for operation without a manual. The drive shall have a complete manual stored in memory that can be accessed with a single keystroke. This display shall be password protected and allow all setup parameters to be adjusted only by authorized personnel.

J. The VFD shall include built in Startup, Diagnostic, and Maintenance assistants, which allow for step-by-step startup procedures, troubleshooting, and the ability to indicate when the VFD and the system it is applied to needs preventive maintenance performed.

K. The VFD shall include a real time clock with a day/date stamp for troubleshooting purposes. In addition, with the use of this clock the drive shall be capable of stand-alone operation and act as a unitary controller.

L. The VFD shall include (2) Analog inputs either 4–20 madc or 0-10 vdc, (6) programmable Digital Inputs, (2) Programmable analog Outputs, (3) Form C Relay output rated 2 amps continuous minimum, and (2) PID Process controllers.

M. The VFD keypad shall include a backlit LCD display. The display shall be in complete English words for programming and fault diagnostics (LED and alpha-numeric codes are not acceptable). All VFD faults shall be displayed in English words.

N. BYPASS – The drive shall be provided with an integral Bypass circuit which includes a pair of 115V electrically interlocked contactors for drive and bypass operation. The drive shall include a main input circuit breaker, drive input service/isolation switch, and motor overload protection adjustable for either Class 10, 20 or 30 operation. The bypass shall include a built-in status display which shows via colored LED's the system operational status including safeties and run permissive for ease of operation. The Bypass shall have its own interactive, programmable keypad. The Bypass shall provide single-phase protection for the motor while operating in bypass. Bypass that does not protect the motor from single-phase operation shall not be acceptable.

O. The drive and bypass system shall have embedded serial communication capabilities that allow direct connection to Modbus, Johnson Controls, Siemens and BACnet automation systems as part of the drives software suite without the need for extra hardware cards or gateways. The connection shall be tested by the BACnet Testing Labs (BTL) and be BTL Listed. The BACnet interface shall conform to the BACnet standard device type of an Applications Specific Controller (B-ASC). In addition, the drive shall be capable of interfacing with Lonworks with the addition of a communication module.

P. All VFDs shall be provided and installed in strict accordance with the manufacturer's recommendations.

Q. Factory-authorized startup for each drive is mandatory. Provide a written record of the startup of each unit. Start up and programming by a factory-authorized technician. At startup, lockout any speed with the VFD that does not meet the vibration allowanced of the equipment manufacturers.

R. A parts and labor warranty of 3 years from startup and 2 years from the date of substantial completion shall be included. Warranty shall include travel time and expenses.

PART 22 - SERVER FUNCTIONS AND HARDWARE

22.1 GENERAL REQUIREMENTS AND CAPABILITIES

A. A central server shall be provided. The server shall support all Network Area Controllers (NAC) connected to the customer's network whether local or remote.

B. Local connections shall be via an Ethernet LAN. Remote connections can be via ISDN, ADSL, T1 or dial-up connection.

C. It shall be possible to provide access to all Network Area Controllers via a single connection to the server. In this configuration, each Network Area Controller can be accessed from a remote Graphical User Interface (GUI) or from a standard Web browser (WBI) by connecting to the server.

D. The server shall provide the following functions, at a minimum:
   1. Global Data Access: The server shall provide complete access to distributed data defined anywhere in the system.
   2. Distributed Control: The server shall provide the ability to execute global control strategies based on control and data objects in any NAC in the network, local or remote.
   3. The server shall include a master clock service for its subsystems and provide time synchronization for all Network Area Controllers (NAC).
   4. The server shall accept time synchronization messages from trusted precision Atomic Clock Internet sites and update its master clock based on this data.
   5. The server shall provide scheduling for all Network Area Controllers and their underlying field control devices.
   6. The server shall provide demand limiting that operates across all Network Area Controllers. The server must be capable of multiple demand programs for sites with multiple meters and or multiple sources of energy. Each demand program shall be capable of supporting separate demand shed lists for effective demand control.
   7. The server shall implement the BACnet Command Prioritization scheme (16 levels) for safe and effective contention resolution of all commands issued to Network Area Controllers. Systems not employing this prioritization shall not be accepted.
   8. Each Network Area Controller supported by the server shall have the ability to archive its log data, alarm data and database to the server, automatically. Archiving options shall be user-defined including archive time and archive frequency.
   9. The server shall provide central alarm management for all Network Area Controllers supported by the server. Alarm management shall include:
      a. Routing of alarms to display, printer, email and pagers
      b. View and acknowledge alarms

c. Query alarm logs based on user-defined parameters

10. The server shall provide central management of log data for all Network Area Controllers supported by the server. Log data shall include process logs, runtime and event counter logs, audit logs and error logs. Log data management shall include:
    a. Viewing and printing log data
    b. Exporting log data to other software applications
    c. Query log data based on user-defined parameters

22.2 SERVER HARDWARE REQUIREMENTS

A. The server hardware platform shall have the following requirements:
    1. The computer shall be an Intel Pentium M based computer (minimum processing speed of 2.4 GHz with 1 GB RAM and a 100-gigabyte minimum hard drive). It shall include a DVD-ROM/CD-RW Combination Drive, 2-parallel ports, 2-asynchronous serial ports and 2-USB ports. A minimum 17" flat panel color monitor, 1280 x 1024 optimal preset resolution, 25 ms response time shall also be included.
    2. The server operating system shall be Microsoft Windows XP Professional. Include Microsoft Internet Explorer 6.0 or later.
    3. Connection to the FMCS network shall be via an Ethernet network interface card, 100 Mbps.
    4. A system printer shall be provided. Printer shall be laser type with a minimum 600 x 600-dpi resolution and rated for 12-PPM print speed minimum.
    5. For dedicated alarm printing, provide a dot matrix printer, either 80 or 132 column width. The printer shall have a parallel port interface.

PART 23 - SYSTEM PROGRAMMING

23.1 GRAPHICAL USER INTERFACE (GUI) SOFTWARE REQUIREMENTS

A. Graphical User Interface software (GUI) shall provide the ability to perform system programming and graphic display engineering as part of a complete software package. Access to the programming functions and features of the GUI shall be through password access as assigned by the system administrator.

B. A library of control, application, and graphic objects shall be provided to enable the creation of all applications and user interface screens. Applications are to be created by selecting the desired control objects from the library, dragging or pasting them on the screen, and linking them together using a built-in graphical connection tool. Completed applications may be stored in the library for future use. Graphical User Interface screens shall be created in the same fashion. Data for the user displays is obtained by graphically linking the user display objects to the application objects to provide "real-time" data updates. Any real-time data value or object property may be connected to display its current value on a user display. Systems requiring separate software tools or processes to create applications and user interface displays shall not be acceptable.

C. Provide the capability to copy objects from the supplied libraries, or from a user-defined library to the user's application. Objects shall be linked by a graphical linking scheme by dragging a

link from one object to another. Object links will support one-to-one, many-to-one, or one-to-many relationships. Linked objects shall maintain their connections to other objects regardless of where they are positioned on the page and shall show link identification for links to objects on other pages for easy identification. Links will vary in color depending on the type of link; i.e., internal, external, hardware, etc.

D. Configuration of each object will be done through the object's property sheet using fill-in the blank fields, list boxes, and selection buttons. Use of custom programming, scripting language, or a manufacturer-specific procedural language for configuration will not be accepted.

E. The software shall provide the ability to view the logic in a monitor mode. When on-line, the monitor mode shall provide the ability to view the logic in real time for easy diagnosis of the logic execution. When off-line (debug), the monitor mode shall allow the user to set values to inputs and monitor the logic for diagnosing execution before it is applied to the system.

F. All programming shall be done in real-time. Systems requiring the uploading, editing, and downloading of database objects shall not be allowed.

G. The system shall support object duplication within a customer's database. An application, once configured, can be copied and pasted for easy re-use and duplication. All links, other than to the hardware, shall be maintained during duplication.

PART 24 - GRAPHICS SCREENS AND TRENDS

24.1 REQUIREMENTS

A. All dashboard graphics and control graphics screens shall be submitted for review by Owner, Engineer and Commissioning Agency. Refer to drawings for additional information. Provide the following animated, color graphics screens minimally:

B. Entire floor plan home screen with OAT, Time and Date displays.
   1. Floor plan showing major zones per zoning drawings.
   2. Click major zone displays enlarged floor plan of the zone showing individual heat pump zones & numbers. Include link to respective mechanical rooms, closets, crawlspaces.
   3. Click individual zone shows heat pump graphic. Display all data points from points list, occ/unocc schedule and setpoints, OAT, Time and Date.

C. Color Graphic Screens shall be designed for all mechanical systems and shall include the following:
   1. A graphic shall be the starting page with the building graphically indicated. Break up the floor plan into zones to match Contract Documents. The building shall be the point of reference to enter into the respective building control system.
   2. Geothermal plant
   3. All geothermal units including pumps, filters, etc.
   4. DOAS unit
   5. Outside Air Terminal Boxes
   6. Exhaust Air Terminal Boxes
   7. Exhaust Fans

8. Domestic Hot Water Heating
9. Cooling only heat pumps IT/MDF/IDF/Electrical Rooms
10. All floor plans indicating all actual room numbers, thermostats and mechanical equipment. Operator shall be capable of clicking on any equipment and pull up the respective graphic screen.

D. Graphics to include floor plans with room numbers (as-built room numbers) and thermostat locations, links to flow diagrams for heat pumps, geothermal loop systems, outside air systems, and lighting controls.

E. All new graphics shall be similar (or match) the previously provided system graphics for Trumbull School systems.

F. The graphical programming software shall allow for interactive mouse-driven placement of block icons on the graphic screen and connection of block inputs to block outputs by means of drawing lines to form a graphic logic diagram. The user shall not have to manually input text to assign block input/output interconnections. Blocks shall allow entry of adjustable settings and parameters via pop-up windows.

G. The clarity of sequence shall be such that the user has the ability to verify that the system programming meets the specs without having to learn or interpret a manufacturer's unique programming language. Provide a means for testing and/or debugging the control programs off-line (not communicating with control units) using operator entered values for physical inputs and time. Provide a means for testing and/or debugging the control programs on-line (communicating with control units), showing actual physical inputs land all block outputs in real time.

H. Provide a utility that shall allow the graphic logic diagrams to be directly compiled into application programs. Logic diagrams shall be viewable either off-line, or on-line with real-time output values.

I. All graphic software shall be in the html web browser format and support multiple simultaneous screens to be opened and resizable in a "Windows" type environment. All functions, except text entry, shall be executable with a mouse. Graphic software shall provide for multitasking such that third-party programs can be used while the Operator Workstation Software is on-line. Provide the ability to alarm graphically even when operator is in another software package. The software shall allow for Owner to create user defined, color graphic displays of geographic maps, building plans, floor plans, and mechanical and electrical system schematics.

J. The contractor shall provide libraries of pre-engineered screens and symbols for all equipment utilized depicting standard air handling unit components (e.g. fans, coils, filters, dampers, etc.), mechanical system components (e.g., pumps, heat pumps, etc.), complete mechanical systems and electrical symbols.

K. The graphic development package shall use a mouse or similar pointing device to allow the user to perform the following:
1. Define symbols
2. Position items on graphic screens
3. Attach physical or virtual points to a graphic
4. Define background screens

5. Define connecting lines and curves
6. Locate, orient and size descriptive text
7. Define and display colors for all elements
8. Establish correlation between symbols or text and associated system points or other displays.
9. Create hot spots or link triggers to other graphic displays or other functions in the software

L. The TCC shall including programming of a minimum of 30-point trends as directed by the Owner and Engineer. These can be requested at any time during the project including the warranty period. Trend "change of state" for digital inputs. Trend analog points in 30-minute increments. Maintain trend history for one year minimum. Include the following:
1. Outside air temperature
2. VFD speeds (OA, EA, pumps)
3. OA & EA air volume summations
4. Geothermal wellfield main supply and return temperatures
5. Geothermal wellfield main flow rate
6. DOAS main supply and return temperatures
7. DOAS unit and exhaust leaving air temperatures.
8. Makeup water flow rate
9. Geothermal flow rate and BTUs
10. Electrical power kW and kWh including sub-meters
11. Zone Temperatures and Humidity
12. Zone CO2 content

PART 25 - TIME SCHEDULES (ALL TIMES SHALL BE USER ADJUSTABLE)

25.1 REQUIREMENTS

A. During construction, the time schedule (for all equipment except OA unit) will be Occupied at 6:00 AM, Unoccupied setpoint at 6:00 PM five (5) days a week.

B. When the system is fully tested and operational and after the Owner's staff have been fully instructed as to the operation of the system the schedule shall be as follows unless otherwise instructed.

C. Classroom areas
1. Monday through Friday Occupied mode at 8:00 AM, Unoccupied mode at 4:30 PM (adj.). Unoccupied for Saturday and Sunday.

D. Morning Warmup Staging: Gym, Dining, Kitchen, and Media Center heat pumps units shall initiate first, then Heat Pumps in exterior classrooms shall be initiated, and then stage interior units shall be initiated.

E. Building outside air handling unit shall operate Monday thru Friday, 8:00 AM to 4:00 PM (adj.).

F. Each piece of equipment shall have its own adjustable time schedule.

G. All schedules shall be coordinated and confirmed with the Owner prior to final implementation.

END OF SECTION

SECTION 260010 - GENERAL REQUIREMENTS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

B. Refer Specification Section 019113 General Commissioning Requirements.

C. Refer to the Owner's OPR for additional items related to as-builts and O&Ms.

1.2 CODES & STANDARDS (INCLUDING BUT NOT LITED TO THE FOLLOWING):

A. 2021 Connecticut State Building Code (CSBC) (IBC 2021 w/ amendments)

B. 2022 Connecticut State Fire Safety Code (CSFSC) (2021 NFPA-1 w/ amendments)

C. 2022 Connecticut State Electrical Code (CSEC) (NFPA 70 2020 w/ amendments)

D. 2022 Connecticut State Energy Conservation Code (IECC 2021 w/ amendments)

E. 2022 Connecticut State Elevator Code)ASME A17.1-2019 and A17.3-2017 w/ amendments)

F. 2022 Connecticut State Building Performance Standard (High Performance Schools)

G. 2022 Connecticut State Fire Safety Code (CSFSC) (NFPA 101 2021 w/ amendments)

1.3 SUMMARY

A. Section Includes general requirements applicable to work specified in Divisions 26, 27, and 28.

B. The work included in this division consists of the furnishing of all labor, equipment, transportation, supplies, material, and appurtenances and performing all operations necessary for the satisfactory installation of complete and operating Electrical Systems indicated on the drawings and/or specified herein.

C. Any materials, labor, equipment, or services not mentioned specifically herein which may be necessary to complete or perfect any part of the Electrical Systems in a substantial manner, in compliance with the requirements stated, implied, or intended in the drawings and specifications, shall be included as part of this Contract. The Contractor shall give written notice of any materials or apparatus believed inadequate or unsuitable; in violation of laws, ordinances, rules, or regulations of authorities having jurisdiction; and any necessary items of work omitted a minimum of ten days prior to bid. In the absence of such written notice and by the act of submitting a bid, it shall be understood that the Contractor has included the cost of all required

items in their bid, and that they will be responsible for the approved satisfactory functioning of the entire system without extra compensations.

D. It is not the intent of this section of the specifications (or the remainder of the contract documents) to make any specific Contractor, other than the Contractor holding the prime contract, responsible to the Owner, Architect and Engineer. All transactions such as submittal of shop drawings, claims for extra costs, requests for equipment or materials substitution, shall be done through the Contractor to the Architect (if applicable), then to the Engineer.

E. This section of the Specifications or the arrangement of the contract documents shall not be construed as an attempt to arbitrarily assign responsibility for work, material, equipment or services to a particular trade Contractor or Sub-Contractor. Unless stated otherwise, the subdivision and assignment of work under the various sections shall be the responsibility of the Contractor holding the prime contract.

F. Any reference within these specifications to a specific entity, i.e., "Electrical Contractor" is not to be construed as an provide to limit or define the scope of work for that entity or assign work to a specific trade or contracting entity. Such assignments of responsibility are the responsibility of the Contractor holding the prime contract, unless otherwise provided herein.

G. In each of the specifications and drawings referred to herein, consider the advisory provisions to be mandatory, as though the word, "shall" had been substituted for "should" wherever it appears.

H. Intent and Interpretation
   1. It is the intent of these specifications and all associated drawings that the Contractor provide finished work, tested, and ready for operation. Wherever the word "provide" is used, it shall mean "furnish and install complete, tested and ready for operation."
   2. Minor details not usually shown or specified, but necessary for the proper installation and operation, shall be included in the work, the same as if herein specified or shown.
   3. It is the intention of the Contract Documents to call for a complete and operational system, including all components, accessories, finish work, etc. as necessary for trouble free operation, tested and ready for operation. Anything that may be required, implied, or inferred by the Contract Documents shall be provided and included as part of the Bid.
   4. All Contractors and Vendors providing a bid for this project shall review the Plans and Specifications and determine any modifications and/or adjustments necessary relative to the proposed equipment and materials with specific manufacturer’s installation requirements. Include in the bid any necessary installation methods, features, options, accessories, etc. necessary to install the proposed equipment and materials, regardless of whether used as basis of design or being offered as a substitution in accordance with the specific manufacturer’s installation requirements whether specifically detailed or not within the Plans and Specifications.
   5. The Bidder/Proposer shall completely review the Contract Documents. Any interpretation as to design intent or scope shall be provided by the Engineer/ Architect. Should an interpretation be required, the Bidder/Proposer shall request a clarification not less than ten days prior to the submission of the proposal so that the condition may be clarified by Addendum. In the event of any conflict, discrepancy, or inconsistency develops; the interpretation of the Engineer shall be final.

6. The Contractor shall give written notice of any materials or apparatus believed inadequate or unsuitable; in violation of laws, ordinances, rules or regulations of authorities having jurisdiction; and any necessary items of work omitted a minimum of ten days prior to bid. In the absence of such written notice and by the act of submitting a bid, it shall be understood that the Contractor has included the cost of all required items in the bid, and that will be responsible for the approved satisfactory functioning of the entire system without extra compensations.

I. Drawings and Specifications

1. The drawings are diagrammatic only and indicate the general arrangement of the systems and are to be followed insofar as possible. If deviations from the layouts are necessitated by field conditions, detailed layouts of the proposed departures shall be submitted in writing to the Engineer for approval before proceeding with the work. The Contract Drawings are not intended to show every vertical or horizontal offset which may be necessary to complete the systems. Contractors shall, however, anticipate that additional offsets may be required and submit their bid accordingly.
2. The drawings and specifications are intended to supplement each other. No Contractor, bidder, proposer, or supplier shall take advantage of conflict between them, or between parts of either, but should this condition exist, the Contractor or supplier shall request a clarification of the condition at least ten days prior to the submission of bids so that the condition may be clarified by Addendum. In the event that such a condition arises after work is started, the interpretation of the Engineer shall be the determining factor. In all instances, unless modified in writing and agreed upon by all parties thereto, the Contract to accomplish the work shall be binding on the affected Contractor.
3. The drawings and specifications shall be considered to be cooperative and complimentary and anything appearing in the specifications which may not be indicated on the drawings or conversely, shall be considered as part of the Contract and must be executed the same as though indicated by both.
4. This Contractor shall make all their own measurements in the field and shall be responsible for correct fitting. They shall coordinate this work with all other branches of work in such a manner as to cause a minimum of conflict or delay.
5. The Engineer shall reserve the right to make minor adjustments in location of conduit, fixtures, outlets, switches, etc., where they consider such adjustments desirable in the interest of concealing work or presenting a better appearance.
6. Each Contractor shall evaluate ceiling heights called for on Architectural Plans and ensure that these heights may be maintained after all mechanical and electrical equipment is installed. Where the location of Electrical equipment may interfere with ceiling heights, the Contractor shall call this to the attention of the Engineer in writing prior to making the installation. Any such changes shall be anticipated and requested sufficiently in advance so as to not cause extra work on the part of the Contractor or unduly delay the work.
7. Should overlap of work between the various trades become evident, this shall be called to the attention of the Engineer. In such an event, neither trade shall assume that he is to be relieved of the work which is specified under his branch until instructions in writing are received from the Engineer.
8. The Electrical drawings are intended to show the approximate location of equipment, materials, etc. Dimensions given in figures on the drawings shall take precedence over scaled dimensions and all dimensions whether given in figures or scaled shall be verified in the field. In case of conflict between small- and large-scale drawings, the larger scale drawings shall take precedence.

9. The Electrical Contractor and their Sub-Contractors shall review all drawings in detail as they may relate to his work (structural, architectural, site survey, mechanical, etc.). Review all drawings for general coordination of work, responsibilities, ceiling clearances, wall penetration points, chase access, fixture elevations, etc. Make any pertinent coordination or apparent conflict comments to the Engineers at least ten days prior to bids, for issuance of clarification by written addendum.
10. Where on any of the drawings a portion of the work is drawn out and the remainder is indicated in outline, or not indicated at all, the parts drawn out shall apply to all other like portions of the work. Where ornament or other detail is indicated by starting only, such detail shall be continued throughout the courses or parts in which it occurs and shall also apply to all other similar parts of the work, unless otherwise indicated.

1.4 GENERAL SCOPE OF WORK

A. New electrical systems will be installed (Extent of demolition and new scope differs at each CIP school).

B. New utility pad mounted service transformer and primary electric service duct bank to new utility service poles at the street and on the school property. This applies to Trumbull Hillcrest Middle Schooland Kickemuit Middle School.

C. Secondary electric service lateral from utility transformer to new main switchboard in the Main Electric Room. This applies to Trumbull Hillcrest Middle School.

D. All low-voltage distribution equipment, switchboards, panelboards, disconnect switches, fuses, transformers, contactors, starters, etc.

E. Electrical Studies including Fault Current, Arc Flash, and Coordination Studies. All studies to be performed by manufacturer of electrical distribution equipment prior to release of equipment.

F. All raceways, conduits, cable management systems, cable trays, J-hooks, conductors, outlet boxes, fittings, pull boxes, manholes, etc.

G. All lighting systems (indoor and outdoor, normal, night, emergency, and exit) including all fixtures, lamps, mounting accessories, switches, controls, outlets, wiring, raceways, and all other components and fittings required for a complete lighting system.

H. Lighting control and dimming system.

I. All wiring devices and device plates.

J. Coordination between electrical and other trades.

K. Electrical connection to all electrically operated equipment furnished and/or installed by others, including powered casework, gym/athletic equipment, elevator, mechanical equipment, kitchen equipment, etc.

L. New Diesel Generator and generator docking stations.

M. Grounding and bonding of all electrical systems and equipment.

N. Identification of electrical systems and equipment labeling.

O. Power wiring to HVAC, plumbing and fire protection equipment.

P. Emergency responder radio coverage system.

Q. Testing of all electrical systems.

R. Low-voltage raceway system.

S. Voice Evacuation fire alarm system

T. All required staging and scaffolding of any height.

U. Lightning protection.

V. All Trade Contractors to provide 1-year Project Warranty and 1st year services for all equipment and materials installed.

W. Include all scope/costs related to any necessary Firewatch per local fire department, inspection/permits for all work provided per AHJ requirements.

X. Provide all necessary permits and inspections by AHJ and provide all required fire watches.

Y. Comply with all OSHA requirements, building safety regulations and construction standards.

Z. Any required asbestos abatement will be performed by Owner prior to commencement of construction.

AA. Provide labeling of all new systems and equipment including signage for notification of equipment operating remote.

BB. Provide all required building penetrations for all raceways and conduit as required.

CC. Provide patching/sealing of existing penetrations not used with new work.

DD. Rigging:
1. Include all rigging costs for all new equipment and materials.
2. Provide any traffic barriers/safety caution tape to cordon off crane and staging area.
3. Provide all required hoisting, scaffolding, chain falls for all rigging activities.

EE. Outlet and switch plates
1. Color as selected by Architect from manufacturer's full range.

43. IDF: Intermediate Distribution Frame
44. IECC: International Energy Conservation Code
45. ISO: International Standards Organization.
46. IT: Information Technology
47. KVA: Kilovolt-Amperes

48. KW: Kilowatt
49. KWH: Kilowatts Hours
50. LRA: Locked Rotor Amps
51. LTG: Lighting
52. MC: Mechanical Contractor
53. MCA: Minimum Circuit Ampacity
54. MCB: Main Circuit Breaker
55. MDF: Main Distribution Frame
56. MDP: Main Distribution Panel
57. MLO: Main Lugs Only
58. MOCP: Maximum Overcurrent Protection
59. MSB: Main Switchboard
60. N/A: Not Applicable
61. NEC: National Electrical Code
62. NECA: Standards for Installation.
63. NEMA: National Electrical Manufacturers Association.
64. NESC: National Electrical Safety Code.
65. NFPA: National Fire Protection Association.
66. NIC: Not in Contract
67. NRTL: Nationally Recognized Testing Laboratory
68. NTS: Not to Scale
69. N/A: Not Applicable
70. OFCI: Owner Furnished, Contractor Installed
71. OFOI: Owner Furnished, Owner Installed
72. OSHA: Office of Safety and Health Administration.
73. P: Pole, Poles
74. PC: Plumbing Contractor
75. PIR: Passive Infrared
76. RFI: Request for Information
77. RIO: Rough-in Only
78. RM: Room
79. SPD: Surge Protection Device
80. SS: Stainless Steel
81. SWBD: Switchboard
82. TIA: Telecommunications Industry Association
83. TYP: Typical
84. UL: Underwriters Laboratories, Inc.
85. UON or UNO: Unless otherwise noted.
86. UG: Underground
87. V: Volt, Volts
88. VFD: Variable Frequency Drive
89. W: Watts
90. WG: Wire Guard
91. WP: Weather Proof
92. XFMR: Transformer

B. Definitions
   1. Architect: The Architect of Record for the project, if applicable.

2. Basis of Design (BOD): Documentation of primary thought processes and assumptions behind design decisions made to meet design intent. Describes systems, components, conditions, and methods chosen to meet intent.
3. Bidder/Proposer: Any person, agency or entity submitting a proposal to any person, agency, or entity for any part of the work required under this contract.
4. Contract Documents: All documents pertinent to the quality and quantity of work to be performed on this project. Includes, but not limited to: Plans, Specifications, Instructions to Bidders, General and Special Conditions, Addenda, Alternates, Lists of Materials, Lists of Sub-Contractors, Unit Prices, Shop Drawings, Field Orders, Change Orders, Cost Breakdowns, Schedules of Value, Periodical Payment Requests, Construction Manager's Assignments, Architect's Supplemental Instructions, Construction Contract with Owner, etc.
5. Contractor: Any Contractor whether bidding, proposing, or working independently or under the supervision of a Prime Contractor or Construction Manager and who installs any type of Electrical Work as specified in the Contract Documents.
6. Electrical Contractor: Any Contractor whether bidding or working independently or under the supervision of the entity holding the Prime Contract and who installs any type of Electrical work, such as: power, lighting, television, telecommunications, data, fiber optic, intercom, fire detection and alarm, security, video, underground or overhead electrical, etc.
7. Electrical Sub-Contractor: Each or any Contractor contracted to, or employed by, the Electrical Contractor for any work required by the Electrical Contractor.
8. Engineer: The Consulting Mechanical-Electrical Engineer consulting to the Owner, Architect, or Other, etc.
9. Indicated: Listed in the Specifications, shown on the Plans or Addenda thereto.
10. Install: Install equipment furnished by others in complete working order.
11. Installer: Contractor or another entity engaged by Contractor as an employee, subcontractor, or sub-subcontractor, to perform a particular construction operation, including installation, erection, application, assembly, and similar operations.
12. Furnish: Deliver to the site in good condition and turn over to the Contractor who is to install.
13. Prime Contractor: The Contractor who has been engaged by the Owner in a contractual relationship to accomplish the work.
14. Project: All of the work required under this Contract.
15. Provide: Furnish and install complete, tested, and ready for operation.
16. Start-Up: The activities where systems or equipment are initially tested and operated. Start-up is completed prior to functional testing.
17. Typical: Where indicated repeat this work, method or means each time the same or similar condition occurs whether indicated or not.
18. Vendor: Supplier of equipment.

C. Reference Standards: Contractor is responsible for knowledge and application of current versions of all applicable standards and codes. Contractor shall adhere to the most recent revisions or version adopted by the Authorities Having Jurisdiction, including all relevant changes or addenda at the time of installation.
   1. IEEE – Institute of Electrical and Electronics Engineers.
      a. IEEE C2, National Electrical Safety Code
   2. NECA – National Electrical Contractors Association.
      a. NECA 1, Standard for Good Workmanship in Electrical Construction
   3. NFPA - National Fire Protection Association.
      a. NFPA 70, National Electrical Code (NEC)

4. OSHA - The Occupational Safety and Health Act

1.6 COORDINATION

A. Utility Company Requirements
   1. Contact the utility company for specifics on construction of pads, conduit, grounding, etc., prior to bidding the work and determine all their requirements. All work shall be in accordance with their standards.
   2. Each contractor, prior to bidding the work, is to contact the utility companies (electric and telecommunications) and determine the exact points of extension of all underground services in the field with a representative of each utility company. Also, obtain construction details on manholes, pull boxes, transformer pads, pedestal stub-ups, etc., from each utility company as applicable. Extension points indicated on the plans are approximate and are given for the bidder's information only.
   3. The Contractor shall provide the local utility company with a drawing produced by a licensed Land Surveyor or a licensed Engineer and acceptable to the utility that locates the centerline of the service and connection point. Coordinate further requirements with utility company.
   4. The Contractor is responsible for all fees, permit costs, etc., from the electrical utility, data, telephone, and cable TV companies. This includes any cost associated with the underground electrical service extension.

B. Coordination with Existing Utilities and Structures
   1. The locations of all piping, conduits, cables, utilities, and manholes existing, or otherwise, that are present within the contract construction site, shall be subject to continuous uninterrupted maintenance with no exception unless the Owner of the utility grants permission for temporary interruption.
   2. Known utilities and structures as available to the Engineer are shown on the drawings. However, it is additionally required that, prior to any excavation being performed, each Contractor ascertain and mark all utilities or lines that would be endangered by the excavation. Contractor shall bear costs of repairing damaged utilities.
   3. If utilities or structures are installed within the construction project boundary, the Contractor shall first probe and make every effort to locate the lines prior to excavating in the respective area.
   4. Cutting into existing utilities and services shall be done in coordination with and as designated by the Owner of the utility. The Contractor shall work continuously to restore service(s) upon deliberate or accidental interruption, providing premium time and materials as needed without extra claim to the Owner.
   5. The Contractor shall repair to the satisfaction of the Engineer any surface or subsurface improvements damaged during the course of the work, unless such improvement is shown to be abandoned or removed.
   6. Machine excavation shall not be permitted within ten feet of existing gas or fuel lines. Hand excavate only in these areas, in accord with utility company, agency or other applicable laws, standards or regulations.
   7. Protect all new or existing lines from damage by traffic, etc. during construction.
   8. Protect existing trees, indicated to remain with fencing or other approved method. Hold all new subsurface lines outside the drip line of trees, offsetting as necessary to protect root structures. Refer to planting or landscaping plans, or in their absence, consult with the Architect.

C. Interruption of Existing Services: In general, and to the extent possible, perform all work without interruption of the existing facilities' operations. Do not interrupt services to facilities occupied by Owner or others unless permitted under the following conditions:
   1. Notify the Owner, Architect, and Engineer no fewer than seven days in advance of proposed interruption of service.
   2. Provide the exact time the interruption will occur and the length of the interruption.
   3. Do not proceed with interruption of service without written permission from Owner, Architect, and Engineer.
   4. Failure to comply with this requirement may result in complete work stoppage by the Contractors involved until a complete schedule of interruptions can be developed.
   5. Contractor will not be entitled to additional compensation due to work stoppage mandated by unscheduled interruption.
   6. Coordinate interruptions with systems impacted by outages including but not limited to the following:
      a. Generators
      b. Emergency Lighting
      c. Elevators
      d. Fire Alarm Systems
   7. Whenever utilities are interrupted, either deliberately or accidentally, the Contractor shall work continuously to restore the service. The Contractor shall provide tools, materials, skilled journeymen of their own and other trades as necessary, premium time as needed and coordination with all applicable utilities, including payment of utility company charges (if any), all without requests for extra compensation to the Owner, except where otherwise provided for in the contract for the work.

D. Coordination Between Trades
   1. The Contractor is expressly directed to read the General Conditions and all detailed sections of these specifications for all other trades and to study all drawings applicable to their work, including Architectural, Mechanical, Structural, and other pertinent Drawings, to the end that complete coordination between trades will be affected.
   2. The Contractor is responsible for the correct location of all rough-in and connections at every piece of equipment. Work not correctly located shall be relocated at the Contractor's expense.
   3. It shall be the responsibility of each Contractor to leave the necessary room for other trades. No extra compensation or time will be allowed to cover the cost of removing fixtures, devices, conduit, ducts, etc. or equipment found encroaching on space required by others.
   4. Where any work is to be installed in close proximity to, or will interfere with work of other trades, each shall cooperate in working out space conditions to make a satisfactory adjustment. If directed by the Engineer, the Contractor shall prepare composite working drawings and sections at a suitable scale not less than ¼ inch = 1 Foot, clearly indicating how his work is to be installed in relation to the work of other trades, or so as not to cause any interference with work of other trades. The Contractor shall make the necessary changes in his work to correct the condition without extra charge.
   5. The Contractor shall furnish to other trades, as required, all necessary templates, patterns, setting plans, and shop details for the proper installation of work and for the purpose of coordinating adjacent work.

E. Temporary Services
   1. The Contractor shall arrange for temporary electrical and other services required to accomplish the work. In the absence of other provisions in the contract, the Contractor

shall provide for temporary services of all types, including the cost of connections, utility company fees, construction, removal, etc., in their bid.

2. All temporary services shall be removed by Contractor prior to acceptance of work.

F. Temporary Use of Equipment

1. The permanent electrical equipment, when installed, may be used for temporary services, subject to an agreement among the Contractors involved, the Owner, and with the consent of the Engineer. Should the permanent systems be used for this purpose, each Contractor shall pay for all temporary connections required and any replacements required due to damage without additional cost to the Owner, leaving the equipment and installation in "as new" condition. The Contractor may be required to bear utility costs, user fees, etc.
2. Permission to use the permanent equipment does not relieve the Contractors who utilize this equipment from the responsibility for any damages to the building construction and/or equipment which might result from its use.

G. Preinstallation Conference

1. Conduct a preinstallation conference at project site before each construction activity when required by other Sections and when required for coordination with other construction.
2. Attendees: Installer and representatives of manufacturers and fabricators involved in or affected by the installation and its coordination or integration with other materials and installations that have preceded or will follow, shall attend the meeting. Advise Architect and Engineer of scheduled meeting dates.
3. Agenda: Review progress of other construction activities and preparations for the particular activity under consideration, including any possible conflicts, requirements, limitations, and coordination with other work.
4. Record significant conference discussions, agreements, and disagreements, including required corrective measures and actions.
5. Reporting: Distribute minutes of the meeting to each party present and to other parties requiring information.
6. Do not proceed with installation if the conference cannot be successfully concluded. Initiate whatever actions are necessary to resolve impediments to performance of the Work and reconvene the conference at earliest feasible date

1.7 MAINTENANCE MATERIAL

A. Spare Parts and Extra Stock Material

1. Parts and Materials shall be properly marked and packaged for long term storage.

B. Special Tools and Keys:

1. Provide, along with the equipment provided, any special wrenches or tools necessary to dismantle or service equipment or appliances.
2. Wrenches shall include necessary keys, handles and operators for valves, switches, breakers, etc. and keys to electrical panels, emergency generators, alarm pull boxes and panels, etc.
3. Provide at least two of any such special wrench, keys, etc. to the Owner prior to completion of the project. Obtain a receipt that this has been accomplished and forward a copy to the Architect and Engineer.

1.8 QUALITY ASSURANCE

A. Manufacturer Qualifications: Manufacturer shall be a firm engaged in the manufacture of specified products of types and sizes required, and whose products have been in satisfactory use in similar service for a minimum of five years unless otherwise approved.
   1. The manufacturer shall have a valid ISO 9001 certification and an applicable quality assurance system that is regularly reviewed and audited by a third-party registrar. Manufacturing, inspection, and testing procedures shall be developed and controlled under the guidelines of the quality assurance system.
   2. Equipment shall be supported by service organizations which are reasonably convenient to the equipment installation in order to render satisfactory service to the equipment on a regular and emergency basis during the warranty period of the contract.

B. Installer Qualifications
   1. All Electrical Contractors bidding this project must have been a licensed company for a minimum of three years to qualify to bid this project. Individual employee experience does not supersede this requirement.
   2. All subcontractors bidding the electrical work must have completed one project of 70 percent this subcontract cost size and two projects of 50 percent this subcontract cost size.
   3. All electrical work shall be accomplished by qualified workers competent in the area of work for which they are responsible. Untrained and incompetent workers as evidenced by their workmanship shall be relieved of their responsibilities in those areas. The Engineer shall reserve the right to determine the quality of workmanship of any worker and unqualified or incompetent workers shall refrain from work in areas not satisfactory to them. Requests for relief of a worker shall be made through the normal channels of responsibility established by the Architect or the contract document provisions.
   4. All electrical work shall be accomplished by Journeymen electricians under the direct supervision of a licensed Electrician.
   5. Special electrical systems, such as Fire Alarm Systems, Telecommunications or Data Systems, Video Systems, Special Electronic Systems, Control Systems, etc., shall be installed by workers normally engaged or employed in these respective trades. Refer to Divisions 27 and 28 for additional requirements.

C. Licensed Professional Engineer Qualifications: Professional Engineer possessing active qualifications in accordance with Division 01 and licensed by the State of Connecticut

1.9 DELIVERY, STORAGE, AND HANDLING

A. Do not deliver or install indoor equipment until spaces are enclosed and weathertight, wet work in spaces is complete and dry, work above equipment is complete, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

1.10 FIELD CONDITIONS

A. Ambient Conditions:
   1. Rate equipment for continuous operation under the following conditions unless otherwise indicated:

a. Ambient Temperature: Not exceeding 104 deg F.
b. Altitude: Not exceeding 6600 feet.

1.11 WARRANTIES

A. Contractor Warranty: Contractor shall unconditionally guarantee all equipment, apparatus, materials, and workmanship entering into this Contract to be the best of its respective kind and shall replace all parts at their own expense, which fail or are proven defective within one year from Substantial Completion of the work by the Engineer. The effective date of completion of the work shall be the date each or any portion of the work is accepted by the Architect, Engineer, and Owner's Statement of Substantial Completion.

B. Manufacturer Warranty: Items of equipment which have longer guarantees, as called for in these specifications or as otherwise offered by the manufacturer shall have warranties and guarantees completed in order and shall be in effect at the time of final acceptance of the work by the Engineer. The Contractor shall present the Engineer with such warranties and guarantees at the time of final acceptance of the work. The Owner reserves the right to use equipment installed by the Contractor prior to date of final acceptance. Such use of equipment shall in no way invalidate the guarantee except that the Owner shall be liable for any damage to equipment during this period due to negligence of his operator or other employee.

C. The Warranties specified herein, and other Sections shall not deprive the Owner of other rights the Owner may have under provisions of the Contract Documents and shall be in addition to and run concurrently with other warranties made by the Contractor under requirements of the Contract Documents.

1.12 INDEMNIFICATION

A. The Contractor shall hold harmless and indemnify the Engineer, employees, officers, agents and consultants from all claims, loss, damage, actions, causes of actions, expense and/or liability resulting from, brought for, or on account of any personal injury or property damage received or sustained by any person, persons, (including third parties), or any property growing out of, occurring, or attributable to any work performed under or related to this contract, resulting in whole or in part from the negligence of the Contractor, any subcontractor, any employee, agent or representative.

1.13 HAZARDOUS MATERIALS

A. The Contractor is hereby advised that it is possible that asbestos and/or other hazardous materials are or were present in this building(s). Any worker, occupant, visitor, inspector, etc., who encounters any material of whose content they are not certain shall promptly report the existence and location of that material to the Contractor and/or Owner. The Contractor shall, as a part of their work, ensure their workers are aware of this potential and what they are to do in the event of suspicion. The Contractor shall also keep uninformed persons from the premises during construction. Furthermore, the Contractor shall insure that no one comes near to or in contact with any such material or fumes therefrom until its content can be ascertained to be non-hazardous.

B. CMTA, Inc., Consulting Engineers, have no expertise in the determination of the presence of hazardous materials. Therefore, no attempt has been made by them to identify the existence or location of any such material. Furthermore, CMTA nor any affiliate thereof will neither offer nor make any recommendations relative to the removal, handling, or disposal of such material.

C. If the work interfaces, connects or relates in any way with or to existing components which contain or bear any hazardous material, asbestos being one, then, it shall be the Contractor's sole responsibility to contact the Owner immediately.

D. The Contractor by execution of the contract for any work and/or by the accomplishment of any work thereby agrees to bring no claim relative to hazardous materials for negligence, breach of contract, indemnity, or any other such item against CMTA, its principals, employees, agents, or consultants. Also, the Contractor further agrees to defend, indemnify, and hold CMTA, its principals, employees, agents, and consultants, harmless from any such related claims which may be brought by any subcontractors, suppliers or any other third parties.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency suitable to the AHJ, and marked for intended location and application.

B. Materials used shall present no environmental or toxicological hazards as defined by current industry standards and shall comply with OSHA and EPA standards, other applicable federal, state, and local laws.

C. Standard Products
1. Except where specifically noted otherwise, all equipment supplied by the Contractor shall be the standard products of a single manufacturer of known reputation and experience in the industry.
2. Only equipment, components, and accessories in current production for at least five years beyond the completion date of this system shall be used and installed. Any equipment found to be obsolete or not in future production will be removed and replaced at Contractor’s expense. This includes all equipment, materials, and labor.
3. Products manufactured more than 2 years prior to date of delivery to site shall not be used, unless specified otherwise.

D. Product numbers are subject to change by the manufacturer without notification. In the event a product number is invalid or conflicts with the written description, notify the Engineer in writing prior to ordering the material and performing installation work.

2.2 PRODUCT SUBSTITUTIONS

A. Conform to the substitutions requirements and procedures outlined in Division 01.

B. One substitution for each product specified will be considered and substitutions must be submitted to Engineer a minimum of 10 days prior to bid using the standard CSI substitution request form.

C. If prevailing laws of cities, towns, states, or countries are more stringent than these specifications regarding such substitutions, then those laws shall prevail over these requirements.

D. Where products are noted as "or equal", a product of equivalent design, manufacture, and performance will be considered. Submit product data (product information, catalog cut sheets, test data, etc.) to substantiate that the product is in fact equivalent to that specified. The burden of proof that the substituted product is equivalent to the specified product rests with the Contractor. Whenever material, process or equipment is specified in accordance with an industry specification (ANSI, TIA, etc.), UL rating, or other association standard, present an affidavit from the manufacturer certifying that the product complies with the particular standard specification. When requested by the Engineer, submit supporting test data to substantiate compliance.

E. Manufacturers' names and model numbers used in conjunction with materials, processes or equipment included in the contract documents are used to establish standards of quality, utility and appearance and shall not be construed as limiting competition. Materials, processes, or equipment that, in the opinion of the Engineer, are equivalent in quality, utility and appearance will be approved as substitutions to that specified when “or equal” follows the manufacturers' names or model number(s).

F. When the Engineer accepts a substitution in writing, it is with the understanding that the Contractor guarantees the substituted product, component, article, or material to be equivalent to the one specified and dimensioned to fit within the construction according to contract documents. Do not provide substituted material, processes, or equipment without written authorization from the Engineer. Assumptions on the acceptability of a proposed substitution, prior to acceptance by the Engineer, are at the sole risk of the Contractor.

G. Approved substitutions shall not relieve the Contractor of responsibilities for the proper execution of the work, or from provisions of the specifications.

H. Contractor shall pay expenses, without additional charge to the Owner, in connection with substitution materials, processes and equipment, including the effect of substitution on their work or other Contractor's work.

I. In all cases where substitutions affect other trades, the Contractor offering such substitutions shall advise all such Contractors of the change and shall reimburse them for all necessary changes in their work. Any Drawings, Specifications, Diagrams, etc., required to describe and coordinate such substitutions or deviations shall be professionally prepared at the responsible Contractor's expense. Review of Shop Drawings by the Engineer does not absolve the Contractor of this responsibility.

J. Contractor shall be responsible and assume all costs for removal and replacement of any substituted product installed without prior written approval. Such costs shall include, but not be limited to labor, materials as well as any penalties, fees or costs incurred for late completion.

PART 3 - EXECUTION

3.1 INSTALLERS

A. Supervision of Work: Each Contractor and Sub-Contractors shall personally supervise the work or have a competent superintendent on the project site at all times during progress of the work, with full authority to act in matters related to the project.

B. Conduct of Workmen: The Contractor shall be responsible for the conduct of all workmen under their supervision. Misconduct on the part of any workmen to the extent of creating a safety hazard, or endangering the lives and property of others, shall result in the prompt relief of that workman. The consumption or influence of alcoholic beverages, narcotics or illegally used controlled substances on the jobsite is strictly forbidden. Possession of a firearm is prohibited and may result in prosecution. Foul or bad language, graffiti is strictly prohibited. Display of nude tattoos is prohibited.

C. No tobacco use, including smokeless tobacco, is allowed on property.

3.2 EXAMINATION

A. Each Contractor shall inform themself of all of the conditions under which the work is to be performed, the site of the work, the structure of the ground, the obstacles that may be encountered, the availability and location of necessary facilities and all relevant matters concerning the work. All Contractors shall carefully examine all Drawings and Specifications and inform themselves of the kind and type of materials to be used throughout the project and which may, in any way, affect the execution of their work.

B. Each Contractor shall fully acquaint themself with all existing conditions as to ingress and egress, distance of haul from supply points, routes for transportation of materials, facilities and services, availability of temporary or permanent utilities, etc. The Contractor shall include in their work all expenses or disbursements in connection with such matters and conditions. Each Contractor shall verify all work shown on the drawings and conditions at the site and shall report in writing to the Engineer ten days prior to bid, any apparent omissions, or discrepancies in order that clarifications may be issued by written addendum. No allowance is to be made for lack of knowledge concerning such conditions after bids are accepted.

3.3 PREPARATION

A. Surveys, Measurements, and Grades
   1. The Contractor shall lay out their work and be responsible for all necessary lines, levels, elevations, and measurements. They must verify the figures shown on the drawings before laying out the work and will be held responsible for any error resulting from their failure to do so.
   2. Base all measurements, both horizontal and vertical from established benchmarks. All work shall agree with these established lines and levels. Verify all measurements at site and check the correctness of same as related to the work.

3. Should the Contractor discover any discrepancy between actual measurements and those indicated, which prevents following good practice or the intent of the drawings and specifications, they shall notify the Engineer through normal channels of job communication and shall not proceed with his work until they have received instructions from the Engineer.

3.4 INSTALLATION

A. At no time shall the contractor work on energized electrical equipment. Contractor shall comply with NFPA 70E requirements at all times throughout construction.

B. Permits and Fees
1. The Contractor shall give all necessary notices, obtain, and pay for all permits, government sales taxes, fees, and other costs in connection with their work. As necessary, the Contractor shall file all required plans, utility easement requests and drawings, survey information online locations, load calculations, etc., prepare all documents and obtain all necessary approvals of all utility and governmental departments having jurisdiction; obtain all required certificates of inspection for their work and deliver same to the Engineer before request for final acceptance and final payment for the work.
2. Ignorance of Codes, Rules, regulations, utility company requirements, laws, etc., shall not diminish or absolve Contractor's responsibilities to provide and complete all work in compliance with such.

C. Codes and Regulations
1. The Contractor shall include in the work, without extra cost, any labor, materials, services, apparatus, or drawings required in order to comply with all applicable laws, ordinances, rules and regulations, whether or not shown on drawings and/or specified.
2. All materials furnished and all work installed shall comply with the adopted edition of the National Electrical Codes, National Fire Codes of the National Fire Protection Association, the requirements of local utility companies, and with the requirements of all governmental agencies or departments having jurisdiction.
3. All electrical work is to be constructed and installed in accordance with plans and specifications which have been approved in their entirety and/or reflect any changes requested by the AHJ, as applicable or required. Electrical work shall not commence until such plans are in the hands of the Electrical Contractor.
4. The Contractor shall insure their work is accomplished in accord with OSHA Standards and any other applicable government requirements.
5. Where conflict arises between any code and the contract documents, the code shall apply except in the instance where the plans and specifications exceed the requirements of the code. Any changes required as a result of these conflicts shall be brought to the attention of the Engineer at least ten working days prior to bid date, otherwise the Contractor shall make the required changes at their own expense. The provisions of the codes constitute minimum standards for wiring methods, materials, equipment and construction and compliance therewith will be required for all electrical work, except where the drawings and specifications require better materials, equipment, and construction than these minimum standards, in which case the drawings and specifications shall be the minimum standards.

D. Materials and Workmanship
   1. All electrical equipment, materials and articles incorporated in the work shall be new and of equal quality to the specified basis of design. All workmanship shall be first-class and shall be performed by electricians skilled and regularly employed in their respective trades.
   2. The Contractor shall determine that the equipment he proposes to furnish can be brought into the building(s) and installed within the space available. All equipment shall be installed so that all parts are readily accessible for inspection, maintenance, replacement, etc. Extra compensation will not be allowed for relocation of equipment for accessibility or for dismantling equipment to obtain entrance into the building(s).
   3. All fixtures, devices and wiring required shall be installed to make up complete systems as indicated on the drawings and specified herein.
   4. All electrical materials, equipment and appliances shall conform to the latest standards of the National Electric Manufacturers Association (NEMA) and the National Board of Fire Underwriters (NBFU) and shall be approved by the Owner's insuring agency if so required.
   5. Comply with National Electrical Contractors Association (NECA) performance standards that are published as National Electrical Installation Standards (NEIS).
   6. All applicable equipment and devices provided shall meet all FCC requirements and restrictions.

E. Weatherproofing
   1. Where any work penetrates waterproofing, including waterproof concrete, the method of installation shall be as approved by the Architect and/or Engineer before work is done. The Contractor shall furnish all necessary sleeves, caulking and flashing required to make openings absolutely watertight.
   2. Wherever work penetrates roofing, it shall be done in a manner that will not diminish or void the roofing guarantee or warranty in any way. Coordinate all such work with the roofing installer.

F. Equipment Access
   1. The Contractor shall be responsible for the sufficiency of the size of shafts and chases, the adequate clearance in partitions and above suspended ceilings for the proper installation of their work. Cooperate with the Prime Contractor and all other Contractors whose work is in the same space and advise each Contractor of equipment requirements. Such spaces and clearances shall be kept to the minimum size required to ensure adequate clearance and access.
   2. The Contractor shall locate all equipment which must be serviced, operated, or maintained in fully accessible positions. Equipment shall include but not be limited to junction boxes, pull boxes, contactors, panels, disconnects, controllers, switchgear, etc. Minor deviations from drawings may be made to allow for better accessibility, and any change shall be approved where the equipment is concealed.
   3. Each Contractor shall provide (or arrange for the provision by other trades) the access panels for each concealed junction box, pull box, fixtures or electrical device requiring access or service as shown on Engineer's plans or as required. Locations of these panels shall be identified in sufficient time to be installed in the normal course of work. All access panels shall be installed in accord with the Architect's standards for such work. In the absence of such specifications, at a minimum such work shall comply with the specifications below. All locations for access panels which are not specifically indicated on the drawings shall be submitted to and approved by the architect prior to ordering.

4. Access Doors; in Ceilings or Walls:
   a. In mechanical, electrical, and service spaces: 14-gauge aluminum brushed satin finish, 1" border.
   b. In finished areas: 14-gauge primed steel with 1" border to accept the architectural finishes specified for the space. Confirm these provisions with the Architect prior to obtaining materials or installing any such work.
   c. In fire or smoke rated partitions, access doors shall be provided that equal or exceed the required rating of the construction they are mounted in.

G. Connections
1. Provide rough-in and final connections to all electrically operated equipment furnished under the Work of the contract documents. Carefully coordinate with equipment suppliers, manufacturer's representatives, vendors, and other trades to provide complete electrical and dimensional interface to all equipment.
2. Provide all power wiring complete from power source to motor or equipment junction box, including power wiring through starters or contactors. Install all starters not factory mounted on equipment.
3. Provide all control, interlock, sensor, thermocouple, and other connections required for equipment operation. Coordinate ampacity and voltage characteristics for all motors and equipment.
4. Prior to bidding the work, coordinate power, control, sensor, interlock and all other wiring requirements for equipment or motors with all other trades, to ensure all needed wiring is provided. Failure to provide such coordination shall not be justification for claims of extra compensation of a time extension to the Contract.
5. At no times shall the contractor work on energized electrical equipment. Comply with NFPA 70E requirements at all times during construction.

H. Scaffolding, Rigging, and Hoisting: The Contractor shall furnish all scaffolding, rigging, hoisting, and services necessary for erection and delivery into the premises of any equipment and apparatus furnished. All such temporary appurtenances shall be set up in strict accord with OSHA Standards and Requirements. Remove same from premises when no longer required.

3.5 RESTORATION

A. The Contractor shall replace to their original condition all paving, curbing surfaces, drainage ditches, structures, fences, shrubs, existing or new building surfaces and appurtenances, and any other items damaged or removed by his operations. Replacement and repairs shall be in accordance with good construction practice and shall match materials employed in the original construction of the item to be replaced. All repairs shall be to the satisfaction of the Engineer, and in accord with the Architect's standards for such work, as applicable. Patchwork on new construction will not be accepted.

3.6 INDETIFICATION AND OPERATING INSTRUCTIONS

A. Provide all equipment with a nameplate bearing the manufacturer's name, address, model number, and serial number securely affixed in a conspicuous place; the nameplate of the distributing agent will not be acceptable.

B. Provide operating instructions for each system and principal item of equipment as specified in the technical sections for use by operation and maintenance personnel. The operating instructions shall include the following:
   1. Wiring diagrams, control diagrams, and control sequence for each principal system and item of equipment.
   2. Start up, proper adjustment, operating, lubrication, and shutdown procedures.
   3. Safety precautions.
   4. The procedure in the event of equipment failure.
   5. Other items of instruction as recommended by the manufacturer of each system or item of equipment.

C. Print or engrave operating instructions and frame under glass or in approved laminated plastic. Post instructions where directed. For operating instructions exposed to the weather, provide weather-resistant materials or weatherproof enclosures. Operating instructions shall not fade when exposed to sunlight and shall be secured to prevent easy removal or peeling.

3.7 SYSTEM TESTING, VERIFICATION, AND START-UP

A. The Contractor (and Sub-Contractors) shall be responsible for starting-up, testing, checking, examining, inspecting, and verifying their systems.

B. The Electrical Contractor shall designate an individual under their employment to lead the start-up, testing, and verification process. This person should not be the project manager or job site superintendent, but a person dedicated to making this critical task successful and completed in a timely manner.

C. A pre-start-up conference shall be held with the Architect, Owner, Contractors, and the Manufacturer providing startup services. The purpose of this meeting will be to discuss the goals, procedures, etc. for start-up.

D. The Contractor shall include in the bid to provide systems startup and verification for all electrical systems specified for this project. Specific startup, testing, and verification requirements are included throughout the Electrical specifications. In general, as part of the verification process, equipment suppliers shall perform start-up by their factory authorized technicians (unless noted otherwise) and shall complete and submit start-up reports/checklists. Submit start-up reports to the Engineer. The Contractor shall have appropriate trades on site to correct all deficiencies noted by the factory representative. For each deficiency noted, documentation of corrective action (including date and time) shall be submitted to the Engineer and Owner.

E. Where manufacturer start-up is not specified for a particular piece of equipment or system, the Contractor shall be responsible to perform start-up in strict accordance with manufacturer's instructions.

F. The Contractor shall be responsible for completion of a System Verification Checklist (SVC) / Manufacturer's Checklists. Furnish to the Testing Agent and Engineer. Sample checklists shall be submitted to the Engineer, Owner, and Testing Agent for approval.

G. The completed reports shall be organized and bound together in a tabbed binder and submitted for review and approval.

3.8 FIELD QUALITY CONTROL

A. Inspections
   1. Before requesting a final review of the installation from the Architect and/or Engineer, the Contractor shall thoroughly inspect the installation to assure that the work is complete in every detail and that all requirements of the Contract Documents have been fulfilled. Failure to accomplish this may result in charges from the Architect and/or Engineers for unnecessary and undue work on their part.
   2. Owner's and Engineer's inspections: Two inspections will be held to generate and then review punchlist items. All site inspections and visits thereafter shall be billed to the Contractor at the Engineer's standard hourly rates.
   3. The Contractor shall provide as a part of this contract electrical inspection by a competent Electrical Inspection Agency, licensed to provide such services. The name of this agency shall be included in the list of materials of the Form of Proposal by the Contractor. All costs incidental to the provision of electrical inspections shall be borne by the Electrical Contractor.

   4. The Contractor shall advise each Inspection Agency in writing (with an information copy of the correspondence to the Architect and/or Engineer) when they anticipate commencing work. Failure of the Inspection Agency to inspect the work in the stage following and submit the related reports may result in the Contractor's having to expose concealed work not so inspected. Costs associated with any rework, cutting, and patching will be at the expense of the responsible Contractor.
   5. Inspections shall be scheduled for rough-in as well as finished work. The rough inspections shall be divided into as many inspections as may be necessary to correct deficiencies. Report of each such inspection visit shall be submitted to the Architect, Engineer, and the Contractor within three days of the inspection.
   6. Approval by an Inspector does not relieve the Contractor from the responsibilities of furnishing equipment having a quality of performance equivalent to the requirements set forth in these plans and specifications. All work under this contract is subject to the review of the Architect and/or Engineer, whose decision is binding.
   7. Before final acceptance, the Contractor shall furnish three copies of the certificates of final approval by the Electrical Inspector (as well as all other inspection certificates) to the Engineer with one copy of each to the appropriate government agencies, as applicable. Final payment for the work shall be contingent upon completion of this requirement.

B. Punch Lists
   1. The Contractor shall review each area and prepare a punch list for each of the subcontractors, as applicable, for at least three stages of the project.
      a. For review of in-wall work that will be concealed by drywall or other materials well before substantial completion.
      b. For review of the above-ceiling work that will be concealed by tile or other materials well before substantial completion.
      c. For review of all other work as the project nears substantial completion.
   2. When all work from the Contractor’s punch list is complete at each of these stages and prior to completing ceiling installations (or at the final punch list stage), the Contractor shall request that the Engineer develop a punch list. This request is to be made in writing two weeks prior to the proposed date.

3. After all corrections have been made from the Engineer's punch list, the Contractor shall review and initial off on each item. This signed-off punch list shall be submitted to the Engineer. The Engineer shall return to the site once to review each punch list and all work prior to the ceilings being installed and at the final punch list review.
4. At the engineer's option, the contractor shall supply digital photographs via email or file-share of any installed work.
5. If additional visits are required by the Engineer to review work not completed by this review, the Engineer shall be reimbursed directly by the Contractor by check or money order (due 10 days from date of each additional visit) at a rate of $125.00 per hour for extra trips required to complete either of the above-ceiling or final punch lists.
6. All panelboard fronts shall be removed prior to final punch list inspection and re-installed after completion. Directories for each panelboard shall be completed and available for review by the Engineer at that time.

3.9 CLEANING

A. The Contractor shall, at all times, keep the area of work presentable to the public and clean of rubbish caused by their operations; and at the completion of the work, shall remove all rubbish, all tools, equipment, temporary work and surplus materials, from and about the premises, and shall leave the work clean and ready for use. If the Contractor does not address such cleaning immediately upon request, the Engineer may cause cleaning to be done by others and charge the cost of same to the responsible Contractor. Each Contractor shall be responsible for all damage from fire which originates in, or is propagated by, accumulations of rubbish or debris.

B. After completion of all work and before final acceptance of the work, each Contractor shall thoroughly clean all equipment and materials and shall remove all foreign matter such as grease, dirt, plaster, labels, stickers, etc., from the exterior of materials, equipment, and all associated fabrication. Pay particular attention to finished area surfaces such as lighting fixture lenses, lamps, reflectors, panels, etc.

3.10 TRAINING

A. Upon completion of all work and all tests, each Contractor shall furnish the necessary skilled labor and helpers for operating all systems and equipment for a period of three days of eight hours each, or as otherwise specified. During this period, instruct the Owner or their representative fully in the operations, adjustment, and maintenance of all equipment furnished. Give at least one week's written notice to the Owner, Architect and Engineer in advance of this period. The Engineer may attend any such training sessions or operational demonstrations. The Contractor shall certify in writing to the Engineer that such demonstrations have taken place, noting the date, time and names of the Owner's representative that were present.

B. Training shall be accompanied by complete as-built documentation and the technical systems operation manual.

C. The training shall be accomplished by a factory trained representative. Include a minimum of Four hours for each system described here-in unless noted otherwise. Each equipment representative shall be represented wherever their equipment is used.

D. Demonstration and Training DVDs: These training sessions shall be videotaped by the Installer. Submit two copies within seven days of end of each training module. On each copy, provide an applied label with the following information:
   1. Name of Project.
   2. Name and address of photographer.
   3. Name of Architect and Construction Manager.
   4. Name of Contractor.
   5. Date video was recorded.

E. Brochures: Furnish Owner a complete set of operating instructions and diagrams.

F. Instruction Program: Submit outline of instructional program for demonstration and training, including a schedule of proposed dates, times, length of instruction time, and instructors' names for each training module. Include learning objective and outline for each training module.

G. At completion of training, submit two complete training manual(s) for Owner's use.

H. Qualification Data: For facilitator, instructor, and photographer.

I. Attendance Record: For each training module, submit list of participants and length of instruction time.

3.11 PROTECTION

A. The Contractor shall be entirely responsible for all material and equipment furnished for their work and special care shall be taken to properly protect all parts thereof from damage during the construction period. Such protection shall be by a means acceptable to the Engineer. Equipment damaged while stored on site either before or after installation shall be repaired or replaced (as determined by the Engineer) by the responsible Contractor. Electrical equipment exposed to the weather shall be replaced by the Contractor at their own expense.

3.12 COMMISSIONING - CONTRACTOR RESPONSIBILITIES

A. The contractor shall assign representatives with expertise and authority to act on its behalf and shall schedule them to participate in and perform commissioning process activities including, but not limited to the following:
   1. Evaluate performance deficiencies identified in test reports and, in collaboration with entity responsible for system and equipment installation, recommend corrective action.
   2. Cooperate with the CxA for resolution of issues recorded in the Issues Log.
   3. Attend commissioning team meetings.
   4. Integrate and coordinate commissioning process activities with construction schedule.
   5. Complete electronic construction checklists as Work is completed and provide to the Commissioning Authority.
   6. Review and accept commissioning process test procedures provided by the Commissioning Authority.
   7. Complete commissioning process test procedures.

END OF SECTION

SECTION 260500 - COMMON WORK RESULTS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and General Provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

B. Refer Specification Section 019113 General Commissioning Requirements.

C. Refer to the Owner's OPR for additional items related to as-builts and O&Ms.

1.2 SUMMARY

A. Section Includes:
1. Slotted Support Systems.
2. Conduit and Cable Supports.
3. Mounting, Anchoring, and Attachment Components.
4. Fabricated Metal Supports.
5. Concrete Bases.
6. Vibration Isolation pads.
7. Sleeves for penetration of non-fire-rated construction walls and floors.
8. Sleeve-seal systems.
9. Firestopping.
10. Cutting and Patching
11. Painting

1.3 REFERENCES

A. Abbreviations and Acronyms
1. EMT: Electrical Metallic Tubing.
2. FMC: Flexible Metal Conduit.
3. GRC/GRS: Galvanized Rigid Steel Conduit.
4. LFMC: Liquid-tight flexible metal conduit.
5. RMC: Rigid Metal Conduit

B. Definitions
1. Channel: A continuous slotted channel (strut) with inturned lips suitable for assembly into multiple configurations

C. Reference Standards: The following publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest version as of the date of the Contract Documents, unless otherwise specified.
1. Metal Framing Manufacturers Association (MFMA)
a. MFMA-4: Metal Framing Standards Publication

b. MFMA-103: Guidelines for the use of Metal Framing

1.4 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

B. Coordinate installation of roof curbs, equipment supports, and roof penetrations with Division 07 Section "Roof Accessories."

1.5 SUBMITTALS

A. Product Data: For each type of product.
1. Include construction details, material descriptions, dimensions of components, profiles, and finishes.
2. Include rated capacities.

B. Shop Drawings: For fabrication and installation details and include calculations for the following:
1. Slotted channel systems.
2. Equipment supports.
3. Concrete Bases for Equipment.
4. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include adjustable motor bases, rails, and frames for equipment mounting.

C. Delegated-Design Submittal: Signed and sealed by a qualified professional engineer. For field assembled or fabricated hangers and supports for electrical systems.
1. Include design calculations and details of trapeze hangers.

D. Qualification Data: For professional engineer.

1.6 QUALITY ASSURANCE

A. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

B. Comply with NFPA 70.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency acceptable to the authority having jurisdiction and marked for intended location and application.

B. Delegated Design: Design support systems, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

2.2 SLOTTED SUPPORT SYSTEMS

A. Description: Preformed, continuous slot, bolted channels with associated fittings and hardware.
   1. Available Manufacturers: Subject to compliance with requirements, provide products from one of the following or an approved equal:
      a. Eaton B-Line.
      b. Kindorf.
      c. nVent Caddy.
      d. Power-Strut.
      e. SuperStrut.
      f. Unistrut.
   2. Comply with MFMA-4 for factory fabricated components suitable for field assembly.
   3. Material and Finish for channel, fittings, and accessories:
      a. Steel: Minimum 16 gauge, Hot dip galvanized after fabrication and applied according to ASTM A123 or A153 suitable for indoor or outdoor wet locations.
      b. Stainless Steel (type 316) per ASTM A276 suitable for corrosive environments.
   4. Channel Dimensions: Minimum 1-5/8 inches wide with varying heights and welded combinations selected to meet applicable load criteria.

2.3 CONDUIT AND CABLE SUPPORTS

A. Available Manufacturers: Subject to compliance with requirements, provide products from one of the following or an approved equal:
   1. Eaton B-Line
   2. nVent Caddy
   3. Thomas & Betts

B. Conduit and Cable Support Devices: Steel hangers, clamps, and associated fittings, designed for types and sizes of raceway or cable to be supported.

C. Support for Conductors in Vertical Conduit: Factory-fabricated assembly consisting of threaded body and insulating wedging plug or plugs for non-armored electrical conductors or cables in riser conduits. Provide plugs with number, size, and shape of conductor gripping pieces as required to suit individual conductors or cables supported.

D. Device Box Mounting Brackets: Factory-fabricated sheet steel brackets for support of device boxes adjacent to or between studs.

E. Through-Stud Cable and Raceway Support Clips: Factory-fabricated spring steel clip for cables or raceways where run horizontally through metal studs.

F. Roof-mounted Raceway Support Blocking: Non-penetrating, factory-fabricated support blocking for use under roof-mounted raceways. Wedge-shaped blocking constructed of 100% recycled UV-resistant Rubber with integral galvanized steel strut to accept raceway support clips.

G. Tee Bar Grid Box Hanger: Factory-fabricated metal electrical box hanger for supporting boxes at locations between ceiling system t-grid components. Height adjustable for various electrical box depths. Attached to ceiling tee bar with screws or integral clamp for stability. Includes tab for independent support wire attachment.

2.4 MOUNTING, ANCHORING, AND ATTACHMENT COMPONENTS

A. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Eaton B-Line
   2. Empire Industries.
   3. Hilti.
   4. ITW.
   5. MKT Fastening.

B. Description: Items for fastening electrical items or their supports to building surfaces include the following:
   1. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened Portland cement concrete, or steel with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.
   2. Mechanical-Expansion Anchors: Insert-wedge-type, zinc-coated or stainless steel, for use in hardened portland cement concrete with tension, shear, and pullout capacities appropriate for supported loads and building materials in which used.
   3. Concrete Inserts: Steel, slotted support system units similar to MSS Type 18; complying with MFMA-4 or MSS SP-58.
   4. Clamps for Attachment to Steel Structural Elements: MSS SP-58, type suitable for attached structural element.
   5. Through Bolts: Structural type, hex head, and high strength. Comply with ASTM A 325.
   6. Toggle Bolts: All-steel springhead type.
   7. Hanger Rods: Solid, threaded steel.

2.5 FABRICATED METAL EQUIPMENT SUPPORT ASSEMBLIES

A. Description: Welded or bolted, structural-steel shapes, shop or field fabricated to fit dimensions of supported equipment.

B. Materials: Comply with requirements in Division 05 Section "Metal Fabrications" for steel shapes and plates.

2.6 VIBRATION ISOLATION PADS

A. Basis-of-Design Product: Subject to compliance with requirements, provide Korfund Maxi-Flex Pads or a comparable product by one of the following:
   1. Ace Mountings Co.
   2. California Dynamics Corporation.
   3. Eaton B-Line.
   4. Kinetics Noise Control.

5. Mason Industries.
6. Vibration Eliminator Co.
7. VMC Group

B. Description: Molded, oil resistant, non-skid elastomeric pads arranged in 2-inch square segments.

C. Load Rating from 120 lbs. up to 360 lbs. per 2-inch segment.

D. Provide for all transformers located within the building.

2.7 SLEEVES

A. Wall and Floor Sleeves:
1. Galvanized Steel Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, zinc coated, plain ends.

2.8 SLEEVE-SEAL SYSTEMS

A. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and raceway or cable. Link Seal system or approved equal.
1. Sealing Elements: EPDM rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.
2. Pressure Plates: Glass reinforced nylon polymer.
3. Connecting Bolts and Nuts: Stainless steel of length required to secure pressure plates to sealing elements.

2.9 FIRESTOPPING FOR ELECTRICAL SYSTEMS

A. Manufacturers: Subject to compliance with requirements, provide products from one of the following or approved equal:
1. Hilti
2. Specified Technologies Inc (STI)
3. Wiremold

B. Source Limitations: Obtain firestopping systems through one source from a single manufacturer.

C. General Requirements:
1. Firestopping systems shall bear UL classification marking corresponding to its Fire Resistance Directory.
2. Comply with testing requirements set forth in ASTM E814 or UL 1479.
3. Provide through-penetration firestop systems that are compatible with one another, with the substrates forming openings, and with the items, if any, penetrating through-penetration firestop systems, under conditions of service and application, as demonstrated by through-penetration firestop system manufacturer based on testing and field experience.
4. Provide components for each through-penetration firestop system that are needed to install fill materials. Use only components specified by the firestopping manufacturer and approved by the qualified testing agency for the designated fire-resistance-rated systems.

D. Fire rated cable pathways: Re-penetrable, maintenance-free cable management devices for use with cable bundles penetrating through fire rated walls or floors.
   1. Shall contain a built-in fire sealing system sufficient to maintain the hourly rating of the fire rated wall or floor being penetrated.
   2. The system shall adjust to the installed cable loading and shall permit cables to be installed, removed, or retrofitted without the need to remove or reinstall firestop materials.
   3. Shall be engineered to allow two or more devices to be ganged together with wall plates for larger cable capacities.

E. Fire-rated cable grommets: Molded, two-piece grommet with sealing membrane for use with single cables or small bundles at through or membrane wall penetrations.
   1. System shall be installed around cables and shall lock tightly into the wall assembly.

F. Outlet Box Putty Pads: Non-hardening, moldable, intumescent material shaped into preformed pads for use with metallic outlet boxes.

G. Refer to Division 07 for requirements related to other firestopping systems and materials.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine areas and equipment to receive vibration isolation devices for compliance with manufacturer's installation requirements for installation tolerances and other conditions affecting performance.

B. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.

C. Examine substrates and conditions for compliance with requirements for opening configurations, penetrating items, substrates, and other conditions affecting performance of the Work.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 CUTTING AND PATCHING

A. Unless otherwise indicated, provide cutting and patching necessary to install the work specified. Patching shall match adjacent surfaces to the satisfaction of the Engineer and shall be in accordance with the Architect's standards for such work.

B. Do not cut structural elements without reinforcing the structure to maintain the designed weight bearing and stiffness. Coordinate approved reinforcement method with Architect and Structural Engineer.

3.3 SUPPORT SYSTEM APPLICATION

A. Comply with NFPA 70, NECA 1, NECA 101, and MFMA-103 for application of hangers and supports for electrical equipment and systems except where requirements of this Section are more stringent.

B. Do not support conduit, raceways, or equipment from existing plaster ceilings and/or supports. Each piece of equipment, apparatus or conduit mounted above the floor level shall be provided with suitable structural support, platform, or carrier in accordance with the best recognized practice. Such supporting or mounting means shall be provided by the Contractor for all equipment, conduit, and raceways. Exercise extreme care that structural members of building are not overloaded by such equipment. Provide any required additional bracing, cross members, angles, support, etc. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components multiplied by a safety factor of four with a minimum of 200 lbs.

C. Maximum Horizontal and Vertical Support Spacing for Raceway(s): Space supports for raceways as required by NFPA 70.

D. Minimum Hanger Rod Size for Raceway Supports: 3/8-inch diameter unless noted otherwise.

E. Single Raceways:
   1. For Raceways 1-1/4-inch and smaller: Install adjustable steel band hanger suspended on threaded rod.
   2. Spring-steel clamps designed for supporting single conduits without bolts may be used for 1-1/4-inch and smaller raceways serving branch circuits and communication systems above suspended ceilings and for fastening raceways to trapeze supports.

F. Multiple Raceways and single raceways larger than 1-1/4-inch:
   1. Install trapeze-type supports fabricated with slotted support system suspended on threaded rods for horizontal applications and fastened to building structure for vertical applications.
   2. Size so capacity can be increased by at least 25 percent in future without exceeding specified design load limits.
   3. Secure raceways and cables to these supports with two-bolt steel conduit clamps or single-bolt steel conduit clamps using spring friction action for retention in support channel.

3.4 SUPPORT SYSTEM INSTALLATION

A. Comply with NFPA 70, NECA 1, NECA 101, and MFMA-103 for installation requirements except where requirements of this Article are more stringent.

B. Mounting and Anchorage of Surface-Mounted or Recessed-Mounted Equipment and Components: Anchor and fasten electrical items and their supports to building structural elements by the following methods unless otherwise indicated by code:
   1. To Wood: Fasten with lag screws or through bolts.
   2. To New Concrete: Bolt to concrete inserts.
      a. Where support anchors are required, establish their type and locate in concrete construction before concrete is poured. Fit each hanger rod with a nut at its upper

end and set nut in a universal concrete insert in the form. Where supported weight exceeds holding strength of a single insert, pass rods through top slot of inserts and interlock with reinforcing steel. Also, where particularly heavy loads are to be supported, suspend hanger rod or rods from a structural angle spanning two or more inserts and securely bolted thereto to distribute the weight.

3. To Masonry: Approved toggle-type bolts on hollow masonry units and expansion anchor fasteners on solid masonry units.
4. To Existing Concrete: Self-drilling concrete anchors or expansion anchor fasteners.
5. To Steel: Beam clamps (MSS Type 19, 21, 23, 25, or 27) complying with MSS SP-69 or Spring-tension clamps.
6. To Light Steel: Sheet metal screws.
7. For Surface-Mounted Items on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to structure. Attachment to gypsum wall board is not acceptable as sole support means; slotted-channel rack solidly attached to structure or light-gauge metal framing at both ends is required.
8. For Recessed-Mounted Items in Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices to intermediate light-gauge metal framing members on each side of device or provide slotted-channel racks within hollow wall attached to structure by means that meet anchorage requirements. Attachment to gypsum wall board is not acceptable as sole support means.

C. Drill holes for expansion anchors in concrete at locations and to depths that avoid reinforcing bars or existing raceways embedded in slab. Verify reinforcing locations with Structural Engineer and X-Ray existing concrete structures as required.

D. Do not support any items (equipment, piping, conduit, etc.) exceeding 2 inches in diameter from the bottom of slabs. Where intermediate supports are required between structural members, use slotted steel channels support systems attached to beams or joists in order to avoid attachment to slabs.

E. Slotted Support Systems
1. Install slotted channel systems level and plumb.
2. Remove burrs from all exposed cut edges prior to installation.

F. Wall Stud and Ceiling Supports
1. Fasten junction, pull and devices boxes securely to the building construction, independent of raceway system.
2. Install Device Box Mounting Brackets supported between two studs. Attach all device boxes to two studs, device box stabilizers are prohibited.
3. Install Tee Bar Grid Box Hanger supported between two ceiling grid tee bars where devices boxes are located flush in recessed suspended ceilings. Install at least one independent support rod from box hanger to structure.
4. Install Through-Stud Cable and Raceway Support Clips where cables or raceways run horizontally through metal studs.

G. Install Roof-mounted Raceway Support Blocking where raceways run on across roofing.

1. Coordinate installation of roof supports with items specified in Division 07 Section "Roof Accessories." Provide products compatible with rooftop materials included in the Work to maintain warranty of roof system.

H. Threaded Rod Hardware
   1. Provide minimum of two lock nuts per threaded support rod except where lock nut tightens against a threaded socket, one locknut may be used.
   2. Trim rod excess to within 1-inch of locknut, de-burr, and provide protective endcap.

I. Support raceways at a distance above suspended ceilings to permit removal of ceiling panels and luminaires.

J. Locate raceways and supports so as not to hinder function or code required clearance to any system or equipment.

K. Provide independent supports and hang all electrical raceways and devices from the building structure with UL listed and approved materials. Utilizing the support systems of other trade's work is prohibited, except with written approval from the Engineer.

L. Provide riser support clamps for vertical conduit runs and install at each floor level penetration and at additional locations required to support weight of system.

M. Tighten all bolted connections to proper torque values in accordance with manufacturer's written instructions.

N. Provide supports to maintain 1/4-inch air space between raceway and mounting surface where raceways are mounted exposed in wet or corrosive locations and where directly attached to concrete or masonry.

O. The use of tie wire or perforated metal tape for support or fastening of any raceway system is prohibited.

P. Where galvanized wire is used for cable supports above suspended ceilings, provide minimum #12 support wire independent of ceiling system secured at both ends. Paint or provide tag to distinguish supports from ceiling system.

Q. Welding directly on raceways, fittings, or outlet boxes is prohibited.

3.5 INSTALLATION OF VIBRATION ISOLATION PADS

A. Select vibration device load ratings to match equipment loading and deflection criteria.

B. Arrange pads in single or multiple layers of sufficient stiffness for uniform loading.

C. Install pre-cut segments in accordance with manufacturer recommendations to match shape of equipment base.

3.6 INSTALLATION OF FABRICATED METAL SUPPORTS

A. Comply with installation requirements in Division 05 Section "Metal Fabrications" for site-fabricated metal supports.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.

C. Field Welding: Comply with AWS D1.1/D1.1M.

3.7 CONCRETE EQUIPMENT BASES

A. Housekeeping Pads: Construct concrete housekeeping pads a minimum of 4-inches thick and 6-inches larger in both directions than supported unit.

B. Exterior Equipment Pads: Construct exterior equipment pads a minimum of 8-inches thick and 6-inches larger in both directions than supported unit unless noted otherwise.

C. Use 3000-psi, 28-day compressive-strength concrete unless otherwise noted. Comply with Division 03 Section "Cast-in-Place Concrete" and ACI standards for subbase requirements, concrete materials, reinforcement, placement, and cover requirements.
   1. Reinforce pads with a minimum #4 rebar on 12-inch centers each way or equivalent welded wire fabric. Support reinforcement and tie together to prevent displacement during construction.
   2. For interior pads, provide #4 dowels at 24-inch centers each way (minimum of 4) to anchor to structural slab below. Embed dowels into slab a minimum of 3-inches.
   3. Provide rubbed finish for all surfaces.
   4. Provide ¾-inch chamfer at all exposed edges.
   5. Provide Engineer approved repairs if pad surface is rough or shows signs of honeycomb.
   6. Provide crown for exterior pads with a slope of 1/8-inch per foot.
   7. Do not set heavy equipment on pad for at least 7 days after pour unless approved by Engineer.

D. Anchor equipment to concrete base.
   1. Locate anchors to be a minimum of 10 bolt diameters from edge of the base.
   2. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   3. Install anchor bolts to elevations required for proper attachment to supported equipment.
   4. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

3.8 SLEEVE INSTALLATION FOR NON-FIRE-RATED ELECTRICAL PENETRATIONS

A. Comply with NECA 1.

B. Coordinate all required openings and provide sleeves and inserts prior to construction of wall and floor systems. Where openings are missed or incorrectly located, provide core-drilling and patching at no additional expense to owner.

C. Install sleeves without compromising structural integrity of wall or floor.

D. Sleeves for Conduits or Cable Penetrating Above-Grade Non-Fire-Rated Concrete and Masonry-Unit Floors and Walls:
   1. Interior Penetrations of Non-Fire-Rated Walls and Floors:
      a. Seal annular space between sleeve and raceway or cable, using joint sealant appropriate for size, depth, and location of joint.
      b. Seal space outside of sleeves with mortar or grout. Pack sealing material solidly between sleeve and wall so no voids remain. Tool exposed surfaces smooth; protect material while curing.
   2. Unless sleeve seal systems are used, size pipe sleeves to provide a minimum 1/4-inch annular clear space between sleeve and raceway. Where conduit motion due to expansion and contraction will occur, provide sleeves a minimum of two conduit sizes larger than the nominal conduit diameter.
   3. Install sleeves for wall penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of walls.
      a. For conduit penetrations, cut sleeves to length for mounting flush with both surfaces of walls. Deburr after cutting.
      b. For cable penetrations, extend sleeve a minimum of 2-inches beyond surface of wall and provide plastic insulated bushing.
   4. Install sleeves for floor penetrations. Extend sleeves installed in floors a minimum of 6-inches above finished floor level unless noted otherwise. Install sleeves during erection of floors.
   5. Fasten sleeves securely in floors, walls, so that they will not become displaced when concrete is poured or when other construction occurs around them. Take precautions to prevent concrete, plaster or other materials being forced into the space between pipe and sleeve during construction.

E. Sleeves for Cables Penetrating Non-Fire-Rated Gypsum Board Assemblies:
   1. Use circular metal sleeves unless penetration arrangement requires rectangular sleeved opening.
   2. Seal space outside of sleeves with approved joint compound or acoustical sealant for gypsum board assemblies.

F. Roof-Penetration Sleeves: Seal penetration of individual raceways and cables with flexible boot-type flashing units and counter flashing applied in coordination with roofing work. Coordinate all work with roofing system to maintain roof warranty.

G. Exterior-Wall and Floor Penetrations: Seal penetrations using steel pipe sleeves and mechanical sleeve seal system. Size sleeves to allow for manufacturer recommended annular clear space between raceway or cable and sleeve for installing sleeve-seal system. Where sleeves are installed in core drilled openings, grout sleeve into the opening.

H. Where sleeves are installed exposed in finished spaces, provide metal escutcheon plates of size to match the sleeve.

I. Sleeve-Seal-System:
   1. Install sleeve-seal systems in sleeves in exterior concrete walls and slabs-on-grade at raceway entries into building.

2. Install type and number of sealing elements recommended by manufacturer for raceway or cable material and size. Position raceway or cable in center of sleeve. Assemble mechanical sleeve seals and install in annular space between raceway or cable and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

3.9 ELECTRICAL SYSTEM FIRESTOPPING INSTALLATION

A. Install firestopping at all penetrations of fire-rated assemblies. Comply with requirements in Division 07 and as outlined below.

B. Coordinate location and proper selection of firestop devices with fire rated assembly. Ensure cast-in place devices are installed before placement of concrete.

C. Install firestop materials in accordance with UL Fire Resistance Directory and manufacturer's instructions.

D. Affix permanent label to each side of penetration immediately adjacent to firestopping to communicate to futures installers and code authorities the following:
1. Fire-stop product/system used
2. Installation Company
3. Penetration Hour Rating
4. Installation Date

E. Examine sealed penetration areas to ensure proper installation before concealing or enclosing areas. Keep areas of work accessible until inspection by applicable code authorities.

3.10 PAINTING

A. Touchup: Comply with requirements in Division 09 painting Sections for cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal.

B. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

END OF SECTION

SECTION 260519 - LOW-VOLTAGE ELECTRICAL POWER CONDUCTORS AND CABLES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. This Section includes the following:
   1. Building wire and cable rated 600 V and less.
   2. Connectors, splices, and terminations rated 600 V or less.
   3. Control Voltage Conductors and Cables

B. Related Requirements:

C. Refer to Division 27 for additional cabling requirements.

1.3 REFERENCES

A. Abbreviations
   1. RoHS: Restriction of Hazardous Substances.

B. Definitions
   1. Low Voltage: Circuits and equipment operating at more than 50VAC but less than 1000VAC for building electrical distribution systems.
   2. Control Voltage: Circuits and equipment operating at less than 50VAC for remote-control and signaling power-limited circuits.
   3. Plenum: A space forming part of the air distribution system to which one or more air ducts are connected. An air duct is a passageway, other than a plenum, for transporting air to or from heating, ventilating, or air-conditioning equipment.
   4. Homerun: The run of raceway(s) and cable(s) between the panelboard or switchboard and the junction box in the area served where branch circuit cables originate.

C. Reference Standards: The following publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest version as of the date of the Contract Documents, unless otherwise specified.
   1. National Electrical Contractors Association (NECA)
      a. NECA 104, “Installing Aluminum Building Wire and Cable”
      b. NECA/NACMA 120, “Standard for Installing Armored Cable (Type AC) and Type Metal-Clad (MC) Cable”.

PART 2 - – PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Comply with NFPA 70.

2.2 BUILDING WIRE AND CABLE

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Alpha Wire Company.
2. Cerro Wire LLC.
3. Encore Wire Corporation.
4. General Cable Technologies Corporation.
5. Okonite Compony.
6. Southwire Company.

B. Building Wire Description: Flexible, insulated, and uninsulated, drawn current-carrying conductor with an overall insulation layer or jacket, or both, rated 600 V or less.

C. Cable Description: A factory assembly of one or more current-carrying insulated conductors in an overall protective sheath.

D. General Requirements:
1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.
2. RoHS compliant.
3. Conductor and Cable Marking: Comply with wire and cable marking according to UL's "Wire and Cable Marking and Application Guide."

E. Copper Conductors: 98% conductive annealed copper, complying with ASTM B 3 for bare annealed copper and with ASTM B 8 for stranded conductors.

F. Conductor Insulation:

G. 600V, 90°C

H. Comply with ANSI/NEMA WC 70/ICEA S-95-658.

I. THHN/THWN-2: Comply with UL 83.

J. XHHW-2: Comply with UL 44.

K. Metal Clad Cable, Type MC

1. Comply with UL1569.
2. Circuits: Single circuit with color coded current carrying conductors and insulated ground conductor.
3. Conductor Insulation: THHN/THWN-2.
4. Armor Jacket: Galvanized Steel Interlocking Armor. Aluminum Armor is not acceptable.
5. Connectors shall be provided with lock nut connection to the termination point enclosure.
6. Connectors shall be steel, die cast is not acceptable.
7. Listed for use in penetration firestop systems.

L. Mineral Insulated Cable, Type MI
1. Solid copper conductors encased in compressed metal oxide with an outer metallic sheath
2. UL 2196 for fire resistance.
3. Insulation: Compressed magnesium oxide
4. Sheath: Copper

2.3 SPLICING DEVICES & CONNECTORS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. 3M; Electrical Products Division.
2. AFC Cable Systems, Inc.
3. Burndy
4. Gardner Bender.
5. Hubbell Power Systems, Inc.
6. Ideal Industries, Inc.
7. ILSCO.
8. NSi Industries LLC.
9. O-Z/Gedney;
10. Thomas & Betts.
11. Tyco Electronics Corp.

B. Description: Factory-fabricated connectors, splices, and lugs of size, ampacity rating, material, type, and class for application and service indicated; listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and use.

C. Twist-On Wire Connectors: spring pressure type, 600V, 105°C insulation, suitable for connecting two or more wires in a pigtail application.

D. Material: Tin plated copper

E. Crimp Sleeve Splices: butt or parallel crimp type, copper sleeve with nylon cover and skirted insulators, capable of permanent connection of two or more wires up to #10 AWG.

F. Compression Splices: standard or long barrel type, 90°C, with cold shrink tubing, for use with hydraulic crimping tool, capable of permanent connection of wires #6 AWG and larger.

G. Ring or Flanged Fork Tongue Terminals: crimp type, 600V, 105°C insulation, insulated serrated barrel, capable of terminating wires up to #10 AWG.

H. No aluminum splicing devices or connectors are permitted.

2.4 CONTROL VOLTAGE CONDUCTORS AND CABLE

A. Control Cable: NFPA 70, Type CMG or CMP
   1. Single or multi-pair, twisted, minimum No. 18 AWG, stranded tinned copper conductors.
   2. PVC insulation.
   3. Shielded or Unshielded.
   4. Flame Resistance:
      a. CMG: Comply with UL1685
      b. CMP: Comply with NFPA 262

B. Class 1, 2, and 3 Control Circuits: Stranded Copper, Type THHN/THWN-2

PART 3 - EXECUTION

3.1 CONDUCTOR AND INSULATION APPLICATION

A. Branch Circuits: Copper. THHN/THWN-2. Solid for #10 AWG and smaller; stranded for # 8 AWG and larger.

B. Provide XHHW-2 insulation for the following:
   1. Feeder circuits (60A and more)
   2. Circuits routed exposed on rooftops.
   3. Conductors on the load side of a Variable Frequency Drive.
   4. Circuits run in underground conduits.

C. Conductors for motors or vibrating or oscillating equipment: Extra flexible stranded.

D. Cord Drops and Portable Appliance Connections: Type SOOW, hard service cord with stainless-steel, wire-mesh, strain relief device at terminations to suit application.

E. Conductor sizes indicated on drawings are based upon 75 degree C rating.

F. Minimum branch circuit or feeder size:
   1. Not less than #12 AWG copper wire unless noted otherwise within the building.
   2. Not less than #8 AWG copper wire for circuits run to the exterior.

G. Minimum control circuit conductor sizes:
   1. Class 1 remote-control and signal circuits; No 14 AWG.
   2. Class 2 low-energy, remote-control, and signal circuits; No. 16 AWG.
   3. Class 3 low-energy, remote-control, alarm, and signal circuits; No 12 AWG

H. Provide all the wire for the project in new and undamaged condition. Deliver in standard coils or reels. Wires and cables manufactured more than 24 months prior to date of delivery to the site are not acceptable.

3.2 EXAMINATION

A. Prior to installing conductors and cables:
   1. Verify that raceway installation is complete according to Section 260533 “Raceways and Boxes for Electrical Systems” and ready for installation of conductors and cables.
   2. Verify that raceways are properly sized in accordance with NEC.
   3. Visually inspect exposed raceways to ensure that raceways are not damaged, and bends are not deformed.
   4. Verify that raceways do not exceed the maximum number of bends between pull-points.
   5. Verify raceways have been cleaned of all dirt and debris.

3.3 INSTALLATION OF CONDUCTORS AND CABLES

A. Pulling Conductors in Raceways
   1. Pull cables in accordance with cable manufacturer and pulling equipment manufacturer recommendations as well as applicable sections of the National Electric Code.
   2. Use installation equipment, tools, and materials as necessary, such as sheaves, pulling eyes, basket grips, winches, cable reels and/or cable reel jacks, duct entrance funnels, and pulling tension gauges, and approved pulling lubricants where required to facilitate cable pulling without damage to cables or raceway.
   3. Use manufacturer-approved pulling compound or lubricant where necessary; compound used must not deteriorate conductor or insulation. Do not use lubricants that harden or become adhesive with age. Apply lubricant where cables enter ducts and conduits and at all intermediate access points on long or difficult pulls.
   4. Do not exceed manufacturer's recommended maximum pulling tensions and sidewall pressure values. Utilize special remote readout equipment to ensure compliance.
   5. Avoid abrasion and other damage to cables during installation. Provide physical protection of cables, such as using appropriately sized flexible cable guides or feed-in tubes, at the entrance of boxes and raceways.
   6. If basket-grip type cable-pulling devices are used to pull cable in place, cut off the section of cable under the grip before splicing and terminating.

B. Bend Radius
   1. Handle conductors and cables carefully. Make bends in cables and conductors such that cables, conductors, sheaths, armor, etc., are not damaged.
   2. Do not bend conductors and cables to less than the NEC and manufacturer recommended minimum bending radius.
   3. Ensure that tools and accessories used to install conductors and cables, such as rollers, sheaves, trolley assemblies, tube guides, and/or raceways, are properly sized and utilized to be greater than the minimum bending radii of conductors and cables.
   4. Minimize bending where conductors and cables enter or exit raceways, cabinets, and boxes. Do not install cables that have been bent or kinked to a radius less than the recommended dimension.
   5. Install conductors only after insulating bushings are in place.

C. If multiple circuits are pulled in a single homerun, provide a dedicated neutral for each phase conductor. In these cases, a maximum of seven conductors (six current carrying and one ground) are permitted in a single conduit except for switch legs and travelers in multi-point switching arrangements. De-rate conductors per NEC.

D. Multi-wire branch circuits with a shared neutral are not permitted unless specifically noted on the drawings. Where indicated, group the phases and neutral together with cable ties in the panelboard and in all pull boxes.

E. Install conductors for isolated power systems in as short a run of conduit as practicable. The use of pulling compound or lubricant is not permitted on conductors in isolated power systems.

F. Voltage Drop:
   1. Adjust conductors and conduit sizes accordingly based on actual field installed conditions.
   2. Size and install all feeders and branch circuits for a maximum 2% voltage drop in feeders and 3% in branch circuits with a maximum total voltage drop of 5%.
   3. Calculate using a load equal to 80% of the supply breaker rating unless the circuit breaker is rated to carry 100% of the load.
   4. When the conductor length from the panel to the first outlet on a circuit exceeds the values below, adjust branch circuit conductors from the panel to the first outlet. Increase the conductor size of remaining branch circuit as needed to meet above voltage drop limitations.
      a. For 277VAC homeruns exceeding 125-feet, #10 AWG minimum.
      b. For 120VAC homeruns exceeding 100-feet, #10 AWG minimum.
      c. For 120VAC homeruns exceeding 175-feet, #8 AWG minimum.

G. Conceal cables in finished walls, ceilings, and floors unless otherwise indicated.

H. Install cables parallel and perpendicular to surfaces of exposed structural members and follow surface contours.

I. Bundle cables where run in groups using listed supports. Provide independent supports directly from structure, do not route through structure or on work of other trades.

J. Metal Clad Cable, Type MC
   1. MC cable is permitted for the following applications:
      a. Normal power branch circuits between wiring devices and nearest junction box, #10 AWG and smaller, where concealed in walls and ceilings.
      b. Provide no more than three MC cable circuit connections per junction box.
      c. For power circuits, limit length of MC cable to 10ft from the junction box to the first wiring device and transition circuit to conduit if it continues outside the wall.
      d. For lighting circuits, limit length of MC cable to 6ft from the junction box to the first luminaire and extend MC cable to other fixtures in the same room.
   2. MC cable is not permitted for the following:
      a. Emergency or standby power circuits
      b. Feeders
      c. Homeruns to panelboards.
      d. Branch circuits with conductors larger than #10 AWG.
      e. Branch circuits serving HVAC, elevator/escalator, and kitchen equipment loads.
      f. Within mechanical, electrical or telecommunication equipment rooms.
      g. Exposed locations.
      h. Inaccessible ceiling locations.
      i. Within masonry walls.
      j. Exterior or outdoor locations.
      k. Wet or damp locations.
      l. Direct buried locations.

3. Where MC cable is permitted, comply with the following:
   a. Install MC cables and connectors in accordance with NECA/NACMA 120.
   b. Use only for single-circuit applications. For devices in the same wall connected to different circuits, install separate single circuit cable for each circuit.
   c. Support MC cables with clamps, clips, or similar product specifically designed for supporting cables in accordance with NEC and route all runs parallel or perpendicular to building lines with right angle turns complying with manufacturer's bend radius requirements.
   d. Cables shall be bundled and run in groups using listed supports to maintain proper spacing. Where spacing can't be maintained, apply adjustment factors for derating conductors.
   e. Do not route through structure or on work of other trades. Provide independent supports directly from structure.

K. Control Circuit Conductors and Cables
1. Use insulated spade lugs for wire and cable connection to screw terminals.
2. Conductors installed within environmental air plenums shall be per NEC. Article 800 and other applicable codes, with FEP-type insulation or an approved equivalent. Provide plenum-rated cable supports where plastic straps or other supports, etc., are installed in plenum areas.
3. Where indicated, systems and control conductors that are installed exposed shall not be routed across ceilings or ductwork. Provide independent supports anchored to building structure or other permanent support members.
4. Install in such a manner as to not interfere with the access to or operation of equipment or removal of ceiling tiles.
5. Nylon tie-wraps shall be installed in such a manner so as to bundle conductors neatly, allowing runouts of single conductors or groups to drop down to equipment served.
6. Install grommets where dropping out of trays or into panels or service columns.
7. Install sleeves with bushings where penetrating partitions.
8. Provide firestopping for penetrations of fire rated assemblies with approved materials.

3.4 SPLICES, TAPS, CONNECTIONS, AND TERMINATIONS

A. Prepare cable in accordance with the conductor, cable, splice and termination component manufacturers' recommendations and instructions.

B. Cut conductors and cables using tools and methods which ensure a square cut. Do not nick or damage conductors.

C. Ensure conductor inserts fully into the connector or termination with the insulation fitting closely to the connector or termination.

D. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A and UL 486B. Where a tightening torque is indicated as a numeric value on equipment or in installation instructions provided by the manufacturer, a calibrated torque tools shall be used to achieve that indicated torque value, unless the equipment manufacturer has provided installation instructions for an alternative method of achieving the required torque.

E. Splices and Taps
1. Make splices and taps that are compatible with conductor material and that possess equivalent or better mechanical strength and insulation ratings than un-spliced conductors.
2. Make splices and taps in junction boxes or other enclosure approved for the wiring method.
3. For conductors #10 AWG and smaller conductors, use pressure crimp type connections.
4. For conductors #8 AWG and larger, use a hydraulic compression type connection, with cold shrink tubing and tape to restore full insulation value of the wire being spliced.

F. Connections and Terminations
1. Ensure that conductor temperature and ampacity ratings are compatible with connectors, terminals, and equipment to which they are to be connected.
2. Provide crimp-applied ring or flanged fork type terminals for motor and equipment terminals where such terminals are provided on motor and equipment leads or on all stranded wire terminations using #10 AWG or smaller conductors.
3. Motor Connections shall use connection lugs with motor stub splice insulators.

G. Wiring at Outlets: Install conductors at each outlet with at least 12 inches of slack.

H. All cables and wiring, regardless of voltage, installed in manholes or cable vaults shall be routed in such a manner to provide a minimum of 10 feet of slack cable for future splicing. Install cables along walls by utilizing the longer route from entry to exit. If both routes are symmetrical, provide a loop of cable secured to the wall. All cables shall be tied to insulated cable supports on wall-mounted racks, spaced a maximum of three feet apart.

3.5 PROTECTION

A. Intentional or unintentional painting of exposed low-voltage and/or control-voltage cabling insulation is prohibited. Ensure that exposed cabling is adequately protected from direct painting or overspray whether painting is required within the electrical specifications or required by other disciplines/trades.

B. Review the project’s painting requirements for all disciplines and provide protection as required.

C. Where exposed cabling is being installed in exposed ceiling or wall spaces that are required to be painted, provide cabling in enclosed raceways, or provide alternate options for cable colors to engineer for approval.

3.6 IDENTIFICATION

A. Comply with Section 260553 "Identification for Electrical Systems."
1. Identify all conductors by means of labels placed on conductors in all junction boxes and at each terminal point with labels indicating source, circuit number or terminal number.
2. Identify each spare conductor at each end with identity number and location of other end of conductor and identify as spare conductor.
3. Identify each control voltage conductor or cable on each end and at each terminal with a number-coded identification tag. Each wire must have a unique tag.

B. Provide conductors, in all sizes of cable, with continuous solid insulation color(s) from the manufacturer. Taped ends shall not be acceptable.
   1. Conductors shall be color coded as follows:
      a. 120/208 Volt Conductors
      b. Phase A: Black
      c. Phase B: Red
      d. Phase C: Blue
      e. Neutral: White
      f. Ground: Green
      g. Isolated Ground: Green/Yellow
      h. 277/480 Volt Conductors
      i. Phase A: Brown
      j. Phase B: Orange
      k. Phase C: Yellow
      l. Neutral: Gray or White with Brown tracer
      m. Ground: Green
      n. Isolated Ground: Green/Yellow
   2. Control voltage wiring color coding shall be consistent throughout the project and shall match existing equipment and standards where applicable. Color coding for each system shall be unique.
   3. Conductors within enclosures that may be energized when enclosure disconnect is off - yellow or taped with 1/2" yellow tape every 6" of length, inside enclosure. Provide limacoid plate warning sign on front of enclosure where this condition occurs.
   4. DC Wiring:
      a. Positive: Light Blue
      b. Negative: Dark Blue

3.7 FIELD QUALITY CONTROL

A. Perform tests and inspections and prepare test reports.

B. Visual Inspections:
   1. Compare cable data with drawings and specifications.
   2. Inspect exposed sections of cable for physical damage and correct connections in accordance with drawings.
   3. Inspect bolted electrical connections for high resistance. Verify tightness of accessible bolted electrical connections by calibrated torque-wrench method in accordance with manufacturer’s published data.
   4. Inspect compression-applied connectors for correct cable match and indentation.
   5. Inspect for correct identification and arrangements.
   6. Inspect cable jacket insulation and condition.

C. Electrical Tests:
   1. Perform insulation resistance testing for all electrical distribution system feeders unless notes otherwise. Testing may be witnessed by the Engineer and/or Commissioning agent. Schedule all tests with Architect with sufficient notice.
   2. Insulation resistance tests shall be performed at a DC voltage of 1,000 volts for 600 volt rated equipment, and at a DC voltage of 500 volts for 120-300 volt rated equipment. The test duration shall be one minute. The minimum acceptable (temperature corrected) resistance is

25 megaohms for 120-300 volt rated equipment and 100 megaohms for 600 volt rated equipment and wiring.

3. Test instruments shall be calibrated to national standards within the last 12 months.

D. Test and Inspection Reports: Prepare a written report to record the following:
   1. Test procedures used.
   2. Results that comply with requirements.
   3. Results that do not comply with requirements and corrective action taken to achieve compliance with requirements.

E. Cables will be considered defective if they do not pass tests and inspections. Remove and replace malfunctioning units and retest as specified above.

F. Submit test results to Architect and Engineer for approval.

END OF SECTION

SECTION 260526 - GROUNDING AND BONDING FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. Description: Grounding and Bonding for electrical systems cover several different but interrelated systems including Electrical System Grounding, Equipment Grounding System, Grounding Electrode System, and interfaces with telecommunications bonding infrastructure as well as lighting protection systems.

B. Section includes requirements for electrical system and equipment grounding, plus the following special applications:
   1. Underground distribution grounding.
   2. Power system grounding.
   3. Electrical equipment grounding and bonding.
   4. Grounding electrodes.
   5. Ground bonding common with lightning protection system.

C. Related Requirements:
   1. Refer to Section 270526 “Grounding and Bonding for Communications Systems” for requirements associated with the telecommunications bonding infrastructure.

1.3 SYSTEM DESCRIPTION

A. The entire electrical installation (non-current carrying metal parts), including but not limited to, metallic conduits and raceways, cable trays, junction and pull boxes, enclosures, fixtures, service equipment, distribution boards and panels, transformers, switches, motor frames, cabinets and equipment shall be completely and effectively grounded in accordance with all code requirements, whether or not such connections are specifically shown or specified.

B. Resistance: Resistance from the main ground bus bar through the ground electrode to earth shall not exceed 5 OHMS unless otherwise noted.

C. Ground each separately derived system neutral as described herein except as otherwise shown or specified.

D. Provide telecommunications system grounding as described herein except as otherwise shown of specified.

E. Ground HVAC ductwork per Division 23 requirements.

1.4 REFERENCES

A. Abbreviations
   1. MGB: Main Grounding Busbar

B. Definitions
   1. Grounding: Establishing a direct or indirect connection to Earth or some conducting body that serves in place of Earth.
   2. Bonding: Method by which all non-energized conductive materials are effectively interconnected to create a low impedance path.

C. Reference Standards: The following publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest version as of the date of the Contract Documents, unless otherwise specified.
   1. National Electrical Contractors Association (NECA)
      a. NECA 331 – Standard for Building and Service Entrance Grounding and Bonding.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency acceptable to authorities having jurisdiction and marked for intended location and application.

B. Comply with NFPA 70 and UL 467 for grounding and bonding materials and equipment.

2.2 MANUFACTURERS:

A. Subject to compliance with requirements, provide products by one of the following:
   1. Burndy Electrical
   2. nVent Erico Inc.
   3. Thomas & Bett, Electrical
   4. VFC Lyncole

2.3 CONDUCTORS

A. Insulated Copper Conductors: Comply with Section 260519 “Low-Voltage Electrical Power Conductors and Cables”.

B. Bare Copper Conductors:
   1. Solid Conductors: ASTM B 3.
   2. Stranded Conductors: ASTM B 8.
   3. Tinned Conductors: ASTM B 33.

4. Boding Cable: 28 kcmil, 14 strands of No. 17 AWG copper conductor
5. Bonding Conductor: No. 4 or No. 6 AWG, stranded copper conductor.

C. Grounding electrode conductor shall be a minimum of #4/0 AWG unless otherwise indicated, and shall be continuous without joints or splices. Conductor shall be stranded cable.

D. Underground conductors shall be #4/0 AWG, bare, tinned, stranded, unless otherwise indicated.

E. Straps/Jumpers: Copper tape, braided conductors pre-terminated with copper ferrules, cross-sectional area no less than a No. 6 AWG conductor.

2.4 ELECTRICAL SYSTEM BUSBARS

A. Grounding Busbar: Predrilled rectangular bars of annealed copper, minimum 1/4 by 4 inches in cross section, with 9/32-inch holes spaced 1-1/8 inches apart. Size busbar length to accommodate initial conductor installation plus a 50% growth factor. Stand-off insulators for mounting shall comply with UL 891 for use in switchboards, 1000 V and shall be Lexan or PVC, impulse tested at 5000 V.

2.5 CONNECTORS

A. Listed and labeled by an NRTL acceptable to authorities having jurisdiction for applications in which used and for specific types, sizes, and combinations of conductors and other items connected.

B. Welded Connectors: Exothermic-welding kits consisting of graphite molds, copper oxide and aluminum weld metal, and electronic ignition system. Provide types recommended by kit manufacturer for materials being joined and installation conditions.

C. Irreversible Compression Connectors: Tin-plated copper, for installation using a hydraulic compression tool and die matched to connector type. Provide die code or other visual indicator to ensure proper connector selection and uniform compression for a permanent connection.
1. Taps: C-type, H-type, or Figure 6/8 type.
2. Splices: Long Barrel straight or tee.
3. Terminals: Two-hole lug long barrel type.

D. Mechanical Connectors: Tin-plated high strength copper alloy or high strength cast bronze.
1. Water Service Pipe Clamps: Heavy-Duty, two-piece saddle type with stainless steel bolts.
2. Pipe Clamps: Heavy-Duty, U-bolt type with silicon bronze hardware.
3. Lay-in Lug Connector: Heavy-Duty, open face lug with hex head set screw.

2.6 GROUNDING ELECTRODES

A. Ground Rods: 10 mil pure electrolytic copper coating with molecular bond to high strength steel core; 3/4 inch by 12 feet with chamfered end. Ensure ground rods are die-stamped near the top with the name and trademark of the manufacturer and the length in feet.

B. Enhanced Composite Backfill: Electrically conductive, environmentally safe, maintenance free backfill material with neutral PH properties that creates a stable, non-corrosive, low resistance connection between a grounding electrode and earth. Basis of Design: Erico Ground Enhancement Material (GEM).

C. Test Well: Lightweight polymer concrete, Tier 15 rated, non-slipcover, suitable for non-deliberate incidental traffic. 12-inch by 12-inch minimum, 12-inches deep unless noted otherwise, with "GROUND" legend unless noted otherwise. Provide hand holes for Test Wells.

PART 3 - EXECUTION

3.1 GENERAL

A. Bond grounding bus and all non-current carrying metallic parts of raceways systems and equipment to common ground in accordance with the National Electrical Code, NECA 331, as shown on the Contract Drawings, and in accordance with the requirements of the local authority having jurisdiction.

B. The size of the grounding and bonding conductors shall be not less than that given in Article No. 250 of the National Electrical Code, and/or as shown on the Contract Drawings.

C. Interconnect all grounding systems in or on the structure to provide a common ground potential.

D. Bond all outlet, junction, pull boxes, and enclosures to the equipment grounding conductor with a grounding pigtail.

E. Provide (2) grounding electrodes exterior to the building near the main electrical room not less than (6) feet apart.

3.2 APPLICATIONS

A. Conductors: Install solid conductor for #10 AWG and smaller, and stranded conductors for #8 AWG and larger unless otherwise indicated.
   1. Installing bare conductors where not specifically identified as bare or insulated except where installed in conduit with associated phase conductors. Install insulated conductors in conduit with insulation of the same material as the associated phase conductors with which it is installed.
   2. Provide insulated conductors not exceeding No. 8 AWG in size with green colored insulation. Identify conductors larger than No. 6 AWG with 4-inch green tape at each termination and at all junction and pull boxes.

B. Underground Grounding Electrode Conductors: Install bare copper conductor, sized per NEC or as indicated on drawings, whichever is larger.
   1. Bury at least 36 inches below grade or below the frost line depth, whichever is greater.
   2. Duct-Bank Grounding Conductor: Bury 12 inches above duct bank when indicated as part of duct-bank installation.

C. Electrical System Grounding Busbar: Install in electrical rooms housing service equipment, and elsewhere as indicated to provide a common connection point for individual grounding electrode conductors and bonding jumpers.
   1. Install bus horizontally, on insulated spacers 4 inches minimum from wall, 18 inches above finished floor unless otherwise indicated.
   2. Where indicated on both sides of doorways, route bus up to top of door frame, across top of doorway, and down; connect to horizontal bus.
   3. Provide green laminated plastic nameplate with 1/2" high white letters indicating function of ground bus (i.e. “Service Main Ground Busbar”).

D. Conductor Terminations and Connections:
   1. Pipe and Equipment Grounding Conductor Connections: Mechanical connectors.
   2. Underground and Exposed Exterior Connections: Exothermic welded connectors except at test wells and as otherwise indicated.
   3. Connections to Ground Rods at Test Wells: Mechanical connectors.
   4. Connections to Structural Steel: Exothermic welded connectors.
   5. Connections to Busbars: Irreversible compression connectors.

3.3 GROUNDING AT THE SERVICE

A. Equipment grounding conductors and grounding electrode conductors shall be connected to the neutral bus except where service equipment neutral and ground bussing complies with exceptions listed in the NEC. Install a main bonding jumper between the neutral bus and ground bus. Provide external grounding busbar and install grounding electrode conductor to interconnect main grounding busbar and neutral bus.

B. Where ground fault protection is installed, ensure interconnection of neutral bus and ground bus does not interfere with correct operation of fault protection.

3.4 GROUNDING SEPARATELY DERIVED SYSTEMS

A. Transformers: Provide grounding in accordance with the NEC and the following:
   1. System Bonding Jumper (SBJ): Install at the source enclosure between the grounded terminal (neutral) and the equipment grounding terminal.
   2. Supply Side Bonding Jumper (SSBJ): Install wire type SSBJ to bond the source enclosure to the enclosure at the first disconnect or overcurrent protective device.
   3. Grounding Electrode Conductor (GEC): Install at the source enclosure from the SBJ connection point to the building grounding electrode system.
   4. Bonding Jumpers: Where the metal water piping and/or the metal structural steel building frame in the area served by the separately derived system are not used as a grounding electrode, provide bonding jumper to the GEC connection point at the source enclosure.
   5. Equipment Grounding Conductor (EGC): Bond the EGC of the primary feeder to the equipment grounding terminal.

3.5 GROUNDING UNDERGROUND DISTRIBUTION SYSTEM COMPONENTS

A. Comply with IEEE C2 grounding requirements for utility equipment.

B. Exterior Pad-Mounted Equipment: Install a minimum of two ground rods and ground ring around the pad. Ground pad-mounted equipment and noncurrent-carrying metal items are associated with equipment by connecting them to underground grounding conductors and grounding electrodes. Install tinned-copper conductor not less than No. 2 AWG for ground ring and for taps to equipment grounding terminals. Bury ground ring not less than 6 inches from the foundation.

3.6 EQUIPMENT GROUNDING AND BONDING

A. Equipment Grounding Conductors: Install insulated equipment grounding conductors with all feeders and branch circuits. Provide conductors of the same wire/cable type as the ungrounded current carrying conductors.

B. Increase equipment grounding conductor sizes in accordance with NEC article 250 where ungrounded current carrying conductor sizes are increased to minimize voltage drop.

C. Provide all circuits with a dedicated equipment grounding conductor unless noted otherwise.

D. Provide an equipment grounding conductor to each outlet on circuits protected by a GFCI circuit breaker.

E. At all metallic outlet, junction and pull boxes, bond the equipment grounding conductor to the enclosure.

F. Metal Poles Supporting Outdoor Lighting Fixtures: Install a ground rod and a separate insulated equipment grounding conductor at each pole in addition to grounding conductor installed with branch-circuit conductors.

3.7 INSTALLATION

A. Grounding Electrode Conductors and Bonding Jumpers: Securely fasten and route along the shortest and straightest paths possible unless otherwise indicated or required by Code. Avoid obstructing access or placing conductors where they may be subjected to strain, impact, or damage.
   1. Route conductors maintain a downward or horizontal direction to ground with a minimum bend radius of 8-inches.
   2. Protection: Install above grade conductors No 6 AWG or larger exposed to physical damage and all conductors smaller than No. 6 AWG in schedule 80 PVC conduit. Where metallic conduit is required, bond each conduit end to the electrode or ground conductor as close to the openings as possible with a full-size conductor and bonding bushing to create an electrically parallel path.
   3. Clearance: Maintain a minimum separation of 12-inches from open telecommunications cable groups.

B. Bonding for Lightning Protection Systems: Where lightning protection systems are installed comply with NFPA70, NFPA 780, and UL 96 for bonding the lightning protection system grounding electrodes with the building grounding electrode system.

1. Bond electrical power system ground directly to lightning protection system grounding conductor at closest point to electrical service grounding electrode. Use bonding conductor sized same as system grounding electrode conductor.
2. Do not use conductors and electrodes for grounding the lightning protection system in place of the grounding electrodes required by this specification and section 250.50 of NFPA 70.

C. Ground Rods: Auger 6-inch diameter hole to depth 6 inches shorter than the ground rod length. Drive rods a minimum of 12 inches into the bottom of the hole until tops are 12 inches below final grade. After installing connections, backfill around ground rod with enhanced composite backfill.
1. Interconnect ground rods with grounding electrode conductor below grade and as otherwise indicated. Make connections without exposing steel or damaging coating if any.
2. Except at test wells, use exothermic welds for all below-grade connections to ground rods.
3. For the grounding electrode system at the service, install at least three rods spaced at least two-rod lengths from each other and located at least the same distance from other grounding electrodes, and connect to the service grounding electrode conductor.

D. Test Wells: Ground rod driven through drilled hole in bottom of handhole.
1. Install at least one test well for each service unless otherwise indicated. Install it at the ground rod electrically closest to the service entrance. Set top of test well flush with finished grade or floor.

E. Bonding Straps and Jumpers: Install in locations accessible for inspection and maintenance except where routed through short lengths of conduit.
1. Bonding to Structure: Bond straps directly to basic structure, taking care not to penetrate any adjacent parts. Install straps and jumpers such that it does not restrict movement of the structure to which it is connected.
2. Bonding to Equipment Mounted on Vibration Isolation Hangers and Supports: Install bonding so vibration is not transmitted to rigidly mounted equipment.
3. Use exothermic-welded connectors for outdoor locations; if a disconnect-type connection is required, use a bolted clamp.

F. Grounding and Bonding for Piping:
1. Metal Water Service Pipe: Install insulated copper grounding conductors, in conduit, from building's main service equipment, or grounding bus, to main metal water service entrances to building. Connect grounding conductors to main metal water service pipes using a mechanical connector. Where a dielectric main water fitting is installed, connect grounding conductor on street side of fitting. Bond metal grounding conductor conduit or sleeve to conductor at each end.
2. Water Meter: Use braided-type bonding jumpers to electrically bypass water meters. Connect to pipe with a bolted connector.
3. Other Metal Piping: Bond each aboveground portion of metal piping systems, including gas piping, downstream from its equipment shutoff valve in an accessible location.

4. Except for water piping, do not utilize piping systems as a ground path where dielectric fittings are utilized. Do not use bonding jumpers to bridge over such fittings.

5. Do not use underground portions of natural gas, flammable gas, or liquid fuel piping as grounding electrodes.

G. Grounding for Steel Building Structure:
   1. Where the building's steel frame is made discontinuous by masonry breaks or expansion joints, provide an accessible No. 500 kcmil bare copper jumper with exothermic weld connections to bond steel sections together, making the steel frame electrically continuous. The installation of the bonding jumpers shall be reviewed by the Engineer before covering.

H. Concrete-Encased Grounding Electrode (Ufer Ground): Provide and fabricate in accordance with NFPA 70; use a minimum of 20 feet bare copper conductor no smaller than #4 AWG located in building footing that has direct contact with earth.
   1. If concrete foundation is less than 20 feet long, coil excess conductor within base of foundation.
   2. Bond grounding conductor to reinforcing steel in at least four locations and to anchor bolts using exothermic weld connections. Extend grounding conductor below grade and connect to building's ground ring or to grounding electrode external to concrete.

I. Exothermic Welded Connections: Provide in kit form and selected for the specific types, sizes, and combinations of conductors and other items to be connected.
   1. An electronic ignition system shall be used, and weld metal shall be a self-contained, sealed system with a bi-metallic fuse to start the reaction.
   2. Comply with AWS Standards and manufacturer's instructions for procedures, appearance, and quality of welds; and methods used in correcting welding work.
   3. Ensure process joins all strands and does not cause the parts to be damaged or weakened.
   4. A completed connection or joint must be equal or larger in size than the conductors joined and have the same current-carrying capacity as the largest conductor.

J. Mechanical Connections: Install mechanical connections in accessible locations.
   1. Tighten connectors and terminals, including screws and bolts, in accordance with manufacturer's published torque tightening values.
   2. Where manufacturer's torquing requirements are not indicated, tighten connections to comply with tightening torque values specified in UL 486A to assure permanent and effective grounding.

K. Poles Supporting Outdoor Light Fixtures: Install grounding rod and a separate #4 bare ground electrode conductor bonded to pole in addition to equipment grounding conductor installed with branch circuit conductors.

L. Connections between Dissimilar Metals: Make connections so the possibility of galvanic action or electrolysis is minimized. Select connectors, connection hardware, conductors, and connection methods so metals in direct contact are galvanically compatible.
   1. Clean surfaces and apply antioxidant compound prior to installation of connections.
   2. Use electroplated or hot-tin-coated materials to ensure high conductivity and to make contact points closer in order of galvanic series.
   3. Make connections with clean, bare metal at points of contact.
   4. Make aluminum-to-steel connections with stainless-steel separators and mechanical clamps.

5. Make aluminum-to-galvanized-steel connections with tin-plated copper jumpers and mechanical clamps.
6. Coat and seal connections having dissimilar metals with inert material to prevent future penetration of moisture to contact surfaces.

3.8 FIELD QUALITY CONTROL

A. Buried or concealed grounding electrode systems shall be accepted by Engineer and Owner Representative before backfilling or covering.

B. Tests and Inspections:
1. Inspect physical and mechanical condition. Verify tightness of accessible, bolted, electrical connections with a calibrated torque wrench according to manufacturer's written instructions.
2. Bond Resistance Test: Test the bonding connections of the system using a certified micro-ohmmeter, taking two-point resistance measurements across each bond in the grounding electrode system. The maximum acceptable value of each bond is 0.5 milliohms.
3. After completing installation of the grounding electrode system and finished grade, but before permanent electrical circuits have been energized, test for compliance with requirements.
4. Grounding Electrode Resistance Test: Test completed grounding electrode system at service disconnect enclosure grounding terminal and at ground test wells using a manufacturer calibrated and certified 3-point ground resistance tester.
    a. Measure ground resistance no fewer than two full days after last trace of precipitation and without soil being moistened by any means other than natural drainage or seepage and without chemical treatment or other artificial means of reducing natural ground resistance.
    b. Perform tests by three-point fall-of-potential method according to IEEE 81.
    c. Disconnect and isolate the grounding electrode conductor from the electrical system at the main ground bus before testing.
    d. Install outer test probe outside the sphere of influence of the grounding electrode system. This value is typically 10 times the size of the grounding electrode system, between 300 and 500 feet from the main ground bus.
    e. Install inner test probe at 10 equally spaced intervals, in a straight line between the grounding electrode system connection and the outer test probe and note the resistance reading at each location.
    f. The resistance measurements taken from the flat part of the curve shall be averaged to determine the grounding electrode system resistance to earth.
    g. If large variations are noted in the resistance measurements, the outer test probe should be relocated further from grounding electrode system (outside its sphere of influence) to achieve some degree of flatness on the resistance curve.
    h. Excessive Ground Resistance: If resistance to ground exceeds 5-ohms, notify Engineer promptly and include recommendations to reduce ground resistance. If deemed necessary by the Engineer, additional electrodes shall be placed, and the measurement process repeated until the desired ground potential is achieved.
5. Prepare dimensioned Drawings locating each test well, ground rod and ground-rod assembly, and other grounding electrodes. Identify each by letter in alphabetical order, and key to the record of tests and observations. Include the number of rods driven and

their depth at each location, and include test probe locations, observations of weather and other phenomena that may affect test results. Describe measures taken to improve test results.

C. Grounding system will be considered defective if it does not pass tests and inspections.

D. Prepare detailed test and inspection reports and submit them to the Engineer for review.

END OF SECTION

SECTION 260529 - HANGERS AND SUPPORTS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. The Contractor is directed to examine each and every section of these specifications, all drawings relating to the Contract Documents, any and all Addenda, etc., for work described elsewhere that may relate to the provision of the work described herein. Materials and performance requirements are specified elsewhere herein that relate to these systems.

C. Each Electrical Contractor's attention is directed to Section 260501 - General Requirements for Electrical Systems, and all other Contract Documents as they apply to his work.

1.2 SUMMARY

A. Section Includes the following:
   1. Hangers and supports for electrical equipment and systems.
   2. Construction requirements for concrete bases.

B. Related Sections include the following:
   1. Division 26 Section "Common Work Results for Electrical Systems 260500" for products and installation requirements necessary for vibration isolation pads and other support systems.

1.3 DEFINITIONS

A. EMT: Electrical metallic tubing.

B. FMC: Flexible metal conduit

C. LFMC: Liquid-tight flexible metal conduit

D. GRS: Galvanized rigid steel conduit.

1.4 PERFORMANCE REQUIREMENTS

A. Delegated Design: Design supports for multiple raceways, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.

B. Design supports for multiple raceways capable of supporting combined weight of supported systems and its contents.

C. Design equipment supports capable of supporting combined operating weight of supported equipment and connected systems and components.

D. Rated Strength: Adequate in tension, shear, and pullout force to resist maximum loads calculated or imposed for this project, with a minimum structural safety factor of five times the applied force.

1.5 QUALITY ASSURANCE

A. Welding: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel."

B. Comply with NFPA 70.

1.6 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

B. Coordinate installation of roof curbs, equipment supports, and roof penetrations. These items are specified in Division 07 Section "Roof Accessories."

PART 2 - PRODUCTS

2.1 SUPPORT, ANCHORAGE, AND ATTACHMENT COMPONENTS

A. Steel Slotted Support Systems: Comply with MFMA-4, factory-fabricated components for field assembly.
   1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Allied Tube & Conduit
      b. Cooper B-Line, Inc.; a division of Cooper Industries.
      c. ERICO International Corporation.
      d. Thomas & Betts Corporation.
      e. Unistrut; Tyco International, Ltd.
   2. Metallic Coatings: Hot-dip galvanized after fabrication and applied according to MFMA-4.
   3. Channel Dimensions: Selected for applicable load criteria.

B. Raceway and Cable Supports: As described in NECA 1 and NECA 101.

C. Conduit and Cable Support Devices: Steel and malleable hangers, clamps, and associated fittings, designed for types and sizes of raceway or cable to be supported.

D. Support for Conductors in Vertical Conduit: Factory-fabricated assembly consisting of threaded body and insulating wedging plug or plugs for non-armored electrical conductors or cables in riser conduits. Plugs shall have number, size, and shape of conductor gripping pieces as required to suit individual conductors or cables supported. Body shall be malleable iron.

E. Device Box Mounting Brackets: Factory-fabricated sheet steel brackets for support of device boxes adjacent to or between studs.
   1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Cooper B-Line, Inc.; a division of Cooper Industries.
      b. ERICO International Corporation.

F. Through-Stud Cable and Raceway Support Clips: Factory-fabricated spring steel clip for cables or raceways where run horizontally through metal studs.
   1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Cooper B-Line, Inc.; a division of Cooper Industries.
      b. ERICO International Corporation.

G. Roof-mounted Raceway Support Blocking: Factory-fabricated support blocking for use under roof-mounted raceways. Wedge-shaped blocking constructed of 100% recycled UV-resistant Rubber with integral galvanized steel strut to accept raceway support clips.
   1. Basis-of-Design Product: Subject to compliance with requirements, provide Cooper B-Line C-Port series components or a comparable product by one of the following:
      a. Cooper B-Line, Inc.; a division of Cooper Industries.
      b. ERICO International Corporation.

H. Tee Bar Grid Box Hanger: Factory-fabricated metal electrical box hanger for supporting boxes at locations between ceiling system t-grid components. Height adjustable for various electrical box depths. Attached to ceiling tee bar with screws or integral clamp for stability. Includes tab for independent support wire attachment.
   1. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Cooper B-Line, Inc.; a division of Cooper Industries.
      b. ERICO International Corporation.

I. Structural Steel for Fabricated Supports and Restraints: ASTM A 36/A 36M, steel plates, shapes, and bars; black and galvanized.

J. Mounting, Anchoring, and Attachment Components: Items for fastening electrical items or their supports to building surfaces include the following:
   1. Powder-Actuated Fasteners: Threaded-steel stud, for use in hardened Portland cement concrete, or steel with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.
      a. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:

1) Cooper B-Line, Inc.; a division of Cooper Industries.
2) Empire Tool and Manufacturing Co., Inc.
3) Hilti Inc.
4) ITW Ramset/Red Head; a division of Illinois Tool Works, Inc.
5) MKT Fastening, LLC.

2. Mechanical-Expansion Anchors: Insert-wedge-type, zinc-coated or stainless steel, for use in hardened portland cement concrete with tension, shear, and pullout capacities appropriate for supported loads and building materials in which used.
   a. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   b.
      1 Cooper B-Line, Inc.; a division of Cooper Industries.
      2) Empire Tool and Manufacturing Co., Inc.
      3) Hilti Inc.
      4) ITW Ramset/Red Head; a division of Illinois Tool Works, Inc.
      5) MKT Fastening, LLC.
3. Concrete Inserts: Steel or malleable-iron, slotted support system units similar to MSS Type 18; complying with MFMA-4 or MSS SP-58.
4. Clamps for Attachment to Steel Structural Elements: MSS SP-58, type suitable for attached structural element.
5. Through Bolts: Structural type, hex head, and high strength. Comply with ASTM A 325.
6. Toggle Bolts: All-steel springhead type.
7. Hanger Rods: Solid, threaded steel.

2.2 FABRICATED METAL EQUIPMENT SUPPORT ASSEMBLIES

A. Description: Welded or bolted, structural-steel shapes, shop or field fabricated to fit dimensions of supported equipment.

B. Materials: Comply with requirements in Division 05 Section "Metal Fabrications" for steel shapes and plates.

PART 3 - EXECUTION

3.1 APPLICATION

A. Comply with NFPA 70, NECA 1 and NECA 101 for application of hangers and supports for electrical equipment and systems except where requirements of this Section are more stringent.

B. Maximum Horizontal and Vertical Support Spacing for Raceway(s): Space supports for EMT and GRS as required by NFPA 70.

C. Minimum Hanger Rod Size for Raceway Supports: Minimum rod size shall be 1/4 inch in diameter.

D. Single Raceways:
   1. For Raceways 1-1/4-inch and smaller: Install adjustable steel band hanger suspended on threaded rod.
   2. For Raceways larger than 1-1/4-inch: Install trapeze-type supports fabricated with steel slotted support system suspended on threaded rods. Size trapeze members, including the suspension rods, based on the support required for the size, and loaded weight of the conduits.
      a. Secure raceway or cable to support with two-bolt conduit clamps or single-bolt conduit clamps using spring friction action for retention in support channel.

E. Multiple Raceways: Install trapeze-type supports fabricated with steel slotted support system suspended on threaded rods, where multiple raceways are run vertically or horizontally at the same elevations. Size trapeze members, including the suspension rods, based on the support required for the number, size, and loaded weight of the conduits. Space them as required for the smallest conduit to be supported. Size so capacity can be increased by at least 25 percent in future without exceeding specified design load limits.
   1. Secure raceways and cables to these supports with two-bolt conduit clamps or single-bolt conduit clamps using spring friction action for retention in support channel.

F. Spring-steel clamps designed for supporting single conduits without bolts may be used for 1-1/2-inch and smaller raceways serving branch circuits and communication systems above suspended ceilings and for fastening raceways to trapeze supports.

3.2 EXAMINATION

A. Examine roughing-in of reinforcement and cast-in-place anchors to verify actual locations before installation.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 SUPPORT INSTALLATION

A. Comply with NFPA 70, NECA 1 and NECA 101 for installation requirements except where requirements of this Article are more stringent.

B. Fasten junction, pull and devices boxes securely to the building construction, independent of raceway system.

C. Install Device Box Mounting Brackets supported between two studs. All device boxes shall attached to two studs, device box stabilizers shall not be acceptable.

D. Install Through-Stud Cable and Raceway Support Clips where cables or raceways run horizontally through metal studs.

E. Install Tee Bar Grid Box Hanger supported between two ceiling grid tee bars where devices boxes are located flush in recessed suspended ceilings.
   1. Install at least one independent support rod from box hanger to structure.

F. Install Roof-mounted Raceway Support Blocking where raceways run on across roofing.
   1. Coordinate installation of roof supports with items specified in Division 07 Section "Roof Accessories." Provide products compatible with rooftop materials included in the Work.

G. Provide minimum of two lock nuts per threaded support rod except where lock nut tightens against a threaded socket, one locknut may be used.

H. Support raceways at a distance above suspended ceilings to permit removal of ceiling panels and luminaires.

I. Locate raceways so as not to hinder access to mechanical equipment.

J. Do not secure conductors, raceways, or supports to suspended ceiling hanger rods or wires.

K. Strength of Support Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 lb (90 kg).

L. Mounting and Anchorage of Surface-Mounted or Recessed-Mounted Equipment and Components: Anchor and fasten electrical items and their supports to building structural elements by the following methods unless otherwise indicated by code:
   1. To Wood: Fasten with lag screws or through bolts.
   2. To New Concrete: Bolt to concrete inserts. Where support anchors are required, establish their type and locate in concrete construction before concrete is poured, if possible. Fit each hanger rod with a nut at its upper end, and set nut in a universal concrete insert in the form. Where supported weight exceeds holding strength of a single insert, pass rods through top slot of inserts and interlock with reinforcing steel. Also, where particularly heavy loads are to be supported, suspend hanger rod or rods from a structural angle spanning two or more inserts and securely bolted thereto to distribute the weight.
   3. To Masonry: Approved toggle-type bolts on hollow masonry units and expansion anchor fasteners on solid masonry units.
   4. To Existing Concrete: Expansion anchor fasteners.
   5. To Steel: Beam clamps (MSS Type 19, 21, 23, 25, or 27) complying with MSS SP-69 or Spring-tension clamps.
   6. To Light Steel: Sheet metal screws.
   7. For Surface-Mounted Items on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to structure by means that meet seismic-restraint strength and anchorage requirements. Attachment to gypsum wall board is not acceptable as sole support means; slotted-channel rack solidly attached to structure or light-gauge metal framing at both ends is required.
   8. For Recessed-Mounted Items in Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices to intermediate light-gauge metal framing members on each side of device or provide slotted-channel racks within hollow wall attached to structure by means that meet seismic-restraint strength and anchorage requirements. Attachment to gypsum wall board is not acceptable as sole support means.

M. Do not support any items (equipment, piping, conduit, etc.) exceeding 2 inches in diameter from the bottom of slabs. Where intermediate supports are required between structural members, use slotted steel channels support systems attached to beams or joists in order to avoid attachment to slabs.

N. Drill holes for expansion anchors in concrete at locations and to depths that avoid reinforcing bars. Verify reinforcing locations with Structural Engineer. X-Ray existing concrete structures as required.

3.4 INSTALLATION OF FABRICATED METAL SUPPORTS

A. Comply with installation requirements in Division 05 Section "Metal Fabrications" for site-fabricated metal supports.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor electrical materials and equipment.

C. Field Welding: Comply with AWS D1.1/D1.1M.

3.5 CONCRETE BASES

A. Construct concrete bases of dimensions indicated but not less than 3 inches larger in all directions than supported unit, and so anchors will be a minimum of 10 bolt diameters from edge of the base.

B. Use 3000-psi, 28-day compressive-strength concrete. Concrete materials, reinforcement, and placement requirements are specified in Division 03 Section "Cast-in-Place Concrete."

C. Anchor equipment to concrete base.
   1. Place and secure anchorage devices. Use supported equipment manufacturer's setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   2. Install anchor bolts to elevations required for proper attachment to supported equipment.
   3. Install anchor bolts according to anchor-bolt manufacturer's written instructions.

3.6 PAINTING

A. Touchup: Comply with requirements in Division 09 painting Sections for cleaning and touchup painting of field welds, bolted connections, and abraded areas of shop paint on miscellaneous metal.

B. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas and apply galvanizing-repair paint to comply with ASTM A 780.

END OF SECTION

SECTION 260533 - RACEWAYS AND BOXES FOR ELECTRICAL SYSTEMS

PART 1 - – GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 – General Requirements for Electrical Systems apply to this Section.

1.2 SUMMARY

A. This section is intended to specify the raceways, fittings, boxes, cabinets, specialties and related items necessary to complete the work as shown on the drawings (Power, lighting and low voltage) and specified herein.

B. Section Includes:
1. Metal conduits and fittings
2. Nonmetallic conduits and fittings
3. Surface metal raceway
4. Metal wireways and auxiliary gutters.
5. Boxes, enclosures, and cabinets
6. Wall ducts and trench ducts.

C. Related Requirements:
1. Refer to Division 07 firestopping section and Section 260010 “General Requirements for Electrical Systems” for penetration firestopping requirements related to electrical pathways and boxes.
2. Refer to Section 270528 “Pathways for Communications Systems” for supplemental pathway requirements related to communications systems.

1.3 REFERENCES

A. Abbreviations
1. EMT: Electrical Metallic Tubing
2. ERMC-S: Electrical Rigid Metal Conduit – Steel.
3. FMC: Flexible Metal Conduit
4. GRC: Galvanized Rigid Steel Conduit
5. IMC: Intermediate Metal Conduit
6. LFMC: Liquid-tight Flexible Metal Conduit.
7. RAC: Rigid Aluminum Conduit
8. RMC: Rigid Metal Conduit

B. Definitions
1. Outlet: A point on the wiring system at which current is taken to supply utilization equipment.

2. Raceway: an enclosed channel designed for enclosing and protecting electrical, communications, and signaling wires and cables.

C. Reference Standards: The following publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest version as of the date of the Contract Documents, unless otherwise specified.
1. National Electrical Contractors Association (NECA)
   a. NECA 101 - Standard for Installing Steel Conduits (RMC, IMC, EMT)
   b. NECA 111 - Standard for Installing Nonmetallic Raceways (RNC, ENT, LFNC)
2. National Electrical Manufacturers Association (NEMA)
   a. NEMA FB 2.10 - Selection and Installation Guidelines for Fittings for Use with Non-Flexible Metallic Conduit or Tubing (Rigid Metal Conduit, Intermediate Metal Conduit, and Electrical Metallic Tubing)
   b. NEMA FB 2.20 - Selection and Installation Guidelines for Fittings for Use with Flexible Electrical Conduit and Cable
   c. NEMA RV 3 - Application and Installation Guidelines for Flexible and Liquid-tight Flexible Metal Conduits

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Comply with NFPA 70.

2.2 METAL CONDUIT AND FITTINGS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. AFC Cable Systems, Inc.
2. Allied Tube & Conduit.
3. Anamet Electrical, Inc.
4. Calconduit
5. Electri-Flex Company.
6. O-Z/Gedney.
7. Southwire Company.
8. Thomas & Betts Corporation.
9. Wheatland Tube Company.

B. Electrical Metallic Tubing (EMT) and Elbows:
1. Comply with ANSI C80.3 and UL 797.
2. Shall be of corrosion-resistant steel construction.

C. Electrical Rigid Metal Conduit (ERMC-S, GRC, RMC) and Elbows:
   1. Comply with ANSI C80.1 and UL 6.
   2. Zinc coating both inside and outside by means of hot-dip galvanizing.
   3. Use only threaded fittings for ERMC-S.

D. PVC Coated Galvanized Rigid Metal Conduit (RMC) and Elbows:
   1. Comply with NEMA RN 1
   2. Minimum 40 mil thick PVC exterior coating with overlapping sleeves protecting threaded joints.
   3. Minimum 2 mil thick urethane interior coating.
   4. Clear urethane coating over hot-dip galvanized threads.

E. Electrical Intermediate Metal Conduit (IMC) and Elbows:
   1. Comply with ANSI C80.6 and UL 1242

F. Flexible Metal Conduit (FMC):
   1. Comply with UL 1.
   2. Continuous interlocked hot-dip zinc galvanized steel with smooth interior and exterior.
   3. Suitable for dry locations.

G. Liquid-tight Flexible Metal Conduit (LFMC):
   1. Comply with UL 360.
   2. Continuous interlocked hot-dip zinc galvanized steel core with smooth interior and exterior.
   3. Suitable for wet and dry locations, direct burial applications, and concrete encasement.
   4. Sunlight resistant, flame-retardant thermoplastic PVC jacket resistant to heat, oil, and chemical breakdown.

H. Metal Fittings
   1. Comply with NEMA FB1 and UL 514B.
   2. Listed and labelled for type of conduit, location, and use.
   3. Fittings for EMT:
      a. Compression type, zinc-plated galvanized steel.
      b. Concrete-tight- or rain-tight, hardened steel locknuts, and nylon insulating throats.
   4. Fittings for ERMC-S and IMC:
      a. Threaded zinc plated steel.
      b. Concrete-tight- or rain-tight, nylon insulating throats.
   5. Conduit Bodies:
      a. Material: gray iron or heavy copper-free cast aluminum
      b. Available in varying configurations with integral bushing and gasketed coverplate.
   6. Expansion/Deflection Fittings: UL 651 listed, manufactured coupling accommodating 3/4-inch linear movement from normal and 30-degree angular movement in all directions
      a. Basis of Design: OZ/Gedney DX
      b. PVC or steel sleeve to match conduit type with neoprene jacket, rated for environmental conditions were installed.
      c. Integral braided copper bonding jumper.
   7. Fittings for FMC and LFMC:
      a. LFMC: Tubular Steel, zinc-plated with gland nut, sealing ring, high tensile grounding ferrule, insulated throat, and body for liquid tight connection.
   8. Fittings for Hazardous (Classified) Locations: Comply with UL 1203 and NFPA 70.

9. "Kwik-Couple" type fittings are not permitted.
10. Indentation, set-screw, or die-cast fittings are not permitted.

I. Joint Compound for threaded conduit: UL 2419 listed for use in conduit assemblies and compounded for use to lubricate and protect threaded conduit joints from corrosion and to enhance their conductivity.

2.3 NON-METALLIC CONDUITS AND FITTINGS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Allied Tube & Conduit
2. Cantex
3. Carlon
4. Prime Conduit

B. Rigid Polyvinylchloride (PVC) Conduit:
1. Comply with NEMA TC-2 and UL 651.
2. Sunlight resistant and suitable for use with 90 degree C conductors.
3. Type EPC-40 suitable for normal duty applications.
4. Type EPC-80 suitable for heavy duty applications.

C. Non-Metallic Fittings
1. Comply with NEMA TC 3 and UL514B.
2. Listed and labelled for type of conduit, location, and use.
3. Compatible with conduit type and material.
4. Solvents and Adhesives: as recommended by conduit manufacturer.

2.4 SURFACE MOUNTED METAL RACEWAY

A. Manufacturers: Subject to compliance with requirements, provide products from one of the following:
1. Hubbell
2. Mono-Systems
3. Legrand Wiremold

B. Source Limitations: Obtain surface metal raceway, components, outlets, and fittings from single manufacturer.

C. Single and Multi-Channel Raceways:
1. Two-piece design with base and snap on cover complying with UL 5, suitable for use with electrical branch circuit wiring, data/voice network cabling, and low voltage wiring.
2. Material: Galvanized Steel
3. Finish: Manufacturer's standard enamel finish in color selected by Architect, suitable for field painting to match adjacent surfaces.
4. Size: Available in varying widths, selected to accommodate number of conductors and services indicated on drawings with a maximum of 40-percent fill.

D. For multi-channel configurations, provide integral divider separating raceway into equal compartments for power and low voltage wiring.

E. Fittings: Include clips, straps, couplings, elbows, tees, connectors, and bushings suitable for interconnecting raceway segments in various configurations. Fittings to overlap raceway and hide uneven cuts. Material and finish to match raceway.

F. Device Boxes: single and multi-gang configurations, suitable for mounting standard devices and faceplates. Material and finish to match raceway.

G. Device Plates: sized to match raceway width with openings suitable for mounting various standard power and communications devices. Material and finish to match raceway.

H. Device Brackets: suitable for mounting standard single or two-gang devices horizontally or vertically within large raceways.

I. Plugmold: steel surface metal raceway with integral Simplex NEMA 5-20R outlets spaced 12-inches on center or as indicated on drawings.

2.5 METAL WIREWAYS AND AUXILIARY GUTTERS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Eaton B-Line
2. Hubbell Wiegmann.
3. nVent Hoffman.
4. Square D.

B. Description: Sheet metal, complying with UL 870 and NEMA 250, Type 1 unless otherwise required by environmental application, and sized according to NFPA 70. Minimum of 14-gauge steel before finishes are applied.

C. Fittings and Accessories: Include covers, couplings, offsets, elbows, expansion joints, adapters, hold-down straps, end caps, and other fittings to match and mate with wireways as required for a complete system.
1. Provide knockouts on all runs, unless otherwise indicated or prohibited by codes.
2. Provide dividers to separate conductors of different insulation levels or where required by equipment vendor installation instructions.

D. Wireway Covers: Furnish with continuous hinged covers on all runs and removable covers on all fittings unless otherwise noted, to allow a continuous unobstructed path for conductor installation.

E. Finish: Manufacturer's standard enamel finish resistant to corrosion, moisture, and oil.

F. Size: available in nominal sizes 2-1/2-inch by 2-1/2-inch, 4-inch by 4-inch, 6-inch by 6-inch or 12-inch by 12-inch.

G. Install supports to allow unobstructed access to wireway interior. Use minimum 1/4-inch rod hangers for up to 4-inch by 4-inch wireway, 3/8-inch rod up to 8-inch by 8-inch wireway, and 1/2-inch rod for 12-inch by 12-inch wireway.

2.6 BOXES, ENCLOSURES, AND CABINETS

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Eaton Crouse-Hinds.
   2. Emerson/Appleton Electric.
   3. FSR Inc.
   4. Garvin Industries
   5. Hoffman.
   6. Hubbell Killark.
   7. Mono-Systems, Inc.
   8. O-Z/Gedney.
   9. RACO / Hubbell.
   10. Thomas & Betts.
   11. Wiremold / Legrand.

B. General Requirements for Boxes, Enclosures, and Cabinets: Boxes, enclosures, and cabinets shall be listed for intended use.

C. Sheet Metal Outlet and Device Boxes: Comply with NEMA OS 1 and UL 514A.

D. Cast-Metal Outlet and Device Boxes: Comply with NEMA FB 1, ferrous alloy or aluminum, Type FD, with gasketed cover.

E. Luminaire Outlet Boxes: Non-adjustable, designed for attachment of luminaires, listed and marked for the maximum allowable weight with at least a 2.0 safety factor for the anticipated fixture weight.

F. Paddle Fan Outlet Boxes: Nonadjustable, designed for attachment of paddle fan weighing 70 lb.

G. Small Sheet Metal Pull and Junction Boxes: NEMA OS 1, constructed of code gauge, galvanized steel with sides formed and corner seams riveted or welded before galvanizing

H. Cast-Metal Access, Pull, and Junction Boxes: Comply with NEMA FB 1 and UL 1773, cast aluminum with gasketed cover.

I. For box extensions and mud rings used to accommodate building finishes, provide with same material as recessed box.

J. Minimum Device Box Dimensions unless noted otherwise:
   1. Single gang: 4-inches square by 2-1/8-inches deep with single gang extension ring.
   2. Two gang: 4-inches square by 2-1/8-inches deep with two-gang extension ring.
   3. Three gang: 8-5/8-inches by 4-1/2-inches by 2-1/2-inches deep with three gang extension ring.

4. Four gang: 10-7/16-inches by 4-1/2-inches by 2-1/2-inches deep with four gang extension ring.

K. Gangable boxes are prohibited.

L. Boxes assembled with sheet metal screws are prohibited.

M. Hinged Cover Enclosures: Comply with UL 50 and NEMA 250, suitable for installed environment with continuous-hinge cover and flush latch unless noted otherwise.
1. Metal Enclosures: Steel, finished inside and out with manufacturer's standard enamel.
2. Nonmetallic Enclosures: Fiberglass
3. Interior Panels: Steel, all sides finished with manufacturer's standard enamel.

PART 3 - EXECUTION

3.1 RACEWAY APPLICATION

A. Unless more stringent requirements are specified in Contract Documents or manufacturers' written instructions, comply with NFPA 70 for selection of raceways. Consult Architect for resolution of conflicting requirements.

B. Apply raceway products as specified below unless otherwise indicated:
1. Refer to Section 260543, "Underground Ducts and Raceways for Electrical Systems" for additional requirements related to raceways installed underground outside of the building footprint.
2. Exterior and Exposed: ERMC-S/GRC
3. Concealed Underslab: ERMC-S/GRC or PVC Type EPC-40 where approved.
4. Concealed Underslab with conductors above 600V: Concrete encased ERMC-S or concrete encased PVC Type EPC-40 where approved.
5. Interior, Concealed in Ceilings, Walls, and Partitions: EMT, IMC, or ERMC-S
6. Interior, Concealed in Below Grade Concrete or Grouted Masonry Walls and Partitions: IMC or ERMC-S/GRC
7. Interior, Damp or Wet Locations: ERMC-S.
8. Interior, Where exposed and Not Subject to Physical Damage: EMT, ERMC-S, or IMC. Raceway locations include the following:
   a. Electrical Rooms
   b. Mechanical Rooms (Above 8'-0")
9. Interior, Where Exposed and Subject to Severe Physical Damage: ERMC-S. Raceway locations include the following:
   a. Loading dock.
   b. Corridors used for traffic of mechanized carts, forklifts, and pallet-handling units.
   c. Mechanical rooms (below 8'-0").
   d. Gymnasiums
10. Interior, where Exposed in washdown area and Subject to Severe Physical Damage: PVC Coated GRC. Raceway locations include the following:
11. Exposed stub-ups in Commercial/Institutional Kitchen or Cafeteria.
12. Conductors operating above 600V: ERMC-S.

13. Connection to Vibrating Equipment (Including Transformers and Hydraulic, Pneumatic, Electric Solenoid, or Motor-Driven Equipment): LFMC.
14. Connection to ceiling mounted recessed and semi-recessed luminaires and electrical devices: FMC.
15. Boxes and Enclosures: NEMA 250, Type 1 except as follows:
    a. Damp or Wet locations: NEMA 250, Type 3R
    b. Kitchens and Cafeterias: NEMA 250, Type 3R
    c. Corrosive environments: NEMA 250, Type 4X
16. Exposed Boxes subject to physical damage: Die cast metal boxes with threaded hubs.
17. EMT is not permitted underslab, embedded in concrete slabs, or where exposed to physical damage.
18. Non-metallic conduit is not permitted for the following applications unless approved by the Engineer:
    a. Interior Locations including environmental air plenums.
    b. Applications where a redundant ground fault path is required by code.
19. Flexible non-metallic conduit is not permitted.

C. Minimum Raceway Size: 3/4-inch trade size unless noted otherwise on the drawings.

D. Raceway Fittings: Compatible with raceways and suitable for use and location
1. Rigid and Intermediate Steel Conduit: Use threaded rigid steel conduit fittings unless otherwise indicated. Comply with NEMA FB 2.10.
2. PVC Externally Coated, Rigid Steel Conduits: Use only fittings listed for use with this type of conduit. Patch and seal all joints, nicks, and scrapes in PVC coating after installing conduits and fittings. Use sealant recommended by fitting manufacturer and apply in thickness and number of coats recommended by manufacturer.
3. EMT: Use compression, steel fittings. Comply with NEMA FB 2.10.
4.
5. Flexible Conduit: Use only steel fittings listed for use with flexible conduit. Comply with NEMA FB 2.20.

E. Do not install aluminum conduits, boxes, or fittings in contact with concrete or earth or where prolonged contact with construction materials will degrade the aluminum.

F. Install raceways and fittings in a manner to avoid use of dissimilar metals that would result in galvanic action corrosion.

G. Install surface conduits or raceways only where indicated on Drawings.

H. Do not install surface conduits or raceways on exterior facades unless approved by Engineer.

I. Do not install nonmetallic conduit where ambient temperature or operating temperature of the conductors exceeds the rating of the raceway.

J. Conduit installed embedded in concrete slabs is not permitted.

3.2 RACEWAY INSTALLATION

A. Comply with requirements in Section 260500 "Common Work Results for Electrical Systems" for hangers and supports.

B. Comply with NECA 1, NECA 101, NECA 111 and manufacturer's written instruction for installation requirements except where requirements on Drawings or in this article are stricter. Comply with NFPA 70 limitations for types of raceways allowed in specific occupancies and number of floors.

C. Complete raceway installation before starting conductor installation.

D. Comply with utility company requirements for raceways and boxes containing utility company conductors.

E. Size raceways to conform with Annex C, of the National Electrical Code, unless otherwise shown in the Contract Drawings.

F. Level and square raceway runs and installs at proper elevations and required heights. Hold tight to structure wherever possible, to maximize available space and not restrict other trades.

G. Conceal conduit within finished walls, ceilings, and floors unless otherwise indicated.

H. Install conduits with runs parallel or perpendicular to building lines, walls, structural members or intersections of vertical planes and ceilings, with right angle turns consisting of cast metal fittings or symmetrical bends unless otherwise shown. Randomly routed conduits are not acceptable.

I. Make bends in raceway using large-radius preformed elbows. Provide concentric bends for parallel runs of conduit. Conform with NFPA 70 minimum radii requirements for field bending. Use only equipment specifically designed for material and size involved.

J. Install no more than the equivalent of three 90-degree bends in any conduit run. Support within 12-inches of changes in direction.

K. Provide junction boxes or pull boxes so that conduit runs do not exceed 100 feet, or as shown on the Contract Drawings. Size junction boxes per NEC, Article 370.

L. Provide conduit supports spaced not more than 8-feet apart.

M. Support conduit within 12-inches of enclosures to which attached.

N. Do not drill into bar joists to support raceways or cables.

O. Install conduits at least 12-inches away from flues, steam or hot water pipes.

P. Conduit installed under concrete slabs is permitted for feeders and for branch circuits serving floor outlets. Underslab conduit is prohibited for other locations unless noted on the drawings or with permission of the engineer. Where approved, comply with the following:
   1. Locate raceway a minimum of 12-inches below the bottom of slab.

2. Provide minimum 2-inch spacing between conduits to ensure proper compaction of structural fill.
3. Arrange raceways to cross building expansion joints at right angles with expansion fittings.
4. Transition underslab RNC to ERMC-S for all bends larger than 20-degrees and for all stub-ups through a slab on grade. Arrange stub-ups so curved portions of bends are not visible above finished slab. Extend ERMC-S stub-ups a minimum of 6" above the concrete slab. Schedule 80 PVC stub-ups are allowed where approved by engineer.
5. Seal around conduits when penetrating vapor barriers.

Q. Where raceways are subject to environmental changes, locate seals immediately at the boundary so no fittings or boxes are between the seal and the change of environments that would allow migration of condensation within the raceway system. Seal the interior of all raceways at the following points:
1. Where conduits pass from cold to warm locations, such as boundaries of refrigerated spaces and at building wall and roof penetrations.
2. Where an underground service raceway enters a building or structure.
3. Conduit extending from interior to exterior of building.
4. Conduit extending into pressurized duct and equipment.
5. Conduit extending into pressurized zones that are automatically controlled to maintain different pressure set points.
6. Where otherwise required by NFPA 70.

R. Install conduits in a manner so as to ensure against collection of trapped condensation. Arrange all runs of conduit so as to be devoid of traps. Provide trapped conduit runs with explosion proof drains at low points.

S. At hazardous locations, install raceway sealing fittings at accessible locations according to NFPA 70 and fill them with listed non-shrink sealing compound. For concealed raceways, install each fitting in a flush steel box with a blank cover plate having a finish similar to that of adjacent plates or surfaces.

T. Coordinate with other trades, including metal and concrete deck trades, as necessary to interface installation of electrical raceways and components.

U. Complete installation of electrical raceways before starting installation of cables or wires within raceways.

V. Take precautions to prevent the lodgment of dirt, plaster, or trash in all conduit or tubing, fittings, and boxes during construction. Use mandrel to clean all conduit for floor boxes or conduit below grade and ensure its swabbed free of debris or moisture before wiring is installed.

W. Unless using ERMC-S, do not locate conduits, cables, raceways, and enclosures within 2 inches of bottom of metal-corrugated sheet roof decking, measured from the lowest surface of the roof decking to the top of the conduit, cable, raceway, or box.

X. Conduits, cables, raceways, and enclosures are not permitted in concealed locations of metal-corrugated sheet decking type roofing.

Y. Flexible Conduit Connections: Comply with NEMA RV 3. Use a maximum of 72-inches of flexible conduit for ceiling mounted recessed and semi-recessed luminaires, and 36-inches for all other equipment subject to vibration, noise transmission, or movement, and for transformers and motors.
   1. Install as a single piece with clamp-on insulated throat connectors designed for the purpose.
   2. Provide strain relief fittings where subject to vibration.
   3. Provide an equipment grounding conductor and bonding jumper at all locations.
   4. For LFMC, provide a minimum of 18-inches and loop to avoid restraining vibrating equipment.

Z. Stub-ups to Accessible Ceilings:
   1. Use a conduit bushing or insulated fitting to terminate stub-ups not terminated in hubs or into an enclosure.
   2. Where conduits terminate at a cable tray pathway, provide listed fitting to secure conduit to cable tray.

AA. Mechanically fasten conduit terminations at a wireway, provide metal insulated bushings, and bond to the wireway with bonding jumper.

BB. Furnish conduit bodies in proper configurations, avoiding excessive openings. Any openings that are left shall be properly plugged. Wiring splices within conduit bodies are not permitted.

CC. Threaded Conduit Joints, Exposed to Wet, Damp, Corrosive, or Outdoor Conditions: Apply listed compound to threads of raceway and fittings before making up joints. Follow compound manufacturer's written instructions.

DD. Provide a completely separate raceway system, including junction boxes and pull-boxes, for each emergency power, optional stand-by, and normal power system for complete separation in accordance with NEC.

EE. Install pull wires in empty raceways. Use polypropylene or monofilament plastic line with not less than 200-lb tensile strength. Leave at least 12 inches of secured slack at each end of pull wire. Secure pull string at each end and cap raceways.

FF. Coordinate with vendors and provide extra pull-strings as required to ensure sufficient number of pull strings.

GG. Cut conduit perpendicular to the length. For conduits 2-inch trade size and larger, use roll cutter or a guide to make cut straight and perpendicular to the length. Ream inside of conduit to remove burrs.

HH. Raceway Fittings: Install fittings in accordance with NEMA FB 2.10 guidelines.
   1. Install raceways square to enclosures and terminate with appropriate fitting:
   2. For enclosures without hubs, terminate with appropriate fitting, insulated throat liner, and case-hardened locknuts on both sides of enclosure wall.
   3. Terminate rigid conduits with threaded hubs or with locknuts on inside and outside of enclosure and insulated throat metal bushing.
   4. Install locknuts hand tight, plus one-quarter turn more.

5. Do not rely on locknuts to penetrate nonconductive coatings on enclosures. Remove coatings in the locknut area prior to assembling conduit to enclosure to assure a continuous ground path.
6. All threaded fittings shall engage a minimum of seven full threads. Fasteners shall be properly torqued to manufacturer's recommendations.
7. Split sleeve insulators are not permitted.

II. Comply with manufacturer's written instructions for solvent welding RNC and fittings.

JJ. Expansion-Joint Fittings:
1. Install expansion fittings at all locations where conduits cross building or structure expansion joints.
2. Install each expansion-joint fitting with position, mounting, and piston setting selected according to manufacturer's written instructions for conditions at specific location at time of installation. Install conduit support to allow for expansion movement.

KK. Where raceways penetrate rooms or walls with acoustical requirements, seal raceway openings on both sides of penetration with acoustically rated putty or sealant.

3.3 BOX AND ENCLOSURE INSTALLATION

A. Provide electrical outlets and enclosures as required for splices, taps, wire pulling, and equipment connections.

B. Provide pull boxes as required to maintain conduit run and bend limitations specified herein.

C. Size all outlets, pull boxes, junction boxes, cabinets, etc., per adopted edition of the National Electrical Code.

D. Boxes, enclosures, and cabinets installed in wet locations shall be listed for use in wet locations.

E. Install interior and exterior outlet boxes recessed in building construction with face or cover flush with finished surfaces unless noted otherwise. Where outlet boxes are installed in walls of glazed tile, brick, concrete block, or in walls covered by wood wainscot or paneling, provide deep box to ensure the outlet boxes are installed straight and secure in walls.

F. Mount boxes at heights indicated on Drawings. If mounting heights of boxes are not individually indicated, give priority to ADA requirements and architectural elevations. Install boxes with height measured to center of box unless otherwise indicated.

G. Recessed Boxes in Masonry Walls: Saw-cut opening for box in center of cell of masonry block and install box flush with surface of wall. Prepare block surfaces to provide a flat surface for a raintight connection between box and cover plate or supported equipment and box. Do not split the mortar joint.

H. Provided 3/4-inch rigid conduit pendants where lighting fixtures, appliances, or wiring devices are to be suspended from ceiling outlet boxes. Outlet boxes shall be malleable iron, provided with self-aligning covers with swivel ball joint and #14-gauge steel locking ring. Provide safety chain between building structure and housing for all fixtures, appliances, or devices greater than

10 lbs weight. Install fixtures plumb and level. Cover pendants shall be finished to match fixtures.

I. Horizontally separate boxes mounted on opposite sides of walls, so they are not in the same vertical channel.

J. Locate boxes so that cover or plate does not span different building finishes.

K. Provide spanner bars to support all boxes from more than one side by spanning two framing members.

L. Fasten boxes up to 4-11/16 square size to their mounting surface or support with two fasteners of proper size. Fasten larger sizes with four fasteners, minimum.

M. Support boxes recessed in ceilings independent of ceiling tiles and ceiling grid.

N. Fasten junction and pull boxes to, or support from, building structure. Do not support boxes by conduits or ceiling support wires.

O. Provide all cabinets and boxes for NEMA 1 applications with knockouts, as necessary, or field cut with approved cutting tools which will provide a clean, symmetrically cut opening to maintain UL listing of enclosure.

P. Replace any unused knockouts or openings with a listed knockout closure.

Q. Coordinate with equipment vendors to provide special sized outlet boxes to support installed equipment.

R. Where boxes and enclosures are located in areas or on walls with acoustical requirements, seal openings and knockouts in back and sides of boxes with acoustically rated putty or sealant and provide gasket for wall plates and covers.

3.4 GROUNDING AND BONDING

A. Comply with requirements in Section 260526 “Grounding and Bonding for Electrical Systems”.

B. Where conductors are spliced or terminated within a box, or supported by a box, bond metal box with pigtail to the equipment grounding conductor.

C. Provide insulated throat grounding bushings with appropriately sized bonding jumpers for the following locations to maintain electrical continuity between the raceway and enclosure:
   1. Metal raceways and enclosures that contain service conductors.
   2. Metal raceways and enclosures that contain grounding electrode conductors.
   3. Where metal raceways containing circuits over 250V terminate in a concentric or eccentric knockout at cabinets, enclosures, or sheet metal pull boxes listed in accordance with UL 50.
   4. Where the integrity of a concentric or eccentric knockout has been compromised.
   5. Metal raceways and enclosures that contain feeders.

3.5 PROTECTION

A. Protect coatings, finishes, and cabinets from damage and deterioration.
   1. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.
   2. Repair damage to PVC coatings or paint finishes with matching touchup coating recommended by manufacturer.

B. Protect threads on conduits and fittings with plastic protectors or other means to prevent damage prior to installation.

C. Provide protection for all conduit stubbed through floor during construction with plastic caps approved for this purpose.

D. Provide backboxes for all low-voltage floor-mounted and wall-mounted outlets, including all necessary accessories required to extend the low-voltage cabling to the ceiling.

3.6 IDENTIFICATION

A. Comply with requirements in Section 260553 "Identification for Electrical Systems."

B. Identify all junction, outlet and pull boxes in data/mechanical/electrical rooms and above ceilings with panel and circuit designation on outside of covers. Identify all exposed junction, outlet and pull boxes in finished areas with panel and circuit designation on the inside of covers.

C. Provide black finish for exposed raceways and junction boxes on theater stage.

3.7 PAINTING

A. Raceways installed in exterior locations shall receive one coat of primer, two coats finish paint after preparation of galvanizing, color selected by Architect.

B. Exposed raceways in painted interior areas shall be painted to match adjacent finishes.

END OF SECTION

SECTION 260543 - UNDERGROUND DUCTS AND RACEWAYS FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Direct-buried and concrete-encased conduits, ducts, and duct accessories.
   2. Handholes and boxes.
   3. Utility Structure accessories.

B. Related Requirements:
   1. Refer to Section 260533 “Raceways and Boxes for Electrical Systems” for pathway requirements installed under building slabs.

1.3 REFERENCES

A. Abbreviations
   1. GRC: Galvanized rigid conduit.
   2. IMC: Intermediate metal conduit.
   3. RNC: Rigid nonmetallic conduit.

B. Definitions
   1. Backfill: Earth or other controlled material placed in trenches for filling and grading back to a finished state.
   2. Initial Backfill (encasement): Backfill placed beside and over conduit arrangements in a trench, including haunches to support sides of conduits.
   3. Final Backfill: Backfill placed over initial backfill to fill a trench.
   4. Bedding Course: Aggregate layer placed over the excavated subgrade in a trench before laying conduit.
   5. Duct: A single or multiple underground conduits encased in concrete or direct buried.
   6. Duct Bank: An arrangement of two or more ducts installed together.
   7. Encasement: Material placed around a duct or duct bank to provide additional protection.
   8. Trafficways: Locations where vehicular or pedestrian traffic is a normal course of events.

C. Reference Standards: The following publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest version as of the date of the Contract Documents, unless otherwise specified.

D. National Electrical Manufacturers Association (NEMA):
   1. NEMA TCB-2 “Guidelines for the Selection and Installation of Underground Nonmetallic Raceways”.

1.4 FIELD CONDITIONS

A. Ground Water: Assume ground-water level is at grade level unless a lower water table is noted on Drawings.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Comply with IEEE C2 and NFPA 70.

2.2 CONDUITS AND FITTINGS

A. Comply with 260533 “Raceways and Boxes for Electrical Systems”.

2.3 DUCT ACCESSORIES

A. Duct Separators: Factory-fabricated rigid PVC interlocking spacers, sized for type and size of ducts with which used, and selected to provide minimum duct spacing indicated while supporting ducts during encasement or backfilling.

B. Fabric Innerduct: Continuous, nylon resin polyester, multi -pocket fabric innerduct, with internal pull tape. Maxcell or equal.

C. Pull Line: Flat, woven, polyester or polyaramid tape, low stretch, pre-lubricated for reduced friction. Strength suitable for required pulling tensions with a minimum of 200-lb. Muletape or equal.

D. Underground Detectable Warning Tape: Flexible tape constructed with solid aluminum foil backing and clear film laminate, 6-inches wide, 5-mil overall thickness.
   1. Suitable for the method of installation and locating underground utility lines.
   2. Chemically inert tape material and ink, resistant to degradation when exposed to acids, alkalis, and other destructive substances commonly found in soils.
   3. Comply with APWA Uniform Color Code.
   4. Inscriptions for Red-Colored Tapes: "CAUTION BURIED ELECTRIC LINE BELOW".
   5. Inscriptions for Orange-Colored Tapes: “CAUTION BURIED COMMUNICATIONS LINE BELOW”.

E. Duct Sealants: Re-enterable, two-part, closed-cell urethane foam capable of sealing conduits with multiple cable configurations.
   1. Capable of withstanding temperatures from -40 deg F to 200 deg F and holding 22 feet waterhead pressure continuous.
   2. Chemically resistant to gasoline, oils, dilute acids and bases.
   3. Compatible with cable jacket and shall not affect the physical or electrical properties of wire and cable.
   4. Workable at temperatures as low as 40 deg F.
   5. UL94 Class HBF fire retardant rating.

2.4 POLYMER CONCRETE HANDHOLES AND BOXES

A. Description: Molded of sand and aggregate, bound together with a polymer resin, and reinforced with steel or fiberglass or a combination of the two. Coordinate all boxes for utility cabling with utility requirements.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Armorcast
   2. NewBasis
   3. Oldcastle
   4. Hubbell Quazite

C. General Requirements:
   1. Comply with SCTE 77. Minimum Tier 15.
   2. Color: Gray.
   3. Configuration: Designed for flush burial with open bottom unless otherwise indicated.
   4. Cover: Weatherproof, secured by tamper-resistant locking devices and having structural load rating consistent with enclosure.
   5. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
   6. Cover Legend: Molded lettering, as indicated for each service.

2.5 PRECAST CONCRETE HANDHOLES

A. Description: Factory fabricated, one-piece units and units with interlocking mating sections, complete with accessories, hardware, and features. Frame and cover shall have load rating consistent with that of structure.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Christy Concrete Products
   2. Oldcastle
   3. Utility Concrete Products
   4. Utility Vault Co

C. Comply with ASTM C 858.

D. Precast reinforced-concrete, H-20 structural load rating according to AASHTO HB 17.

E. Windows: Precast openings in walls, arranged to match dimensions and elevations of approaching ducts and duct banks, plus an additional 12 inches vertically and horizontally to accommodate alignment variations.
   1. Locate windows no less than 6 inches from interior surfaces of walls, floors, or roofs of structure, but close enough to corners to facilitate racking of cables on walls.
   2. Provide window opening with cast-in-place, welded-wire fabric reinforcement for field cutting and bending to tie in to concrete envelopes of duct banks.
   3. Provide window opening frame with at least two additional No. 3 steel reinforcing bars in concrete around each opening.
   4. Provide windows 1-1/2 to 2 inches thick.

F. Duct Entrances in Walls: Cast end-bell or duct-terminating fitting in wall for each entering duct.
   1. Type and size shall match fittings to duct or conduit to be terminated.
   2. Fittings shall align with elevations of approaching ducts and be located near interior corners of structures to facilitate racking of cable.

G. Joint Sealant: Asphaltic-butyl material with adhesion, cohesion, flexibility, and durability properties necessary to withstand maximum hydrostatic pressures at the installation location with the ground-water level at grade.

H. Provide ventilation openings where indicated on drawings.

I. Frames, Covers, and Chimney Components: Comply with structural design loading specified for structure.
   1. Frame and Cover: Weatherproof, gray cast iron complying with ASTM A 48/A 48M, Class 35 cast iron with milled cover-to-frame bearing surfaces; diameter, 32 inches.
   2. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.
   3. Special Covers: Recess in face of cover designed to accept finish material in paved areas.
   4. Cover Legend: Cast in. Selected to suit system.
   5. All covers shall be provided with 2 inch lettering and with the structure number, assigned by Owner, welded onto the cover if not provided by the manufacturer.
   6. All covers shall be provided with stainless steel drop handles.
   7. Chimney Components: Precast concrete rings with dimensions matched to those of roof opening.
   8. Mortar for Chimney Ring and Frame and Cover Joints: Comply with ASTM C 270, Type M, except for quantities less than 2.0 cu. ft. (60 L) where packaged mix complying with ASTM C 387, Type M, may be used.
   9. Seal joints watertight using preformed plastic or rubber conforming to ASTM C 990. Install sealing material according to the sealant manufacturers' printed instructions.

J. Sump Frame and Grate: ASTM A 48/A 48M, Class 30B, gray cast iron.

K. Pulling Eyes in Concrete Walls: Eyebolt with reinforcing-bar fastening insert, 2-inch diameter eye, and 1-by-4 inch bolt.
   1. Working Load Embedded in 6-Inch, 4000-psi Concrete: 13,000-lbf minimum tension.

L. Pulling-In and Lifting Irons in Concrete Floors: 7/8-inch diameter, hot-dip galvanized, bent steel rod; stress relieved after forming; and fastened to reinforcing rod. Exposed triangular opening.
   1. Ultimate Yield Strength: 40,000-lbf shear and 60,000-lbf tension.

M. Bolting Inserts for Concrete Utility Structure Cable Racks and Other Attachments: Flared, threaded inserts of noncorrosive, chemical-resistant, nonconductive thermoplastic material; 1/2-inch ID by 2-3/4 inches deep, flared to 1-1/4 inches minimum at base.

N. Tested Ultimate Pullout Strength: 12,000 lbf minimum.

O. Ground Rod Sleeve: 3-inch, PVC conduit sleeve in floors 2 inches from the wall adjacent to, but not underneath, the ducts routed from the facility.

P. Expansion Anchors for Installation after Concrete Is Cast: Zinc-plated, carbon-steel-wedge type with stainless-steel expander clip with 1/2-inch bolt, 5300-lbf rated pullout strength, and minimum 6800-lbf rated shear strength.

Q. Cable Rack Assembly: Steel, hot-dip galvanized, except insulators.
   1. Stanchions: T-section or channel; 2-1/4-inch nominal size; punched with 14 holes on 1-1/2-inch centers for cable-arm attachment.
   2. Arms: 1-1/2 inches wide, lengths ranging from 3 inches with 450-lb minimum capacity to 18 inches with 250-lb minimum capacity. Arms shall have slots along full length for cable ties and be arranged for secure mounting in horizontal position at any vertical location on stanchions.
   3. Insulators: High-glaze, wet-process porcelain arranged for mounting on cable arms.

2.6 SOURCE QUALITY CONTROL

A. Test and inspect precast concrete utility structures according to ASTM C 1037.

B. Nonconcrete Handhole and Pull-Box Prototype Test: Test prototypes of handholes and boxes for compliance with SCTE 77. Strength tests shall be for specified tier ratings of products supplied.
   1. Tests of materials shall be performed by an independent testing agency.
   2. Strength tests of complete boxes and covers shall be by either an independent testing agency or manufacturer. A qualified registered professional engineer shall certify tests by manufacturer.
   3. Testing machine pressure gauges shall have current calibration certification, complying with ISO 9000 and ISO 10012, and traceable to NIST standards.

PART 3 - EXECUTION

3.1 PREPARATION

A. Coordinate layout and installation of ducts, handholes, and boxes with final arrangement of other utilities, site grading, and surface features as determined in the field.

B. Notify Architect if there are obstructions or conflicts between areas of excavation and existing structures or archaeological features to remain.

C. Coordinate elevations of ducts and duct-bank entrances into handholes, and boxes with final locations and profiles of ducts and duct banks, as determined by coordination with other utilities, underground obstructions, and surface features. Revise locations and elevations as required to suit field conditions and to ensure that duct runs drain to handholes, and as approved by Architect.

D. All necessary precautions shall be taken by the contractor during construction to prevent the lodging of dirt, plaster or trash in all conduit, tubing, fittings and boxes.

3.2 UNDERGROUND DUCT APPLICATION

A. Apply underground duct products as specified unless noted otherwise:
   1. Refer to Section 260533, "Raceways and Boxes for Electrical Systems" for additional requirements related to underground conduit below building slabs.
   2. Ducts for Utility Company primary conductors: comply with utility company standards unless noted otherwise.
   3. Ducts for Electrical Service Secondary Conductors: RNC, Type EPC-40 PVC, in concrete-encased duct bank unless otherwise indicated.
   4. Ducts for Electrical Cables greater than 600 V: RNC, Type EPC-40 PVC, in concrete-encased duct bank unless otherwise indicated.
   5. Ducts for Electrical Feeders 600 V and Less: RNC, Type EPC-40 PVC, in concrete-encased duct bank unless otherwise indicated.
   6. Ducts for Electrical Branch Circuits: RNC, Type EPC-40 PVC, in direct buried duct bank unless otherwise indicated.
   7. Ducts for Communications Cables: RNC, Type EPC-40 PVC, in direct buried duct bank unless otherwise indicated.
   8. Underground Ducts 600V and less Crossing Driveways and Roadways: RNC, Type EPC-40-PVC, encased in reinforced concrete. Extend reinforcement a minimum of 5-feet beyond the edge of paved surfaces.

B. Minimum Cover Requirements: Provide reinforced concrete encasement where minimum depths are not achievable.
   1. Electrical Primary or Conductors more than 600V: 42-inches unless otherwise indicated by utility company requirements.
   2. Electrical Secondary Service and Feeders: 36-inches
   3. Electrical Branch Circuits: 24-inches
   4. Communications: 30-inches

C. Transition RNC to GRC for all stub-ups and building enclosure penetrations. Use fittings manufactured for RNC-to-GRC transition.
   1. Arrange stub-ups so curved portions of bends are not visible above grade. Increase burial depth where required to maintain cover for curves and bends.
   2. Do not use steel raceways for equipment stub-ups where prohibited by utility company standards.
   3. Minimum Underground Raceway Size: 1-inch trade size unless noted otherwise on the drawings.

3.3 EARTHWORK

A. Contractor shall accept the site as they find it and remove all trash, rubbish, and material from the site prior to starting excavation work.

B. Subsurface Data
   1. Subsurface investigations have been performed and the results provided with the contract documents. The information was obtained primarily for use in preparing foundation design. Each contractor may draw their own conclusions therefrom. No responsibility is assumed by the Owner for subsoil quality or conditions other than at the locations and at the time the investigations were made.
   2. Materials to be excavated shall be unclassified, and shall include eart, rock, or any other material encountered in the excavation to the depth and extent indicated on the drawings and specified herein. No adjustment in the contract sum will be made on account of the presence or absence of rock, shale, or other materials encountered in excavating.

C. Benchmarks and Monuments
   1. Carefully maintain all benchmarks, monuments, and other reference points. If disturbed or destroyed, replace as directed.

D. Excavation:
   1. Remove rock by using hand or power tools only. Blasting is not permitted unless authorized in writing by the Architect.
   2. Any damage to existing structures, exterior services, or rock intended for bearing shall be corrected by the Contractor at their own expense.
   3. Take necessary precautions to control runoff of eroded earth onto the property of others or against the structures. All such damage or any other damage incurred in the course of excavation, shall be corrected by the Contractor at their own expense.
   4. Trenching:
   5. Cut trenches neatly and uniformly. Work with extreme care near existing ducts, conduits, and other utilities to avoid damaging them.
   6. Width: Excavate trench a minimum of 3 inches wider than duct bank on each side with a minimum trench width of 12-inches.
   7. Depth: Excavate to a minimum depth that equals ductbank height plus minimum cover requirements.
   8. Hand excavate trench bottom to provide uniform bearing and support of conduits on an undisturbed subgrade matching slope requirement. Remove all debris, stones, and other projections.
   9. For rock or other unyielding soils, excavate trenches 6-inches deeper than required elevation and provide level 6-inch compacted sand bedding course.
   10. For unstable soils or where bedding course is subject to washout, provide concrete trench bottom.
   11. Coordinate protection of roots in tree and plant protection zones with Division 31 requirements.
   12. Keep trenches free from water while construction is in progress. Installation of conduit or cable in trenches with water is not permitted. Contractor is responsible for all costs associated with dewatering of trenches.

E. Final Backfill: Comply with Division 31 and as indicated below:

1. Use satisfactory soil to backfill trenches to final subgrade elevation unless required otherwise by Civil or Structural subgrade requirements.
2. Install final backfill in 6-inch layers.
3. Compact all backfill to 95% standard proctor density.
4. Mechanical means for compaction can be used once conduits have been covered with at least 12-inches of hand tamped backfill. Do not use heavy-duty, hydraulic-operated, compaction equipment.

F. Restoration:
1. Replace area immediately after backfilling is completed or after construction in immediate area is complete.
2. Restore all surface features at areas disturbed by excavation, storing of dirt, cable laying, and other work, and re-establish original grades unless otherwise indicated.
3. Restore vegetation and include 6-inches of clean topsoil, fertilizing, liming, seeding, sodding, sprigging, and mulching. Comply with Division 32.

G. Cut and patch existing pavement in the path of underground ducts and utility structures according to the "Cutting and Patching" requirements in Division 01 and Section 260010, “General Requirements for Electrical”.

3.4 DUCT INSTALLATION

A. Install ducts, spacers, and accessories into ductbank configurations to accommodate duct quantities and sizes indicated on drawings.

B. Install ducts according to NEMA TCB 2.

C. Slope: Pitch ducts a minimum slope of 1:300 down toward handholes and away from buildings and equipment. Slope ducts from a high point in runs between two handholes, to drain in both directions. Install ducts in such manner to avoid traps and insure against collection of moisture.

D. Curves and Bends:
1. Use 5-degree angle couplings for small changes in direction.
2. Use manufactured long sweep bends with a minimum radius of 36 inches vertically and 60-inches horizontally, unless otherwise indicated.
3. Field manufactured bends are acceptable for a bend radius greater than 35-feet. Install field bends in accordance with NEMA TCB 2.
4. Electrical duct and duct banks: Install no more than the equivalent of three 90-degree bends in any conduit run.
5. Communications duct and duct banks: Install no more than the equivalent of two 90-degree bends in any conduit run and a maximum of 600 feet between pull points.

E. Joints: Use solvent-cemented joints in non-metallic ducts and fittings and make watertight according to manufacturer's written instructions. Stagger couplings so those of adjacent ducts do not lie in same horizontal or vertical plane to ensure encasement or backfill fully surrounds each raceway.

F. Installation Adjacent to High-Temperature Steam Lines: Where duct banks are installed parallel to underground steam lines, provide minimum 6-foot separation or perform calculations

showing the duct bank will not be subject to environmental temperatures above 40 deg C. Where environmental temperatures are calculated to rise above 40 deg C, and anywhere the duct bank crosses above an underground steam line, install insulation blankets listed for direct burial to isolate the duct bank from the steam line.

G. Installation Adjacent to Other Utilities:
   1. Provide minimum 12-inches of earth or 3-inches of concrete between power and communications ducts.
   2. Provide minimum 24-inches of earth between power or communications ducts and other parallel utilities. At utility crossings, provide minimum 6-inches of separation except provide 12-inches separation where crossing utility is gas or other line that transports flammable material.
   3. Do not locate power and communications ducts below water and sewer lines.

H. Duct Entrances to Concrete Handholes: Use end bells, spaced approximately 10 inches o.c. for 5-inch ducts, and vary proportionately for other duct sizes.
   1. Begin change from regular spacing to end-bell spacing 10 feet (3 m) from the end bell without reducing duct line slope and without forming a trap in the line.
   2. Direct-Buried Duct Banks: Install an expansion and deflection fitting in each conduit in the area of disturbed earth adjacent to handhole. Install an expansion fitting near the center of all straight line direct-buried duct banks with calculated expansion of more than 3/4 inch (19 mm).
   3. Grout end bells into structure walls from both sides to provide watertight entrances.

I. Building Penetrations: Make a transition from underground duct to GRC at least 10 feet outside the building wall, without reducing duct line slope away from the building and without forming a trap in the line. Use fittings manufactured for RNC-to-GRC transition. Provide sleeves at building penetration and make water-tight with sleeve seal.

J. Duct Support
   1. For concrete encased applications, support ducts on duct separators coordinated with duct size, duct spacing, and outdoor temperature.
   2. Separator Installation: Space separators at a maximum of 5-feet to prevent sagging and deforming of ducts. Place spacers within 24-inches of duct ends. Stagger separators approximately 6 inches between tiers.
   3. Minimum Space between Ducts: 3 inches between ducts and between ducts and exterior envelope wall.

K. Concrete-Encased Ducts:
   1. Secure separators to earth and to ducts to prevent floating during encasement. Tie entire assembly together using non-ferrous tie-wires or straps; do not use tie wires or reinforcing steel that may form conductive or magnetic loops around ducts or duct groups.
   2. Reinforcement: Where indicated, reinforce concrete-encased duct banks for their entire length. Arrange reinforcing rods and ties without forming conductive or magnetic loops around ducts or duct groups.
   3. Forms: Use walls of trench to form side walls of duct bank where soil is self-supporting and concrete envelope can be poured without soil inclusions; otherwise, use forms.
   4. Concrete Cover: Install a minimum of 3 inches of concrete cover between edge of duct and exterior envelope wall.

5. Concreting Sequence: Pour each run of envelope between terminations in one continuous operation.
    a) Start at one end and finish at the other, allowing for expansion and contraction of ducts as their temperature changes during and after the pour. Use expansion fittings installed according to manufacturer's written recommendations, or use other specific measures to prevent expansion-contraction damage.
    b) If more than one pour is necessary, terminate each pour in a vertical plane and install 3/4-inch reinforcing-rod dowels extending a minimum of 18 inches into concrete on both sides of joint near corners of envelope.

L. Concrete Encasement:
1. Use normal strength concrete, minimum 3000 psi at 28 days, 6 to 8 inch slump, with maximum 1/2 inch aggregate.
2. Comply with requirements in "Concrete Placement" Article in Division 03. Place concrete carefully during pours to prevent voids under and between conduits and at exterior surface of envelope.
3. Do not allow a heavy mass of concrete to fall directly onto ducts. Allow concrete to flow to center of bank and rise up in middle, uniformly filling all open spaces.
4. Do not use power-driven agitating equipment unless specifically designed for duct-bank application.

M. Complete final backfilling after concrete has cured.

N. Direct-Buried Duct Banks:
1. Set elevation of bottom of duct bank below frost line.
2. After installing first tier of ducts, install initial backfill and compact.
3. Start at tie-in point and work toward end of duct run, leaving ducts at end of run free to move with expansion and contraction as temperature changes during this process.
4. Perform initial backfilling/encasement in 2-inch lifts. Compact to 95% standard proctor density.
5. Repeat procedure after placing each tier. After placing last tier, hand place backfill to 4 inches over ducts and hand tamp.
6. Firmly tamp initial backfill around ducts to provide maximum supporting strength. Use hand tamper only.
7. After placing initial backfill over final tier, make final duct connections at end of run and complete backfilling.
8. Initial backfill/encasement material shall be crushed stone, sand, or pea gravel with a maximum aggregate size of 1/2-inch.

O. Warning Tape: Bury warning tape approximately 12 inches above all ducts. Align tape parallel to and within 3 inches of centerline of duct bank. Provide an additional warning tape for each 12-inch increment of duct-bank width over a nominal 18 inches. Space additional tapes 12 inches apart, horizontally.

P. Install pull tape in all spare ducts with 3ft of slack tied off and secured at each pull point.

Q. Duct Sealing:
1. Provide temporary plugs of all ducts upon completion of each portion of work to prevent ingress of foreign material into the duct.

2. After conductors have been installed seal all ducts, including spare ducts, at building entrances and equipment terminations. Use sealing compound and foam plugs capable of withstanding at least 15-psig hydrostatic pressure.

3.5 INSTALLATION OF CONCRETE HANDHOLES, AND BOXES

A. Precast Concrete Handhole Installation:
   1. Comply with ASTM C 891 unless otherwise indicated.
   2. Install units level and plumb and with orientation and depth coordinated with connecting ducts, to minimize bends and deflections required for proper entrances.
   3. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1-inch sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.

B. Elevations:
   1. Handhole Covers: In paved areas and trafficways, set surface flush with finished grade. Set covers of other handholes 1 inch above finished grade.

C. Where indicated, cast handhole cover frame integrally with handhole structure.

D. Waterproofing: Apply waterproofing to exterior surfaces of handholes after concrete has cured at least three days. After ducts have been connected and grouted, and before backfilling, waterproof joints and connections, and touch up abrasions and scars.

E. Hardware: Turn over removable hardware, including pulling eyes, cable stanchions, cable arms, to Construction Manager for use during next phase.

F. Field-Installed Bolting Anchors in Concrete Handholes: Do not drill deeper than 2 inches (50 mm) for handholes, for anchor bolts installed in the field. Use a minimum of two anchors for each cable stanchion.

3.6 INSTALLATION OF HANDHOLES AND BOXES OTHER THAN PRECAST CONCRETE

A. Install hand-holes and boxes level and plumb and with orientation and depth coordinated with connecting ducts, to minimize bends and deflections required for proper entrances. Use box extension if required to match depths of ducts, and seal joint between box and extension as recommended by manufacturer.

B. Unless otherwise indicated, support units on a12-inch thick level bed of crushed stone or gravel, graded from 1/2-inch sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.

C. Elevation: In paved areas and trafficways, set cover flush with finished grade. Set covers of other handholes 1 inch above finished grade. Install handholes and boxes with bottom below frost line.

D. Field cut openings for ducts and conduits according to enclosure manufacturer's written instructions. Cut wall of enclosure with a tool designed for material to be cut. Size holes for terminating fittings to be used, and seal around penetrations after fittings are installed.

E. For enclosures installed in asphalt paving, form and pour a concrete ring encircling, and in contact with, enclosure and with top surface screeded to top of box cover frame. Bottom of ring shall rest on compacted earth.
   1. Concrete: 3000 psi, 28-day strength, complying with Division 03, with a troweled finish.
   2. Dimensions: minimum 10 inches wide and 12 inches deep or as shown on drawings.

3.7 GROUNDING

A. Comply with Section 260526 “Grounding and Bonding for Electrical Systems”.

B. Grounding Handholes: Install a driven ground rod through handhole floor, close to wall, and set rod depth so 4 inches will extend above finished floor. If necessary, install ground rod before handhole is placed and provide #1/0 AWG bare, tinned-copper conductor from ground rod into handhole through a waterproof sleeve in handhole wall. Protect ground rods passing through concrete floor with a double wrapping of pressure-sensitive insulating tape or heat-shrunk insulating sleeve from 2 inches above to 6 inches below concrete. Seal floor opening with waterproof, non-shrink grout.

3.8 IDENTIFICATION

A. Comply with Section 260553 “Identification for Electrical Systems”
   1. Where ducts transition through handholes, and at each termination point, provide each duct with a unique identifier to indicate origination point.
   2. Cover legends shall be consistent with the owner’s standard practices, especially within existing facilities, unless otherwise require by codes.

3.9 FIELD QUALITY CONTROL

A. Prior to covering duct or underground structures, perform visual inspections to verify the following:
   1. Proper installation depths and slopes have been maintained.
   2. Proper vertical and horizontal spacing in multi-duct formations.
   3. All conduit sections have been properly jointed.
   4. Proper bend radius of curved sections have been maintained.
   5. Check for damage at changes in grades or at bends.
   6. Perform the following tests and inspections and prepare test reports:
   7. Demonstrate capability and compliance with requirements on completion of installation of underground ducts and utility structures.
   8. Pull solid aluminum or wood test mandrel through duct to prove joint integrity and adequate bend radii, and test for duct deflections or out of round conditions. Provide a minimum 6-inch- long mandrel 1/2-inch smaller in diameter than diameter of duct. If obstructions are discovered, remove obstructions and retest.

B. Correct deficiencies, replace affected duct sections, and retest as specified above to demonstrate compliance.

C. Prepare detailed test and inspection reports with accompanying digital photographs.

D. Concealed Work Photographs: Before proceeding with installing backfill that will conceal work, take photographs sufficient in number, with annotated descriptions, to record nature and location of concealed Work.

3.10 CLEANING

A. Pull leather-washer-type duct cleaner, with graduated washer sizes, through full length of all ducts until duct cleaner indicates that duct is clear of dirt and debris. Follow with rubber duct swab for final cleaning and to assist in spreading lubricant throughout ducts.

B. Clean internal surfaces of handholes, including sump. Remove dirt and foreign material.

END OF SECTION

SECTION 260544 -SLEEVES AND SLEEVE SEALS FOR ELECTRICAL RACEWAYS AND CABLING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Sleeves for raceway and cable penetration of non-fire-rated construction walls and floors.
   2. Sleeve-seal systems.
   3. Sleeve-seal fittings.
   4. Grout.
   5. Silicone sealants.

B. Related Requirements:
   1. Division 07 Section "Penetration Firestopping" for penetration firestopping installed in fire-resistance-rated walls, horizontal assemblies, and smoke barriers, with and without penetrating items.

PART 2 - PRODUCTS

2.1 SLEEVES

A. Wall Sleeves:
   1. Steel Pipe Sleeves: ASTM A 53/A 53M, Type E, Grade B, Schedule 40, zinc coated, plain ends.
   2. Cast-Iron Pipe Sleeves: Cast or fabricated "wall pipe," equivalent to ductile-iron pressure pipe, with plain ends and integral waterstop unless otherwise indicated.

B. Sleeves for Conduits Penetrating Non-Fire-Rated Gypsum Board Assemblies: Galvanized-steel sheet; 0.0239-inch (0.6-mm) minimum thickness; round tube closed with welded longitudinal joint, with tabs for screw-fastening the sleeve to the board.

C. PVC-Pipe Sleeves: ASTM D 1785, Schedule 40.

D. Molded-PVC Sleeves: With nailing flange for attaching to wooden forms.

E. Molded-PE or -PP Sleeves: Removable, tapered-cup shaped, and smooth outer surface with nailing flange for attaching to wooden forms.

F. Sleeves for Rectangular Openings:
1. Material: Galvanized sheet steel.
2. Minimum Metal Thickness:

a) For sleeve cross-section rectangle perimeter less than 50 inches (1270 mm) and with no side larger than 16 inches (400 mm), thickness shall be 0.052 inch (1.3 mm).
b) For sleeve cross-section rectangle perimeter 50 inches (1270 mm) or more and one or more sides larger than 16 inches (400 mm), thickness shall be 0.138 inch (3.5 mm).

2.2 SLEEVE-SEAL SYSTEMS

A. Description: Modular sealing device, designed for field assembly, to fill annular space between sleeve and raceway or cable.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

c) Advanced Products & Systems, Inc.
d) CALPICO, Inc.
e) Metraflex Company
f) Pipeline Seal and Insulator, Inc.
g) Proco Products, Inc.

B. Sealing Elements: EPDM rubber interlocking links shaped to fit surface of pipe. Include type and number required for pipe material and size of pipe.

C. Pressure Plates: Carbon Steel.

D. Connecting Bolts and Nuts: Stainless Steel of length required to secure pressure plates to sealing elements.

2.3 SLEEVE-SEAL FITTINGS

A. Description: Manufactured plastic, sleeve-type, waterstop assembly made for embedding in concrete slab or wall. Unit shall have plastic or rubber waterstop collar with center opening to match piping OD.
1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

h) Presealed Systems.
i) Roxtec
j) EJ Prescot Linkseal.

2.4 GROUT

A. Description: Non-shrink; recommended for interior and exterior sealing openings in non-fire-rated walls or floors.

B. Standard: ASTM C 1107/C 1107M, Grade B, post-hardening and volume-adjusting, dry, hydraulic-cement grout.

C. Design Mix: 5000-psi (34.5-MPa), 28-day compressive strength.

D. Packaging: Premixed and factory packaged.

2.5 SILICONE SEALANTS

A. Silicone Sealants: Single-component, silicone-based, neutral-curing elastomeric sealants of grade indicated below.
   1. Grade: Pourable (self-leveling) formulation for openings in floors and other horizontal surfaces that are not fire rated.

B. Silicone Foams: Multicomponent, silicone-based liquid elastomers that, when mixed, expand and cure in place to produce a flexible, non-shrinking foam.

PART 3 - EXECUTION

3.1 SLEEVE INSTALLATION FOR NON-FIRE-RATED ELECTRICAL PENETRATIONS

A. Comply with NECA 1.

B. Comply with NEMA VE 2 for cable tray and cable penetrations.

C. Sleeves for Conduits Penetrating Above-Grade Non-Fire-Rated Concrete and Masonry-Unit Floors and Walls:
   1. Interior Penetrations of Non-Fire-Rated Walls and Floors:
      k) Seal annular space between sleeve and raceway or cable, using joint sealant appropriate for size, depth, and location of joint. Comply with requirements in Division 07 Section "Joint Sealants."
      l) Seal space outside of sleeves with mortar or grout. Pack sealing material solidly between sleeve and wall so no voids remain. Tool exposed surfaces smooth; protect material while curing.
   2. Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.
   3. Size pipe sleeves to provide 1/4-inch (6.4-mm**)** annular clear space between sleeve and raceway or cable unless sleeve seal is to be installed.
   4. Install sleeves for wall penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of walls. Cut sleeves to length for mounting flush with both surfaces of walls. Deburr after cutting.
   5. Install sleeves for floor penetrations. Extend sleeves installed in floors 2 inches (50 mm) above finished floor level. Install sleeves during erection of floors.

D. Sleeves for Conduits Penetrating Non-Fire-Rated Gypsum Board Assemblies:
   1. Use circular metal sleeves unless penetration arrangement requires rectangular sleeved opening.
   2. Seal space outside of sleeves with approved joint compound for gypsum board assemblies.

E. Roof-Penetration Sleeves: Seal penetration of individual raceways and cables with flexible boot-type flashing units applied in coordination with roofing work.

F. Aboveground, Exterior-Wall Penetrations: Seal penetrations using steel pipe sleeves and mechanical sleeve seals. Select sleeve size to allow for 1-inch (25-mm) annular clear space between pipe and sleeve for installing mechanical sleeve seals.

G. Underground, Exterior-Wall and Floor Penetrations: Install cast-iron pipe sleeves. Size sleeves to allow for 1-inch (25-mm) annular clear space between raceway or cable and sleeve for installing sleeve-seal system.

3.2 SLEEVE-SEAL-SYSTEM INSTALLATION

A. Install sleeve-seal systems in sleeves in exterior concrete walls and slabs-on-grade at raceway entries into building.

B. Install type and number of sealing elements recommended by manufacturer for raceway or cable material and size. Position raceway or cable in center of sleeve. Assemble mechanical sleeve seals and install them in annular space between raceway or cable and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

3.3 SLEEVE-SEAL-FITTING INSTALLATION

A. Install sleeve-seal fittings in new walls and slabs as they are constructed.

B. Assemble fitting components of length to be flush with both surfaces of concrete slabs and walls. Position water stop flange to be centered in concrete slab or wall.

C. Secure nailing flanges to concrete forms.

D. Using grout, seal the space around outside of sleeve-seal fittings.

END OF SECTION

SECTION 260553 - IDENTIFICATION FOR ELECTRICAL SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Equipment Nameplates.
   2. Cable and Conductor Labels.
   3. Wiring Device Labels
   4. Safety Labels.
   5. Instruction Signs.
   6. Miscellaneous identification products.

B. Related Requirements
   1. Refer to Section 260573, “Power System Studies” for additional requirements related to fault current and arc flash labeling.
   2. Refer to Section 270553, “Identification for Communications Systems” for additional requirements related to labeling of communications equipment and cabling.

1.3 REFERENCES

A. Reference Standards: The following publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest version as of the date of the Contract Documents, unless otherwise specified.
   1. American National Standards Institute (ANSI)
      a. ANSI Z535.4, “Product Safety Signs and Labels”
   2. National Fire Protection Association (NFPA)
      a. NFPA 70E, “Standard for Electrical Safety in the Workplace”
   3. Occupational Safety and Health Administration (OSHA)
      a. 29 CFR 1910.144, “Safety color code for marking physical hazards.”
      b. 29 CFR 1910.145, “Specifications for accident prevention signs and tags”
   4. Underwriters Laboratories Inc (UL)
      a. UL 969, “Marking and Labeling Systems”

1.4 COORDINATION

A. Verify and coordinate identification names, abbreviations, colors, and other features with requirements in other Sections requiring identification applications, Drawings, Shop Drawings,

manufacturer's wiring diagrams, and the Operation and Maintenance Manual; and with those required by codes and standards. Use consistent designations throughout Project.

B. All identifications shall be consistent with the owner's standard practices, especially within existing facilities, unless otherwise required by codes. Where the requirements herein are in conflict, the contractor shall notify the engineer in writing prior to ordering any material.

C. All room names and/or numbers for labeling or programming shall use the Owner's approved room name and numbering scheme, not names and numbers indicated on floor plans. All reprogramming shall be included as required to accommodate construction phasing.

D. Coordinate installation of identifying devices with completion of covering and painting of surfaces where devices are to be applied.

E. Coordinate installation of identifying devices with location of access panels and doors.

F. Install identifying devices before installing acoustical ceilings and similar concealment.

PART 2 - PRODUCTS

2.1 EQUIPMENT SIGNS AND NAMEPLATES

A. Label all electrical panels, transformers, switchboards, telecoms equipment, disconnect switches, and other electrical equipment with engraved vinyl nameplates.

B. Engraved Plastic Signs and Nameplates.
   1. 3-layer melamine plastic laminate
   2. Weather and UV-resistant for Wet and Damp Locations.
   3. Thickness:
      a. For signs up to 20 sq. in., minimum 1/16 inch thick.
      b. For signs larger than 20 sq. in. or 8 inches in length, 1/8 inch thick.
      c. Punched or drilled for mechanical fasteners with 1/4-inch grommets in corners for mounting.
      d. Framed with mitered melamine molding and arranged for attachment at applicable equipment.
   4. Color: Comply with color legend.

2.2 RACEWAY AND CONDUCTOR LABELS

A. Raceway Labels: Pre-printed, self-adhesive, polyester, suitable for indoor or outdoor use, resistant to abrasion, humidity, and weather.
   1. Color: Black Letters on an orange field.
   2. Size: For each raceway size, comply with ANSI/ASME A13.1 for recommended letter height and field length.

B. Wire and Cable Labels: Machine printed, self-adhesive, polyester, self-laminating, suitable for indoor or outdoor use on flexible cables, resistant to abrasion, humidity, and weather.

2.3 SAFETY SIGNS AND LABELS

A. Comply with NFPA 70 and 29 CFR 1910.145.

B. All field-applied hazard markings shall warn of hazards using effective words, colors, symbols, or any combination thereof as recommended by ANSI Z535.4-2011. This applies to all instances where caution, warning, or danger signs are required per the NEC and applicable OSHA standards.

C. Self-Adhesive Safety Labels: Polyester, Factory-printed, multicolor, pressure-sensitive adhesive labels, configured for intended use and suitable for installed environment.

D. Provide UV over laminating film for outdoor locations.

2.4 INSTRUCTION SIGNS

A. Adhesive Film Label: Machine printed, in black, by thermal transfer or equivalent process. The minimum letter height shall be 3/8 inch.

B. Adhesive Film Label with Clear Protective Overlay: Machine printed, in black, by thermal transfer or equivalent process. The minimum letter height shall be 3/8 inch. Overlay shall provide a weatherproof and UV-resistant seal for label.

2.5 MISCELLANEOUS IDENTIFICATION PRODUCTS

A. Floor Marking Tape: 2-inch wide, 5-mil pressure-sensitive vinyl tape, with black and white stripes and clear vinyl overlay.

B. Paint: Comply with requirements in Division 09 painting Sections for paint materials and application requirements. Select paint system suitable for surface material and location (exterior or interior).

C. Fasteners for Labels and Signs:
1. Self-tapping, stainless-steel screws, or stainless-steel machine screws with nuts and flat and lock washers.
2. Pop-Rivets.
3. Two-Part Epoxy Adhesive

D. Cable Ties: Self-extinguishing, one-piece, self-locking, UV-stabilized or plenum rated where required by installed environmental conditions. 3/16-inch minimum width.

PART 3 - EXECUTION

3.1 GENERAL REQUIREMENTS

A. Verify the identity of each item before installing identification products.

B. Before installation of labels, clean all surfaces using materials and methods recommended by manufacturer of identification device.

C. Install signs with approved legend to facilitate proper identification, operation, and maintenance of electrical systems and connected items.

D. Install identification materials and devices at locations for most convenient viewing without interference with operation and maintenance of equipment.

E. Install all labels in a neat manner, plumb and parallel to equipment lines.

F. Attach plastic signs and labels to equipment with mechanical fasteners appropriate to the location and substrate. Where screws cannot or should not penetrate substrate use two-part epoxy adhesive listed for use with intended substrate and environmental conditions.

G. Handwritten, non-permanent, or stenciled labels are not permitted unless noted otherwise.

H. For surfaces that require finish work, apply identification devices to surfaces after completing finish work.

I. Identification shall consist of all UPPER-CASE LETTERS.

J. Elevated Components: Increase sizes of labels, signs, and letters to those appropriate for viewing from the floor.

3.2 EQUIPMENT IDENTIFICATION

A. Provide all new and modified equipment with a nameplate consisting of 1/2" letters for equipment designation and 1/4" letters for voltage, source, and feeder information. This includes but is not limited to panelboards, switchboards, switchgear, disconnect switches, transformers, power transfer equipment, generators, motor starters, variable frequency drives, lighting control panels, contactors, cabinets, push button stations, and auxiliary system control panels.

B. Distribution equipment labels shall indicate the following:
   1. Equipment designation.
   2. Voltage system.
   3. Equipment ampacity.
   4. Source equipment designation and location.
   5. Feeder size.

C. Transformer labels shall indicate the following:
   1. Equipment designation.
   2. Primary voltage system and primary feeder ampacity.
   3. Source equipment designation and location.
   4. Primary feeder size.
   5. Secondary voltage system and load equipment designation

D. Equipment disconnect labels shall indicate the following:
   1. Equipment designation.
   2. Voltage system and feeder ampacity
   3. Source equipment designation and location.

E. Locate equipment nameplates at center of top of trim for panelboards, switchboards, switchgear, and centered at side for branch circuit switches.

F. Where equipment is provided with a factory installed disconnecting means or motor controller, install label on factory provided unit.

G. For equipment with multiple power sources, such as transfer switches and control panels, identify each source and its function.

H. Color Legend
   1. Normal Power Systems: Black field with white letters
   2. Emergency Power Systems (As defined by NEC Article 700): Red field with white letters.
   3. Emergency Power Systems (As defined by NEC Article 702): Orange field with white letters.

I. Where electrical distribution equipment, including panelboards, switchboards and switchgear, are connected to an emergency source, the nameplate shall incorporate the word "EMERGENCY" into the legend. Refer to drawings for further details.

J. Where the premise wiring system has feeders and/or branch circuits supplied from more than one nominal voltage system, provide sign at each switchgear, switchboard, and panelboard displaying color coded identification method for each ungrounded, grounded, and equipment grounding conductor.

K. Service Equipment and Building Feeder, Branch Circuit Disconnects.
   1. Provide label for service disconnecting means to permanently identify it as the “SERVICE DISCONNECT”.
   2. Where a building or structure has any combination of feeders, branch circuits, or services passing through it or supplying it, provide a permanent sign at each disconnect location identifying all other feeders, branch circuits, or services and the area served by each.

3.3 IDENTIFICATION OF CONDUCTORS

A. Service, Feeder, and Branch-Circuit Conductors: Refer to Section 260519, “Low Voltage Electrical Power Conductors and Cables” for conductor and cable color coding requirements.

B. Indicate source and circuit number of conductors to be extended in the future.

C. Auxiliary Systems Alarm, Signal, and Control Wire Identification: At termination points, identify each conductor by its system, designation, and function.

3.4 IDENTIFICATION OF RACEWAYS AND BOXES

A. Identify all junction, outlet, device, and pull boxes with wiring system, voltage, and circuit designations of conductors.
   1. In concealed locations above accessible ceilings and in exposed unfinished areas such as data, mechanical, or electrical rooms, provide designations on outside of box covers.
   2. For exposed boxes in finished areas, provide designations on inside of box covers.
   3. System Legend shall be as follows:
      a. Power
      b. Emergency
      c. UPS

B. The inside of all junction and backboxes shall be marked with panel and circuit number in permanent marker.

C. All empty conduit runs and conduit with conductors for future use shall be identified for use and shall indicate where they terminate.

3.5 IDENTIFICATION OF WIRING DEVICES

A. All new and existing receptacle cover plates in the area of work shall be marked with their panel and circuit number(s) with clear, machine printed adhesive labels with black lettering.

3.6 CIRCUIT DIRECTORIES

A. For Distribution Panelboards, Motor Control Centers, Switchboards, and Switchgear provide nameplates at each switch or circuit breaker to indicate load designation.

B. Provide clearly legible typewritten directories in each electrical panel indicating the area, item of equipment, etc. controlled by each switch, breaker, fuse, etc. Insert directories into plastic cardholders on the back of the door in each panel. Provide descriptions to identify each circuit as to its clear, evident, and specific purpose or use. The identification shall include an approved degree of detail that allows each circuit to be distinguished from all others. Spaces and Spare positions shall be described accordingly.
   1. At a minimum, provide the following panel information for each panel directory:
      a. Panel name
      b. Panel bus rating
      c. Voltage System
      d. Mains Configuration and Rating
      e. Short Circuit Current Rating
   2. Circuit Designation Examples:
      a. LIGHTS, ROOM 100
      b. FLOOR RECEPTACLES, ROOM 200
      c. ERV-1 RECEPTACLE, ROOF

C. Panel Schedules and circuit numbers on Record Drawings shall match.

3.7 SAFETY SIGNS

A. Install Warning, Caution, and Danger signs in accordance with NFPA 70 and OSHA requirements to ensure safe operation of electrical equipment and the items to which they connect.

B. Comply with 29 CFR 1910.145 and ANSI Z535.4.

C. Apply to exterior of door, cover, or other access point.

D. Labels and signs shall include, but are not limited to, the following legends:
   1. Identify system voltage with black letters on an orange background.
   2. Multiple Power Source Warning: "DANGER - ELECTRICAL SHOCK HAZARD - EQUIPMENT HAS MULTIPLE POWER SOURCES."
   3. Workspace Clearance Warning: "WARNING - OSHA REGULATION - AREA IN FRONT OF ELECTRICAL EQUIPMENT MUST BE KEPT CLEAR FOR 36 INCHES"
   4. Where series combination ratings are allowed: "CAUTION - SERIES COMBINATION SYSTEM RATED ____ AMPERES. IDENTIFIED REPLACEMENT COMPONENTS REQUIRED."

3.8 INSTRUCTION SIGNS

A. Operating Instruction Signs: Install instruction signs with minimum 3/8-inch letters to facilitate proper operation and maintenance of electrical systems and items to which they connect. Install instruction signs with approved legend where instructions are needed for system or equipment operation, power transfer, and load shedding.

3.9 WORKSPACE INDICATION

A. Install floor marking tape to show working clearances in the direction of access to live parts. Workspace shall be as required by NFPA 70 and 29 CFR 1926.403 unless otherwise indicated. Do not install flush-mounted panelboards and similar equipment in finished spaces.

3.10 IDENTIFICATION FOR EQUIPMENT AND RACEWAYS RATED MORE THAN 600V

A. Provide warning signs for the enclosures of electrical equipment including pad-mounted transformers, pad-mounted switches, and switchgear having a nominal rating exceeding 600 volts.
   1. When the enclosure integrity of such equipment is specified to be in accordance with IEEE C57.12.28 or IEEE C57.12.29, such as for pad-mounted transformers, provide self-adhesive warning signs on the outside of the high voltage compartment door(s). Sign shall have nominal dimensions of 7 by 10 inches with the legend "DANGER HIGH VOLTAGE" printed in two lines of nominal 2-inch-high letters. The word "DANGER" shall be in white letters on a red background and the words "HIGH VOLTAGE" shall be in black letters on a white background.
   2. When such equipment is guarded by a fence, mount signs on the fence. Provide metal signs having nominal dimensions of 14 by 10 inches with the legend "DANGER HIGH

VOLTAGE KEEP OUT" printed in three lines of nominal 3-inch-high white letters on a red and black field.

B. Concealed Raceways, Duct Banks, More Than 600 V, within Buildings: Tape and stencil 4-inch-wide black stripes on 10-inch centers over orange background that extends full length of raceway or duct and is 12 inches wide. Stencil legend "DANGER CONCEALED HIGH VOLTAGE WIRING" with 3-inch-high black letters on 20-inch centers. Stop stripes at legends. Apply to the following finished surfaces:
   1. Floor surface directly above conduits running beneath and within 12 inches of a floor that is in contact with earth or is framed above unexcavated space.
   2. Wall surfaces directly external to raceways concealed within wall.
   3. Accessible surfaces of concrete envelope around raceways in vertical shafts, exposed in the building, or concealed above suspended ceilings.

C. Accessible Raceways, More Than 600 V: Self-adhesive vinyl labels. Install labels at 10-foot maximum intervals.

END OF SECTION

SECTION 260573 - POWER SYSTEM STUDIES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. Section includes the following computer-based studies:
   1. Fault-current study to determine the minimum interrupting capacity of circuit protective devices.
   2. Overcurrent protective device coordination studies to determine overcurrent protective devices and to determine overcurrent protective device settings for selective tripping.
   3. Arc-flash study to determine the arc-flash hazard distance and the incident energy to which personnel could be exposed during work on or near electrical equipment.

B. Related Requirements
   1. Refer to Section 260553, “Identification for Electrical Systems” for label material and performance requirements.

1.3 REFERENCES

A. Abbreviations
   1. SCCR: Short-circuit current rating.

B. Definitions
   1. Emergency Electrical Systems: Those systems are legally required and classed as emergency by NFPA 70 Article 700, municipal, state, other codes, or by any government agency having jurisdiction.
   2. Existing to Remain: Existing items of construction that are not to be removed and that are not otherwise indicated to be removed and salvaged, or removed and reinstalled. Existing items shall remain functional throughout the construction period.
   3. One-Line Diagram: A diagram that shows, by means of single lines and graphic symbols, the course of an electric circuit or system of circuits and the component devices or parts used therein.
   4. Power System Analysis Software Developer: An entity that commercially develops, maintains, and distributes computer software used for power system studies.
   5. Power Systems Analysis Specialist: Professional engineer in charge of performing the study and documenting recommendations, licensed in the State of Connecticut.
   6. Protective Device: A device that senses when an abnormal current flow exists and then removes the affected portion of the circuit from the system.

7. Service: The conductors and equipment for delivering electric energy from the serving utility to the wiring system of the premises served.
8. Single-Line Diagram: See "Normal Power Single Line Diagram, Contract Drawing E4.01" and “Emergency Power Single Line Diagram, Contract Drawing E4.02.”

C. Reference Standards: The following publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest version as of the date of the Contract Documents, unless otherwise specified.
1. Institute of Electrical and Electronics Engineers (IEEE)
   a. IEEE 141 - Recommended Practice for Electric Power Distribution and Coordination of Industrial and Commercial Power Systems
   b. IEEE 241 - Recommended Practice for Electric Power Systems in Commercial Buildings
   c. IEEE 242 - Recommended Practice for Protection and Coordination of Industrial and Commercial Power Systems
   d. IEEE 399 - Recommended Practice for Industrial and Commercial Power System Analysis
   e. IEEE 551 - Recommended Practice for Calculating AC Short-Circuit Currents in Industrial and Commercial Power Systems
   f. IEEE 1015 - Recommended Practice for Applying Low-Voltage Circuit Breakers Used in Industrial and Commercial Power Systems
   g. IEEE 1584 - Guide for Performing Arc-Flash Hazard Calculations
   h. IEEE 3002.3 - IEEE Recommended Practice for Conducting Short-Circuit Studies and Analysis of Industrial and Commercial Power Systems
2. American National Standards Institute (ANSI)
   a. ANSI C57.12.00 - Standard General Requirements for Liquid-Immersed Distribution, Power, and Regulating Transformers
   b. ANSI C37.13 - Standard for Low Voltage AC Power Circuit Breakers Used in Enclosures
   c. ANSI C37.010 - Standard Application Guide for AC High Voltage Circuit Breakers Rated on a Symmetrical Current Basis
   d. ANSI C 37.41 - Standard Design Tests for High Voltage Fuses, Distribution Enclosed Single-Pole Air Switches, Fuse Disconnecting Switches and Accessories
3. The National Fire Protection Association (NFPA)
   a. NFPA 70E - Standard for Electrical Safety in the Workplace

1.4 SEQUENCING

A. The short-circuit and protective device coordination studies shall be submitted for review prior to receiving final approval of the distribution equipment shop drawings and/or prior to release of equipment drawings for manufacturing.

B. If formal completion of studies will cause delay in equipment manufacturing, obtain approval from Architect for preliminary submittal of sufficient study data to ensure that selection of devices and associated characteristics is satisfactory.

1.5 QUALITY AsSURANCE

A. Study shall be performed using commercially developed and distributed software designed specifically for power system analysis.

B. Software algorithms shall comply with the requirements of standards and guides specified in this Section.

C. Manual calculations are not acceptable.

D. Power Systems Analysis Specialist Qualifications: Professional engineer licensed in the State of Connecticut and skilled in performing and interpreting the power system studies. All elements of the study shall be performed under the direct supervision and control of this professional engineer.
   1. Engineer shall be a full-time employee of the electrical equipment manufacturer.
   2. The engineer shall have a minimum of five (5) years' experience performing power system studies.

E. Power System Study Certification: Report shall be signed and sealed by Power Systems Analysis Specialist.

F. Field Adjusting Personnel Qualifications:
   1. The technician shall be a full-time employee of the electrical equipment manufacturer.
   2. The technician responsible for all field adjusting of the Work shall have a minimum NICET Electrical Power Testing Level III certification or equivalent.

PART 2 - PRODUCTS

2.1 POWER SYSTEM ANALYSIS SOFTWARE

A. Perform studies using the latest version of one of the following:
   1. Power Tools for Windows by SKM Systems Analysts.
   2. ETAP by Operation Technology, Inc.
   3. EasyPower by Easypower, LLC

B. Comply with IEEE 242, IEEE 399, IEEE 551, IEEE 1584, IEEE 3002.3, and NFPA 70E.

C. Analytical features of power systems analysis software program shall have capability to calculate "mandatory," "very desirable," and "desirable" features as listed in IEEE 399.

D. The computer software program shall be capable of plotting and diagramming time-current-characteristic curves as part of its output. The computer software program shall report device settings and ratings of all overcurrent protective devices and shall demonstrate selective coordination by computer-generated, time-current coordination plots.

2.2 POWER SYSTEM STUDY REPORT CONTENTS

A. Executive summary of study findings.

B. Study descriptions, purpose, basis, and scope. Include case descriptions, definition of terms, and guide for interpretation of results.

C. One-line diagram of modeled power system, showing the following:
   1. Protective device designations and ampere ratings.
   2. Conductor types, sizes, and lengths.
   3. Transformer kilovolt ampere (kVA) and voltage ratings.
   4. Motor and generator designations and kVA ratings.
   5. Switchgear, switchboard, motor-control center, and panelboard designations and ratings.
   6. Derating factors and environmental conditions.
   7. Any revisions to electrical equipment required by the study.

D. Study Input Data
   1. Available Power source data.
   2. Manufacturer, model, and interrupting rating of protective devices.
   3. Conductors.
   4. Transformer data.

E. Comments and recommendations for system improvements or revisions in a written document, separate from one-line diagram.

F. Protective Device Evaluation:
   1. Evaluate equipment and protective devices and compare to available short-circuit currents. Verify that equipment SCCR ratings exceed available short-circuit current at equipment installation locations.
   2. Tabulations of circuit breaker, fuse, and other protective device ratings versus calculated short-circuit duties.
   3. For 600-V overcurrent protective devices, ensure that interrupting ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.
   4. For devices and equipment rated for asymmetrical fault current, apply multiplication factors listed in standards to 1/2-cycle symmetrical fault current.
   5. Verify adequacy of phase conductors at maximum three-phase bolted fault currents; verify adequacy of equipment grounding conductors and grounding electrode conductors at maximum ground-fault currents. Ensure that SCCR ratings are equal to or higher than calculated 1/2-cycle symmetrical fault current.

G. Short-Circuit Study Output Reports:
   1. Low-Voltage Fault Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
      a. Voltage.
      b. Calculated fault-current magnitude and angle.
      c. Fault-point X/R ratio.
      d. Equivalent impedance.
   2. Momentary Duty Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
   3.
      a. Voltage.
      b. Calculated symmetrical fault-current magnitude and angle.
      c. Fault-point X/R ratio.
      d. Calculated asymmetrical fault currents:

1) Based on fault-point X/R ratio.
2) Based on calculated symmetrical value multiplied by 1.6.
3) Based on calculated symmetrical value multiplied by 2.7.

4. Interrupting Duty Report: Three-phase and unbalanced fault calculations, showing the following for each overcurrent device location:
   a. Voltage.
   b. Calculated symmetrical fault-current magnitude and angle.
   c. Fault-point X/R ratio.
   d. No AC Decrement (NACD) ratio.
   e. Equivalent impedance.
   f. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a symmetrical basis.
   g. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a total basis.

H. Protective Device Coordination Study:
   1. Report recommended settings of protective devices, ready to be applied in the field. Use manufacturer's data sheets for recording the recommended setting of overcurrent protective devices when available.
      a. Phase and Ground Relays:
         1) Device tag.
         2) Relay current transformer ratio and tap, time dial, and instantaneous pickup value.
         3) Recommendations on improved relaying systems, if applicable.
      b. Circuit Breakers:
         1) Adjustable pickups and time delays (long time, short time, and ground).
         2) Adjustable time-current characteristic.
         3) Adjustable instantaneous pickup.
         4) Recommendations on improved trip systems, if applicable.
   2. Fuses: Show current rating, voltage, and class.

I. Time-Current Coordination Curves: Determine settings of overcurrent protective devices to achieve selective coordination. Graphically illustrate that adequate time separation exists between devices installed in series, including power utility company's upstream devices. Prepare separate sets of curves for the switching schemes and for emergency periods where the power source is local generation. Show the following information:
   1. Device tag and title, one-line diagram with legend identifying the portion of the system covered.
   2. Terminate device characteristic curves at a point reflecting maximum symmetrical or asymmetrical fault current to which the device is exposed.
   3. Identify the device associated with each curve by manufacturer type, function, and, if applicable, tap, time delay, and instantaneous settings recommended.
   4. Plot the following listed characteristic curves, as applicable:
      a. Power utility's overcurrent protective device.
      b. Medium-voltage equipment overcurrent relays.
      c. Medium- and low-voltage fuses include manufacturer's minimum melt, total clearing, tolerance, and damage bands.
      d. Low-voltage equipment circuit-breaker trip devices, including manufacturer's tolerance bands.
      e. Transformer full-load current, magnetizing inrush current, and ANSI through-fault protection curves.

f. Cables and conductors damage curves.
g. Ground-fault protective devices.
h. Motor-starting characteristics and motor damage points.
i. Generator short-circuit decrement curve and generator damage point.
j. The largest feeder circuit breaker in each motor-control center and panelboard.

5. Maintain selectivity for tripping currents caused by overloads.
6. Maintain maximum achievable selectivity for tripping currents caused by overloads on series-rated devices.
7. Provide adequate time margins between device characteristics such that selective operation is achieved.
8. Comments and recommendations for system improvements.

J. Arc-Flash Study Output Reports:
1. Interrupting Duty Report: Three-phase and unbalanced fault calculations, showing the following for each equipment location included in the report:
a. Voltage.
b. Calculated symmetrical fault-current magnitude and angle.
c. Fault-point X/R ratio.
d. No AC Decrement (NACD) ratio.
e. Equivalent impedance.
f. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a symmetrical basis.
g. Multiplying factors for 2-, 3-, 5-, and 8-cycle circuit breakers rated on a total basis.

K. Incident Energy and Flash Protection Boundary Calculations:
1. Arcing fault magnitude.
2. Protective device clearing time.
3. Duration of arc.
4. Arc-flash boundary.
5. Restricted approach boundary.
6. Limited approach boundary.
7. Working distance.
8. Incident energy.
9. Hazard risk category.
10. Recommendations for arc-flash energy reduction.

2.3 ARC-FLASH WARNING AND AVAILABLE FAULT CURRENT LABELS

A. Comply with requirements in Section 260553 "Identification for Electrical Systems" for self-adhesive equipment labels. Produce a 3.5-by-5-inch self-adhesive equipment label for each location indicated in the analysis unless noted otherwise.

B. Arc Flash Warning Labels shall have an orange header with the wording, "WARNING, ARC-FLASH HAZARD," and shall include all information required by NFPA 70E and the following information taken directly from the arc-flash hazard analysis:
1. Location designation.
2. Engineering report number, revision number, and issue date.

C. Available Fault Current Labels shall have an orange header with the wording, “WARNING”, and shall include the following information taken directly from the short circuit study.
   1. Location designation.
   2. Maximum available fault current.
   3. Calculation date.
   4. Engineering report number, revision number, and issue date.

D. Labels should be machine printed, with no field-applied markings.

PART 3 - EXECUTION

3.1 POWER SYSTEM DATA

A. Obtain all data necessary for conducting the study.
   1. Verify completeness of data supplied on one-line diagram. Call any discrepancies to Engineer's attention.
   2. For equipment included as Work of this Project, use characteristics submitted under provisions of action submittals and information submittals for this Project.
   3. For relocated equipment and that which is existing to remain, obtain required electrical distribution system data by field investigation and surveys, conducted by qualified technicians and engineers. Qualifications of technicians and engineers shall be as defined by NFPA 70E.

B. Electrical Survey Data: Gather and tabulate the required input data to support the short-circuit study. Comply with requirements in Section 017839 "Project Record Documents" for recording circuit protective device characteristics. Record data on a Record Document copy of one-line diagram. Comply with recommendations in IEEE 551 as to the amount of detail that is required to be acquired in the field. Field data gathering shall be under direct supervision and control of the engineer in charge of performing the study. Data includes, but is not limited to, the following:
   1. Product Data for Project's overcurrent protective devices involved in overcurrent protective device coordination studies. Use equipment designation tags that are consistent with electrical distribution system diagrams, overcurrent protective device submittals, input and output data, and recommended device settings.
   2. Electrical power utility impedance and available short circuit current at the service.
   3. Power sources and ties.
   4. Short-circuit current at each system bus (three phase and line to ground).
   5. Full-load current of all loads.
   6. Voltage level at each bus.
   7. For transformers, include kVA, primary and secondary voltages, connection type, impedance, X/R ratio, taps measured in percent, and phase shift.
   8. For reactors, provide manufacturer and model designation, voltage rating, and impedance.
   9. For circuit breakers and fuses, provide manufacturer and model designation. List type of breaker, type of trip, SCCR, current rating, and breaker settings.
   10. Generator short-circuit current contribution data, including short-circuit reactance, rated kVA, rated voltage, and X/R ratio.
   11. For relays, provide manufacturer and model designation, current transformer ratios, potential transformer ratios, and relay settings.

12. Busway manufacturer and model designation, current rating, impedance, lengths, and conductor material.
13. Motor horsepower and NEMA MG 1 code letter designation.
14. Conductor sizes, lengths, number, conductor material and conduit material (magnetic or nonmagnetic).
15. Derating factors.
16. Data sheets to supplement electrical distribution system one-line diagram, cross-referenced with tag numbers on diagram, showing the following:
    a. Special load considerations, including starting inrush currents and frequent starting and stopping.
    b. Transformer characteristics, including primary protective device, magnetic inrush current, and overload capability.
    c. Motor full-load current, locked rotor current, service factor, starting time, type of start, and thermal-damage curve.
    d. Generator thermal-damage curve.
    e. Ratings, types, and settings of utility company's overcurrent protective devices.
    f. Special overcurrent protective device settings or types stipulated by utility company.
    g. Time-current-characteristic curves of devices indicated to be coordinated.
    h. Manufacturer, frame size, interrupting rating in amperes root mean square (rms) symmetrical, ampere or current sensor rating, long-time adjustment range, short-time adjustment range, and instantaneous adjustment range for circuit breakers.
    i. Manufacturer and type, ampere-tap adjustment range, time-delay adjustment range, instantaneous attachment adjustment range, and current transformer ratio for overcurrent relays.
    j. Switchgear, switchboards, motor-control centers, and panelboards ampacity, and SCCR in amperes rms symmetrical.
    k. Identify series-rated interrupting devices for a condition where the available fault current is greater than the interrupting rating of downstream equipment. Obtain device data details to allow verification that series application of these devices complies with NFPA 70 and UL 489 requirements.

3.2 POWER SYSTEMS STUDY

A. Perform study following the general study procedures contained in IEEE 399.

B. Base study on device characteristics supplied by device manufacturer.

C. Gather all necessary data from the existing facility as needed to perform the study.

D. The Contractor shall be responsible for modifying settings on existing equipment only at over-current protection devices upstream of new equipment unless noted otherwise.

E. The scope of the studies shall include all new distribution equipment and devices indicated on Drawings as well as all directly affected existing distribution equipment and devices at the customer facility. Begin analysis at the distribution system utility service, extending down to system overcurrent protective devices.

F. Study electrical distribution system from normal and alternate power sources throughout electrical distribution system for Project. Study all cases of system-switching configurations and alternate operations that could result in maximum fault conditions.

G. Include the ac fault-current decay from induction motors, synchronous motors, and asynchronous generators and apply to low- and medium-voltage, three-phase ac systems. Also account for the fault-current dc decrement to address asymmetrical requirements of interrupting equipment.

H. Identify in the report any protective device applied outside its capacity.

I. Short Circuit Study
   1. Calculate short-circuit currents according to IEEE 551.
   2. Calculate short-circuit momentary and interrupting duties for a three-phase bolted fault and a single line-to-ground fault at each equipment indicated on one-line diagram.
      a. For grounded systems, provide a bolted line-to-ground fault-current study for areas as defined for the three-phase bolted fault short-circuit study.
   3. Evaluate equipment and protective devices and compare short-circuit ratings.

J. Coordination Study
   1. Comply with IEEE 242 for calculating short-circuit currents and determining coordination time intervals.
   2. Transformer Primary Overcurrent Protective Devices:
      a. Device shall not operate in response to the following:
         1) Inrush current when first energized.
         2) Self-cooled, full-load current or forced-air-cooled, full-load current, whichever is specified for that transformer.
         3) Permissible transformer overloads according to IEEE C57.96 if required by unusual loading or emergency conditions.
      b. Device settings shall protect transformers according to IEEE C57.12.00, for fault currents.
   3. Motor Protection:
      a. Select protection for low-voltage motors according to IEEE 242 and NFPA 70.
      b. Select protection for motors served at voltages more than 600 V according to IEEE 620.
   4. Conductor Protection: Protect cables against damage from fault currents according to ICEA P-32-382, ICEA P-45-482, and protection recommendations in IEEE 242. Demonstrate that equipment withstands the maximum short-circuit current for a time equivalent to the tripping time of the primary relay protection or total clearing time of the fuse. To determine temperatures that damage insulation, use curves from cable manufacturers or from listed standards indicating conductor size and short-circuit current.
   5. Generator Protection: Select protection according to manufacturer's written instructions and to IEEE 242.

K. Arc Flash Hazard Analysis
   1. Comply with NFPA 70E and its Annex D for hazard analysis study.
   2. Preparatory Studies: Perform the Short-Circuit and Protective Device Coordination studies prior to starting the Arc-Flash Hazard Analysis.

3. Calculate maximum and minimum contributions of fault-current size.
    a. Maximum calculation shall assume a maximum contribution from the utility and shall assume motors to be operating under full-load conditions.
    b. Calculate arc-flash energy at 85 percent of maximum short-circuit current according to IEEE 1584 recommendations.
4. Calculate the arc-flash protection boundary and incident energy at locations in electrical distribution system where personnel could perform work on energized parts.
5. Include medium- and low-voltage equipment locations.
6. Calculate the limited and restricted approach boundaries for each location.
7. Incident energy calculations shall consider the accumulation of energy over time when performing arc-flash calculations on buses with multiple sources. Iterative calculations shall take into account the changing current contributions, as the sources are interrupted or decremented with time. Fault contribution from motors and generators shall be decremented as follows:
    a. Fault contribution from induction motors shall not be considered beyond three to five cycles.
    b. Fault contribution from synchronous motors and generators shall be decayed to match the actual decrement of each as closely as possible (for example, contributions from permanent magnet generators will typically decay from 10 per unit to three per unit after 10 cycles).
8. Arc-flash energy shall generally be reported for the maximum of line or load side of a circuit breaker. However, arc-flash computation shall be performed and reported for both line and load side of a circuit breaker as follows:
    a. When the circuit breaker is in a separate enclosure.
    b. When the line terminals of the circuit breaker are separate from the work location.
9. Base arc-flash calculations on actual overcurrent protective device clearing time. Cap maximum clearing time at two seconds based on IEEE 1584, Section B.1.2.

3.3 LABELING

A. All labels will be based on recommended overcurrent device settings and will be provided to the owner after the results of the analysis have been presented and after any system changes, upgrades, or modifications have been incorporated in the system.

B. Arc Flash Labeling:
1. Provide and install an arc-flash label for each piece of electrical equipment listed below and each piece of equipment that is likely to require examination, adjustment, servicing, or maintenance while energized:
    a. Motor-control centers.
    b. Switchboards.
    c. Meter Enclosures.
    d. Medium voltage and low voltage transformers
    e. Panelboards.
    f. Equipment Control panels.
    g. Motor Controllers.
    h. Disconnect Switches.
    i. Generator
    j. Automatic Transfer Switches

2. Apply arc-flash label on the front cover of each section of the equipment and on side or rear covers with accessible live parts and hinged doors or removable plates for each equipment included in the study. Base arc-flash label data on highest values calculated at each location.

C. Available Fault Current Labeling
1. Provide and install an available fault current label for each piece of electrical equipment listed below:
a. Service equipment.
b. Elevator Control Panel.

D. Install warning labels under the direction of the Power System Analysis Specialist.

3.4 FIELD ADJUSTING

A. Adjust relay and protective device settings according to recommended settings provided by the coordination study. Field adjustments shall be completed by a qualified technician from the engineering service division of the equipment manufacturer.

B. Make modifications to equipment as required to accomplish compliance with short-circuit and protective device coordination studies.

C. Notify Architect and Engineer in writing of any required major modifications.

D. Equipment shall not be energized until all breakers or protective relays are set either to the recommended values indicated by the studies or to minimum trip settings.

E. Certification: Prior to project Substantial Completion, submit four signed copies of a document certifying that the settings and selection scope have been completed as specified.

3.5 DEMONSTRATION

A. Acquaint personnel with the fundamentals of operating the power system in normal and emergency modes.

B. Hand-out and explain the power system study objectives, study descriptions, purpose, basis, and scope. Include case descriptions, definition of terms, and guide for interpreting time-current coordination curves.

C. Arc Flash Training
1. Train Owner's maintenance personnel in potential arc-flash hazards associated with working on energized equipment and the significance of arc-flash warning labels (minimum of 4 hours).
2. The training shall be certified for continuing education units (CEUs) by the International Association for Continuing Education Training (IACET) or equivalent.
3. Include in Project Close-out Documents training notes, outlines, and Power Point presentation of training session. Also include attendance record of personnel attending the training session.

4. Training session shall be videotaped. Include copy of DVD of training session in Project Close-out Documents.

END OF SECTION

SECTION 260900 - ADVANCED METERING DATA ACQUISITION SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 – General Requirements for Electrical Systems apply to this Section.

B. Refer to Electrical Riser for Meter Locations and quantities.

1.2 SYSTEM DESCRIPTION

A. The products specified herein are intended to provide a complete sub-metering solution. This solution shall be utilized to measure and monitor various meters and monitors throughout the building as shown on the drawings or required herein. The system will also allow for compliance with national and local energy codes and provide equipment needed to meet specific energy monitoring objectives. This shall comply with Connecticut State Building Performance Standard (High-Performance Schools) metering requirements.

1.3 SECTION INCLUDES

A. Electrical sub-metering equipment, data collection systems, and data management software systems including:
   1. Multi-point electrical sub-meters, including current transformers
   2. Energy monitoring software

1.4 STANDARDS

A. Provide equipment of this Section in full compliance with the following applicable portions of the latest revisions of the following standards:
   1. ANSI C12.1 & C12.20 at 0.5 Accuracy Class
   2. UL Certified to IEC/EN/UL/CSA 61010-1 2nd Edition.
   3. UL916:
      a. These requirements cover energy management equipment and associated sensing devices rated 600 volts or less and intended for installation in accordance with the National Electrical Code, NFPA 70.
   4. NEMA -ESM-1

1.5 INSTALLATION, OPERATION, AND MAINTENANCE MANUALS

A. Submit installation, operation, and maintenance manuals for the electrical sub-metering components.

1.6 TECHNICAL PERFORMANCE

A. The minimum measured technical performance of each piece of installed equipment shall meet the specifications published by the manufacturer.
   1. Optimize technical performance of all systems to produce the highest achievable technical performance to the satisfaction of consultant and/or client.

B. Any deficiencies in the system, particularly information communication errors or operational deficiencies, shall be cause for rejection. All CT readings shall be field verified in the presence of the engineer. Contractor shall connect CTs to meters and program all CTs correctly to show in the graphical user interface.

1.7 WARRANTY

A. All electrical sub-meters included in this specification to be free from defects in materials and workmanship from the date of substantial completion for a period of 5 Years.
   1. All data collection system components included in this specification to be free from defects in materials and workmanship from the date of substantial completion for a period of 5 Years.

PART 2 - PRODUCTS

2.1 ACCEPTABLE MANUFACTURERS

A. Basis of Design: eGauge Pro System
   1. Substitutions:
   2. Provide Manufacturer's reference list.
   3. Clearly delineate all propose substitutions as such and submit in writing for approval by the engineer a minimum of 10 working days prior to the bid date
   4. Prior to rough-in, provide complete engineered shop drawings, including power wiring, with deviations for the original design highlighted in an alternate color, to the engineer for review and approval.
   5. By using pre-approved substitutions, the contractor accepts responsibility and associated costs for all required modifications to circuitry, devices, and wiring.

2.2 METERS AND CURRENT TRANSFORMERS

A. Multipoint metering devices: eGauge Pro Model EG4030

B. Solid core, Split core, and Rogowski coil current transformers with full scale output 0.333v

2.3 SYSTEM DESCRIPTION – SINGLE POINT METERING DEVICES

A. Provide single point metering devices capable of metering 1PH/2W, 2PH/3W, 3PH/3W, and/or 3PH/4W loads.

1. Meters must be capable of directly metering North American 120/208/V and 277/480V.
2. Metering units must be capable of metering loads between 20A and 2500A. Provide meters specific to each load as indicated on construction drawings.
3. Must meet all ISO 9001 standards for quality control where all meter's test to a minimum of +/- 0.2% or 0.5% accuracy, dependent on stated accuracy class.

B. The system shall be as described below:

2.4

1. To consist of electronic meters with embedded communications capability, and solid core, split core, or Rogowski coil current transformer technology. The current transformers shall have a full-scale output of.333v and secondary voltage clamps for safety purposes.
2. Meters to be used for Energy Monitoring applications
3. The meters will be capable of remote communication from each metering device.
4. Advanced meters shall transmit data via one of the following communication protocols:
   a. BACnet/IP
   b. BACnet MS/TP
5. Failure of the building electrical normal power system shall not result in loss of data and will not require manual restarting of the metering system
6. The electronic energy monitoring system shall be fully automated microprocessor-based electrical energy measurement system for Measurement and Verification purposes. The system shall incorporate complete metering, communications, reporting functions, energy monitoring and threshold limit capabilities.

2.5 SYSTEM DESCRIPTION – MULITPOINT METERING DEVICES

A. The system shall be as described below:
   1. To consist of electronic multiple point meters with embedded communications capability, and solid core or split core current transformer technology. The current transformers shall have a full-scale output of.333v A/C outputs and secondary voltage clamps for safety purposes.
   2. Meters to be used for Energy Monitoring applications
   3. Meters shall be capable of external mounting in a NEMA 1 enclosure or internal mounting in electrical panels or switchgear.
   4. The meters will be capable of remote communication from each metering device. Each device shall have IP sockets and RS-485 terminals to accommodate data transmission via BACNet MS/TP, BACNet IP and standard Ethernet. Data shall be transmitted by one or a combination of the following:
      a. Standard Ethernet interface
      b. Ethernet connection to PC or laptop via crossover cable.
      c. RS-485 Network-Modbus BACNet MS/TP
   5. Systems to have backup storage power to key components so no data is lost during power outages. The system shall continue to function after resumption of power.
   6. Failure of the building electrical normal power system shall not result in loss of data and will not require manual restarting of the metering system.

B. Meters shall have 30 sensor ports for inputs of up to (10) 3-phase loads.

2.6 SYSTEM MEASUREMENTS – MULITPOINT METERING DEVICES

A. Meters to connect to a web-based interface to measure the following loads.
   1. Energy Parameters:
   2. kWh real energy consumption
   3. kW instantaneous power
   4. kVAh apparent consumption
   5. kVA apparent power
   6. kVARh reactive consumption
   7. kVAR reactive power
   8. Phase Diagnostics: Parameters to be displayed for each individual phase of each metered load:
   9. Voltage Phase to neutral or phase to phase
   10. Amps Instantaneous amperage for each phase
   11. kW Instantaneous power
   12. PF Power factor
   13. PA Phase angle
   14. kVA Instantaneous apparent energy

PART 3 - EXECUTION

3.1 WIRING AND CONNECTIONS

A. All wiring must meet and or exceed local electrical code.
   1. Install all wiring in conduit.
   2. Provide an Ethernet drop for each meter location.
   3. Perform all necessary system calibration, testing, commissioning, and demonstrations as required. Utilize attached form to submit testing/calibration information. Verification shall be performed with the Engineer present.

B. Prepare and submit record drawings and installation, operation and maintenance manuals for the energy metering system as required.

3.2 TESTING AND COMMIISSIONING (ECO)

A. Perform final testing, adjustment, and commissioning of the systems, report results to the Architect/Engineer, and include the results in the installation, operation, and maintenance manuals. Provide qualified technicians for testing and commissioning.
   1. Perform sufficient technical and operational tests to ensure the technical performance of the system meets the intent of the Contract Documents. Typical testing to include but not be limited to:
   2. Verification of meter readings and proper installation of meter equipment (utilize attached form for recording system verification) shall be in the presence of the project engineer.
   3. Communication system connectivity
   4. Verify communications and delta transfer to BAS / EMS.

3.3 PROVIDE FUNCTIONAL TESTING INCLUDING END TO END VERIFICATION THAT ALL METERS ARE OPERATING PROPERLY.

A. Demonstrate the operation of the system to the Owner at a time suitable to them.

3.4 FIELD VERIFICATION, ACCEPTANCE, AND TRAINING

A. Provide all “AS BUILT” DRAWINGS and data showing each meter, serial number, IP address, MAC address, cross reference, load and CT ratio prior to field verification.
   1. The manufacturer’s representative shall verify, adjust and test the system. Verification of the energy monitoring system is to be carried out with the assistance of an electrical contractor at all times and in the presence of the project engineer. Upon completion, the manufacturer shall issue a “Commissioning Report” to the owner, electrical consultant, contractor and client.
   2. Manufacturer’s representative shall demonstrate operation of the system as follows:
   3. Meter readings
   4. Phase diagnostics
   5. Provide manual of the installed system
   6. Ensure the system is connected to the cloud as required to communicate with software servers.

B. Include (8) hours of training time for the Owner.

3.5 FIELD QUALITY CONTROL

A. Submit a detailed testing and commissioning procedure to the Consultant and Client for review and approval prior to undertaking this Work. The procedure shall indicate all test equipment required and acceptance criteria.
   1. Upon completion of all testing and commissioning, submit a copy of the test results and certify the system as acceptable for revenue metering purposes.
   2. Undertake the testing and commissioning Work with the manufacturer's factory representative(s) and project engineer.

END OF SECTION

SECTION 260923 - LIGHTING CONTROL DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. Section Includes:
1. Photoelectric switches.
2. Standalone daylight-harvesting switching and dimming controls.
3. Indoor occupancy and vacancy sensors.
4. Switchbox-mounted occupancy sensors.
5. Emergency shunt relays.

B. Related Requirements:
1. Section 262726 "Wiring Devices" for wall-box dimmers, non-networkable wall-switch occupancy sensors, and manual light switches.
2. Section 265116 “Network Lighting Systems” for device integration with head-end lighting control system.
3. Coordinate with mechanical systems/ATC system. All occupancy/vacancy sensors shall be provided with dual contacts to integrate with HVAC system.

1.3 MAINTENANCE MATERIAL

A. Extra Stock Material: Provide two (2) of each type of sensor, switch, dimmer, power pack, and emergency lighting control device installed. Package with protective covering for storage and identified with labels describing contents.

B. Keys and Special Tools: Provide one extra set for access to locked or tamperproof enclosures.

1.4 COORDINATION

A. Preinstallation Conference: Arrange a pre-installation conference between all applicable subcontractors and architect/engineer prior to the installation of rough ins for the lighting controls.

B. Coordinate layout and installation of ceiling-mounted devices with other construction that penetrates ceilings or is supported by them, including light fixtures, speakers, fire alarm, HVAC equipment, fire-suppression system, and partition assemblies.

C. Coordinate protocol and interface points of lighting control devices with temperature controls (BAS/DDC) specified in Division 23.

D. Product procurement and coordination:

E. Order products according to application.

F. Confirm the proper and complete catalog number with distributor and agent.

G. Provide additional parts and pieces required to complete the installation in the location and manner intended by the design.

H. Confirm voltages.

I. Contractor shall coordinate with Vendors and other trades, in advance of installation work, to define all infrastructure and installation requirements. Contractor shall coordinate all infrastructure requirements with all approved lighting control devices prior to infrastructure installation. This includes, but not limited to, appropriately sized, positioned, and located junction boxes, structural supports, feeds, power conduits, control conduits, and remote code-compliant power-supply enclosures.

1.5 WARRANTY

A. Manufacturer's Warranty: Manufacturer and Installer agree to repair or replace lighting control devices that fail(s) in materials or workmanship within specified warranty period.
   1. Failures include, but are not limited to, the following:
      a. Faulty operation of lighting control software.
      b. Faulty operation of lighting control devices.
   2. Warranty Period: Five years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 TIME SWITCHES

A. Manufacturers: Basis of design shall be Acuity, Inc./nLight. Subject to compliance with requirements, alternates can be provided by:
   1. Lutron, Inc.
   2. Wattstopper, Inc.
   3. Cooper Industries

B. Electronic Time Switches: Solid state, programmable, with alphanumeric display; complying with UL 917.
   1. Listed and labeled as defined in NFPA 70 and marked for intended location and application.
   2. Contact Configuration: SPST.
   3. Contact Rating: 20A, 277V AC.
   4. Programs: Sixteen on-off set points on a 24-hour schedule and an annual holiday schedule that overrides the weekly operation on holidays. Each contact is to be individually programmable.

5. Circuitry: Allow connection of a photoelectric relay as substitute for on-off function of a program.
6. Astronomic Time: All channels.
7. Automatic daylight savings time changeover.
8. Battery Backup: Not less than seven days reserve, to maintain schedules and time clock.

C. Electromechanical-Dial Time Switches: Comply with UL 917.
1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
2. Contact Configuration: SPST.
3. Contact Rating: 20-A ballast load, 120V AC.
4. Circuitry: Allows connection of a photoelectric relay as a substitute for the on-off function of a program.
5. Astronomic time dial.
6. Wound-spring reserve carryover mechanism to keep time during power failures, minimum of [16] hours.

2.2 PHOTOELECTRIC SWITCHES

A. Manufacturers: Basis of design shall be Acuity, Inc./nLight. Subject to compliance with requirements, alternates can be provided by:
1. Lutron, Inc.
2. Wattstopper, Inc.

B. Description: Solid state, one set of NO dry contacts rated for 24 V dc at 1 A or 24 V ac at 1 A, to operate connected load, complying with UL 773, and compatible with luminaire, power pack, and lighting control panelboard.
1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
2. Light-Level Monitoring Range: 1.5 to 10 fc (16.14 to 108 lux), with an adjustment for turn-on and turn-off levels within that range.
3. Time Delay: Fifteen-second minimum, to prevent false operation.
4. Surge Protection: Metal-oxide varistor.
5. Mounting: 1/2-inch (13-mm) threaded male conduit..
6. Failure Mode: Luminaire stays ON.
7. Power Pack: Digital controller capable of accepting four RJ45 inputs with two outputs rated for 20-A LED load at 120- and 277-V ac, for 16-A LED at 120- and 277-V ac, and for 1 hp at 120-V ac. Sensor has 24-V dc, Class 2 power source, as defined by NFPA 70.
a. With integral current monitoring
b. Compatible with digital addressable lighting interface.
c. Plenum rated.

2.3 DAYLIGHT-HARVESTING SWITCHING CONTROLS

A. Manufacturers: Basis of design shall be Acuity, Inc./nLight. Subject to compliance with requirements, alternates can be provided by:
1. Lutron, Inc.
2. Wattstopper, Inc.

B. Description: System operates indoor lighting.

C. Sequence of Operation: As daylight increases, the lights are turned off at a predetermined level. As daylight decreases, the lights are turned on at a predetermined level.
   1. Lighting control set point is based on two lighting conditions:
      a. When no daylight is present.
      b. When significant daylight is present (target level).
      c. System programming is done with two hand-held, remote-control tools.

D. Ceiling-Mounted Switching Controls: Solid-state, light-level sensor unit, with integrated power pack, that detects changes in indoor lighting levels that are perceived by the eye.

E. Electrical Components, Devices, and Accessories:
   1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
   2. Operating Ambient Conditions: Dry interior conditions, 32 to 120 deg F (0 to 49 deg C).
   3. Sensor Output: Contacts rated to operate the associated power pack, complying with UL 773A. Sensor shall be powered by the power pack.
   4. Sensor Output: Digital signal compatible with power pack.
   5. Sensor type: Close loop
   6. Zone: Multi
   7. Power Pack: Digital controller capable of accepting 4 RJ45 inputs with two outputs rated for 20A LED load at 120- and 277-V ac, for 13A ballast or LED at 120- and 277-V ac, and for 1 hp at 120-V ac. Sensor has 24-V dc Class 2 power source, as defined by NFPA 70.
      a. With integral current monitoring
      b. Compatible with digital addressable lighting interface.
      c. Plenum rated.
   8. General Space Sensors Light-Level Monitoring Range: 10 to 200 fc (108 to 2152 lux), with an adjustment for turn-on and turn-off levels within that range.
   9. Atrium Space Sensors Light-Level Monitoring Range: 100 to 1000 fc (1080 to 10 800 lux), with an adjustment for turn-on and turn-off levels within that range.
   10. Skylight Sensors Light-Level Monitoring Range: 1000 to 10,000 fc (10 800 to 108 000 lux), with an adjustment for turn-on and turn-off levels within that range.
   11. Time Delay: Adjustable from 5 to 300 seconds to prevent cycling.
   12. Set-Point Adjustment: Equip with deadband adjustment of 25, 50, and 75 percent above the "on" set point, or provide with separate adjustable "on" and "off" set points.
   13. Test Mode: User selectable, overriding programmed time delay to allow settings check.
   14. Control Load Status: User selectable to confirm that load wiring is correct.
   15. Indicator: Two digital displays to indicate the beginning of on-off cycles.

2.4 DAYLIGHT-HARVESTING DIMMING CONTROLS

A. Manufacturers: Basis of design shall be Acuity, Inc./nLight. Subject to compliance with requirements, alternates can be provided by:
   1. Lutron, Inc.
   2. Wattstopper, Inc.

B. Description: Sensing daylight and electrical lighting levels, the system adjusts the indoor electrical lighting levels. As daylight increases, the lights are dimmed.

1. Lighting control set point is based on two lighting conditions:
   a. When no daylight is present (target level).
   b. When significant daylight is present.
2. System programming is done with two hand-held, remote-control tools.
   a. Initial setup tool.
   b. Tool for occupants to adjust the target levels by increasing the set point up to 25 percent, or by minimizing the electric lighting level.

C. Ceiling-Mounted Dimming Controls: Solid-state, light-level sensor unit, with integrated power pack, to detect changes in indoor lighting levels that are perceived by the eye.

D. Electrical Components, Devices, and Accessories:
1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
2. Sensor Output: 0- to 10-V dc to operate luminaires. Sensor is powered by controller unit.
3. Light-Level Sensor Set-Point Adjustment Range: 20 to 60 fc (120 to 640 lux).

E. Power Pack: Digital controller capable of accepting 4 RJ45 inputs with two outputs rated for 20A incandescent or LED load at 120- and 277-V ac, for 16A ballast load or LED at 120- and 277-V ac, and for 1 hp at 120-V ac. Sensor has 24-V dc Class 2 power source, as defined by NFPA 70.
1. With integral current monitoring
2. Compatible with digital addressable lighting interface.
3. Plenum rated.

2.5 INDOOR OCCUPANCY AND VACANCY SENSORS

A. Manufacturers: Basis of design shall be Acuity, Inc./nLight. Subject to compliance with requirements, alternates can be provided by:
1. Lutron, Inc.
2. Wattstopper, Inc.

B. General Requirements for Sensors:
1. Wall or Ceiling-mounted, solid-state indoor occupancy and vacancy sensors.
2. Dual technology.
3. Integrated power pack.
4. Hardwired connection to switch and BAS and lighting control system.
5. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
6. Operation:
   a. Combination Sensor: Unless otherwise indicated, sensor shall be programmed to turn lights on when coverage area is occupied and turn them off when unoccupied, or to turn off lights that have been manually turned on; with a time delay for turning lights off, adjustable over a minimum range of 1 to 15 minutes.
7. Sensor Output: Sensor is powered from the power pack.
8. Power: Line voltages
9. Power Pack: Dry contacts rated for 20-A LED load at 120- and 277-V ac, and for 1 hp at 120-V ac. Sensor has 24-V dc, 150-mA, Class 2 power source, as defined by NFPA 70.
10. Comaptible with receptacle loads.
11. Mounting:

a. Sensor: Suitable for mounting in any position on a standard outlet box.
b. Relay: Externally mounted through a 1/2-inch (13-mm) knockout in a standard electrical enclosure.
c. Time-Delay and Sensitivity Adjustments: Recessed and concealed behind hinged door.

12. Bypass Switch: Override the "on" function in case of sensor failure.
13. Automatic Light-Level Sensor: Adjustable from 2 to 200 fc (21.5 to 2152 lux); turn lights off when selected lighting level is present.

C. Dual-Technology Type: Wall and Ceiling mounted; detect occupants in coverage area using PIR and ultrasonic detection methods. The particular technology or combination of technologies that control on-off functions is selectable in the field by operating controls on unit.
1. Sensitivity Adjustment: Separate for each sensing technology.
2. Detector Sensitivity: Detect occurrences of 6-inch- (150-mm-) minimum movement of any portion of a human body that presents a target of not less than 36 sq. in. (232 sq. cm), and detect a person of average size and weight moving not less than 12 inches (305 mm) in either a horizontal or a vertical manner at an approximate speed of 12 inches/s (305 mm/s).
3. Detection Coverage (Standard Room): Detect occupancy anywhere within a circular area of 1000 sq. ft. (93 sq. m) when mounted on a 96-inch- (2440-mm-) high ceiling.
4. Detection Coverage (Room, Wall Mounted): Detect occupancy anywhere within a 180-degree pattern centered on the sensor over an area of 3000 square feet (330 square meters) when mounted 48 inches (1200 mm) above finished floor.
5. Detection Coverage (Corridor): Detect occupancy anywhere within 90 feet (27.4 m) when mounted on a 10-foot- (3-m-) high ceiling in a corridor not wider than 14 feet (4.3 m).
6. Detection Coverage (Room, Wall Mounted): Detect occupancy anywhere within a 180-degree pattern centered on the sensor over an area of 2000 square feet (220 square meters) when mounted 84 inches (2100 mm) above finished floor.

2.6 HIGH-BAY OCCUPANCY SENSORS

A. Manufacturers: Basis of design shall be Acuity, Inc./nLight. Subject to compliance with requirements, alternates can be provided by:
1. Lutron, Inc.
2. Wattstopper, Inc.

B. General Description: Solid-state unit. The unit is designed to operate with the lamp and ballasts indicated.
1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
2. Operation: sensor shall be programmed to turn lights on when coverage area is occupied and turn them off when unoccupied, or to turn off lights that have been manually turned on; with a time delay for turning lights off, adjustable over a minimum range of 1 to 15 minutes.
3. Power: Line voltage.
4. Operating Ambient Conditions: 32 to 149 deg F (0 to 65 deg C).
5. Mounting: Threaded pipe.
6. Time-Delay and Sensitivity Adjustments: Recessed and concealed behind hinged door.
7. Detector Technology: PIR.

2.7 SWITCHBOX-MOUNTED OCCUPANCY SENSORS

A. Manufacturers: Basis of design shall be Acuity, Inc./nLight. Subject to compliance with requirements, alternates can be provided by:
   1. Cooper Industries, Inc.
   2. Hubbell Building Automation, Inc.
   3. Leviton Manufacturing Co., Inc.
   4. Lutron Electronics Co., Inc.
   5. Sensor Switch, Inc.
   6. Watt Stopper.

B. General Requirements for Sensors: Automatic-wall-switch occupancy sensor with manual on-off switch, suitable for mounting in a single gang switchbox, with provisions for connection to BAS using hardwired connection.
   1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
   2. Occupancy Sensor Operation: Unless otherwise indicated, turn lights on when coverage area is occupied, and turn lights off when unoccupied; with a time delay for turning lights off, adjustable over a minimum range of 1 to 15 minutes.
   3. Operating Ambient Conditions: Dry interior conditions, 32 to 120 deg F (0 to 49 deg C).
   4. Switch Rating: Not less than 800-VA LED load at 120 V, 1200-VA LED load at 277 V.

C. Wall-Switch Sensor:
   1. Standard Range: 180-degree field of view, field adjustable from 180 to 40 degrees; with a minimum coverage area of 2100 sq. ft (196 sq. m).
   2. Sensing Technology: Dual technology - PIR and ultrasonic.
   3. Switch Type: SP, field-selectable automatic "on," or manual "on," automatic "off."
   4. Capable of controlling load in three-way application.
   5. Voltage: Dual voltage - 120 and 277 V.
   6. Ambient-Light Override: Concealed, field-adjustable, light-level sensor from 10 to 150 fc (108 to 1600 lux). The switch prevents the lights from turning on when the light level is higher than the set point of the sensor.
   7. Concealed, field-adjustable, "off" time-delay selector at up to 30 minutes.
   8. Adaptive Technology: Self-adjusting circuitry detects and memorizes usage patterns of the space and helps eliminate false "off" switching.
   9. Color: White, as selected by architect.
   10. Faceplate:
      a. Sporting venues, meeting rooms, corridors, circulation spaces, locker rooms: stainless steel.
      b. Other spaces including offices: white.

2.8 OUTDOOR MOTION SENSORS

A. Manufacturers: Basis of design shall be Acuity, Inc./nLight. Subject to compliance with requirements, alternates can be provided by:
   1. Cooper Industries
   2. Lutron, Inc.
   3. Hubbell
   4. Wattstopper, Inc.

B. Description: Solid-state outdoor motion sensors.
   1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
   2. Dual-technology (PIR and ultrasonic) type, weatherproof. Detect occurrences of 6-inch-(150-mm-) minimum movement of any portion of a human body that presents a target of not less than 36 sq. in. (232 sq. cm). Comply with UL 773A.
   3. Switch Rating:
      a. Separately Mounted Sensor: Dry contacts rated for 20-A LED load at 120- and 277-V ac, and for 1 hp at 120-V ac. Sensor has 24-V dc, 150-mA, Class 2 power source, as defined by NFPA 70.
   4. Switch Type: SP, field-selectable automatic "on, automatic "off.".
   5. Voltage: Match the circuit voltage type.
   6. Detector Coverage:
      a. Standard Range: 210-degree field of view, with a minimum coverage area of 900 sq. ft. (84 sq. m).
      b. Long Range: 180-degree field of view and 110-foot (34-m) detection range.
   7. Ambient-Light Override: Concealed, field-adjustable, light-level sensor from 10 to 150 fc (108 to 1600 lux). The switch prevents the lights from turning on when the light level is higher than the set point of the sensor.
   8. Concealed, field-adjustable, "off" time-delay selector at up to 30 minutes.
   9. Adaptive Technology: Self-adjusting circuitry detects and memorizes usage patterns of the space and help eliminate false "off" switching.

C. Operating Ambient Conditions: Suitable for operation in ambient temperatures ranging from minus 40 to plus 130 deg F (minus 40 to plus 54 deg C), rated as "raintight" according to UL 773A.

2.9 PLUG LOAD CONTROL POWER PACK

A. Manufacturers: Basis of design shall be Acuity, Inc./nLight NPP20-PL. Subject to compliance with requirements, alternates can be provided by:
   1. Cooper Industries
   2. Lutron, Inc.
   3. Hubbell
   4. Wattstopper, Inc.

B. Provide (1) power pack device for every 120V/20A circuit shown with controlled plug load symbol control on contract drawings. Integrate into occupancy sensor serving that space.

2.10 EMERGENCY SHUNT RELAY

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Philips Bodine, GTD20A
   2. Lighting Control and Design.
   3. Watt Stopper.

B. Description: NC, electrically held relay, arranged for wiring in parallel with manual or automatic switching contacts; complying with UL 924.
   1. Coil Rating: 277V.

2.11 CONDUCTORS AND CABLES

A. Power Wiring to Supply Side of Remote-Control Power Sources: Not smaller than No. 12 AWG. Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

B. Classes 2 and 3 Control Cable: Multiconductor cable with stranded-copper conductors not smaller than No. 18 AWG. Comply with requirements in Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine lighting control devices before installation. Reject lighting control devices that are wet, moisture damaged, or mold damaged.

B. Examine walls and ceilings for suitable conditions where lighting control devices will be installed.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 SENSOR INSTALLATION

A. Comply with NECA 1.

B. Coordinate layout and installation of ceiling-mounted devices with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, smoke detectors, fire-suppression systems, and partition assemblies.

C. Install and aim sensors in locations to achieve not less than 90-percent coverage of areas indicated. Do not exceed coverage limits specified in manufacturer's written instructions.

3.3 CONTACTOR INSTALLATION

A. Comply with NECA 1.

B. Mount electrically held lighting contactors with elastomeric isolator pads to eliminate structure-borne vibration unless contactors are installed in an enclosure with factory-installed vibration isolators.

3.4 WIRING INSTALLATION

A. Comply with NECA 1.

B. Wiring Method: Comply with Section 260519 "Low-Voltage Electrical Power Conductors and Cables." Minimum conduit size is 1/2 inch (13 mm).

C. Wiring within Enclosures: Comply with NECA 1. Separate power-limited and nonpower-limited conductors according to conductor manufacturer's written instructions.

D. Size conductors according to lighting control device manufacturer's written instructions unless otherwise indicated.

E. Splices, Taps, and Terminations: Make connections only on numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures.

3.5 IDENTIFICATION

A. Identify components and power and control wiring according to Section 260553 "Identification for Electrical Systems."

B.

1. Identify controlled circuits in lighting contactors.
2. Identify circuits or luminaires controlled by photoelectric and occupancy sensors at each sensor.

C. Label time switches and contactors with a unique designation.

3.6 FIELD QUALITY CONTROL

A. Perform the following tests and inspections with the assistance of a factory-authorized service representative:

1. Operational Test: After installing time switches and sensors, and after electrical circuitry has been energized, start units to confirm proper unit operation.
2. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

B. Lighting control devices will be considered defective if they do not pass tests and inspections.

C. Prepare test and inspection reports.

3.7 ADJUSTING

A. Occupancy Adjustments: When requested within 12 months from date of Substantial Completion, provide on-site assistance in adjusting lighting control devices to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

1. For occupancy and motion sensors, verify operation at outer limits of detector range. Set time delay to suit Owner's operations.

2. For daylighting controls, adjust set points and deadband controls to suit Owner's operations.
3. Align high-bay occupancy sensors using manufacturer's laser aiming tool.

3.8 SOFTWARE SERVICE AGREEMENT

A. Technical Support: Beginning at Substantial Completion, service agreement shall include software support for two years.

B. Upgrade Service: At Substantial Completion, update software to latest version. Install and program software upgrades that become available within two years from date of Substantial Completion. Upgrading software shall include operating system and new or revised licenses for using software.
1. Upgrade Notice: At least 30 days to allow Owner to schedule and access the system and to upgrade computer equipment if necessary.

3.9 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain lighting control devices. Provide a minimum of (4) hours training.

END OF SECTION

SECTION 262200 - LOW-VOLTAGE TRANSFORMERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

B. Description: Section includes requirements for the provision of Low-Voltage, dry type distribution transformers including manufacturing, fabrication, configuration, and installation as required for the complete performance of the Work, as shown on the Drawings, as specified herein.

C. Section includes distribution, energy efficiency, dry-type transformers with a nominal primary and secondary rating of 600 V and less.

D. Transformers shall be dry type, electro-static shielded transformers.

E. Related Requirements:
   1. Refer to Section 260500 “Common Work Results for Electrical Systems” for requirements related to equipment bases, supports, and vibration pads.

1.3 REFERENCES

A. Abbreviations
   1. DOE: Department of Energy
   2. XFMR: Transformer

B. Reference Standards: The following publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest version as of the date of the Contract Documents, unless otherwise specified.
   1. National Electrical Contractors Association (NECA)
   2. NECA 409, “Standard for Installing and Maintaining Dry-Type Transformers”.
   3. National Electrical Manufacturers Association (NEMA)
   4. NEMA ST20, “Dry Type Transformers for General Applications”.
   5. Underwriters Laboratories Inc (UL)
   6. UL 1561, “Dry-Type General Purpose and Power Transformers”.
   7. Federal Regulations and Policies
   8. DOE 10 CFR Part 429, “Certification, Compliance, and Enforcement for Consumer Products and Commercial and Industrial Equipment”.
   9. DOE 10 CFR Part 431, “Energy Efficient Program for Certain Commercial and Industrial Equipment”.

1.4 SEQUENCING

A. Submit the preliminary power system study prior to receiving final approval of equipment and system protective devices submittals and prior to release of equipment drawings for manufacturing. Adjust equipment sizes, frame sizes, and trip units as necessary to achieve performance requirements outlined in Section 260573, “Power Systems Studies”.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Remove and replace access fencing, doors, lift-out panels, and structures as required to provide pathway for moving transformers into place.

B. Comply with manufacturer instructions for storage of electrical equipment to prevent damage from condensation or other environmental concerns.

1.6 COORDINATION

A. Coordinate size and location of concrete bases with dimensions of transformer provided.

B. Coordinate installation of wall and ceiling mounting hardware and structural supports with transformer provided.

C. Distribution equipment sizes and equipment layouts shall be considered the basis of design. Equipment sizes vary by manufacturer. If the proposed equipment is larger than the sizes illustrated, the burden shall be on the Contractor to provide equipment which fits in the space allotted while maintaining all code-required and manufacturer-recommended clearances.

D. Drawings indicate space available for electrical equipment, including clearances between equipment and adjacent surfaces and other items. Equipment installed must comply with all clearance, access and replacement working space requirements of the NEC and Owner.

E. Conduct and submit results of power system studies before submitting Product Data and Shop Drawings for electrical equipment.

F. Coordinate inrush current values of transformer provided with overcurrent protection device settings as described in Section 260573, “Power System Studies”. Adjust overcurrent protection device size, settings, and feeder size to eliminate nuisance operation in response to the actual transformer inrush current.

1.7 WARRANTY

A. Manufacturer’s Warranty: Manufacturer agrees to repair or replace transformers, finishes, controls, wiring, and all of its components that fail in materials or workmanship within 12 months from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Eaton Electrical Co.
   2. Square D.; Schneider Electric.
   3. ABB.

B. Source Limitations: Obtain transformers and all other electrical distribution equipment through one source from a single manufacturer.

2.2 GENERAL TRANSFORMER REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Comply with NFPA 70, NEMA ST 20, and list and label as complying with UL 1561.

C. Comply with (DOE) 10 CFR 431 for minimum energy efficiency levels. Transformers shall bear the UL Energy Efficiency Verification Mark to confirm that the unit meets minimum efficiency levels.

D. Description: Factory-assembled and tested, air-cooled units for 60-Hz service.

E. Phase, kVA Ratings, and Primary and Secondary Voltages: as indicated on drawings.

F. Cores: Grain-oriented, non-aging silicon steel with high permeability and low hysteresis and eddy current losses. Magnetic flux densities are to be kept well below the saturation point to prevent core overheating.
   1. One leg per phase.
   2. Core volume shall allow efficient transformer operation at 10 percent above the nominal tap voltage.
   3. Visibly grounded to the enclosure by means of a flexible grounding conductor sized in accordance with applicable UL and NEC standards.
   4. Cores shall be clamped with structural angles and bolted to the enclosure to prevent damage during shipment or rough handling.

G. Coils: Continuous windings without splices except for taps. Coils shall have a final wrap of electrical insulating material designed to prevent injury to the coil wire.
   1. Coil Material: Copper.
   2. Internal Coil Connections: Brazed or pressure type.
   3. Terminal Connections: Welded.

H. Insulation Class: Minimum 220 deg C, UL-component-recognized insulation system.
   1. Temperature Rise: 115 deg C unless noted otherwise.
   2. All insulation materials shall be flame-retardant and shall not support combustion as defined in ASTM Standard Test Method D635
   3. Wire left bare will not be accepted, all conductors must have insulation material.

I. Enclosure: Ventilated
   1. NEMA 250, Type 2 unless otherwise required by environmental conditions. Provide weather shield for ventilation openings where located outdoors.
   2. Heavy gauge steel construction.
   3. The core and coil unit shall be completely isolated from the enclosure by means of a vibration isolating system and shall be so designed as to provide for continual securement of the core and coil unit to the enclosure.
   4. Core and coil shall be encapsulated within non-hygroscopic thermosetting varnish, sealing out moisture and air.
   5. Wiring Compartment: Sized for conduit entry and wiring installation.
   6. Minimum clearances from ventilated openings to obstructions shall be indicated on the nameplate and not exceed 6-inches.
   7. The maximum top of case temperature shall not exceed 35 deg C above 40 deg C ambient.
   8. Finish: Gray weather resistant baked enamel, complying with NEMA 250.

J. Taps:
   1. Three-phase transformers rated 15 kVA and larger shall be provided with six 2-1/2% full capacity taps, two above and four below rated primary voltage.
   2. Three-phase transformers rated below 15kVA shall be provided with two 5% full capacity taps rated below primary voltage.

K. K-Factor Rating: Transformers shall comply with UL 1561 requirements for non-sinusoidal load current-handling capability to the degree defined by designated K-factor.
   1. Neutral rated 200 percent of full load current.
   2. Unit shall not overheat when carrying full-load current with harmonic distortion corresponding to designated K-factor.
   3. Indicate value of K-factor on transformer nameplate.

L. Electrostatic Shielding: Each winding shall have an independent, single, full-width copper electrostatic shield arranged to minimize interwinding capacitance.
   1. Arrange coil leads and terminal strips to minimize capacitive coupling between input and output terminals.
   2. Include special terminal for grounding the shield.
   3. Shield effectiveness:
   4. Capacitance between Primary and Secondary Windings: Not to exceed 33 picofarads over a frequency range of 20 Hz to 1 MHz.
   5. Common-Mode Noise Attenuation: Minimum of minus 120 dBA at 0.5 to 1.5 kHZ; minimum of minus 65 dBA at 1.5 to 100 kHz.
   6. Normal-Mode Noise Attenuation: Minimum of minus 52 dBA at 1.5 to 10 kHz.

M. Grounding: Provide ground bar installed on the inside of the transformer enclosure.

N. Wall and Ceiling Brackets: Manufacturer's standard brackets.

O. Low-Sound-Level Requirements: Minimum of 3 dBA less than NEMA ST 20 standard sound levels when factory tested according to IEEE C57.12.91.

P. Terminations: Mechanical Lugs listed to accept specified wiring method, conductor size, and temperature rating.

2.3 SOURCE QUALITY CONTROL

A. Test and inspect transformers according to IEEE C57.12.91 and IEEE C57.12.91.
   1. Ratio tests at the rated voltage connection and at all tap connections.
   2. Polarity and phase relation tests on the rated voltage connection
   3. Applied potential tests.
   4. Induced potential test.
   5. No-load and excitation current at rated voltage on the rated voltage connection

B. Sound level as determined in accordance with NEMA standards shall not exceed the following:
   1. 0-50 kVA: 45 dB
   2. 51-150 kVA: 50 dB
   3. 151-300 kVA: 55 dB
   4. 301-500 kVA: 60 dB

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine conditions for compliance with enclosure- and ambient-temperature requirements for each transformer.

B. Verify that field measurements are needed to maintain working clearances and equipment operation required by NFPA 70 and manufacturer's written instructions.

C. Examine walls, floors, roofs, and concrete bases for suitable mounting conditions where transformers will be installed.

D. Verify that ground connections are in place and requirements in Section 260526 "Grounding and Bonding for Electrical Systems" have been met. Maximum ground resistance shall be 5 ohms at the location of transformer.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install transformers level and plumb with vibration dampening supports.
   1. Provide wall and ceiling mounted transformers with brackets fabricated by transformer manufacturer.
   2. Coordinate installation of structural steel supports with actual transformer provided.

B. Construct concrete bases and anchor floor-mounted transformers according to manufacturer's written instructions.

C. Secure covers to enclosure and tighten all bolts to manufacturer-recommended torques to reduce noise generation.

D. Remove shipping bolts, blocking, and wedges.

3.3 CONNECTIONS

A. Ground equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."

B. Connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

C. Provide flexible connections at all conduit and conductor terminations and supports according to Section 260533, "Raceways and Boxes for Electrical Systems" and Section 260500, "Common Work Results for Electrical Systems" to eliminate sound and vibration transmission to the building structure.

D. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

E. Where a tightening torque is indicated as a numeric value on equipment or in installation instructions provided by the manufacturer, use a calibrated torque tool to achieve that indicated torque value, unless the equipment manufacturer has provided installation instructions for an alternative method of achieving the required torque.

3.4 IDENTIFICATION

A. Comply with requirements in Section 260553, "Identification for Electrical Systems".
   1. Where primary disconnecting means is not provided within sight of transformer, identify transformer with equipment designation and location of remote lockable disconnecting means by permanent nameplate.
   2. All distribution equipment shall be shipped from the manufacturer with factory-applied warning labels affixed to the outside front of the equipment (as it will be installed per the plans). All labeling shall be in compliance with NFPA 70 requirements.
   3. Labels affixed to equipment by the equipment manufacturer shall comply with drawing and specification labeling requirements or shall be omitted by the manufacturer and field-installed by the Contractor. Labels which are factory-installed and not in compliance shall be removed and replaced and equipment enclosures refinished or replaced by the manufacturer to repair finish.

3.5 FIELD QUALITY CONTROL

A. Tests and Inspections: Perform the following tests and inspections. Certify compliance with test parameters.
   1. Visual and Mechanical Inspection
   2. Document equipment nameplate data on the test report. Verify that transformer nameplate ratings are in accordance with drawings.
   3. Inspect the physical and mechanical condition of the equipment.
   4. Inspect anchorage, alignment, and grounding.
   5. Verify that resilient mounts are free and that any shipping brackets have been removed.
   6. Inspect bolted electrical connections for high resistance by verifying tightness with calibrated torque-wrench method in accordance with manufacturer's published data.
   7. Electrical Tests

8. Perform insulation-resistance tests. Measurements shall be made from winding-to-winding and each winding-to-ground. Test voltages and minimum resistance shall be in accordance with the manufacturer's published data.
9. Verify correct secondary voltage phase-to-phase and phase-to-neutral after energization and prior to loading.

B. Test and Inspection Reports: Prepare a written report to certify compliance with test parameters and record the following:
1. Test procedures used.
2. Results that comply with requirements.
3. Results that do not comply with requirements and corrective action taken to achieve compliance with requirements.

C. Products will be considered defective if they do not pass tests and inspections. Remove and replace malfunctioning units and retest as specified above.

D. Test Labeling: On completion of satisfactory testing of each unit, attach a dated and signed "Satisfactory Test" label to tested component.

3.6 ADJUSTING

A. Record transformer secondary voltage at each unit for at least 48 hours of typical occupancy period. Adjust transformer taps to provide optimum voltage conditions at secondary terminals. Optimum is defined as not exceeding nameplate voltage plus 10 percent and not being lower than nameplate voltage minus 3 percent at maximum load conditions. Submit recording and tap settings as test results.

B. Output Settings Report: Prepare a written report recording output voltages and tap settings.

3.7 CLEANING

A. Vacuum dirt and debris; do not use compressed air to assist in cleaning.

END OF SECTION

SECTION 262413 - SWITCHBOARDS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. Description: Provide labor, material, equipment, related services, and supervision required, including, but not limited to, manufacturing, fabrication, configuration, and installation for low voltage switchboards as required for the complete performance of the Work, as shown on the Drawings as specified herein.

B. Section Includes:
1. Service and distribution switchboards rated 600 V and less.
2. Disconnecting and overcurrent protective devices.
3. Instrumentation.
4. Control power.
5. Accessory components and features.
6. Identification.

C. Related Requirements:
1. Refer to Section 260500, “Common Work Results for Electrical Systems” for requirements related to equipment pads.

1.3 REFERENCES

A. Abbreviations
1. SPD: Surge Protective Device
2. SWBD: Switchboard

B. Definitions:
1. Switchboard: A large single panel, frame, or assembly of panels on which are mounted switches, over-current, and other protective devices, buses, and instruments.

C. Reference Standards: The following publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest version as of the date of the Contract Documents, unless otherwise specified.
1. National Electrical Contractors Association (NECA):
   a) NECA 400, “Standard for Installing and Maintaining Switchboards"
2. National Electrical Manufacturers Association (NEMA):
   a) NEMA PB 2, "Deadfront Distribution Switchboards."

b) NEMA PB 2.1, "General Instructions for Proper Handling, Installation, Operation and Maintenance of Deadfront Distribution Switchboards Rated 600 Volts or Less."

3. Underwriter Laboratories (UL):

a) UL 50, "Enclosures for Electrical Equipment, Non-Environmental Considerations."
b) UL 489, "Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures."
c) UL 891, "Standard for Switchboards"

1.4 SEQUENCING

A. Submit the preliminary power system study prior to receiving final approval of equipment and system protective devices submittals and prior to release of equipment drawings for manufacturing. Adjust equipment sizes, frame sizes, and trip units as necessary to achieve performance requirements outlined in Section 260573, "Power Systems Studies".

1.5 QUALITY ASSURANCE

A. Installer Qualifications:
1. Minimum of five years of successful installation experience with projects utilizing switchboards similar in type and scope to that required for this Project.
2. An employer of qualified workers as defined in NEMA PB 2.1 and trained in electrical safety as required by NFPA 70E.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Deliver Switchboards in sections or lengths that can be moved past obstructions in delivery path. Remove and replace access fencing, doors, lift-out panels, and structures as required to provide pathway for moving switchboards into place.

B. Handle and prepare Switchboards for installation according to NECA 400 and NEMA PB 2.1. Lift only by lifting means provided for this express purpose. Handle carefully to avoid damage to switchboard internal components, enclosure, and finish.

C. Comply with manufacturer instructions for storage of electrical equipment to prevent damage from condensation or other environmental concerns.

D. Unit shall be shipped with doors screwed shut and outside air hood closed to prevent damage during transport and thereafter while in storage awaiting installation.

E. Follow Installation, Operation, and Maintenance manual instructions for rigging, moving, and unloading the unit at its final location.

F. Unit shall be stored in a clean, dry place protected from construction traffic in accordance with the Installation, Operation, and Maintenance manual.

1.7 COORDINATION

A. Coordinate layout and installation of Switchboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

B. Coordinate sizes and locations of concrete bases with dimensions of actual equipment provided.

C. Distribution equipment sizes and equipment layouts shall be considered the basis of design. Equipment sizes vary by manufacturer. If the proposed equipment is larger than the sizes illustrated, the burden shall be on the Contractor to provide equipment which fits in the space allotted while maintaining all code-required and manufacturer-recommended clearances.

D. Drawings indicate space available for electrical equipment, including clearances between equipment and adjacent surfaces and other items. Equipment installed must comply with all clearance, access and replacement working space requirements of the NEC and Owner.

1.8 WARRANTY

A. Manufacturer's Warranty: Manufacturer agrees to repair or replace switchboards, circuit breakers, finishes, controls, wiring, and all of its components that fail in materials or workmanship within 18 months from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Eaton Electrical Inc.
   2. Square D.; a brand of Schneider Electric.
   3. ABB.

B. Source Limitations: Obtain switchboards, overcurrent protection devices, and all other electrical distribution equipment through one source from a single manufacturer.

2.2 GENERAL REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Comply with NEMA PB 2, NFPA 70, and UL 891.

C. Front-Connected, Front-Accessible Switchboards unless otherwise indicated:

4. Main Devices: Fixed, individually mounted unless otherwise indicated.
5. Branch Devices: panel mounted.
6. Sections front and rear aligned.

D. Nominal System Voltage and Main Bus Ratings as indicated in the drawings.

E. Short Circuit Current Rating: Switchboards shall be rated with a minimum short circuit current rating of 100,000 AIC, unless otherwise indicated on drawings. Short circuit rating shall be confirmed by the Power systems Study.

F. Service Entrance: Where switchboards are used as service equipment with one or more main service disconnecting and overcurrent protective devices, provide marking by an NRTL acceptable to authority having jurisdiction indicating panelboard is suitable for use as service equipment. Coordinate with utility company for any additional requirements.

G. Utility Metering Compartment: Where indicated, provide barrier compartment and section complying with utility company's requirements; hinged sealable door; buses provisioned for mounting utility company's current transformers and potential transformers, or potential taps as required by utility company. If a separate vertical section is required for utility metering, match and align with basic switchboard. Provide service entrance label and necessary applicable service entrance features.

H. Indoor Enclosure: Steel, NEMA 250, Type 1 unless otherwise.
1. Finish: Factory-applied finish in manufacturer's standard gray finish over a rust-inhibiting primer on treated metal surface. The switchboard enclosure shall be painted on all exterior surfaces.
2. Provide removable steel base channels bolted to the frame to rigidly support the entire shipping section for moving on rollers and floor mounting. The framework is to be formed of code gauge steel, rigidly welded together to support all cover plate, bussing and component devices.
3. All front covers shall be screw removable with a single tool and all doors shall be hinged with removable hinge pins.

I. Customer Metering Compartment: Provide a separate customer metering compartment and section with front hinged door, for indicated metering, and current transformers for each meter. Current transformer secondary wiring shall be terminated on shorting-type terminal blocks. Include potential transformers having primary and secondary fuses with disconnecting means and secondary wiring terminated on terminal blocks. Coordinate all requirements with utility (United Illuminating).

J. Bus Transition and Incoming Pull Sections: Matched and aligned with basic switchboard.

K. Hinged Front Panels: Allow access to circuit breaker, metering, accessory, and blank compartments.

L. Buses and Connections: Three phase, four wire unless otherwise indicated.
1. Provide phase bus arrangement A, B, C from front to back, top to bottom, and left to right when viewed from the front of the switchboard.
2. Phase-, Neutral, and Ground -Bus Material: Hard-drawn copper of 98 percent conductivity.

3. Copper feeder circuit-breaker line connections.
4. Neutral Buses: 100 percent of the ampacity of phase buses unless otherwise indicated, equipped with mechanical connectors for outgoing circuit neutral cables. Brace bus extensions for busway feeder neutral bus.
5. Ground Bus: Size per current NEC and UL 891 Tables 28.1 and 28.2, equipped with pressure connectors for feeder and branch circuit ground conductors.
6. Main-Phase Buses, Neutral Buses, and Equipment-Ground Buses: Uniform full capacity for entire length of switchboard's main and distribution sections to comply with ampacity indicated. Tapered bus is not permitted. Provide sufficient cross-sectional area to meet UL 891 temperature rise requirements. Provide for future extensions from both ends.
7. Disconnect Links:
    a) Isolate neutral bus from incoming neutral conductors.
    b) Bond neutral bus to equipment-ground bus with an appropriately sized main bonding conductor for switchboards utilized as service equipment or separately derived systems.

M. Future Devices: Equip all unused spaces and compartments with mounting brackets, supports, bus connections, and appurtenances at full rating of circuit-breaker compartment to allow future installation of OCPDs.

2.3 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

A. Molded-Case Circuit Breaker (MCCB): Comply with UL 489, with interrupting capacity to meet available fault currents.
1. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 225 A and larger.
2. Adjustable Instantaneous-Trip Circuit Breakers: Magnetic trip element with front-mounted, field-adjustable trip setting.
3. Electronic trip circuit breakers with rms sensing; field-replaceable rating plug or field-replicable electronic trip; and the following field-adjustable settings where indicated:
    a) Instantaneous trip.
    b) Long- and short-time pickup levels.
    c) Long- and short-time adjustments.
    d) Ground-fault pickup level, time delay, and I squared t response.
4. GFCI Circuit Breakers: Single- and double-pole configurations with Class A ground-fault protection (6-mA trip).
5. Ground-Fault Equipment Protection (GFEP) Circuit Breakers: Class B ground-fault protection (30-mA trip).
6. MCCB Features and Accessories:
    a) Standard frame sizes, trip ratings, and number of poles.
    b) Lugs: Mechanical style, suitable for number, size, trip ratings, and conductor material.
    c) Application Listing: Appropriate for application; Type SWD for switching fluorescent lighting loads; Type HID for feeding fluorescent and high-intensity discharge (HID) lighting circuits: Type HACR for heating, air-conditioning, and refrigeration equipment.
    d) Ground-Fault Protection: Integrally mounted relay and trip unit with adjustable

pickup and time-delay settings, push-to-test feature, and ground-fault indicator.

e) Shunt Trip: 120-V trip coil energized from separate circuit, set to trip at 55 percent of rated voltage.

f) Undervoltage Trip: Set to operate at 35 to 75 percent of rated voltage without intentional time delay.

g) Auxiliary Contacts: One SPDT switch with "a" and "b" contacts; "a" contacts mimic circuit-breaker contacts, "b" contacts operate in reverse of circuit-breaker contacts.

h) Zone-Selective Interlocking: Integral with electronic trip unit; for interlocking ground-fault protection function.

B. Provide ground fault protection for all overcurrent protective devices 1000 amps or greater on 480Y/277V systems.

C. Provide arc energy reduction maintenance switch for all overcurrent protective devices rated 1200 amps or greater or where the continuous current trip setting can be adjusted to 1200A or greater.

2.4 MAIN SECTION DEVICES

A. Two-step stored energy electronic trip insulated molded case circuit breaker:

1. Circuit protective devices shall be two-step stored energy type circuit breaker(s)].
2. Circuit breaker trip system shall be a microprocessor-based true RMS sensing design with sensing accuracy through the thirteenth (13th) harmonic. Sensor ampere ratings shall be as indicated on the associated drawings.
3. The integral trip system shall be independent of any external power source and shall contain no less than industrial grade electronic components.
4. Circuit breakers shall be equipped with back-up thermal and magnetic trip system.
5. The ampere rating of the circuit breaker shall be determined by the combination of an interchangeable rating plug, the sensor size and the long-time pickup adjustment on the circuit breaker. The sensor size, rating plug and switch adjustments shall be clearly marked on the face of the circuit breaker. Circuit breakers shall be UL Listed to carry 100% of their ampere rating continuously when applied in QED switchboards.
6. The following time/current response adjustments shall be provided. Each adjustment shall have discrete settings and shall be independent from all other adjustments.

    a) Long Time Pickup & Long Time Delay
    b) Short Time Pickup & Short Time Delay (I^2t IN & I^2t OUT)
    c) Instantaneous Pickup
    d) Ground Fault Pickup & Ground Fault Delay (I^2t IN and I^2t OUT)

7. A means to seal the rating plug and trip unit adjustments in accordance with NEC Section 240-6(b) shall be provided.
8. Local visual trip indication for overload, short circuit and ground fault trip occurrences shall be provided.
9. Long Time Pickup indication to signal when loading approaches or exceeds the adjusted ampere rating of the circuit breaker shall be provided.
10. The trip system shall include a Long Time memory circuit to protect against intermittent overcurrent conditions above the long time pickup point. Means shall be provided to reset Long Time memory circuit during primary injection testing.

11. Circuit breaker trip system shall be equipped with an externally accessible test port for use with a Universal Test Set. Provide one (1) Universal Equipment Test Set for this project job for final inspection. This test set shall be suitable for testing all electric circuit breakers specified for this project. No disassembly of the circuit breaker is required for testing.
12. True two-step stored energy mechanism with five (5) cycle closing time shall be provided. All circuit breakers shall have multiple CHARGE/CLOSE provisions allowing the following sequence: CHARGE, CLOSE, RECHARGE, OPEN/CLOSE/OPEN.
13. Local control pushbuttons to OPEN and CLOSE circuit breaker shall be provided. Color coded visual indication of contact position (OPEN or CLOSED) shall be provided on the face of the circuit breaker. Local manual charging following CLOSE operation shall be provided. Color coded visual indication of mechanism CHARGED and DISCHARGED position shall be provided on the face of the circuit breaker. Visual indicator shall indicate CHARGED only when closing springs are completely charged.
14. Each circuit breaker shall be electrically operated to permit remote CHARGE, CLOSE, and OPEN capabilities. Electrically operated circuit breaker shall be equipped with charge contact switch for remote indication of mechanism charge status.
15. All circuit breakers shall be equipped with electrical accessories as noted on drawings.
16. Equipment Ground Fault Protection
    a) Circuit breaker(s) shall be provided with integral equipment protection for grounded systems.
    b) The ground fault system shall be of the residual type.
    c) Circuit breaker(s) shall be provided with zone selective interlocking (ZSI) on the Ground Fault function in order to limit thermal stress caused by a fault, yet permit optimum coordination with all other electronic trip circuit breakers.
17. Terminations
    a) All lugs shall be UL Listed to accept solid and/or stranded copper conductors only. Lugs shall be suitable for 75° C rated wire.
18. All circuit breakers shall be UL Listed to accept field installable/removable mechanical type lugs.
19. Main circuit breaker shall be individually fixed mounted.

2.5 INSTRUMENTATION

A. Instrument Transformers: NEMA EI 21.1, ANSI/IEEE C57.13, and the following:
   1. Potential Transformers: Secondary voltage rating of 120 volts and NEMA accuracy class of 0.3 with burdens of W, X, and Y.
   2. Current Transformers: Ratios shall be as indicated with accuracy class and burden suitable for connected relays, meters, and instruments.
   3. Control Power Transformers: Dry type, mounted in separate compartments for units larger than 3 kV.
   4. Current Transformers for Neutral and Ground Fault Current Sensing: Connect secondaries to ground overcurrent relays to provide selective tripping of main and tie circuit breaker. Coordinate with feeder circuit breaker ground fault protection.

2.6 METERING

A. Overcurrent Protective Device Communication Capability: Where indicated provide electronic trip circuit breakers and integral communication module with functions and features compatible with power monitoring and control systems.

2.7 SURGE PROTECTIVE DEVICES

A. Where Switchboards are indicated with integral SPD, comply with requirements in Section 264300, “Surge Protective Devices”. Surge protective devices shall be installed by, and shipped from, the electrical distribution equipment manufacturer’s factory.

2.8 CONTROL POWER

A. Control Circuits: 120-V ac, supplied through secondary disconnecting devices from control-power transformer, if required.

B. Control-Power Fuses: Primary and secondary fuses for current-limiting and overload protection of transformer and fuses for protection of control circuits.

C. Control Wiring: Factory installed, with bundling, lacing, and protection included. Provide flexible conductors for #8 AWG and smaller, for conductors across hinges, and for conductors for interconnections between shipping units.

2.9 ACCESSORY COMPONENTS AND FEATURES

A. Accessory Set: Include tools and miscellaneous items required for overcurrent protective device test, inspection, maintenance, and operation.

B. Portable Test Set: For testing functions of solid-state trip devices without removing from switchboard. Include relay and meter test plugs suitable for testing switchboard meters and switchboard class relays.

C. Lock-out, Tag-out: All circuit breakers in the Switchboard to include fixed padlock attachments.

2.10 IDENTIFICATION AND MARKINGS

A. Presentation Media: Painted graphics in color contrasting with background color to represent bus and components complete with lettering designations.

B. Service Equipment Label: Where Switchboard is provided with one or more service disconnecting and overcurrent protective devices, provide NRTL label indicating use as service equipment.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Receive, inspect, handle, and store switchboards according to NECA 400 and NEMA PB 2.1.

B. Examine Switchboard interior and exterior before installation. Reject Switchboards that are moisture damaged or physically damaged.

C. Examine elements and surfaces to receive Switchboards for compliance with installation tolerances and other conditions affecting performance of the Work.
   1. Verify concrete pads are level and free of irregularities.
   2. Ensure area to receive switchboard has adequate clearance for switchboard installation.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install Switchboards and accessories according to manufacturer's written guidelines, NECA 400 and NEMA PB 2.1.

B. Equipment Mounting: Install Switchboards on concrete base, 4-inch nominal thickness. Comply with requirements for concrete base specified in Division 03 and Section 260500, “Common Work Results for Electrical Systems.”
   1. Install conduits entering underneath the switchboard, entering under the vertical section where the conductors will terminate. Install couplings flush with the concrete base. Extend 2 inches above concrete base after switchboard is anchored in place.
   2. Install dowel rods to connect concrete base to concrete floor. Unless otherwise indicated, install dowel rods on 18-inch centers around the full perimeter of concrete base.
   3. For supported equipment, install epoxy-coated anchor bolts that extend through concrete base and anchor into structural concrete floor.
   4. Place and secure anchorage devices. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
   5. Install anchor bolts to elevations required for proper attachment to Switchboards.

C. Temporary Lifting Provisions: Remove any temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from Switchboard units and components.

D. Operating Instructions: Frame and mount basic operating instructions for Switchboards, including any control and key interlocking sequences and emergency procedures. Fabricate frame of finished wood or metal and cover instructions with clear acrylic plastic. Mount on front of Switchboards.

E. Install filler plates in unused spaces of panel-mounted sections.

F. Install overcurrent protective devices, transient voltage suppression devices, and instrumentation.

G. Comply with NECA 1.

3.3 CONNECTIONS

A. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B. Where a tightening torque is indicated as a numeric value on equipment or in installation instructions provided by the manufacturer, use a calibrated torque tool to achieve that indicated torque value, unless the equipment manufacturer has provided installation instructions for an alternative method of achieving the required torque.

B. Provide ground bushings and bonding conductor connections to the equipment ground bus sized per NFPA 70 on each metallic conduit entering or leaving the switchboard and at the terminal end for each continuous metallic feeder conduit.

C. Support and secure conductors within the switchboard according to NFPA 70.

3.4 IDENTIFICATION

A. Comply with requirements in Section 260553, “Identification for Electrical Systems”
   1. Identify field-installed conductors, interconnecting wiring, and components.
   2. Provide warning signs and labels to advise personnel of possible hazards in accordance with UL, NFPA 70, NFPA 70E, and other applicable standards.
   3. Provide nameplate for each switchboard compartment. Nameplates shall be screwed into front of switchboard.
   4. Provide nameplate for each disconnecting and overcurrent protective device and each meter and control device mounted in compartment doors.
   5. All distribution equipment shall be shipped from the manufacturer with factory-applied warning labels affixed to the outside front of the equipment (as it will be installed per the plans). All labeling shall be in compliance with NFPA 70 requirements.
   6. Labels affixed to equipment by the equipment manufacturer shall comply with drawing and specification labeling requirements or shall be omitted by the manufacturer and field-installed by the Contractor. Labels which are factory-installed and not in compliance shall be removed and replaced and equipment enclosures refinished or replaced by the manufacturer to repair finish.

3.5 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to inspect, test, and adjust components, assemblies, and equipment installations, including connections.

B. Tests and Inspections:
   1. Visual and Mechanical Inspection: Provide manufacturer’s standard start-up inspections, including the following:
      a) Examine equipment nameplate data and confirm proper identification.
      b) Inspect the physical, electrical, and mechanical condition of the equipment and all components in accordance with the manufacturers’ instructions.

c) Inspect anchorage, alignment, and grounding.
d) Verify controls and instrumentation, ensuring that current and potential transformer ratios are correct.
e) Inspect bolted electrical connections and terminations for high resistance by verifying tightness with calibrated torque-wrench method in accordance with manufacturer's published data.
f) Exercise all active components.
g) Inspect all mechanical indicating devices for correct operation.
h) Physically test key interlock systems to check for proper functionality prior to energizing.

2. Electrical Acceptance Testing: Provide manufacturer's standard start-up testing, including the following:

a) Perform insulation resistance test for one minute on each switchboard bus section. Open control and metering circuits within the switchboard and remove neutral connection to surge protection and other electronic devices prior to insulation test. Reconnect after test. Test voltages and minimum resistance shall be in accordance with the manufacturer's published data.
b) Perform a control wiring performance test by applying control voltage.

3. Circuit Breaker Testing: For all circuit breakers with electronic trip units, determine minimum pickup current, long-time and short-time pickup and delay, and instantaneous pickup by secondary current injection. Certify compliance with test parameters and ensure settings match recommendations from final approved power system study.
4. Test ground-fault protection of equipment for service equipment per NFPA 70.
5. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.
6. Perform the following infrared scan tests and inspections:

a) Initial Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switchboard.
b) Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switchboard 11 months after date of Substantial Completion.
c) Instruments and Equipment: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device in report.

C. The switchboard will be considered defective if it does not pass tests and inspections.

D. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest as specified above.

E. Prepare test and inspection reports, including a certified report that identifies Switchboards included. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.6 ADJUSTING

A. Adjust moving parts and operable components to function smoothly and lubricate as recommended by manufacturer.

B. Set field-adjustable circuit-breaker trip ranges and time delay settings to recommended values identified in the final approved power system study.

3.7 OWNER TRAINING

A. Engage a factory-authorized instructor to train Owner's maintenance personnel to adjust, operate, and maintain Switchboards, overcurrent protective devices, instrumentation, and accessories, and to use and reprogram any microprocessor-based trip, monitoring, and communication units.

B. Training shall consist of two (2) sessions with four (4) hours of onsite classroom and hands-on instruction at each session for a minimum of four attendees. Training shall cover the following topics at a minimum:

7. Theory of operation
8. Operation of Switchboard and components
9. Maintenance and configuration
10. Troubleshooting and Repair
11. Replacement of components.

END OF SECTION

SECTION 262416 - PANELBOARDS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. Description: Section includes requirements for the provision of Panelboards including manufacturing, fabrication, configuration, and installation as required for the complete performance of the Work, as shown on the Drawings, as specified herein.

B. Section Includes:
   1. Distribution panelboards
   2. Lighting and appliance branch-circuit panelboards
   3. Disconnecting and overcurrent protective devices.

C. Related Requirements:
   1. Refer to Section 260500, “Common Work Results for Electrical Systems” and 260529 “Electrical Hangers and Supports” for requirements related to equipment supports.

1.3 REFERENCES

A. Abbreviations
   1. AFCI: Arc-fault circuit interrupter.
   2. GFCI: Ground-fault circuit interrupter.
   3. GFPE: Ground-fault protection of equipment.
   4. MCCB: Molded Case Circuit Breaker
   5. SWD: Switching Duty
   6. VPR: Voltage protection rating.

B. Definitions
   1. Panelboard: A single panel or group of panel units designed for assembly in the form of a single panel, including buses and automatic overcurrent devices, and equipped with or without switches for the control of light, heat, or power circuits; designed to be placed in a cabinet or cutout box placed in or against a wall, partition, or other support; and accessible only from the front.

C. Reference Standards: The following publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest version as of the date of the Contract Documents, unless otherwise specified.
   1. National Electrical Contractors Association (NECA):

a. NECA 407, “Standard for Installing and Maintaining Panelboards"

2. National Electrical Manufacturers Association (NEMA):
   a. NEMA AB 1, "Molded Case Circuit Breakers and Molded Case Switches."
   b. NEMA PB 1, "Panelboards."
   c. NEMA PB 1.1, "General Instructions for Proper Installation, Operation and Maintenance of Panelboards Rated 600 Volts or Less."
3. Underwriter Laboratories (UL):
   a. UL 50, "Enclosures for Electrical Equipment, Non-Environmental Considerations.”
   b. UL 67, "Standard for Panelboards."
   c. UL 489, "Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures.”

1.4 SEQUENCING

A. Submit the preliminary power system study prior to receiving final approval of equipment and system protective devices submittals and prior to release of equipment drawings for manufacturing. Adjust equipment sizes, frame sizes, and trip units as necessary to achieve performance requirements outlined in Section 260573, “Power Systems Studies”.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: An employer of qualified workers as defined in NEMA PB 1.1 and trained in electrical safety as required by NFPA 70E.

1.6 DELIVERY, STORAGE, AND HANDLING

A. Handle and prepare panelboards for installation according to NECA 407 and NEMA PB 1. Handle carefully to avoid damage to internal components, enclosure, and finish.

B. Comply with manufacturer instructions for storage of electrical equipment to prevent damage from condensation or other environmental concerns.

1.7 COORDINATION

A. Coordinate layout and installation of panelboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

B. Distribution equipment sizes and equipment layouts shall be considered the basis of design. Equipment sizes vary by manufacturer. If the proposed equipment is larger than the sizes illustrated, the burden shall be on the Contractor to provide equipment which fits in the space allotted while maintaining all code-required and manufacturer-recommended clearances.

C. Drawings indicate space available for electrical equipment, including clearances between equipment and adjacent surfaces and other items. Equipment installed must comply with all clearance, access and replacement working space requirements of the NEC and Owner.

1.8 WARRANTY

A. Manufacturer's Warranty: Manufacturer agrees to repair or replace panelboards, circuit breakers, finishes, controls, components, and accessories that fail in materials or workmanship within 24 months from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Eaton Electrical Inc.
   2. Square D.; a brand of Schneider Electric.
   3. ABB.

B. Source Limitations: Obtain panelboards, overcurrent protection devices, and all other electrical distribution equipment through one source from a single manufacturer.

2.2 GENERAL REQUIREMENTS FOR PANELBOARDS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Comply with NFPA 70 and NEMA PB 1.

C. Provide circuit breaker type panelboards unless noted otherwise.

D. Enclosures: Flush- or surface-mounted, dead-front cabinets as indicated on drawings.
   1. Rated for environmental conditions at installed location.
      a. Indoor Dry and Clean Locations: NEMA 250, Type 1.
      b. Outdoor and Wet Locations: NEMA 250, Type 3R.
      c. Indoor Locations Subject to Dust, Falling Dirt, and Dripping Noncorrosive Liquids: NEMA 3R, Stainless Steel.
   2. Hinged Front Cover: Entire front trim hinged to box and with standard door within hinged trim cover.
   3. Front: Secured to box with concealed trim clamps. For surface-mounted fronts, match box dimensions; for flush-mounted fronts, overlap box and keep tight to wall with no gaps allowing access to live parts. Oversize trims will not be acceptable.
   4. Interior trim shall be of dead-front construction to shield user from all energized parts.

5. Gutter Extension and Barrier: Same gage and finish as panelboard enclosure; integral with enclosure body. Arrange to isolate individual panel sections.
6. Materials and Finishes:
   a. Panel Fronts and Trim: Galvanized Steel, factory finished immediately after cleaning and pretreating with manufacturer's standard two-coat, baked-on finish consisting of prime coat and thermosetting topcoat.
   b. For panelboards located in corridors and public areas (not within MEP or other back-of-house spaces), architect shall select color from full range for panel to be painted.
   c. Back Boxes: Galvanized steel.
7. Boxes shall have removable end walls. End walls shall not be provided with concentric knockouts. Boxes shall have welded interior mounting studs. Interior mounting brackets are not required.
8. Directory Card: Inside panelboard door, mounted in metal frame with transparent protective cover.
9. All lock assemblies shall be keyed alike.

E. Incoming Mains:
1. Circuit breaker or Lugs only as indicated on drawings.
2. Location: Top or bottom to match feeder conduit entry.
3. Feeders routed through the side gutters to reach the top or bottom main breakers from the opposite end of the panel are not acceptable.
4. Main lugs or main breakers shall have barriers on five sides.

F. Phase, Neutral, and Ground Busses:
1. Material: Hard-drawn copper, 98 percent conductivity.
   a. Bus shall be fully rated the entire length, with one continuous bus bar per phase.
2. Phase bussing shall be pre-drilled to accommodate field installable options.
3. Interiors shall be factory assembled into a unit. Replacing switching and protective devices shall not disturb adjacent units or require removing the main bus connectors.
4. Equipment Ground Bus: Extend full length of panelboard and adequate for feeder and branch-circuit equipment grounding conductors; bonded to box.
5. Isolated Ground Bus: Adequate for branch-circuit isolated ground conductors; insulated from box, where applicable.
6. Full-Sized Neutral: Equipped with full-capacity bonding strap for service entrance applications. Mount electrically isolated from enclosure. Do not mount neutral bus in gutter.

G. Conductor Connectors: Suitable for use with conductor material and sizes.
1. Material: Tin-plated aluminum.
2. Terminations shall allow use of 75 deg C rated conductors without derating. Terminations shall be suitable for the size and quantity of conductors specified on the one line diagram.
3. Size: Lugs suitable for indicated conductor sizes, with additional gutter space, if required, for larger conductors.
4. Main and Neutral Lugs: Mechanical type.
5. Ground Lugs and Bus-Configured Terminators: Mechanical type.
6. Feed-Through Lugs: Where indicated provide mechanical type, suitable for use with conductor material. Locate at opposite end of bus from incoming lugs or main device. Provide where indicated on drawings.

7. Subfeed (Double) Lugs: Where indicated provide mechanical type suitable for use with conductor material. Locate at same end of bus as incoming lugs or main device.
8. Extra-Capacity Neutral Lugs: Rated 200 percent of phase lugs mounted on extra-capacity neutral bus where indicated.

H. Service Entrance: Where panelboards are used as service equipment with one or more main service disconnecting and overcurrent protective devices, provide marking by an NRTL acceptable to authority having jurisdiction indicating panelboard is suitable for use as service equipment. Coordinate with utility company for any additional requirements.

I. Future Devices: Provide mounting brackets, bus connections, filler plates, and necessary appurtenances required for future installation of devices. Where panelboards. are noted to have "space" or "space only", this shall be prepared space with all bussing, lugs, etc. as required to accept future installation of over-current devices.

J. Panelboard Short-Circuit Current Rating: Fully rated to interrupt symmetrical short-circuit current available at terminals. Panelboard and overcurrent protective device short circuit ratings shall be at least 110 percent of the actual available fault current.
1. Panelboards rated 240V or less: minimum 22,000 A.
2. Panelboards rated above 240V: minimum 42,000 A.

K. Provide dead front panelboards with copper bus bars, arranged for 208Y/120V, three phase, four wire, solid neutral or 480Y/277V, three phase, four wire, solid neutral as shown on drawings. Panels shall meet or exceed all requirements of NEMA PB-1 and UL 67. Panels shall be minimum 20" wide.

L. Provide full size insulated neutral bus where neutral indicated on the schedules.

M. Provide ½ inch spaces for panels mounted at exterior walls below grade to establish air space behind panels.

N. Provide bolt-on, molded case, circuits breakers with thermal-magnetic trips. Muti-pole breakers shall be single handle, common trip. Provide handle locks for emergency lighting circuits, fire alarm, security, or other similar functions. Circuit breakers rated 125A or less shall be marked for 60 and 75 degrees C conductors.

O. Provide fully rated circuit breakers equal to short circuit interrupting ratings as scheduled on Drawings.

P. Provide adjustable magnetic trip units for circuit breakers rated 125A to 600A serving motors, with range of 5-10 times (10 percent tolerance) trip unit rating.

Q. Provide UL-listed shunt trip attachment for breakers where indicated on Drawings.

R. Provide HACR listed circuit breakers where breakers serve HVAC packaged units.

2.3 DISTRIBUTION PANELBOARDS

A. Panelboards: NEMA PB 1, power and feeder distribution type.

B. Provide bolt-on circuit breakers for overcurrent protective devices.

C. Doors: Secured with three-point vault-type latch with tumbler lock; keyed alike. For doors more than 36 inches high, provide two latches.

D. All panelboards shall be capable of accepting 225-amp 3 pole branch breakers as a minimum unless otherwise noted.

2.4 LIGHTING AND APPLIANCE BRANCH-CIRCUIT PANELBOARDS

A. Panelboards: NEMA PB 1, lighting and appliance branch-circuit type.

B. Branch Overcurrent Protective Devices: Bolt-on circuit breakers, replaceable without disturbing adjacent units.

C. Doors: Door-in-door construction with concealed hinges; secured with multipoint latch with tumbler lock; keyed alike. The outer door shall permit full access to the panel interior. Inner door shall permit access to breaker operating handles and labeling, but current carrying terminals and bus shall remain concealed.

D. All panelboards shall have space to accept forty-two 20-amp single pole circuit breakers unless otherwise noted.

2.5 DISCONNECTING AND OVERCURRENT PROTECTIVE DEVICES

A. Molded-Case Circuit Breaker (MCCB): Comply with UL 489, with interrupting capacity to meet available fault currents.
   1. Thermal-Magnetic Circuit Breakers:
      a. Inverse time-current element for low-level overloads.
      b. Instantaneous magnetic trip element for short circuits.
      c. Adjustable magnetic trip setting for circuit-breaker frame sizes 225 A and larger.
   2. Adjustable Instantaneous-Trip Circuit Breakers:
      a. Magnetic trip element with front-mounted, field-adjustable trip setting.
   3. Electronic trip circuit breakers for circuit breaker frame sizes 400A and larger, as well as all main circuit breakers associated with NEC 700 Emergency System:
      a. RMS sensing.
      b. Field-replaceable rating plug or field-replicable electronic trip.
      c. Digital display of settings, trip targets, and indicated metering displays.
      d. Multi-button keypad to access programmable functions and monitored data.
      e. Ten-event, trip-history log. Each trip event shall be recorded with type, phase, and magnitude of fault that caused the trip.
      f. Integral test jack for connection to portable test set or laptop computer.
      g. Field-adjustable Instantaneous, Long- and short-time pickup, and Ground-fault pickup settings.
   4. GFCI Circuit Breakers: Single- and two-pole configurations with Class A ground-fault protection (6-mA trip).
   5. GFEP Circuit Breakers: Class B ground-fault protection (30-mA trip).
   6. AFCI Circuit Breakers: Comply with UL 1699; 120/240-V, single-pole configuration.

7. MCCB features and accessories:
   a. Standard frame sizes, trip ratings, and number of poles.
   b. The breaker handle indicates tripped status.
   c. Lugs: Mechanical style, suitable for number, size, trip ratings, and conductor materials.
   d. Ground-Fault Protection: Integrally mounted relay and trip unit with adjustable pickup and time-delay settings, push-to-test feature, and ground-fault indicator.
   e. Shunt Trip: 120 V or 24V trip coil energized from separate circuit, set to trip at 75 percent of rated voltage.
   f. Undervoltage Trip: Set to operate at 35 to 75 percent of rated voltage with field-adjustable 0.1- to 0.6-second time delay.
   g. Multipole units enclosed in a single housing or factory assembled to operate as a single unit.
   h. Handle Padlocking Device: Fixed attachment, for locking circuit-breaker handle on or off position.

B. Provide Ground Fault protection for circuit breakers rated 1000 A and higher on solidly grounded wye systems more than 150V to ground.

C. Provide Arc Flash energy reducing maintenance switch with local status indicator for circuit breakers rated 1200A and higher or where circuit breaker trip setting can be adjusted to 1200A or greater.

2.6 METERING

A. Where indicated comply with requirements shown on drawings.

2.7 SURGE PROTECTION DEVICES

A. Where panelboards are indicated with integral SPD, comply with requirements in Section 264300, “Surge Protective Devices”. Factory install SPDs prior to shipment.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Verify actual conditions with field measurements prior to ordering panelboards to verify that equipment fits in allocated space in, and comply with, minimum required clearances specified in NFPA 70.

B. Receive, inspect, handle, and store panelboards according to NECA 407 and NEMA PB 1.1.

C. Examine panelboards before installation. Reject panelboards that are damaged or rusted or have been subjected to water saturation.

D. Examine elements and surfaces to receive panelboards for compliance with installation tolerances and other conditions affecting performance of the Work. Ensure area to receive panelboard has adequate clearance for panelboard installation.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Coordinate layout and installation of panelboards and components with other construction that penetrates walls or is supported by them, including electrical and other types of equipment, raceways, piping, encumbrances to workspace clearance requirements, and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

B. Install panelboards and accessories according to NECA 407 and NEMA PB 1.1.

C. Temporary Lifting Provisions: Remove any temporary lifting eyes, channels, and brackets and temporary blocking of moving parts from panelboards.

D. Mount top of trim 90 inches above finished floor unless otherwise indicated or where required to maintain center of trip handle on overcurrent protection devices below 79-inches. Where mounted in groups, align top of trim or tub for all panels in an area.

E. Mount panelboard cabinet plumb and rigid without distortion of box.

F. Mount recessed panelboards with fronts uniformly flush with wall finish and mating with back box.

G. Provide steel slotted support structures where required for freestanding equipment or where building mounting surface is unsuitable.

H. Install overcurrent protective devices and controllers not already factory installed. Set field-adjustable, circuit-breaker trip ranges.

I. Install filler plates in unused spaces.

J. Stub four (4) 1-inch and two (2) 1-1/4-inch empty conduits from recessed panelboard into accessible ceiling space or space designated to be ceiling space in the future. Provide suitable closures for spare conduits and identify with a suitable label.

K. Arrange conductors in gutters into groups and bundle and wrap with wire ties after completing load balancing.

L. Comply with NECA 1.

3.3 CONNECTIONS

A. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL

486A-486B. Where a tightening torque is indicated as a numeric value on equipment or in installation instructions provided by the manufacturer, use a calibrated torque tool to achieve that indicated torque value, unless the equipment manufacturer has provided installation instructions for an alternative method of achieving the required torque.

3.4 IDENTIFICATION

A. Comply with requirements in Section 260553, "Identification for Electrical Systems" and as noted below:
   1. Provide a directory card inside each door, covered with a plastic non-yellowing shield. Directory Card to indicate installed circuit loads after balancing panelboard loads. Obtain approval before installing. Use a computer to create directory in Microsoft Excel; handwritten directories are not acceptable. Digital versions to be provided to Owner.
   2. The room numbers used to fill out the panel directories shall match the actual final name and numbering scheme selected by the Owner. They shall not be filled out per the construction drawing numbering scheme unless the Contractor is directed to do so by the Architect or Engineer.
   3. Provide nameplate for each panelboard.
   4. For distribution panelboards, provide nameplate for each branch circuit device.
   5. All distribution equipment shall be shipped from the manufacturer with factory-applied warning labels affixed to the outside front of the equipment (as it will be installed per the plans). All labeling shall be in compliance with NFPA 70 requirements.
   6. Labels affixed to equipment by the equipment manufacturer shall comply with drawing and specification labeling requirements or shall be omitted by the manufacturer and field-installed by the Contractor. Labels which are factory-installed and not in compliance shall be removed and replaced and equipment enclosures refinished or replaced by the manufacturer to repair finish.

3.5 FIELD QUALITY CONTROL

A. Perform the following Tests and Inspections:
   1. Visual and Mechanical Inspection:
      a. Examine equipment nameplate data and confirm proper identification.
      b. Inspect the physical, electrical, and mechanical condition of the equipment and all components in accordance with the manufacturers' instructions.
      c. Inspect anchorage, alignment, and grounding.
      d. Inspect bolted electrical connections and terminations for high resistance by verifying tightness with calibrated torque-wrench method in accordance with manufacturer's published data.
      e. Exercise all active components.
      f. Inspect all mechanical indicating devices for correct operation.
      g. Physically test key interlock systems to check for proper functionality prior to energizing.
   2. Electrical Acceptance Testing:
      a. Perform an insulation resistance test for one minute on each panelboard bus, component, connecting supply, feeder, and control circuit. Open control and metering circuits within the panelboard and remove neutral connection to surge protection and other electronic devices prior to insulation test. Reconnect after test.

Test voltages and minimum resistance shall be in accordance with manufacturer's published data.

3. Circuit Breaker Testing: For all circuit breakers with electronic trip units, determine minimum pickup current, long-time and short-time pickup and delay, and instantaneous pickup by secondary current injection. Certify compliance with test parameters and ensure settings match recommendations from final approved power system study.
4. Test ground-fault protection of equipment for service equipment per NFPA 70.
5. Test and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

B. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace them with new units and retest.

C. Panelboards will be considered defective if they do not pass tests and inspections.

D. Prepare test and inspection reports, including a certified report that identifies panelboards included and that describes results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.6 CLEANING

A. On completion of installation, inspect interior and exterior of panelboards. Remove paint splatters and other spots. Vacuum dirt and debris; do not use compressed air to assist in cleaning. Repair exposed surfaces to match the original finish.

3.7 ADJUSTING

A. Adjust moving parts and operable component to function smoothly and lubricate as recommended by manufacturer.

B. Set field-adjustable circuit-breaker trip ranges as specified in Section 260573, "Power System Studies".

C. All circuit breakers identified as spares shall be left in the OFF position.

D. Load Balancing: After Substantial Completion, but not more than 60 days after Final Acceptance, measure load balancing and make circuit changes:
1. Measure as directed during period of normal system loading.
2. Perform load-balancing circuit changes outside normal occupancy/working schedule of the facility and at time directed.
3. After circuit changes, recheck loads during normal load period. Record all load readings before and after changes and submit test records.
4. Tolerance: Difference exceeding 20 percent between phase loads, with a panelboard, is not acceptable. Rebalance and recheck as necessary to meet this minimum requirement.

END OF SECTION

SECTION 262726 - WIRING DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. This section of the specifications covers all wiring devices and cover plates, standard, weatherproof and dust-tight.

B. All 120/208V receptacles installed in public areas shall be tamper proof type.

C. Section Includes:
1. Straight Blade receptacles.
2. GFCI receptacles.
3. USB receptacles.
4. SPD receptacles.
5. Twist-locking receptacles.
6. Controlled receptacles.
7. General use snap switches.
8. Manual Motor Control switches.
9. Wall Plates.
10. Cord and plug sets.
11. Floor service fittings.
12. Poke-through assemblies.
13. Prefabricated multioutlet assemblies.
14. Service poles.
15. Cord Reels

1.3 REFERENCES

A. Abbreviations
1. AFCI : Arc-fault circuit interrupter.
2. CR: Corrosion Resistant
3. EMI: Electromagnetic interference.
4. GFCI: Ground-fault circuit interrupter.
5. IG: Isolated Ground
6. SPD: Surge Protective Device
7. TR: Tamper Resistant.
8. USB: Universal Serial Bus.
9. WR: Weather Resistant.

B. Definitions
   1. Outlet: A point on the wiring system at which current is taken to supply utilization equipment.
   2. Pigtail: Short lead used to connect a device to a branch-circuit conductor.
   3. Receptacle. A receptacle is a contact device installed at the outlet for the connection of an attachment plug. A single receptacle is a single contact device with no other contact device on the same yoke. A multiple receptacle is two or more contact devices on the same yoke.

C. Reference Standards: The following publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest version as of the date of the Contract Documents, unless otherwise specified.
   1. National Electrical Contractors Association (NECA):
      a) NECA 130, “Standard for Installing and Maintaining Wiring Devices"
   2. National Electrical Manufacturers Association (NEMA)
      b) NEMA WD 1, “General Color Requirements for Wiring Devices”
      c) NEMA WD 6, “Wiring Devices—Dimensional Specifications”

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide product indicated or equal from one of the following:
   1. Eaton/Arrow Hart
   2. Hubbell
   3. Leviton
   4. Pass & Seymour/Legrand

B. Source Limitations: Obtain each type of wiring device and associated wall plate from single source from single manufacturer.

2.2 GENERAL WIRING-DEVICE REQUIREMENTS

A. Wiring Devices, Components, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Comply with NFPA 70.

C. RoHS compliant.

D. Devices for Fixtures, Furnishings, and Equipment:
   1. Receptacles: Match plug configurations.
   2. Cord and Plug Sets: Match equipment requirements.

E. All terminations shall be side-wired clamping type. “Backstab” terminations or modular connectors are not permitted.

F. Device Color:
1. Wiring devices in finished spaces connected to normal power system: As selected by Architect unless otherwise indicated or required by NFPA 70 or device listing.
2. Wiring Devices in unfinished spaces connected to normal power system: Grey unless otherwise indicated or required by NFPA 70 or device listing.
3.
4. Wiring devices connected to emergency power system: Red unless otherwise indicated or required by NFPA 70 or device listing.

G. Wall Plate Color:
1. Color as selected by Architect from manufacturer’s full range

2.3 SPECIFICATION GRADE STRAIGHT-BLADE RECEPTACLES

A. Specification Grade Receptacle, Comply with NEMA WD 6, UL 498, FS W-C-596

TYPE	RATING	CONFIGURATION	BASIS OF DESIGN
Duplex	20A, 125V	NEMA 5-20R	Hubbell 5362
Single	20A, 125V	NEMA 5-20R	Hubbell 5361
Duplex-TR	20A, 125V	NEMA 5-20R	Hubbell 5362TR
Duplex-IG	20A, 125V	NEMA 5-20R	Hubbell IG5362
Duplex-WR	20A, 125V	NEMA 5-20R	Hubbell 5362WR
Duplex-CR	20A, 125V	NEMA 5-20R	Hubbell HBL53CM62
Single	30A, 250V	NEMA 6-30R	Hubbell HBL9330
Single	50A, 250V	NEMA 6-50R	Hubbell HBL9367
Single	20A, 250V	NEMA 10-20R	Hubbell HBL9326

2.4 SPECIFICATION GRADE GFCI RECEPTACLES

B. Specification Grade GFCI Receptacles, Comply with UL 498, FS W-C-596, and UL 943 Class A.

C. Non-feed through type unless otherwise required, Integral self-testing GFCI with "Test" and "Reset" buttons and LED indicator light that is lighted when the unit is tripped. If critical components are damaged and ground fault protection is lost, power to receptacle shall be discontinued.

TYPE	RATING	CONFIGURATION	BASIS OF DESIGN
Duplex GFCI	20A, 125V	NEMA 5-20R	Hubbell GFRST20
Duplex GFCI with Alarm	20A, 125V	NEMA 5-20R	Hubbell GFRST20A
Duplex GFCI - TR	20A, 125V	NEMA 5-20R	Hubbell GFTRST20
Duplex GFCI - WR	20A, 125V	NEMA 5-20R	Hubbell GFTWRST20

Duplex GFCI - CR	20A, 125V	NEMA 5-20R	Hubbell GFRST52M
GFCI Blank Face	20A, 125V		Hubbell GFBFST20

2.5 USB RECEPTACLES

A. USB Charging Receptacle and Outlet, Comply with UL 1310 and USB 3.0 devices.

B. Dual port, combination USB Type A and C, 5 V dc, and 5 A per receptacle (minimum).

TYPE	RATING	CONFIGURATION	BASIS OF DESIGN
Duplex USB - TR	20A, 125V	NEMA 5-20R	Hubbell USB20AC5
Duplex USB - WR	20A, 125V	NEMA 5-20R	Hubbell USB20AC5WR

C. Twist-Lock, Single Receptacles, with matching plug as required by equipment. Comply with NEMA WD 6, UL 498, FS W-C-596.

TYPE	RATING	CONFIGURATION	BASIS OF DESIGN
Single	20A, 125V	NEMA L5-20R	Hubbell HBL2310
Single	20A, 250V	NEMA L6-20R	Hubbell HBL2320
Single	20A, 277V	NEMA L7-20R	Hubbell HBL2330

2.6 CONTROLLED RECEPTACLES

A. Specification Grade Receptacle, Permanently marked and suitable for use with automatic switching means. Comply with NEMA WD 6, UL 498B, FS W-C-596.

TYPE	RATING	CONFIGURATION	BASIS OF DESIGN
Duplex Single Face Control	20A, 125V	NEMA 5-20R	Hubbell 5362C1TR
Duplex Two Face Control	20A, 125V	NEMA 5-20R	Hubbell 5361C2TR

2.7 GENERAL USE SNAP SWITCHES

A. Switches, 120/277 V, Comply with UL 20, and FS W-S-896.

TYPE	RATING	CONFIGURATION	BASIS OF DESIGN
Single Pole	20A, 120/277V		Hubbell 1221
Double Pole	20A, 120/277V		Hubbell 1222
Three Way	20A, 120/277V		Hubbell 1223
Four Way	20A, 120/277V		Hubbell 1224

B. Pilot-Light Switches, illuminated when switch is ON:

TYPE	RATING	CONFIGURATION	BASIS OF DESIGN
Single Pole	20A, 120/277V		Hubbell 1221PL

C. Illuminated Switches, illuminated when switch is OFF:

TYPE	RATING	CONFIGURATION	BASIS OF DESIGN
Single Pole	20A, 120/277V		Hubbell 1221IL

D. Key-Operated Switches, Factory-supplied key in lieu of switch handle:

TYPE	RATING	CONFIGURATION	BASIS OF DESIGN
Single Pole	20A, 120/277V		Hubbell 1221L
Three Way	20A, 120/277V		Hubbell 1223L
Four Way	20A, 120/277V		Hubbell 1224L

E. Double-Throw, Momentary-Contact, Center-off Switches.

TYPE	RATING	CONFIGURATION	BASIS OF DESIGN
Single Pole	20A, 120/277V		Hubbell 1557
Low Voltage	5A, 24VDC		Hubbell 1557LV

2.8 MANUAL MOTOR CONTROL SWITCHES

A. Motor-Starting Switches (MSS): "Quick-make, quick-break" toggle type for manual control of single or three phase motors up to 3/4 HP where overload protection is not required or is provided separately, marked to indicate whether unit is on or off.
   1. Standard: Comply with NEMA ICS 2, general purpose, Class A.

B. Fractional Horsepower Manual Controllers (FHPMC): "Quick-make, quick-break" toggle type with integral overload protection for use with single phase motors up to 1HP; marked to show whether unit is off, on, or tripped.
   1. Configuration: Non-reversing unless noted otherwise on drawings.
   2. Overload Relays: Inverse-time-current characteristics; NEMA ICS 2, Class 10 tripping characteristics; heaters matched to nameplate full-load current of actual protected motor and ambient temperature; external reset push button; melting alloy type.
   3. Red pilot light where indicated on drawings.
   4. HOA selector switch with dry contact inputs where indicated on drawings.

C. Provide NEMA 1, NEMA 3R or other enclosure suitable for the location and atmosphere.

D. All manual starters located in finished areas shall be in flush-mounted enclosures.

2.9 PENDANT CORD-CONNECTOR DEVICES

A. Description: Matching, locking type plug and receptacle body connector, heavy-duty grade.

B. Body: Nylon, with screw-open, cable-gripping jaws and provision for attaching external cable grip.

C. External Cable Grip: Woven wire-mesh type made of high-strength, galvanized-steel wire strand, matched to cable diameter, and with attachment provision designed for corresponding connector.

2.10 CORD AND PLUG SETS

A. Match voltage and current ratings and number of conductors to requirements of equipment being connected.

B. Cord: Rubber-insulated, stranded-copper conductors, with Type SOW-A jacket; with green-insulated grounding conductor and ampacity of at least 130 percent of the equipment rating.

C. Plug: Nylon body and integral cable-clamping jaws. Match cord and receptacle type for connection.

2.11 WALL PLATES

A. Single and combination types shall match corresponding wiring devices.
   1. Plate-Securing Screws: Metal with head color to match plate finish.
   2. Material for Finished Spaces: Smooth, 0.060-inch high-impact thermoplastic or satin-finished, type 304 stainless steel.
   3. Material for Unfinished Spaces: Aluminum or type 430 stainless steel.
   4. Material for rough service or corrosive locations including gymnasiums, kitchens, mechanical rooms, material management, and food service areas: satin-finished, Type 304 stainless steel.

      d) For kitchen and food service areas, provide foam gasket behind plate to help prevent water infiltration.

B. Material for Interior Damp Locations: Cast aluminum with spring-loaded lift cover and listed and labeled for use in wet and damp locations.

C. Wet-location, Weatherproof, in-use cover plates: extra duty, suitable for use with and decorator style devices, die-cast aluminum lockable cover, self-closing, gasketed, standard box mounting.
   1. Vertical mounting - Hubbell WP26E or equal.
   2. Horizontal mounting - Hubbell WP26EH or equal.

D. Cover plates for lighting control devices exposed to severe physical damage: Low profile, flip-up clear polycarbonate cover. STI Stopper or equal.

2.12 FLOOR BOXES AND POKE-THROUGH ASSEMBLIES

A. Description: Single or multi-service, recess activated, multi-gang floor outlet with devices capable of supplying combinations of power, data, voice, and AV services in a single assembly.

B. Manufacturers: Subject to compliance with requirements, provide product indicated on drawings or approved equal by one of the following:
   1. FSR
   2. Hubbell
   3. Legrand (Wiremold) Basis of Design is Wiremold. Refer to electrical drawings for sizes and quantities of floor boxes.

C. Floor Boxes and Poke-Thru Assemblies
   1. Comply with UL514A.
   2. Material: Cast metal or sheet metal with finished interior
   3. Type: Fully adjustable before and after floor installation.
   4. Shape: Rectangular or Round
   5. Designed for use with industry standard wall plates, devices, and modular inserts.
   6. Painted with corrosion resistant fusion-bonded epoxy where used in on-grade floor applications.
   7. Classified for fire resistance up to 2 hours where used in rated floors.
   8. Evaluated by UL to meet U.S. safety standards for scrub water exclusion.
   9. Provide separate paths for management of telecommunications and power cables in compliance with NFPA 76.
   10. Cover: ADA-compliant, with less than 0.15-inch rise to cover flange, hinged for 180-degree opening, Gasketed, Die-cast powder coated aluminum suitable for multiple floor surfaces.
       e) Surface style for carpet and VCT floor finishes.
       f) Flush style for wood, tile, finished concrete, and terrazzo floor finishes.

2.13 PREFABRICATED MULTIOUTLET ASSEMBLIES

A. Description: Two-piece surface metal raceway, with factory-wired multioutlet harness.

B. Components shall be products from a single manufacturer designed for use as a complete, matching assembly of raceways and receptacles.

C. Raceway Material: Metal, with manufacturer's standard finish.

D. Multioutlet Harness:
   1. Receptacles: 20-A, 125-V.
   2. Receptacle Spacing: 18 inches unless noted otherwise.
   3. Wiring: No. 12 AWG solid, Type THHN copper.

2.14 SERVICE POLES

A. Dual-Channel Service Poles

1. Description: Factory-assembled and -wired units to route power and communications cabling from connections above ceiling to outlets below ceiling.
2. Listed and labeled in accordance with UL 5 for exposed power raceway and fittings, and UL 2024 for communications raceway and fittings.
3. Poles: Minimum 2.5-inch- square cross-section, with height adequate to extend from floor to at least 6 inches above ceiling, and with separate channels for power wiring and voice and data communication cabling.
4. Mounting: Ceiling trim flange with concealed bracing arranged for positive connection to ceiling supports; with pole foot and carpet pad attachment.
5. Material: Aluminum.
6. Finishes: Manufacturer's standard painted finish and trim combination.
7. Wiring: Sized for minimum of five No. 12 AWG power and ground conductors and a minimum of four, balanced twisted pair data communication cables.
8.

2.15 CORD REELS

A. Description: Reel equipped with, or intended for use with, length of flexible cord, providing means for cord to be unwound by user as desired, providing spring take-up mechanism to rewind cord on reel, and providing latch to restrain action of spring take-up mechanism while cord reel is in use.

B. Comply with UL355.

C. Spring Driven, suitable for industrial and commercial use, No. 12 AWG conductors, 20A rating, Black aluminum housing, Ball stop, pivot base, 30ft spool capacity with 20A quadraplex or double duplex receptacles unless noted otherwise.

PART 3 - EXECUTION

3.1 APPLICATION

A. Provide receptacles and cover plates listed for the installed environment.

B. Outdoor receptacles and receptacles located in wet locations shall be weather resistant, GFCI type, with weatherproof enclosure.

C. Provide GFCI receptacles where required by the NEC in addition to the locations noted on the drawings.
1. Bathrooms
2. Kitchens and food preparation or cooking areas
3. Rooftops
4. Outdoor/Exterior locations
5. Within 6 feet of sinks, tubs, showers stalls, eyewash stations, and emergency showers
6. Indoor Wet and Damp locations
7. Locker Rooms and Showers
8. Mechanical/Janitor Rooms

9. Laundry areas

D. Provide weather-resistant rating for GFCI receptacles installed in wet locations.

E. Where GFCI receptacles are located in areas that are not readily accessible, provide GFCI blank face device in readily accessible location approved by Architect.

F. Provide tamper resistant receptacles where required by the NEC in addition to the locations noted on the drawings. Drawings indicate all receptacles in areas accessible to students shall be tamper resistant.

3.2 INSTALLATION

A. Unless more stringent requirements are specified in Contract Documents or manufacturers' instructions, comply with installation instructions in NECA 130.

B. Mounting Heights: Unless otherwise indicated in Contract Documents, comply with mounting heights recommended in NECA NEIS 1.

C. Devices that have been installed before painting shall be masked. No plates or covers shall be installed until all finishing and cleaning has been completed. Replace stained or improperly painted wiring devices and coverplates.

D. Install non-feed-through GFCI receptacles where protection of downstream receptacles is not required. Where GFCI receptacles share a single circuit with other devices, a ground fault on any GFCI receptacle shall not interrupt power to downstream devices.

E. Coordination for all receptacles: Confirm receptacle configuration of all special purpose receptacles with approved submittals prior to installation and provide devices to match equipment plugs. Contractor shall replace any incompatible receptacle discovered during owner move-in.

F. Coordination with Other Trades:
1. Adjust locations of outlets to suit arrangement of partitions and furnishings. Locate outlets to avoid blocking by supports, furnishings, and other architectural fixtures.
2. Adjust locations of floor boxes and poke-throughs to coordinate with locations of structural members, concealed piping, and concealed conduit.
3. Protect installed devices and their boxes. Do not place wall finish materials over device boxes and do not cut holes for boxes with routers that are guided by riding against outside of boxes.
4. Keep outlet boxes free of plaster, drywall joint compound, mortar, cement, concrete, dust, paint, and other material that may contaminate the raceway system, conductors, and cables.
5. Install device boxes in brick or block walls so that the cover plate does not cross a joint unless the joint is troweled flush with the face of the wall.
6. Install wiring devices after all wall preparation, including painting, is complete.

G. Conductors:
1. Do not strip insulation from conductors until right before they are spliced or terminated on devices.
2. Strip insulation evenly around the conductor using tools designed for the purpose. Avoid scoring or nicking of solid wire or cutting strands from stranded wire.
3. The length of free conductors at outlets for devices shall meet provisions of NFPA 70, Article 300, without pigtails.

H. Device Installation:
1. Replace all devices that have been in temporary use during construction and that were installed before building finishing operations were complete.
2. Keep each wiring device in its package or otherwise protected until it is time to connect conductors.
3. Do not remove surface protection, such as plastic film and smudge covers, until all finish work is complete.
4. Connect devices to branch circuits using pigtails that are not less than 6 inches in length.
5. Use side wiring with binding-head screw terminals. Wrap solid conductor tightly clockwise, two-thirds to three-fourths of the way around terminal screw.
6. Use a torque screwdriver when a torque is recommended or required by manufacturer.
7. When conductors larger than #12 AWG are installed on 15- or 20-A circuits, splice #12 AWG pigtails for device connections.
8. Tighten unused terminal screws on the device.
9. When mounting into metal boxes, remove the fiber or plastic washers used to hold device-mounting screws in yokes, allowing metal-to-metal contact.
10. Install devices and assemblies' level, plumb, and square with building lines. Align devices vertically and horizontally. Securely fasten devices into boxes.

I. Device Orientation:
1. Install switches with "OFF" position down.
2. Install ground pin of vertically mounted receptacles up, and on horizontally mounted receptacles to the left so the neutral blade is at the top.

J. Device Plates:
1. Do not use oversized or extra-deep plates. Repair wall finishes and remount outlet boxes when standard device plates do not fit flush or do not cover rough wall opening.
2. All outlets not provided with wiring devices shall be closed with a blank plate matching other plates in the area.
3. Align coverplate mounting screw slots in the same direction, either vertical or horizontal. Do not overtighten coverplate mounting screws. Overtightening can cause the coverplate to warp, dimple, bend, and in the case of plastic faceplates, crack or break.

3.3 IDENTIFICATION:

A. Comply with Section 260553 "Identification for Electrical Systems."
1. All device wall plates shall be labeled with panel and circuit designation by means of machine printed adhesive tape.
2. All device boxes shall have panel and circuit designations identified within the box.

3.4 FIELD QUALITY CONTROL

A. Test Instruments: Use instruments that comply with UL 1436.

B. Using a test plug, perform the following tests and inspections for receptacles:
   1. Insert and remove test plug to verify that devices are securely mounted.
   2. Verify correct configuration of hot, neutral, and ground pins.
   3. Verify correct operation of ground fault protective devices.

C. Nonconforming Work:
   1. Device will be considered defective if it does not pass tests and inspections.
   2. Remove and replace defective units and retest.

D. Prepare test and inspection reports.

END OF SECTION

SECTION 262813 - FUSES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. Description: Provide labor, material, equipment, related services, and supervision required for the installation of cartridge fuses that were utilized for overcurrent and/or current limitation applications.

B. Section Includes:
   1. Cartridge fuses rated 600V-AC and less for use in control circuits, enclosed switches, panelboards, switchboards, and motor controllers.
   2. Spare fuse cabinet.

1.3 REFERENCES

A. Definitions
   1. Fuse: A protective device that opens a circuit during specified overcurrent conditions by means of a current responsive element.

B. Reference Standards: The following publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest version as of the date of the Contract Documents, unless otherwise specified.
   1. National Electrical Contractors Association (NECA)
      a. NECA 420, “Fuse Applications”

1.4 SEQUENCING

A. Submit the preliminary power system study prior to receiving final approval of equipment and system protective devices submittals and prior to release of equipment drawings for manufacturing. Adjust equipment sizes, frame sizes, and trip units as necessary to achieve performance requirements outlined in Section 260573, “Power Systems Studies”.

1.5 COORDINATION

A. Coordinate fuse ratings with utilization equipment nameplate limitations of maximum fuse size and with system short-circuit current levels indicated in power system study.

1.6 MAINTENANCE MATERIALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Fuses: Equal to10 percent of quantity installed for each size and type, but no fewer than three of each 100 amps and above, and not less than six of each size and type for below 100 amps.
   2. Fuse Pullers: Two for each size and type.

1.7 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to replace fuses that fail in materials or workmanship within 18 months from date of Substantial Completion.

1.8 FIELD CONDITIONS

A. Where ambient temperature to which fuses are exposed is less than 40 deg F or more than 100 deg F, apply manufacturer's ambient temperature adjustment factors to fuse ratings.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Cooper Bussmann, Inc.
   2. Littlefuse, Inc.
   3. Mersen USA.

B. Source Limitations: Obtain fuses, for use within a specific product or circuit, from single source from single manufacturer.

2.2 GENERAL REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Comply with:
   1. NEMA FU 1 – Low Voltage Cartridge Fuses.
   2. UL 248 – Standard for Low Voltage Fuses.
   3. UL 512 – Fuseholders.

2.3 CARTRIDGE FUSES

A. Characteristics: NEMA FU 1, current limiting, nonrenewable cartridge fuses with voltage ratings consistent with circuit voltages.
   1. Type RK-1: 250 or 600-V, zero- to 600-A rating, 200 kAIC minimum, fast acting or time delay.
   2. Type RK-5: 250 or 600-V, zero- to 600-A rating, 200 kAIC minimum, fast acting or time delay.
   3. Type CC: 600-V, zero- to 30-A rating, 200 kAIC minimum, fast acting or time delay.
   4. Type J: 600-V, zero-to-600-A rating, 200 kAIC minimum, time delay.
   5. Type L: 600-V, 601- to 6000-A rating, 200 kAIC minimum, time delay option.

B. Voltage: Rating suitable for circuit phase-to-phase voltage.

C. Provide dual element fuses with separate overload and short circuit elements.

2.4 SPARE-FUSE CABINET

A. Manufacturer: Bussmann #SFC-FUSE-CAB spare fuse cabinet or equal.

B. Characteristics: Wall-mounted steel unit with full-length, recessed piano-hinged door and key-coded cam lock and pull.
   1. Size: Adequate for storage of spare fuses specified with 15 percent spare capacity minimum.
   2. Finish: Gray, baked enamel.
   3. Identification: "SPARE FUSES" in 1-1/2-inch-high white letters on black lamicoid plate. Mount plate on exterior of door.
   4. Fuse Pullers: For each size of fuse, where applicable and available, from manufacturer.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine fuses before installation. Reject fuses that are moisture damaged or physically damaged.

B. Examine holders to receive fuses for compliance with installation tolerances and other conditions affecting performance, such as rejection features.

C. Examine utilization equipment nameplates and installation instructions. Install fuses of sizes and with characteristics appropriate for each piece of equipment.

D. Evaluate ambient temperatures to determine if fuse rating adjustment factors must be applied to fuse ratings.

E. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 FUSE APPICATIONS

A. Service, Feeders, and Branch Circuits (601-6000A): Class L, time delay. Bussmann HI-CAP Fuses KRP-C or equal. Fuses shall hold 500% of rated current for a minimum of 4 seconds.

B. Feeders and Branch Circuits (0-600A): Class RK1, time delay. Bussmann Low-Peak Dual Element Fuses, LPN-RK (250 volts) or LPS-RK (600 volts) or equal. The fuse shall hold 500% of rated current for a minimum of 10 seconds.

C. Motor Circuits – Class RK1 or Class L, time delay as indicated above.
   1. Motor with 1.15 service factor: Size at 125% of motor FLA. For high inrush current applications size 150% to 200% of motor FLA.
   2. Motor with 1.0 service factor: Size at 115% of motor FLA.

D. Control Circuits: Class CC, time delay. Bussmann Low-Peak Fuses LP-CC or equal. Fuses shall hold 200% of rated current for a minimum of 12 seconds.

E. Adjust fuse type and selection as required to ensure available fault current at equipment controllers indicated in power systems study does not exceed labeled SCCR values.

3.3 INSTALLATION

A. Fuses shall be shipped separately. Any fuses shipped installed in equipment, shall be replaced by the Electrical Contractor with new fuses as specified above prior to energizing at no additional expense to Owner. All fuses shall be stored in moisture free packaging at job site and shall be installed immediately prior to energizing of the circuit in which it is applied.

B. No fuses shall be installed in the equipment until the installation is complete, including tests and inspections required prior to being energized. All fuses shall be of the same manufacturer to ensure retention of selective coordination, as designed.

C. Provide a complete set of fuses for all fusible devices. Arrange fuses so rating information is readable without removing fuse.

D. Install spare-fuse cabinet(s). Locate in Main Electrical Room.

E. Upon completion of the building, the Contractor shall provide the Owner with spare fuses in Spare-Fuse Cabinet.

3.4 IDENTIFICATION

A. Install labels complying with requirements for identification specified in Section 260553 "Identification for Electrical Systems".
   1. Indicate fuse rating and type on the outside door of each fused switch.

END OF SECTION

SECTION 262816 - ENCLOSED SWITCHES AND CIRCUIT BREAKERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. Description: Section includes requirements for the provision of individually enclosed switches and circuit breakers including manufacturing, fabrication, configuration, and installation as required for the complete performance of the Work, as shown on the drawings and specifications

B. Section includes:
   1. Fusible and Non-Fusible Switches.
   2. Enclosed Circuit Breakers.
   3. Elevator Shunt Trip Switches.
   4. Enclosures.

1.3 REFERENCES

A. Abbreviations
   1. HD: Heavy Duty
   2. MCCB: Molded Case Circuit Breaker
   3. NC: Normally Closed
   4. NO: Normally Open
   5. SCCR: Short Circuit Current Rating

B. Definitions
   1. Disconnect: A switch, device, group of devices, or other means used to disconnect conductors of a circuit from their source of supply.
   2. Switch (switching device): A device, manually operated, unless otherwise designated, for opening and closing or for changing the connection of a circuit. Also referred to as safety switches or disconnect switches.

1.4 SEQUENCING

A. Submit the preliminary power system study prior to receiving final approval of equipment and system protective devices submittals and prior to release of equipment drawings for manufacturing. Adjust equipment sizes, frame sizes, and trip units as necessary to achieve performance requirements outlined in Section 260573, “Power Systems Studies”.

1.5 COORDINATION

A. Product Selection for Restricted Space: Drawings indicate space available for enclosed switches including clearances between enclosed switches and adjacent surfaces and other items. Furnish and install equipment to comply with NEC clearances.

1.6 WARRANTY

A. Manufacturer's Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace devices that fail in materials or workmanship within 18 months from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. ABB/General Electric.
   2. Eaton Electrical Inc.
   3. Square D

B. Source Limitations: Obtain enclosed switches, overcurrent protection devices, and all other electrical distribution equipment through one source from a single manufacturer unless approved otherwise.

2.2 GENERAL REQUIREMENTS

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

B. Comply with NFPA 70.

C. Service-Rated Switches and Circuit Breakers: Labeled for use as service equipment.

D. Short-Circuit Current Rating: Fully rated to interrupt symmetrical short-circuit current available at terminals. Switch and overcurrent protective device short circuit ratings shall be at least 110% of the actual available fault current.

2.3 FUSIBLE AND NON-FUSIBLE SWITCHES

A. Type HD, Heavy Duty, Single Throw, 250-VAC or 600-VAC, 1200 A and Smaller unless noted otherwise.

B. Quick-make, quick-break operating handle and switch mechanism integral to box.

C. UL 98 and NEMA KS 1, horsepower rated, with clips or bolt pads to accommodate fuses where indicated.

D. Externally operable dual interlocked handle to prevent opening front cover with switch in ON position, or closing switch when door is open. Visible load interrupter knife switch blades in the off position with door open.

E. Lockable handle with capability to accept three padlocks and interlocked with cover in closed position.

F. All current carrying parts shall be plated by an electrolytic process to resist corrosion and to promote cooling.

G. Accessories:
1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
3. Lugs: UL Listed, mechanical type, front removeable, and suitable for number, size, and conductor material at 75 deg C.
4.
5. Auxiliary Contact Kit: NO/NC (Form "C") auxiliary contact(s), arranged to activate before switch blades open. Contact rating as required for application.
6. Electrical Interlock Kit: Pivot arm operated from the switch mechanism, breaking a control circuit before the main switch blades break.

H. For receptacle switches provide interlocking linkage between the receptacle and switch mechanism to prevent inserting or removing plug while switch is in the on position, inserting any plug other than specified, and turning switch on if an incorrect plug is inserted or correct plug has not been fully inserted into the receptacle.

2.4 ENCLOSED MOLDED-CASE CIRCUIT BREAKERS

A. General Requirements: Comply with UL 489, NEMA AB 1, and NEMA AB 3, with interrupting capacity to comply with available fault currents.

B. Circuit breakers shall be constructed using glass-reinforced insulating material. Current carrying components shall be completely isolated from the handle and the accessory mounting area.

C. Circuit breakers shall have a toggle operating mechanism with common tripping of all poles, which provides quick-make, quick-break contact action. The circuit-breaker handle shall be over center, be trip free, and reside in a tripped position between on and off to provide local trip indication. Circuit-breaker escutcheon shall be clearly marked on and off in addition to providing international I/O markings. Equip circuit breaker with a push-to-trip button, located on the face of the circuit breaker to mechanically operate the circuit-breaker tripping mechanism for maintenance and testing purposes.

D. MCCBs shall be equipped with a device for locking in the open position.

E. Thermal-Magnetic Circuit Breakers: Inverse time-current element for low-level overloads and instantaneous magnetic trip element for short circuits. Adjustable magnetic trip setting for circuit-breaker frame sizes 250 A and larger.

F. Electronic Trip Circuit Breakers: Field-replaceable rating plug, rms sensing, with the following field-adjustable settings:
   1. Long-time, Short-time, and Instantaneous trip unless noted otherwise on drawings.

G. Current-Limiting Circuit Breakers: Frame sizes 400 A and smaller, and let-through ratings less than NEMA FU 1, RK-5.

H. Ground-Fault, Circuit-Interrupter (GFCI) Circuit Breakers: Single-, two-pole, and three-pole configurations with Class A ground-fault protection (6-mA trip).

I. Ground-Fault Equipment-Protection (GFEP) Circuit Breakers: With Class B ground-fault protection (30-mA trip).

J. Features and Accessories:
   1. Standard frame sizes, trip ratings, and number of poles.
   2. Lugs: UL Listed, mechanical type, suitable for number, size, trip ratings, and conductor material at 75 deg C.
   3. Ground-Fault Protection: Comply with UL 1053; integrally mounted, self-powered type with mechanical ground-fault indicator; relay with adjustable pickup and time-delay settings, push-to-test feature, internal memory, and shunt trip unit; and three-phase, zero-sequence current transformer/sensor.
   4. Shunt Trip: Trip coil energized from separate circuit, with coil-clearing contact. Coordinate coil voltage and provide control circuits as required for application.

2.5 ELEVATOR SHUNT TRIP SWITCHES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Bussmann
   2. Eaton
   3. Littlefuse
   4. Mersen

B. General Requirements: Comply with ASME A17.1, UL 50, and UL 98, with Class J fuse block and 200-kA interrupting and short-circuit current rating.

C. Type HD, Heavy-Duty, Three Pole, Single-Throw Fusible Switch; UL 98 and NEMA KS 1; integral shunt trip mechanism; horsepower rated, with clips or bolt pads to accommodate fuses; lockable handle with capability to accept three padlocks; interlocked with cover in closed position.

D. Control Circuit: 120-V ac; obtained from integral control power transformer, with primary and secondary fuses.

E. Accessories:
   1. Key switch for key-to-test function.
   2. Red ON pilot light.
   3. Isolated neutral lug.
   4. Mechanically interlocked auxiliary contacts that change state when switch is opened and closed.
   5. Form C alarm contacts that change state when switch is tripped.
   6. Three-pole, double-throw, fire-safety, and alarm relay; 24-V dc coil voltage.

F. Three-pole, double-throw, fire-alarm voltage monitoring relay complying with NFPA 72.

2.6 ENCLOSURES

G. Enclosed Switches and Circuit Breakers: NEMA AB 1, NEMA KS 1, NEMA 250, and UL 50, to comply with environmental conditions at installed location.
   1. Indoor, Dry and Clean Locations: NEMA 250, Type 1.
   2. Outdoor and Wet Locations: NEMA 250, Type 3R.
   3. Kitchen and Wash-Down Areas: NEMA 250, Type 3R, stainless steel.

H. Enclosure Finish: The enclosure shall be finished with the standard manufacturer gray finish.

I. Conduit Entry: NEMA 250 Types 4, 4X, and 12 enclosures shall contain no knockouts.

PART 3 - EXECUTION

3.1 EXAMINATION

A. Examine elements and surfaces to receive enclosed switches and circuit breakers for compliance with installation tolerances and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Coordinate layout and installation of switches, circuit breakers, and components with equipment served and adjacent surfaces. Maintain required workspace clearances and required clearances for equipment access doors and panels.

B. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.

C. Securely fasten each switch and circuit breaker to the supporting structure or wall, utilizing a minimum of four (4) 1/4-inch bolts. Do not mount in an inaccessible location or where the passageway to the switch may become obstructed.

D. After equipment has been installed, inspected, and is ready to be energized, install fuses in fusible devices in accordance with equipment nameplates and requirements in Section 262813, “Fuses”.

E. Comply with NFPA 70 and NECA 1.

F. Provide electrical interlock kit and low voltage wiring where utilized on the line side of VFD controller to shut down VFD prior to disconnection of power. Coordinate control wire termination with Division 25.

G. Provide electronic trip breakers where required to achieve performance requirements outlined in Section 260573, “Power Systems Studies”.

H. Provide fusible switches with current limiting fuses or current limiting circuit breaker for equipment disconnecting means where equipment short circuit current rating is insufficient for available fault current.

I. Where battery lowering devices are specified with Elevators, provide connection between an auxiliary contact at the elevator disconnect and the battery lowering device.

J. Where enclosed breakers or switches are provided on the load side of a VFD, provide connection between and auxiliary contact at the disconnect and the VFD that will trigger a freewheel stop on the VFD before the disconnect contacts open.

3.3 CONNECTIONS

A. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B. Where a tightening torque is indicated as a numeric value on equipment or in installation instructions provided by the manufacturer, use a calibrated torque tool to achieve that indicated torque value, unless the equipment manufacturer has provided installation instructions for an alternative method of achieving the required torque.

3.4 IDENTIFICATION

A. Comply with requirements in Section 260553, “Identification for Electrical Systems”
   1. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.
   2. Label each enclosure with nameplate.

3.5 FIELD QUALITY CONTROL

A. Perform the following tests and inspections:
   1. Visual and Mechanical Inspection:
      a. Examine equipment nameplate data and confirm proper identification.
      b. Verify and record fuses sizes and types are in accordance with nameplates and power systems study.

c. Inspect the physical, electrical, and mechanical condition of the equipment and all components in accordance with the manufacturers' instructions.
d. Inspect anchorage, alignment, and grounding.
e. Inspect bolted electrical connections and terminations for high resistance by verifying tightness with calibrated torque-wrench method in accordance with manufacturer's published data.
f. Exercise all active components to ensure proper mechanical operation.
g. Check all interlocking systems for correct operation.

2. Circuit Breaker Testing: For all circuit breakers with electronic trip units, determine minimum pickup current, long-time and short-time pickup and delay, and instantaneous pickup by secondary current injection. Certify compliance with test parameters and ensure settings match recommendations from final approved power system study.
3. Test ground-fault protection of equipment for service equipment per NFPA 70.
4. Test all auxiliary devices/system interfaces and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

B. Switches and Circuit Breakers will be considered defective if they do not pass tests and inspections.

C. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace them with new units and retest.

D. Prepare test and inspection reports, including a certified report that identifies switches and circuit breakers included and that describes results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.6 ADJUSTING

A. Adjust moving parts and operable components to function smoothly and lubricate as recommended by manufacturer.

B. Set field-adjustable circuit-breaker trip ranges as specified in Section 260573 "Power System Studies".

END OF SECTION

SECTION 262900 - MOTOR CONTROLLERS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and General Provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Extent of motor starter work is indicated by drawings and schedules.

B. Section includes:
   1. Combination full voltage, non-reversing Motor Controllers.
   2. Combination Soft Start Motor Controllers

C. Related Requirements:
   1. Refer to Section 260500 “Common Work Results for Electrical Systems” for additional requirements related to motors connections.
   2. Refer to Section 262726 “Wiring Devices” for information on manual motor controllers.
   3. Refer to Division 25 for coordinating requirements related to control system interface points.

1.3 REFERENCES

A. Abbreviations
   1. FVNR: Full Voltage Non Reversing
   2. MCP: Motor Circuit Protector
   3. OCPD: Overcurrent protective device
   4. SCCR: Short Circuit Current Rating
   5. SCPD: Short-circuit protective device
   6. SCR: Silicon Controlled Rectifier

B. Definitions
   1. Soft Starter: Solid state reduced voltage non-reversing motor controller

1.4 SEQUENCING

A. Submit the preliminary power system study prior to receiving final approval of equipment and system protective devices submittals and prior to release of equipment drawings for manufacturing. Adjust equipment sizes, frame sizes, and trip units as necessary to achieve performance requirements outlined in Section 260573, “Power Systems Studies”.

1.5 MAINTENANCE MATERIAL

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Fuses: Equal to one spare for every 10 installed units, but not less than 5 units for each size and type.
   2. Overloads: Equal to one spare for every 9 installed units, but not less than 3 units for each size and type.

1.6 WARRANTY

A. Manufacturer's Warranty: Manufacturer agrees to repair or replace enclosures, starters, overcurrent protective devices, accessories, and factory installed interconnection wiring that fail in materials or workmanship within 18 months.

PART 2 - PRODUCTS

2.1 GENERAL REQUIREMENTS:

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency acceptable to authorities having jurisdiction, and marked for intended location and application.

B. UL Compliance and Labeling: Fabricate and label motor controllers to comply with UL 508.

C. NEC Compliance: Comply with NEC as applicable to wiring methods, construction and installation of motor starters.

D. NEMA Compliance: Comply with applicable portions of NEMA standards pertaining to motor controllers/starters and enclosures.

2.2 MANUFACTURERS:

A. Manufacturer: Subject to compliance with requirements, provide products from one of the following:
   1. ABB/General Electric
   2. Eaton
   3. Siemens.
   4. Square D. Co.

2.3 MANUAL MOTOR CONTROLLERS

A. Refer to Section 262726 “Wiring Devices” for manual motor controller requirements.

2.4 COMBINATION FULL VOLTAGE MOTOR CONTROLLER

A. Description: Factory-assembled, combination full-voltage, non-reversing magnetic motor controller consisting of the controller, indicated disconnecting means, SCPD, OCPD, pushbuttons, selector switch(es), and indicator lights in a single enclosure.

B. All combination starter/disconnect switches shall have low-voltage protection, solid state overloads, start / stop pushbuttons, Hand-Off-Auto selector switch and Red and Green pilot lights.

C. All combination starter/disconnect switches shall be Type HD, Heavy Duty, Single Throw, 600-V ac, 1200 A and Smaller: UL 98 and NEMA KS 1, horsepower rated, lockable handle with capability to accept three padlocks, and interlocked with cover in closed position.

D. Combination motor starters shall be rated in accordance with NEMA sizes and horsepower ratings. No starter shall be listed as a fractional size. Contactor contacts shall be silver alloy, double break, and shall allow for inspection on NEMA Sizes 00 through 4 without the use of tools. Size 5 and larger shall allow for inspection utilizing standard tools. They shall be replaceable without removing the line, load, or control wiring from the starter, and replaceable without removing the starter from the enclosure.

E. Contactor coils shall be the encapsulated type, and shall be replaceable on NEMA Sizes 00 through 4 without the use of tools. Size 5 and larger shall be replaceable with standard tools. They shall be replaceable without removing the line, load, or control wiring from the starter, and replaceable without removing the starter from the enclosure.

F. Overload protection shall be provided by solid state electronic overload relay. Single-phase starters shall provide one- or two-leg overload protection; three-phase starters shall provide three-leg overload protection. Overload protection shall be class 10/20 selectable, have visible trip indicator, and manual or remote reset function.

G. Starter shall include phase failure relay with under-voltage protection.

H. Starter shall have integral controls transformer with primary and secondary fusing.

I. Starter to have two normally closed and two normally open auxiliary contacts.

J. Combination starter shall be suitable for straight through wiring.

K. Fusible Disconnecting Means: Heavy Duty, quick-make, quick-break, load break rated, such that during normal operation of the switch, the operation of the contacts shall not be capable of being restrained by the operating handle after the closing and opening action of the contacts has started. The handle and mechanism shall be an integral part of the box (not cover) with facilities for pad locking in the open or closed position with up to three padlocks. Switch doors shall be interlocked with switch handle so that the door can only be opened when the switch is in the "OFF" (open) position.

L. All safety switches shall have a factory installed neutral lug, when a neutral is necessary.

M. All current carrying parts shall be plated by an electrolytic process to resist corrosion and to promote cooling.

N. Provide the following Accessories:
   1. Equipment Ground Kit: Internally mounted and labeled for copper and aluminum ground conductors.
   2. Neutral Kit: Internally mounted; insulated, capable of being grounded and bonded; labeled for copper and aluminum neutral conductors.
   3. Lugs: Mechanical type, suitable for number, size, and conductor material.

2.5 COMBINATION SOFT START MOTOR CONTROLLER

A. Description: Factory Assembled, Solid state, reduced voltage, non-reversing motor controller consisting of controller, disconnecting means, protection devices, microprocessor with digital keypad in a single enclosure.

B. Enclosure shall include a door mounted digital keypad for adjusting the soft starter parameters and viewing process values and viewing the motor and soft starter status without opening the enclosure door. Provisions shall be available for padlocking the enclosure door.

C. The enclosed product shall be provided with molded case disconnect switch and in-line fuse block for Class J power fuses from 10 to 600A or Class L power fuses from 601 to 1600A for Type 1 short circuit protection.

D. The motor must be automatically protected from solid state component failure by an isolation contactor that opens when the motor is stopped or when the controller detects a fault condition including a shorted SCR.

E. The soft starter shall utilize an SCR bridge consisting of at least two SCRs per phase to control the starting and stopping of industry standard motors.

F. The soft start shall provide torque control for linear acceleration independent of motor load or application type without external feedback. The gating of the SCRs will be controlled in such a manner to ensure stable and linear acceleration ramp.

G. The soft starter shall be controlled by a microprocessor that continuously monitors the current and controls the phasing of the SCRs. Analog control algorithms shall not be allowed.

H. A shorting contactor shall be standard on soft starters in all enclosure configurations. Protective features and deceleration control options integral to the soft starter shall be available even when the shorting contactor is engaged.

I. The SCRs shall have a minimum P.I.V. rating of 1800 Vac. Lower rated SCRs with MOV protection are not acceptable.

J. All programming/configuration devices, display units, and field control wiring terminals shall be accessible on the front of the control module. Exposure to control circuit boards or electrical power devices during routine adjustments is prohibited.

K. Digital indication shall provide, as a minimum, the following conditions:
   1. Soft starter status - ready, starting/stopping, run.
   2. Motor status - current, torque, thermal state, power factor, operating time, power in kW.

3. Fault status - Motor thermal overload, soft starter thermal fault, loss of line or motor phase, line frequency fault, low line voltage fault, locked rotor fault, motor underload, maximum start time exceeded, external fault, serial communication fault, line phase reversal fault, motor overcurrent fault.

L. The soft starter must be preset to the following for adjustment-free operation in most applications:
1. Linear (torque-controlled) acceleration ramp of 15 seconds.
2. Current limitation to 400% of the motor full load current rating.
3. Class 10 overload protection.
4. Motor current preset per NEC / NFPA 70 table 430.150 for standard hp motors.

M. A digital keypad shall be utilized to configure operating and controller parameters such as FLA, acceleration ramp, torque, braking type, thermal overload Class, reset functions, etc.

N. Provide output relays to provide the following status indications:
1. One Form A (N.O.) minimum for indication of fault.
2. One Form A (N.O.) for indication that acceleration ramp is complete and current is below 130% motor FLA (end of start).
3. One Form A (N.O.) assignable to one of the following functions: motor thermal alarm, motor current level alarm, and motor underload alarm.

O. A microprocessor-based thermal protection system shall be included which continuously calculates the temperature-rise of the motor and soft starter and provides:
1. A motor overload pre-alarm that indicates by relay contact or logic output that the motor windings have exceeded 130% of its rated temperature rise. This function shall be for alarm only.
2. A motor overload fault will stop the motor if the windings have exceeded 140% of temperature-rise.
3. An electronic circuit with a time-constant adjustable to the motor's thermal cooling time-constant ensuring the memorization of the thermal state even if power is removed from the soft starter.
4. The soft starter shall provide line and motor phase loss, phase reversal, underload, stall, and jam protection.
5. The integral protective features shall be active even when the shorting contactor is used to bypass the SCRs during steady state operation.
6. The soft starter control circuit shall be fed from the line supply and be completely independent of the power circuit and separate from the control logic.

P. The peripheral soft starter control circuitry shall be operated at 120 Vac 60 Hz from a control power transformer included within the enclosure.

Q. Operator devices shall be door mounted and shall be:
1. Red STOP and black START push buttons.
2. Three position H-O-A switch which provides for manual (HAND) start or remote signal (AUTO) start from user-supplied relay contacts.
3. Three position FWD-OFF-REV switch provides forward, off and reverse selector switch mounted on the door (available with reversing starter only).
4. Red RUN pilot light illuminated whenever the soft starter is provided a run command and no-fault condition is present.

5. Green OFF pilot light illuminated whenever the soft starter is supplied with control power and no run command is present.
6. All operator devices shall be remote-mounted using supplied 120 Vac control logic. Clearly labeled terminals shall be provided for field installation.

R. Provide a shorting contactor that shall close, shorting the SCRs after the acceleration ramp is compete and motor current is below 130% of motor FLA, and open on a stop command to allow a deceleration ramp. Overload protection integral to the soft starter shall continue to protect the motor when shorting is engaged. A microprocessor shall control the operation of the shorting contactor via an output relay.

S. Provide full voltage bypass starter with overload protection to provide motor operation in the event of soft starter failure. Provide "NORM/BYPASS" selector switch on enclosure door.

PART 3 - EXECUTION

3.1 MOTOR CONTROLLER APPLICATION

A. FVNR and Soft Starter type motor controllers shall be combination type starter and disconnect switch unless noted otherwise on plans.

B. Starters smaller than 10HP shall be full voltage non-reversing type (FVNR). Starters 10HP and larger shall be soft starters.

C. SCCR ratings shall exceed the available fault current calculated by the power system study as required by Section 260573, "Power System Studies".

D. The starter shall be designed to operate in the environment in which installed including ambient temperature, humidity, and elevation.

E. Enclosure:
1. Type of each starter to comply with environmental conditions at installed location:
   a. Indoor, Dry and Clean Locations: NEMA 250, Type 1
   b. Outdoor Locations: NEMA 250, Type 3R.
   c. Kitchen and Wash-Down Areas: NEMA 250, Type 4X, stainless steel.
2. Provide provisions for padlocking the enclosure door.

3.2 EXAMINATION

A. Examine elements and surfaces to receive motor starters for compliance with installation tolerances, relationship to motors, and other conditions affecting performance of the Work.

B. Proceed with installation only after unsatisfactory conditions have been corrected.

3.3 INSTALLATION OF MOTOR CONTROLLERS:

A. Install motor starters as indicated, in accordance with manufacturer's written instructions, applicable requirements of NEC, NEMA, and NECA standards, and in compliance with recognized industry practices to ensure that products fulfill requirements.

B. Install individual wall-mounted switches and circuit breakers with tops at uniform height unless otherwise indicated.

C. Securely fasten each switch, circuit breaker and combination starter to the supporting structure or wall, utilizing a minimum of four (4) 1/4 inch bolts.

D. Maintain minimum clearances and workspace at equipment according to manufacturer’s written instructions and NEC. Do not mount in an inaccessible location or where the passageway to the switch may become obstructed.

E. Install fuses in fusible devices in accordance with Section 262813, “Fuses”.

F. Select and set overloads on the basis of full-load current rating as shown on motor nameplate.

G. Verify that overcurrent and overload protection devices are properly matched to actual motor nameplate data and service class.

H. Provide conductor reducers, taps and splices, as required, for proper termination of all branch circuits and feeders at disconnect switches, panelboards, motor starters, VFDs, etc. This shall include where conductors have been oversized to accommodate voltage drop, motor circuit conductor protection, and all instances where conductors are unable to terminate at factory lugs.

I. Final 18 inch of power wiring to motor shall be in liquid tight flexible conduit.

3.4 CONNECTIONS

A. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B.

B. Where a tightening torque is indicated as a numeric value on equipment or in installation instructions provided by the manufacturer, use a calibrated torque tool to achieve that indicated torque value, unless the equipment manufacturer has provided installation instructions for an alternative method of achieving the required torque.

3.5 IDENTIFICATION

A. Comply with requirements in Section 260553, “Identification for Electrical Systems”
   1. Identify field-installed conductors, interconnecting wiring, and components.
   2. Provide Warning Signs.
   3. Label each enclosure with nameplate.

3.6 FIELD QUALITY CONTROL:

A. Perform Test and Inspections:
   1. Visual and Mechanical Inspection:
      a. Compare equipment nameplate data with drawings and specifications.
      b. Inspect physical and mechanical condition.
      c. Inspect anchorage, alignment, and grounding.
      d. Verify the unit is clean.
      e. Inspect contactors:
         1) Verify mechanical operation.
         2) Verify contact gap, wipe, alignment, and pressure are according to manufacturer's published data.
      f. Motor Protection:
         1) Verify overload element rating is correct for its application.
         2) If motor-running protection is provided by fuses, verify correct fuse rating.
      g. Verify tightness of accessible bolted electrical connections by calibrated torque-wrench or low resistance ohmmeter. Bolt-torque levels and/or bolted connection resistance values shall be according to manufacturer's published data.
      h. Verify appropriate lubrication on moving current-carrying parts and on moving and sliding surfaces.
   2. Electrical Tests:
      a. Perform insulation-resistance tests for one minute on each pole, phase-to-phase and phase-to-ground with switch closed, and across each open pole. Insulation-resistance values shall be according to manufacturer's published data.
      b. Test motor protection devices according to manufacturer's published data.
      c. Verify voltages at the controller locations are within plus or minus 10 percent of the motor nameplate rated voltages. If outside the range for any motor, notify the design team before starting the motor.
      d. Perform operational tests by initiating control devices.
      e. Test all auxiliary devices/system interfaces and adjust controls, remote monitoring, and safeties. Replace damaged and malfunctioning controls and equipment.

B. Motor controller will be considered defective if it does not pass tests and inspections.

C. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance, otherwise replace with new units and retest.

D. Prepare test and inspection reports, including a certified report that identifies motor controllers included and that describes results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

END OF SECTION

SECTION 263213 - ENGINE GENERATOR

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. This Section includes packaged engine-generator sets suitable for use in applications with the features as specified and indicated where the engine generators will be used as the Standby power source for the system.

B. As part of this contract, provide all fuel (fill empty tank 100% full), engine fluids, filters, reinforced concrete pad/base and labor. Provide load bank and labor required for testing of the engine generator. At completion of all testing, completely fill all fuel tanks 100% in accordance with manufacturer’s recommendations prior to system turn-over.

1.3 DEFINITIONS

A. Emergency Standby Power (ESP): Per ISO 8528: The maximum power available during a variable electrical power sequence, under the stated operating conditions, for which a generating set is capable of delivering in the event of a utility power outage or under test conditions for up to 200 hours of operation per year with the maintenance intervals and procedures being carried out as prescribed by the manufacturers. The permissible average power output (Ppp) over 24 hours of operation shall not exceed 70 percent of the ESP unless otherwise agreed by the RIC engine manufacturer.

B. Operational Bandwidth: The total variation from the lowest to highest value of a parameter over the range of conditions indicated, expressed as a percentage of the nominal value of the parameter.

1.4 SEQUENCING

A. Submit the preliminary power system study prior to receiving final approval of equipment and system protective devices submittals and prior to release of equipment drawings for manufacturing. Adjust equipment sizes, frame sizes, and trip units as necessary to achieve performance requirements outlined in Section 260573, “Power Systems Studies”.

1.5 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer’s authorized representative who is trained and approved for installation of units required for this Project.

B. Manufacturer Qualifications: A qualified manufacturer. Maintain, within Connecticut, a service center capable of providing training, parts, and emergency maintenance repairs.

C. Source Limitations: Obtain packaged generator sets and auxiliary components through one source from a single manufacturer.

D. Comply with NFPA 37 (Standard For the Installation and Use of Stationary Combustion Engines and Gas Turbines).

E. Comply with NFPA 70 (National Electrical Code. Equipment shall be suitable for use in systems in compliance to Article 700, 701, and 702).

F. Comply with NFPA 110 (Emergency and Standby Power Systems) requirements for Level 1 emergency power supply system.

G. Comply with UL 2200.

1.6 PROJECT CONDITIONS

A. Environmental Conditions: Engine-generator system shall withstand the following environmental conditions without mechanical or electrical damage or degradation of performance capability:
   1. Ambient Temperature: 0F to 104°F
   2. Relative Humidity: 0 to 95 percent.
   3. Altitude: Sea level to 500.0 feet (152.4 m).

1.7 WARRANTY

A. Base Warranty: Manufacturer shall provide base warranty coverage on the material and workmanship of the generator set for a minimum of twenty-four (24) months for Standby product.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Onan/Cummins Power Generation; Industrial Business Group. (Basis of Design)
   2. Kohler
   3. Generac

B. The diesel engine shall be EPA Certified in accordance with the Federal and State of Connecticut Emission Laws.

2.2 ENGINE-GENERATOR SET

A. Factory-assembled and -tested, engine-generator set.

B. Mounting Frame: Maintain alignment of mounted components without depending on concrete foundation; and have lifting attachments.
   1. Rigging Information: Indicate location of each lifting attachment, generator-set center of gravity, and total package weight in submittal drawings.

C. Capacities and Characteristics:
   1. Power Output Ratings: Electrical output power rating for Standby operation at 600kW/ 750kVA, at 80 percent lagging power factor, 480/277 V, Three phase, 4 - wire, 60 hertz.
   2. Alternator shall be capable of accepting maximum 825kVA in a single step and be capable of recovering to a minimum of 90% of rated voltage based on requirements of NEMA MG1-32.
   3. Nameplates: For each major system component to identify manufacturer's name and address, and model and serial number of component. The engine-generator nameplate shall include information of the power output rating of the equipment.
   4.

D. Generator-Set Performance:
   1. Steady-State Voltage Operational Bandwidth: 1.0 percent of rated output voltage from no load to full load.
   2. Transient Voltage Performance: Not more than 20 percent variation for 50 percent step-load increase or decrease. Voltage shall recover and remain within the steady-state operating band within 5 seconds. On application of a 100% load step the generator set shall recover to stable voltage within 10 seconds.
   3. Steady-State Frequency Operational Bandwidth: 0.5 percent of rated frequency from no load to full load.
   4. Steady-State Frequency Stability: When system is operating at any constant load within the rated load, there shall be no random speed variations outside the steady-state operational band and no hunting or surging of speed.
   5. Transient Frequency Performance: Not more than 15 percent variation for 50 percent step-load increase or decrease. Frequency shall recover and remain within the steady-state operating band within 5 seconds. On application of a 100% load step the generator set shall recover to stable frequency within 10 seconds.
   6. Output Waveform: At full load, harmonic content measured line to line or line to neutral shall not exceed 5 percent total and 3 percent for any single harmonic. Telephone influence factor, determined according to NEMA MG 1, shall not exceed 50.
   7. Sustained Short-Circuit Current: (For engine-generator sets using a PMG-excited alternator) For a 3-phase, bolted short circuit at system output terminals, system shall supply a minimum of 300 percent of rated full-load current for not less than 8 seconds without damage to generator system components. For a 1-phase, bolted short circuit at system output terminals, system shall regulate both voltage and current to prevent over-voltage conditions on the non-faulted phases.
   8. Start Time: Comply with NFPA 110, Level 1, Type 10, system requirements.
   9. Ambient Condition Performance: Engine generator shall be designed to allow operation at full rated load in an ambient temperature under site conditions, based on highest ambient condition. Ambient temperature shall be as measured at the air inlet to the engine generator for enclosed units, and at the control of the engine generator for machines installed in equipment rooms.

2.3 ENGINE

E. Fuel: Diesel

F. Rated Engine Speed: 1800RPM.

G. Lubrication System: The following items are mounted on engine or skid:
1. Lube oil pump: shall be positive displacement, mechanical, full pressure pump.
2. Filter and Strainer: Fleetgaurd provided by the engine manufacturer of record to provide adequate filtration for the prime mover to be used, Fleetgaurd or equal.
3. Crankcase Drain: Arranged for complete gravity drainage to an easily removable container with no disassembly and without use of pumps, siphons, special tools, or appliances.

H. Engine Fuel System: The engine fuel system shall be installed in strict compliance to the engine manufacturer's instructions.

I. Coolant Jacket Heater: Electric-immersion type, factory installed in coolant jacket system. Comply with NFPA 110 requirements for Level 1 equipment for heater capacity and performance.

J. Governor: Adjustable isochronous, with speed sensing and a product of the engine manufacturer.

K.

L. Cooling System: Closed loop, liquid cooled
1. The generator set manufacturer shall provide prototype test data for the specific hardware proposed demonstrating that the machine will operate at rated standby load in an outdoor ambient condition of 50 deg C.
2. Coolant: Solution of 50 percent ethylene-glycol-based antifreeze and 50 percent water, with anticorrosion additives as recommended by engine manufacturer.
3. Size of Radiator overflow tank: Adequate to contain expansion of total system coolant from cold start to 110 percent load condition.
4. Temperature Control: Self-contained, thermostatic-control valve modulates coolant flow automatically to maintain optimum constant coolant temperature as recommended by engine manufacturer.

M.

N. Muffler/Silencer: Selected with performance as required to meet sound requirements of the application, sized as recommended by engine manufacturer and selected with exhaust piping system to not exceed engine manufacturer's engine backpressure requirements. For generator sets with outdoor enclosures the silencer shall be inside the enclosure.

O. Air-Intake Filter: Engine-mounted air cleaner with replaceable dry-filter element and restriction indicator.

P. Starting System: 24V, as recommended by the engine manufacturer; electric, with negative ground.
1. Components: Sized so they will not be damaged during a full engine-cranking cycle with ambient temperature at maximum specified in Part 1 "Project Conditions" Article.
2. Cranking Cycle: As required by NFPA 110 for level 1 systems.

3. Battery Cable: Size as recommended by engine manufacturer for cable length as required. Included required interconnecting conductors and connection accessories.
4. Battery Compartment: Factory fabricated of metal with acid-resistant finish.
5. Battery-Charging Alternator: Factory mounted on engine with solid-state voltage regulation. The battery charging alternator shall have sufficient capacity to recharge the batteries with all parasitic loads connected within 4 hours after a normal engine starting sequence.
6. Battery Chargers: Unit shall comply with UL 1236, provide fully regulated, constant voltage, current limited, battery charger for each battery bank. It will include the following features:
    a. Operation: Equalizing-charging rate based on generator set manufacturer's recommendations shall be initiated automatically after battery has lost charge until an adjustable equalizing voltage is achieved at battery terminals. Unit shall then be automatically switched to a lower float-charging mode and shall continue to operate in that mode until battery is discharged again.
    b. Automatic Temperature Compensation: Adjust float and equalize voltages for variations in ambient temperature from minus 20 deg C to plus 40 deg C to prevent overcharging at high temperatures and undercharging at low temperatures.
    c. Automatic Voltage Regulation: Maintain constant output voltage regardless of input voltage variations up to plus or minus 10 percent.
    d. Safety Functions: Sense abnormally low battery voltage and close contacts providing low battery voltage indication on control and monitoring panel. Sense high battery voltage and loss of ac input or dc output of battery charger. Either condition shall close contacts that provide a battery-charger malfunction indication at system control and monitoring panel.
    e. Provide LED indication of general charger condition, including charging, faults, and modes. Provide a LCD display to indicate charge rate and battery voltage. Charger shall provide relay contacts for fault conditions as required by NFPA110.
    f. Enclosure and Mounting: NEMA, Type 1, wall-mounted cabinet.

2.4 FUEL OIL STORAGE

A. Comply with NFPA 30.

B. Sub Base-Mounted Fuel Oil Tank: Provide a double wall secondary containment type sub base fuel storage tank. The tank shall be constructed of corrosion resistant steel and shall be UL 142 listed and labeled. The fuel tank shall include the following features:
    1. Capacity: Fuel for 24 Hour(s) continuous operation at 100 percent rated power output.
    2. Tank rails and lifting eyes shall be rated for the full dry weight of the tank, genset, and enclosure.
    3. Electrical stub up(s)
    4. Normal & emergency vents
    5. Lockable fuel fill
    6. Mechanical fuel level gauge
    7. High and low level switches to indicate fuel level
    8. Leak detector switch
    9.
    10. Sub base tank shall include a welded steel containment basin, sized at a minimum of 110% of the tank capacity to prevent escape of fuel into the environment in the event of a tank rupture.

11. Fill port with overfill prevention valve (OFPV)
12. Tank design shall meet the regional requirements for the Project location

2.5 CONTROL AND MONITORING

A. Engine generator control shall be microprocessor based and provide automatic starting, monitoring, protection and control functions for the unit.

B. Automatic Starting System Sequence of Operation: When mode-selector switch on the control and monitoring panel is in the automatic position, remote-control contacts in one or more separate automatic transfer switches initiate starting and stopping of generator set. When mode-selector switch is switched to the on position, generator set starts. The off position of same switch initiates generator-set shutdown. (Switches with different configurations but equal functions are acceptable.) When generator set is running, specified system or equipment failures or derangements automatically shut down generator set and initiate alarms. Operation of the local (generator set-mounted) and/or remote emergency-stop switch also shuts down generator set.

C. Manual Starting System Sequence of Operation: Switching on-off switch on the generator control panel to the on position starts generator set. The off position of same switch initiates generator-set shutdown. When generator set is running, specified system or equipment failures or derangements automatically shut down generator set and initiate alarms. Operation of the local (generator set-mounted) and/or remote emergency-stop switch also shuts down generator set.

D. Configuration: Operating and safety indications, protective devices, system controls, engine gages and associated equipment shall be grouped in a common control and monitoring panel. Mounting method shall isolate the control panel from generator-set vibration. AC output power circuit breakers and other output power equipment shall not be mounted in the control enclosure.

E. Indicating and Protective Devices and Controls: As required by NFPA 110 for Level 1 system, and the following:
   1. AC voltmeter (3-phase, line to line and line to neutral values).
   2. AC ammeter (3-phases).
   3. AC frequency meter.
   4. AC kVA output (total and for each phase). Display shall indicate power flow direction.
   5. Ammeter-voltmeter displays shall simultaneously display conditions for all three phases.
   6. Emergency Stop Switch: Switch shall be a red “mushroom head” pushbutton device complete with lock-out/tag-out provisions. Depressing switch shall cause the generator set to immediately stop the generator set and prevent it from operating.
   7. Fault Reset Switch: Supply a dedicated control switch to reset/clear fault conditions.
   8. DC voltmeter (alternator battery charging).
   9. Engine-coolant temperature gage.
   10. Engine lubricating-oil pressure gage.
   11. Running-time meter.
   12. Generator-voltage and frequency digital raise/lower switches. Rheostats for these functions are not acceptable. The control shall adjustment of these parameters in a range of plus or minus 5% of the voltage and frequency operating set point (not nominal voltage and frequency values.)

13. AC Protective Equipment: The control system shall include over/under voltage, over current, short circuit, loss of voltage reference, and over excitation shut down protection. There shall be an overload warning, and overcurrent warning alarm.
14. Status LED indicating lamps to indicate remote start signal present at the control, existing alarm condition, not in auto, and generator set running.
15. A graphical display panel with appropriate navigation devices shall be provided to view all information noted above, as well as all engine status and alarm/shutdown conditions (including those from an integrated engine emission control system). The display shall also include integrated provisions for adjustment of the gain and stability settings for the governing and voltage regulation systems.

F. Common Remote Audible Alarm: Comply with NFPA 110 requirements for Level 1 systems. Include necessary contacts and terminals in control and monitoring panel.
1. Overcrank shutdown.
2. Coolant low-temperature alarm.
3. Control switch not in auto position.
4. Battery-charger malfunction alarm.
5. Battery low-voltage alarm.

G. Remote Alarm Annunciator: Comply with NFPA 110. An LED labeled with proper alarm conditions shall identify each alarm event and a common audible signal shall sound for each alarm condition.

H. Remote Emergency-Stop Switch: Flush; wall mounted, unless otherwise indicated; and labeled. Push button shall be protected from accidental operation. Provide additional stop-switches within main electrical room and next to fire alarm control panel.

2.6 GENERATOR OVERCURRENT AND FAULT PROTECTION

A. The control system shall include over/under voltage, over current, short circuit, loss of voltage reference, and over excitation shut down protection. There shall be an overload warning, and overcurrent warning alarm.

B. Ground-Fault Indication: Comply with NFPA 70, "Emergency System" signals for ground-fault. Integrate ground-fault alarm indication with other generator-set alarm indications

C. The alternator shall be provided with an overcurrent protection relay that is UL-listed under category NRGU. The overcurrent protection system shall be coordinated with the thermal damage curve of the specific alternator provided. Submit thermal damage curve for alternator and protection curve (and settings if applicable) for the overcurrent protective system.

D. A 1200A output breaker with LSIG protection shall be provided. Coordinate with requirements of section 260573 “Power System Studies.”

2.7 GENERATOR, EXCITER, AND VOLTAGE REGULATOR

A. Comply with NEMA MG 1.

B. Drive: Generator shaft shall be directly connected to engine shaft. Exciter shall be rotated integrally with generator rotor.

C. Electrical Insulation: Class H

D. Temperature Rise: 105 degrees C over 40 degrees C ambient.

E. Construction shall prevent mechanical, electrical, and thermal damage due to vibration, over speed up to 125 percent of rating, and heat during operation at 110 percent of rated capacity.

F. Permanent Magnet Generator (PMG) provide excitation power for optimum motor starting and short circuit performance.

G. Enclosure: Drip-proof.

H. Voltage Regulator: SCR type, separate from exciter, providing performance as specified. The voltage regulation system shall be microprocessor-controlled, full wave rectified and provide a pulse-width modulated signal to the exciter.

I. Windings: Two-thirds pitch stator winding and fully linked amortisseur winding.

2.8 OUTDOOR GENERATOR-SET ENCLOSURE

A. Description: Sound Attenuated Aluminum Factory Skin-Tight housing. Multiple panels shall be lockable and provide adequate access to components requiring maintenance. Instruments, control, and battery system shall be mounted within enclosure.

B. Construction:
1. Hinged Doors: With padlocking provisions. Restraint/Hold back hardware to prevent door to keep door open at 180 degrees during maintenance. Rain lips over all doors.
2. Exhaust System:
3. Muffler Location: Within enclosure.
4. Hardware: All hardware and hinges shall be stainless steel.
5. Wind Rating: Wind rating shall be 150 mph
6. Mounting Base: Suitable for mounting on sub-base fuel tank or housekeeping pad.
7. A coastal-rated weather protective enclosure shall be provided which allows the generator set to operate at full rated load with a static pressure drop equal to or less than 0.5 inches of water.

C. Engine Cooling Airflow through Enclosure: Housing shall provide ample airflow for engine generator operation at rated load in an ambient temperature of 40 deg C.

D. Sound Performance: Reduce the sound level of the engine generator while operating at full rated load to a maximum of 70 dBA measured at any location 7 meters from the engine generator in a free field environment.

E. Site Provisions:
1. Lifting: Complete assembly of engine generator, enclosure shall be designed to be lifted into place as a single unit, using spreader bars.

2.9 FINISHES

A. Indoor and Outdoor Enclosures and Components: Powder-coated and baked over corrosion-resistant pretreatment and compatible primer. Manufacturer’s standard color or as directed on the drawings.

2.10 SOURCE QUALITY CONTROL

B. Prototype Testing: Factory test engine-generator set using same engine model, constructed of identical or equivalent components and equipped with identical or equivalent accessories.
   1. Tests: Comply with NFPA 110, Level 1 Energy Converters. In addition, the equipment engine, skid, cooling system, and alternator shall have been subjected to actual prototype tests to validate the capability of the design under the abnormal conditions noted in NFPA110.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Comply with packaged engine-generator manufacturers' written installation, application, and alignment instructions and with NFPA 70 and NFPA 110.

B. Equipment shall be installed by the contractor in accordance with final submittals and contract documents. Installation shall comply with applicable state and local codes as required by the authority having jurisdiction. Install equipment in accordance with manufacturer's instructions and instructions included in the listing or labeling of UL listed products.

C. Installation of equipment shall include furnishing and installing all interconnecting wiring between all major equipment provided for the on-site power system. The contractor shall also perform interconnecting wiring between equipment sections (when required), under the supervision of the equipment supplier.

D. Equipment shall be installed on concrete housekeeping pads. Equipment shall be permanently fastened to the pad in accordance with manufacturer’s instructions and seismic requirements of the site.

E. Equipment shall be initially started and operated by representatives of the manufacturer. All protective settings shall be adjusted as instructed by the consulting engineer.

F. All equipment shall be physically inspected for damage. Scratches and other installation damage shall be repaired prior to final system testing. Equipment shall be thoroughly cleaned to remove all dirt and construction debris prior to initial operation and final testing of the system.

G. Drain Piping: Install condensate drain piping to muffler drain outlet with a shutoff valve, stainless-steel flexible connector, and Schedule 40, black steel pipe, the full size of the drain connection, with welded joints.

H. Fuel Piping: Comply with Division 23 for fuel piping, valves, and specialties for fuel distribution.

I. Install electrical devices and components that are not factory mounted.

J. Provide all interconnection wiring between system components and equipment.

K. On completion of the installation by the electrical contractor, the generator set supplier shall conduct a site evaluation to verify that the equipment is installed per manufacturer’s recommended practice.

3.2 CONNECTIONS

L. Coordinate with all trades for generator interface with other building systems.

M. Provide flexible connections for all connections to the generator and between its components to reduce vibrations transmitted to surrounding structures.

N. Piping installation requirements are specified in other Sections. Drawings indicate general arrangement of piping and specialties.

O. Connect engine exhaust pipe to engine with flexible connector.

P. Fuel Connections:

Q. Comply with manufacturer’s instructions.

R. Connect fuel piping to engines with a gate valve and union and flexible connector.

S. Install manual shutoff valve in a remote location to isolate fuel supply to the generator.

T. Provide raceways for all wiring according to Section 260533 “Raceways and Boxes for Electrical Systems.”

U. Install and connect wiring according to Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

V. Provide Class D extra flexible stranded conductors for all connections to genset.

W. Control conductors installed between the transfer equipment and the emergency generator shall be kept entirely independent of all other wiring in accordance with NEC. Start signals shall be provided with 2-hour rated wiring.

X. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B. Where a tightening torque is indicated as a numeric value on equipment or in installation instructions provided by the manufacturer, use a calibrated torque tool to achieve that indicated torque value, unless the equipment manufacturer has provided installation instructions for an alternative method of achieving the required torque.

Y. Balance single-phase loads to obtain a maximum of 10 percent unbalance between any two phases.

3.3 GROUNDING

A. Ground and bond equipment according to Section 260526 "Grounding and Bonding for Electrical Systems."

B. Install a minimum of two auxiliary grounding electrodes at outdoor generator locations. Connect the electrodes to the equipment grounding conductor and to the frame of the generator in accordance with the generator manufacturer's recommendations.

C. If the grounded neutral conductor is switched at a 4-pole transfer switch, provide a main bonding jumper between the generator's grounded terminal (neutral) and the equipment grounding terminal.

3.4 ON-SITE ACCEPTANCE TEST

A. The complete installation shall be tested to verify compliance with the performance requirements of this specification following completion of all site work. Testing shall be conducted by representatives of the manufacturer, with required fuel supplied by Contractor. The Engineer shall be notified in advance and shall have the option to witness the tests.

B. The generator set manufacturer shall provide a site test specification covering the entire system. Tests shall include:

C. Prior to start of active testing, all field connections for wiring, power conductors, and bus bar connections shall be checked for proper tightening torque. Pre-Operational Test and Inspections include:
   1. Visual and Mechanical Inspection:
      a. Examine equipment nameplate data and confirm proper identification.
      b. Inspect the physical, electrical, and mechanical condition of the equipment and all components in accordance with the manufacturers' instructions.
      c. Inspect anchorage, alignment, and grounding.
      d. Verify the unit is clean.
      e. Inspect bolted electrical connections and terminations for high resistance by verifying tightness with calibrated torque-wrench method in accordance with manufacturer's published data.
      f. Exercise all active components.
      g. Inspect all mechanical indicating devices for correct operation.
      h. Physically test key interlock systems to check for proper functionality prior to energizing.
   2. Electrical and Mechanical Tests
      a. Perform insulation-resistance tests in accordance with IEEE 43.
         1) Machines larger than 200 hp. Test duration shall be 10 minutes. Calculate polarization index.
         2) Machines 200 hp or less. Test duration shall be one minute. Calculate the dielectric-absorption ratio.
      b. Test protective relay devices.
      c. Verify phase rotation, phasing, and synchronized operation as required by the application.
      d. Functionally test engine shutdown for low oil pressure, overtemperature, overspeed, and other protection features as applicable.
      e. Verify correct functioning of the governor and regulator.

D. Operational Test: After electrical circuitry has been energized, start units to confirm proper motor rotation and unit operation for generator and associated equipment.

E. Leak Test: After installation, charge exhaust, coolant, and fuel systems and test for leaks. Repair leaks and retest until no leaks exist.

F. Functional Acceptance Testing:
   1. Test the complete automatic transfer switch system and generator control system concurrently to ensure proper operation of the individual components and correct overall sequence of operation and to ensure that the operating transfer time, voltage, frequency, and time delay settings are in compliance with the specification requirements.
   2. Perform tests required by NFPA 110 and additional testing specified herein.
      a. Provide resistive load bank and temporary connections as required to supplement building load equal to 100 percent of the nameplate kW rating.
      b. Factory test data showing run-test loads is not acceptable.
      c. Record fuel consumption, coolant temperature, lube oil pressure, output voltage (each phase), output current (each phase), room temperature at 15-minute intervals during testing.
   3. Cold start test: Demonstrate the engine generator set will attain proper voltage and frequency within the specified time limit from a cold start after the closing of a single contact.
   4. Full load one step pickup: Verify system can achieve full nameplate kW rating in one step and achieve acceptable steady state operation.
   5. Full load operation test: Run the generator for a minimum of two hours while delivering the full nameplate kW rating.
   6. Transient Test: Verify voltage and frequency deviations are within acceptable limits while adding and dropping each step load.
      a. Verify ability to allow starting and running the largest motor load at its full load current rating while supplying all other simultaneous loads.
   7. Power Failure Testing: Open the power supply from the utility service(s), and observe proper sequence of operation of the system. Where multiple sources and/or generators are included in the project, simulate all possible power failure scenarios. Coordinate timing and obtain approval for start of test with site personnel.

G. Test instruments shall have been calibrated within the last 12 months, traceable to NIST Calibration Services, and adequate for making positive observation of test results. Make calibration records available for examination on request.

H. Test and adjust controls and safeties. Replace damaged and malfunctioning controls and equipment.

I. Remove and replace malfunctioning units and retest as specified above.

J. Retest: Correct deficiencies identified by tests and observations and retest until specified requirements are met.

K. Report results of tests and inspections in writing. Record adjustable settings, measured values, and observations. Attach a label or tag to each tested component indicating satisfactory completion of tests.

L. Infrared Scanning: After Substantial Completion, but not more than 60 days after final acceptance, perform an infrared scan of each power wiring termination and each bus connection while running with maximum load. Remove all access panels so terminations and connections are accessible to portable scanner.
   1. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan 11 months after date of Substantial Completion.
   2. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.

3. Record of Infrared Scanning: Prepare a certified report that identifies terminations and connections checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.5 TRAINING

A. The equipment supplier shall provide training for the facility operating personnel covering operation and maintenance of the equipment provided.

B. Training shall consist of not less than eight hours of hands-on instruction for a minimum of four attendees. Training shall cover the following topics at a minimum:
   1. Theory of operation
   2. Operation of Generator and components
   3. Maintenance and configuration
   4. Troubleshooting and Repair
   5. Replacement of components.

3.6 SERVICE AND SUPPORT

C. Initial Maintenance Service: Beginning at Substantial Completion, provide 18 months' full maintenance by skilled employees of manufacturer's designated service organization. Include quarterly exercising to check for proper starting, load transfer, and running under load. Include routine preventive maintenance as recommended by the manufacturer service manual and any calibration required for proper operation. Include emergency service. Provide parts and supplies same as those used in the manufacture and installation of original equipment.

D. The generator set supplier shall maintain service parts inventory for the entire power system at a central location which is accessible to the service location 24 hours per day, 365 days per year.

E. The generator set shall be serviced by a local service organization that is trained and factory certified in generator set service. The supplier shall maintain an inventory of critical power system replacement parts in the local service location. Service vehicles shall be stocked with critical replacement parts. The service organization shall be on call 24 hours per day, 365 days per year. The service organization should be physically located within 50 miles of the site.

END OF SECTION

SECTION 263600 - TRANSFER SWITCHES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. This Section includes transfer switches rated 600 V and less, including the following:
   1. Automatic transfer switches.
   2. Remote annunciation systems.
   3. Remote annunciation and control systems.
   4. 3-way manual transfer switches with (2) breaker interlock

1.3 QUALITY ASSURANCE

A. Manufacturer Qualifications: Maintain a service center capable of providing training, parts, and emergency maintenance repairs within a response period of less than eight hours from time of notification.

B. Testing Agency Qualifications: An independent agency, with the experience and capability to conduct the testing indicated, that is a nationally recognized testing laboratory(NRTL) as defined by OSHA in 29 CFR 1910.7.

C. Source Limitations: Obtain automatic transfer switches, remote annunciators, and remote annunciator and control panels through one source from a single manufacturer.

D. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.

E. Comply with NEMA ICS 1.

F. Comply with NFPA 70.

G. Comply with NFPA 99.

H. Comply with NFPA 110.

I. Comply with UL 1008 unless requirements of these Specifications are stricter.

1.4 SEQUENCING

J. Submit the preliminary power system study prior to receiving final approval of equipment and system protective devices submittals and prior to release of equipment drawings for manufacturing. Adjust equipment sizes, frame sizes, and trip units as necessary to achieve performance requirements outlined in Section 260573, “Power Systems Studies”.

1.5 COORDINATION

A. Coordinate size and location of concrete bases. Cast anchor-bolt inserts into bases. Concrete, reinforcement, and formwork requirements are specified in Division 03.

B. Equipment sizes and equipment layouts shall be considered basis of design. Equipment sizes vary by manufacturer. If proposed equipment is larger than the sizes illustrated, the burden shall be on the Contractor to provide equipment which fits in the space allotted while maintaining all code-required and manufacturer-recommended clearances.

C. Drawings indicate space available for electrical equipment, including clearances between equipment and adjacent surfaces and other items. Equipment installed must comply with all clearance, access and replacement working space requirements of the NEC and Owner

1.6 WARRANTY

A. Warranty Period: Two (2) years from date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Emerson; ASCO Power Technologies, LP.
2. Russelectric, Inc.
3. ESL Power Systems, Inc.

2.2 GENERAL TRANSFER-SWITCH PRODUCT REQUIREMENTS

A. Indicated Current Ratings: Apply as defined in UL 1008 for continuous loading and total system transfer, including tungsten filament lamp loads not exceeding 30 percent of switch ampere rating, unless otherwise indicated.

B. Tested Fault-Current Closing and Withstand Ratings: Adequate for duty imposed by protective devices at installation locations in Project under the fault conditions indicated, based on testing according to UL 1008.

C. Solid-State Controls: Repetitive accuracy of all settings shall be plus or minus 2 per- cent or better over an operating temperature range of minus 20 to plus 70 degrees C.

D. Resistance to Damage by Voltage Transients: Components shall meet or exceed volt- age-surge withstand capability requirements when tested according to IEEE C62.41. Components shall meet or exceed voltage-impulse withstand test of NEMA ICS 1.

E. Electrical Operation: Accomplish by a non-fused, momentarily energized solenoid or electric-motor-operated mechanism, mechanically and electrically interlocked in both directions.

F. Switch Characteristics: Designed for continuous-duty repetitive transfer of full-rated current between active power sources.
   1. Switch Action: Double throw; mechanically held in both directions.
   2. Contacts: Silver composition or silver alloy for load-current switching. Conventional automatic transfer-switch units, rated 225 A and higher, shall have sepa- rate arcing contacts.

G. Neutral Switching. Where four-pole switches are indicated, provide neutral pole switched simultaneously with phase poles.

H. Neutral Terminal: Solid and fully rated, unless otherwise indicated.

I. Heater: Equip switches exposed to outdoor temperatures and humidity, and other units indicated, with an internal heater. Provide thermostat within enclosure to control heater.

J. Annunciation, Control, and Programming Interface Components: Devices at transfer switches for communicating with remote programming devices, annunciators, or annunciator and control panels shall have communication capability matched with remote device and be BACnet compatible or provide means to communicate BACnet protocol.

K. Factory Wiring: Train and bundle factory wiring and label, consistent with Shop Drawings, either by color-code or by numbered or lettered wire and cable tape markers at terminations. Color-coding and wire and cable tape markers are specified in Division 26.
   1. Designated Terminals: Pressure type, suitable for types and sizes of field wiring indicated.
   2. Power-Terminal Arrangement and Field-Wiring Space: Suitable for top, side, or bottom entrance of feeder conductors as indicated.
   3. Control Wiring: Equipped with lugs suitable for connection to terminal strips.

L. Enclosures: General-purpose NEMA 250, Type 1 or 3R (outdoors), complying with NEMA ICS 6 and UL 508, unless otherwise indicated.

2.3 AUTOMATIC TRANSFER SWITCHES

A. Comply with Level 1 equipment according to NFPA 110.

B. Switching Arrangement: Double-throw type, incapable of pauses or intermediate position stops during normal functioning, unless otherwise indicated.

C. Manual Switch Operation: Unloaded. Control circuit automatically disconnects from electrical operator during manual operation.

D. Digital Communication Interface: Matched to capability of remote annunciator or annunciator and control panel.

E. Provide automatic transfer switches of number and rating as shown on Drawings. Current rating shall be based on classes of loads including tungsten and inductive loads. Switch shall be electrically-operated, mechanically-held, with one or two electric operators momentarily energized and connected to transfer mechanism by simple over- center linkage. Switch shall be inherently double throw, contactor design rated for continuous duty with power transfer section and control section interconnected to provide complete automatic operation. Switch shall be totally front accessible and mounted in lockable 12 gauge steel NEMA 1 enclosure. Switch shall meet NEMA and UL-1008 standards for use in emergency systems.

F. Automatic transfer switches with components of molded case circuit breakers or components not designed for continuous duty or repetitive load transfer will not be accepted.

G. Provide 30 cycle closing and withstand ratings for automatic transfer switches used on emergency systems where directly protected by a Power Circuit Breaker where instantaneous trip settings can be turned off to allow selective coordination of upstream over- current devices with downstream devices.

H. Provide heavy duty, silver-tungsten alloy main contacts protected by arcing contacts with magnetic blowouts. Provide wiping action for main contacts. Main contact with- stand rating shall not be less than 20 times continuous duty rating for minimum of three cycles.

I. Provide mechanical interlock to ensure only one of two possible positions, normal or emergency. Operating transfer time in either direction shall not exceed 30 cycles, except where longer period is permitted for motor load transfer.

J. Provide four pole transfer switches on systems with ground fault protection, with four poles mounted on common shaft with continuous current rating and closing and with standard rating of fourth pole equal to main poles.

K. Provide external, manual operator with same transfer speed as electrical operator.

L. In addition to requirements of Part 1, manufacturer shall include following:
   1. Descriptive literature.
   2. Plan, elevation, side, and front view arrangement drawings, including overall dimension, weights, and clearances, as well as mounting or anchoring requirements and conduit entrance locations.
   3. Schematic diagrams.
   4. Wiring diagrams.
   5. Accessory list.

M. Transfer switch shall be equipped with internal welded steel pocket, housing operations, and maintenance manual.

N. Transfer switch shall be top and bottom accessible.

O. Main contacts shall be capable of being replaced without removing main power cables.

P. Main contacts shall be visible for inspection without any major disassembly of transfer switch.

Q. Bolted bus connections shall have Belleville compression type washers.

R. When solid neutral is required, provide fully rated bus bar with required AL-CU neutral lugs.

S. Control components and wiring shall be front accessible. Control wires shall be multi-conductor 18 gauge 600 volt SIS switchboard type point to point harness. Control wire terminations shall be identified with tubular sleeve-type markers.

T. Switch shall be equipped with 90 degrees C rated copper/aluminum solderless mechanical type lugs.

U. Complete transfer switch assembly shall be factory tested to ensure proper operation and compliance with specification requirements. Furnish copy of factory test report upon request.

V. Automatic Transfer Switch Operation:
   1. Transfer switch shall be double throw, actuated by single electrical operator momentarily energized and connected to transfer mechanism by single over center type linkage. Total transfer time shall not exceed 30 cycles.
   2. Normal and emergency contacts shall be positively interlocked mechanically and electrically to prevent simultaneous closing. Main contacts shall be mechanically locked in both normal and emergency positions without use of hooks, latches,
   3. magnets, or springs, and shall be silver-tungsten alloy. Separate arcing contacts with magnetic blowouts shall be provided. Interlocked, molded case circuit breakers or contactors will not be acceptable.
   4. Transfer switch shall be equipped with safe external manual operator, designed to prevent injury to operating personnel. Manual operator shall have same contact to contact transfer speed as electrical operator to prevent flashover from switching main contacts slowly. External manual operator shall be safely operated from outside of transfer switch enclosure while enclosure door is closed.

W. Automatic Transfer Switch Controls:
   1. Transfer switch shall be equipped with microprocessor-based control system, to include operational functions of automatic transfer switch. Controller shall have two asynchronous serial ports. Controller shall have real time clock with NiCad battery back-up.
   2. CPU shall be equipped with self-diagnostics, which perform periodic checks of memory I/O and communication circuits, with watchdog/power fail circuit.
   3. Controller shall use industry standard open architecture communication protocol for high speed serial communications via multidrop connection to other controllers and to master terminal with up to 4,000 feet of cable, or further, with addition of communication repeater. Serial communication port shall be RS422/485 compatible.
   4. Serial communication port shall allow interface to either manufacturer's or Authority's furnished remote supervisory control.
   5. Controller shall have password protection required to limit access to qualified and authorized personnel.

6. Controller shall include 20 character, LCD display, with keypad, which allows access to system.
7. Controller shall include three phase over/under voltage, over/under frequency, phase sequence detection and phase differential monitoring on both normal and emergency sources.
8. Controller shall be capable of storing following records in memory for access either locally or remotely:
    a. Number of hours transfer switch is in emergency position (total since record reset).
    b. Number of hours emergency power is available (total since record reset).
    c. Total transfer in either direction (total since record reset).
    d. Date, time, and description of last four source failures.
    e. Date of last exercise period.
    f. Date of record reset.

X. Sequence of Operation:
1. When voltage on any phase of normal source drops below 70 percent, or 30 percent voltage differential between phases occurs, after programmable time delay period of 0-9999 seconds (factory set at 3 seconds) to al- low for momentary dips, engine starting contacts shall close to start generating plant.
2. Transfer switch shall transfer to emergency when generating plant has reached specified voltage and frequency on all phases.
3. After restoration of normal power on all phases to preset value of at least 90 per- cent to 110 percent of rated voltage, and at least 95 percent to 105 percent of rated frequency, and voltage differential is below 20 percent, adjustable time de- lay period of 0-9999 seconds (factory set at 300 seconds) shall delay retransfer to allow stabilization of normal power. If emergency power source should fail during this time delay period, switch shall automatically return to normal source.
4. After retransfer to normal, engine generator shall be allowed to operate at no load for programmable period of 0-9999 seconds, factory set at 300 seconds.

Y. Automatic Transfer Switch Accessories:
1. Provide programmable three phase sensing of normal source set to pick up at 90 percent and dropout at 70 percent of rated voltage and overvoltage to pick up at 120 percent and dropout out at 110 percent of rated voltage. Provide programmable frequency pickup at 95 percent and dropout at 90 percent and over frequency to pick up at 110 percent and dropout at 105 percent of rated frequency. Provide programmable voltage differential between phases, set at 20 percent, and phase sequence monitoring.
2. Provide time delay for override of momentary normal source power outages (de- lays engine start signal and transfer switch operation), programmable for 0-9999 seconds and set at 3 seconds.
3. Provide time delay to control contact transition time on transfer to either source, programmable for 0-9999 seconds and set with Programmed Neutral Time Delay Emergency to Normal at 0 seconds and Time Delay Normal to Emergency set at 2 seconds.
4. Provide time delay on retransfer to normal, programmable for 0-9999 seconds, factory set at 300 seconds, with overrun to provide programmable 0-9999 second time delay, factory set at 300 seconds (5 minutes), unloaded engine operation after retransfer to normal.
5. Provide time delay on transfer to emergency, programmable, set at 3 seconds. Time delay for each ATS shall be staggered.

6. Provide maintained type load test switch to simulate normal power failure, key- pad initiated.
7. Provide remote type load test switch to simulate normal power failure, remote switch initiated.
8. Provide contact to initiate engine starting rated 10 Amps, 30 volts DC, to close on failure of normal source.
9. Provide contact for customer functions rated 10 Amps, 30 volts DC, to open on failure of normal source.
10. Provide light emitting diodes mounted on microprocessor panel to indicate switch is in normal position, switch is in emergency position, and controller is running.
11. Provide plant exerciser in largest switch with 10 seven day events, programmable for any day of week and 24 calendar events, programmable for any month/day, to automatically exercise generating plant programmable in one mi- nute increments. Also include selection of either "no load" (switch will not trans- fer) or "load" (switch will transfer) exercise period, keypad initiated.
12. Provide option to select either "no commit" or "commit" to transfer operation in event of normal power failure. In "no commit position," load shall transfer to emergency position unless normal power returns before emergency source has reached 90 percent of its rated values (switch will remain in normal). In "commit position" load shall transfer to emergency position after any normal power failure, keypad initiated.
13. Provide two auxiliary contacts rated 10 Amp, 120 volts AC (for switches 100 to 800 amps) 15 amp, 120 volts AC (for switches 1000 to 4000 amps), mounted on main shaft, one closed on normal, other closed on emergency. Both contacts shall be wired to terminal strip for ease of customer connections.
14. Provide 3 phase digital LCD voltage readout, with one percent accuracy to dis- play three separate phase to phase voltages simultaneously, for both normal and emergency source.
15. Provide digital LCD frequency readout with one percent accuracy to display frequency for both normal and emergency source.
16. Provide LCD readout to display normal source and emergency source availability.
17.
18. Provide two time delay contacts that open simultaneously just (milliseconds) prior to transfer in either direction. These contacts shall close after time delay upon transfer, programmable for 0-9999 seconds after transfer.
19. Provide block transfer function energized from 24 VDC signal from generator control switchgear, to allow transfer to emergency.
20. Provide load shed function energized from 24 VDC signal from generator control switchgear, to disconnect load from emergency source when overload condition occurs.
21. Provide peak shave function energized from 24 VDC signal from generator control switchgear. This function shall start emergency generator and transfer ATS to emergency source reducing utility supply to building. After peak shave signal is removed, transfer switch shall retransfer to normal supply, bypassing retransfer time delay.

Z. Generator Control Wiring:
1. Provide control wiring for engine start circuit between generator and emergency automatic transfer switch(es). Wiring shall be independent of any fire pump start circuit wiring . Provide a listed two-hour fire rated wiring method in accordance for engine start circuit where the ATS is an NEC 700 or 701 system.
2. Provide control wiring in 3/4 inch C. between elevator machine room and (elevator) transfer switch.

3. Provide control wiring in 3/4 inch C. between ATS and remote generator annunciator for confirmation of ATS position.

AA. Approval:

1. As condition of approval, manufacturer shall verify that switches meet Standard UL-1008 with three-cycle short circuit closing and withstand unless specified as 30 cycle for applications where for selective coordination the instantaneous trip is disabled, as follows:
   a. RMS Symmetrical Amperes 480 VAC

Amperes	Closing and With-stand	Current Limiting Fuse Rating
100-400	42,000	200,000
600-800	65,000	200,000

2. During three-cycle closing and withstand tests, there shall be no contact welding or damage. Three-cycle tests shall be performed without use of current limiting fuses. Test shall verify that contact separation has not occurred, and there is contact continuity across all phases. Test procedures shall be in accordance with UL-1008, and testing shall be certified by UL.
3. When conducting temperature rise tests to UL-1008, manufacturer shall include post-endurance temperature rise tests to verify ability of transfer switch to carry full rated current after completing overload and endurance tests.
4. Microprocessor controller shall meet the following requirements:
   a. Storage conditions – 25 degrees C to 85 degrees C.
   b. Operation conditions – 20 degrees C to 70 degrees C ambient.
   c. Humidity 0 to 99 percent relative humidity, non-condensing.
   d. Capable of withstanding infinite power interruptions.
   e. Surge withstand per ANSI/IEEE C-37.90A-1978.
5. Manufacturer shall furnish copies of test reports upon request.

BB. Manufacturer:

1. Automatic transfer switches shall be by Russelectric RMTD, Asco 7000, or equal.
2. Transfer switch manufacturer shall employ nationwide factory-direct, field service organization, available on 24 hour per day, 365 days per year, call basis.
3. Manufacturer shall include 800 telephone number, for field service contact, af- fixed to each enclosure.
4.
5. Manufacturer shall maintain records of each transfer switch, by serial number, for minimum of 20 years.

CC. Provide adequate lifting means for ease of installation of wall or floor mounted enclosures.

DD. Provide access and working space according to code requirements.

EE. Tighten assembled bolted connections with appropriate tools to manufacturer's torque recommendations prior to first energization.

FF. Supplier shall maintain full time in-house parts and service organization. Suppliers that depend on others for service will not be accepted.

2.4 REMOTE ANNUNCIATOR SYSTEM

A. Functional Description: Remote annunciator panel shall annunciate conditions for indicated transfer switches. Annunciation shall include the following:
   1. Sources available, as defined by actual pickup and dropout settings of transfer- switch controls.
   2. Switch position.
   3. Switch in test mode.
   4. Failure of communication link.
      a. Capable of withstanding infinite power interruptions.
      b. Surge withstand per ANSI/IEEE C-37.90A-1978.
   5. Manufacturer shall furnish copies of test reports upon request.

B. Manufacturer:
   1. Automatic transfer switches shall be by Russelectric RMTD, Asco 7000, or equal.
   2. Transfer switch manufacturer shall employ nationwide factory-direct, field service organization, available on 24 hour per day, 365 days per year, call basis.
   3. Manufacturer shall include 800 telephone number, for field service contact, affixed to each enclosure.
   4. Manufacturer shall maintain records of each transfer switch, by serial number, for minimum of 20 years.

C. Provide adequate lifting means for ease of installation of wall or floor mounted enclosures.

D. Provide access and working space according to code requirements.

E. Tighten assembled bolted connections with appropriate tools to manufacturer's torque recommendations prior to first energization.

F. Supplier shall maintain full time in-house parts and service organization. Suppliers that depend on others for service will not be accepted.

2.5 REMOTE ANNUNCIATOR SYSTEM

A. Functional Description: Remote annunciator panel shall annunciate conditions for indicated transfer switches. Annunciation shall include the following:
   1. Sources available, as defined by actual pickup and dropout settings of transfer- switch controls.
   2. Switch position.
   3. Switch in test mode.
   4. Failure of communication link.

B. Annunciator Panel: LED-lamp type with audible signal and silencing switch.
   1. Indicating Lights: Grouped for each transfer switch monitored.
   2. Label each group, indicating transfer switch it monitors, location of switch, and identity of load it serves.
   3. Mounting: Flush, modular, steel cabinet, unless otherwise indicated.
   4. Lamp Test: Push-to-test or lamp-test switch on front panel.

2.6 SOURCE QUALITY CONTROL

A. Factory test and inspect components, assembled switches, and associated equipment. Ensure proper operation. Check transfer time and voltage, frequency, and time-delay settings for compliance with specified requirements. Perform dielectric strength test complying with NEMA ICS 1.

2.7 3-WAY MANUAL TRANSFER SWITCH

A. 3-way manual transfer switch shall consist of (2) mechanically -interlocked molded case circuit breakers, and (1) independent load bank breaker with a shunt trip (shunt trip voltage to be per the drawings), male cam-style inlet connectors, female cam-style outlet connectors, power distribution blocks and grounding terminals, all housed within a pad lockable enclosure. The use of trapped key locks (kirk locks) as a interlocking device shall NOT be accepted. Breakers should be interlocked via a mechanical linkage which prevents unsafe operation of the various breakers through the use of operator handles.

B. 3-way manual transfer switch enclosure shall be Type 3R, constructed of continuous seam-welded, powder coated galvanneal steel. The main access shall be through a hinged door that extends the full height of the enclosure. Access for both portable generator cables with female cam-style plugs and for load bank cables with male cam-style plugs shall be via a hinged lower flap door. Hinged flap door shall be provided to cover the cable openings when cables are not connected; the hinged flap door shall allow cable entry only after the main access door has been opened. Enclosure shall be powder coated after fabrication; color shall be wrinkle gray RAL 7035.

C. Cam-style male connectors (inlets) and cam-style female connectors (outlets) shall be UL Listed single-pole separable type and rated 400 amps at 600VAC. All cam-style connectors shall be color coded. Cam-style connectors shall be provided for each phase and for ground, and shall also be provided for neutral. Each of the phase cam-style connectors and the neutral cam-style connectors within the enclosure shall be factory-wired to a molded case circuit breaker. The ground cam-style male connectors shall be bonded to the enclosure, and a ground lug shall be provided for connection of the facility ground conductor. None of the cam-style connectors shall be accessible unless all (3) molded case circuit breakers are in the “OFF” position and the main access door is open.

D. A power distribution block shall be provided for load-side field wiring. The power distribution block shall be factory wired to the molded case circuit breakers.

E. Molded case circuit breakers shall be UL Listed 3-pole and the short circuit interrupt rating shall be a minimum of 50kAIC at 480VAC. Trip rating of the molded case circuit breakers

shall be as shown on the drawings. One molded case circuit breaker shall control the connection between the permanent generator and the automatic transfer switch. A second circuit breaker shall control the connection between the permanent generator and the load bank female cam-style connectors. A third circuit breaker shall control the connection between the portable generator (via male cam-style connectors) and the automatic transfer switch. All (3) molded case circuit breakers shall include UL Listed door-mounted operating mechanisms, preventing the opening of the main access door unless all (3) breakers are in the "OFF" position. All (3) molded case circuit breakers shall be mounted behind a deadfront panel. The load-side of the molded case circuit breakers shall not be energizable unless the main access door is closed and one of the molded case circuit breakers is in the "ON" position. The (2) molded case circuit breakers controlling the connections between the permanent generator and the automatic transfer switch, and the connection between the portable generator and automatic transfer switch shall be safety interlocked by mechanical means to ensure that only one of these breakers can be closed at any given time.

F. An auxiliary contact shall be provided in the circuit breaker controlling the connection from the Permanent Generator to the ATS and shall be factory wired to terminal blocks within the enclosure. The auxiliary contact is provided in compliance with NEC 2017 700.3 (F)(5) which requires a means to activate an annunciator circuit.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Design each fastener and support to carry load indicated by seismic requirements and according to seismic-restraint details.

B. Floor-Mounting Switch: Anchor to floor by bolting.
   1. Concrete Bases: 4 inches high, reinforced, with chamfered edges. Extend base no more than 4 inches in all directions beyond the maximum dimensions of switch, unless otherwise indicated or unless required for seismic support.

C. Annunciator and Control Panel Mounting: Flush in wall, unless otherwise indicated.

D. Identify components according to Division 26.

E. Set field adjustable intervals and delays, relays, and engine exerciser clock.

3.2 CONNECTIONS

A. Wiring to Remote Components: Match type and number of cables and conductors to control and communication requirements of transfer switches as recommended by manufacturer. Increase raceway sizes at no additional cost to Owner if necessary to accommodate required wiring.

B. Ground equipment according to Division 26 Section 260526.

C. Connect wiring according to Division 26 Section 260519.
   a. Provide 2-hour rated conductors conductors for all connections to genset.
   b. Control conductors installed between the transfer equipment, emergency generator, and docking station shall be kept entirely independent of all other wiring in accordance with NEC.
   c. Install wiring in raceways except within electrical enclosures. Size raceways to accommodate manufacturer's wiring requirements. Comply with Section 260526 "Raceways and Boxes for Electrical Systems".
   d. Tighten electrical connectors and terminals according to manufacturer's published torque-tightening values. If manufacturer's torque values are not indicated, use those specified in UL 486A-486B. Where a tightening torque is indicated as a numeric value on equipment or in installation instructions provided by the manufacturer, use a calibrated torque tool to achieve that indicated torque value, unless the equipment manufacturer has provided installation instructions for an alternative method of achieving the required torque.
   e. Wiring to Remote Components: Match type and number of cables and conductors to generator sets, control, and communication requirements of transfer switches as recommended by manufacturer. Increase raceway sizes at no additional cost to Owner, if necessary, to accommodate required wiring.

3.3 FIELD QUALITY CONTROL

A. Testing Agency: Authority will engage a qualified independent testing and inspecting agency to perform tests and inspections and prepare test reports.

B. Testing Agency's Tests and Inspections:
   1. After installing equipment and after electrical circuitry has been energized, test for compliance with requirements.
   2. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
   3. Measure insulation resistance phase-to-phase and phase-to-ground with insulation resistance tester. Include external annunciation and control circuits. Use test voltages and procedure recommended by manufacturer. Comply with manufacturer's specified minimum resistance.
   4. Check for electrical continuity of circuits and for short circuits.
   5. Inspect for physical damage, proper installation and connection, and integrity of barriers, covers, and safety features.
   6. Verify that manual transfer warnings are properly placed.
   7. Perform manual transfer operation.
   8. After energizing circuits, demonstrate interlocking sequence and operational function for each switch at least three times.
      a. Simulate power failures of normal source to automatic transfer switches and of emergency source with normal source available.
      b. Simulate loss of phase-to-ground voltage for each phase of normal source.
      c. Verify time-delay settings.
      d. Verify pickup and dropout voltages by data readout or inspection of control settings.

e. Perform contact-resistance test across main contacts and correct values exceeding 500 microohms and values for one pole deviating by more than 50 percent from other poles.
f. Verify proper sequence and correct timing of automatic engine starting, transfer time delay, retransfer time delay on restoration of normal power, and engine cool-down and shutdown.

9. Ground-Fault Tests: Coordinate with testing of ground-fault protective devices for power delivery from both sources.
a. Verify grounding connections and locations and ratings of sensors.

C. Coordinate tests with tests of generator and run them concurrently.

D. Report results of tests and inspections in writing. Record adjustable relay settings and measured insulation and contact resistances and time delays. Attach a label or tag to each tested component indicating satisfactory completion of tests. Reports shall be type written format.

E. Remove and replace malfunctioning units and retest as specified above.

F. Infrared Scanning: After Substantial Completion, but not more than 60 days after Final Acceptance, perform an infrared scan of each switch. Remove all access panels so joints and connections are accessible to portable scanner.
1. Follow-up Infrared Scanning: Perform an additional follow-up infrared scan of each switch 11 months after date of Substantial Completion.
2. Instrument: Use an infrared scanning device designed to measure temperature or to detect significant deviations from normal values. Provide calibration record for device.
3. Record of Infrared Scanning: Prepare a certified report that identifies switches checked and that describes scanning results. Include notation of deficiencies detected, remedial action taken, and observations after remedial action.

3.4 3 WAY SWITCH INSTALLATION AND TESTING

A. Installation
1. Prior to installation of 3-way manual transfer switches, contractor shall examine the areas and conditions under which the 3-way manual transfer switch is to be installed and notify the engineer in writing if unsatisfactory conditions exist.
2. 3-way manual transfer switch shall be installed as shown on the drawings and per the manufacturer's written instructions. In addition, the installation shall meet the requirements of local codes, the National Electric Code and National Electrical Contractors Association’s “Standard of Installation.”
3. Conduit entry into the 3-way manual transfer switch shall be by Contractor; Contractor shall furnish and install listed watertight conduit hubs, as manufactured by MYERS or T&B, for each conduit entry on the 3-way manual transfer switch. The incoming hub size shall match the conduit size for feeders and ground as shown on the drawings. The outgoing hub size shall match the conduit size for loads and ground as shown on the drawings. Hubs shall be properly installed and tightened to maintain Type 3R integrity of the 3-way manual transfer switch enclosure.

4. Contractor shall terminate feeder conductors, load conductors and ground per the manufacturer's instructions. All field wiring terminations shall be torqued as required per the instructions on the 3-way manual transfer switch's power distribution blocks, circuit breakers, and ground lugs.

B. Field Testing

1. Prior to energizing 3-way manual transfer switch, the contractor shall perform the following checks and tests as a minimum:
   a. Verify mounting and connections are complete and secure.
   b. Verify internal components and wiring are complete and secure.
   c. Perform continuity check or all circuits.
   d. Perform 1,000 VDC megger test on feeder and load cables. Prior to testing, all auxiliary circuits must be turned OFF and all fuses, microswitches and shunt trip circuits must be disconnected. It is required to take out the rating plug of any electronic trip circuit breakers that will be performing a megger (insulation) test.
   e. Verify deadfront is secure.
   f. With the 3-way manual transfer switch deadfront in place and the main access door closed and properly latched, actuate all (3) Operator Mechanisms; verify:
      1) With the breaker controlling the connection between he permanent generator and the automatic transfer switch (ATS) in the "ON" position, the breaker controlling the connection between permanent generator and the load bank can be turned to the "ON" and "OFF" position and the breaker controlling the connection between the portable generator and the automatic transfer switch cannot be turned "ON".
      2) With the breaker controlling the connection between the permanent generator and the automatic transfer switch (ATS) in the "OFF" position, the other (2) breakers controlling the connection between the permanent generator and load bank can be turned "ON" or "OFF", and the breaker controlling the connection between the portable generator and the ATS can be turned "ON" and "OFF".
      3) With the breaker controlling the connection between the portable generator and the ATS is in the "ON" position, the breaker controlling the connection between the permanent generator and the ATS cannot be turned "ON" and the breaker controlling the connection between the permanent generator and the load bank can be turned "ON" and "OFF".
   g. Confirm operation of the 3-way manual transfer switch ground receptacle by attaching a plug to the 3-way manual transfer switch ground receptacle and then verify that the plug is grounded to the facility ground.
   h. Once normal power has been applied, confirm operation of 3-way manual transfer switch by following directions on main access door.

3.5 DEMONSTRATION

A. Engage a factory-authorized service representative to train Owner's maintenance personnel to adjust, operate, and maintain transfer switches and related equipment as specified below. Refer to Division 01.

B. Coordinate this training with that for generator equipment.

END OF SECTION

SECTION 264113 - LIGHTNING PROTECTION FOR STRUCTURES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. Section includes lightning protection system for ordinary structures. The Electrical Contractor shall provide the necessary labor, materials, services necessary to provide the complete lightning protection system as specified herein

1.3 QUALITY ASSURANCE

A. Manufacturer Qualifications: Regularly engaged in manufacturer of lightning protection equipment, of types, sizes and ratings required, whose products have been satisfactorily used in similar service for not less than 5 years. The firm shall be a member of and certified by the Lighting Protection Institute.

B. Installer Qualifications: A firm with at least 3 years of successful installation experience on projects with lightning protection work similar to that required for project

C. The System Design shall be completed, and the shop drawing stamped by an LPI Certified Master Installer – Designer of Lightning Protection Systems.

D. The installing contractor shall be listed with the Lightning Protection Institute, and Underwriters’ Laboratories, Inc.

E. The installation contractor shall have personnel on staff Certified by the LPI as a Master Installer – Designer of lightning protection systems.

F. LPI qualified staff, Journeyman or higher, shall provide on-site supervision of the installation.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. Heary Bros. Lightning Protection Co. Inc.

1. nVent (ERICO).
2. Thompson Lightning Protection, Inc.
3. VFC/Lyncole

2.2 PERFORMANCE REQUIREMENTS

A. NFPA Lightning Protection Standard: Comply with NFPA 780 requirements for Class I buildings.

B. Lightning Protection Components, Devices, and Accessories: Listed and labeled by a qualified testing agency as complying with UL 96, and marked for intended location and application.

2.3 MATERIALS

A. Comply with minimum Class I material requirements as listed in NFPA 780.

B. Air Terminals:
1. Copper
2. 3/8-inch (10-mm) diameter by 12 inches (305 mm) long.
3. Rounded tip.
4. Integral base support.

C. Class 1 Main Conductors:
1. Stranded Copper: 57,400 circular mils in diameter.

D. Class II Main Conductors:
1. Stranded Copper: 115,000 circular mils in diameter.

E. Secondary Conductors:
1. Stranded Copper: 26,240 circular mils in diameter.

F. Ground Loop Conductor: Stranded copper.

G. Ground Rods:
1. Material: Solid copper.

2. Diameter: 3/4 inch (19 mm).
3. Rods shall be not less than 120 inches (3050 mm) long.

H. Conductor Splices and Connectors: Compression fittings that are installed with hydraulically operated tools, or exothermic welds, approved for use with the class type.

I. Adhesives: High performance, solvent free, UV resistant, for durable bond with substrate. All adhesives must be compatible with the roofing material and approved by the roofing system manufacturer.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Install lightning protection components and systems according to NFPA 780.

B. Install conductors with direct paths from air terminals to ground connections. Avoid bends less than 90 degrees and 8 inches (203 mm) in radius and narrow loops.

C. Conceal conductors within normal view from exterior locations at grade within 200 feet (60 m) of building. Comply with requirements for concealed systems in NFPA 780.
   1. Roof penetrations required for down conductors and connections to structural-steel framework shall be made using listed through-roof fitting and connector assemblies with solid rods and appropriate roof flashings. Use materials approved by the roofing manufacturer for the purpose. Conform to the methods and materials required at roofing penetrations of the lightning protection components to ensure compatibility with the roofing specifications and warranty.
   2. Install conduit where necessary to comply with conductor concealment requirements.
   3. Structural elements and design features shall be used whenever possible to minimize the visual impact of exposed conductors.
   4. Coordinate sequence of installation with other trades to avoid coring, cutting, and patching.
   5. Do not install conductors in gutters, downspouts, or on surfaces where water is retained.

D. Ground Ring Electrode: The conductor shall be not less than the main-size lightning conductor.

E. Provide bonding between the LPS grounding electrode system and the Building grounding electrode system in accordance with NEC and NFPA 780 requirements.

F. Install surge suppression at all power service entrances and at all entrances of conductive communications systems.

G. Provide cutting and patch as necessary for installation of work in existing structures. Refer to Section 260500, “Common Work Results for Electrical Systems”.

3.2 CONNECTIONS

A. Aboveground concealed connections, and connections in earth or concrete, shall be done by exothermic welds or by high-compression fittings listed for the purpose.

B. Aboveground exposed connections shall be done using the following types of connectors, listed and labeled for the purpose: exothermic weld.

C. Bonding Straps and Jumpers: Install in locations accessible for inspection and maintenance, except where routed through short lengths of conduit.
   1. Bonding to Structure: Bond straps directly to basic structure, taking care not to penetrate any adjacent parts.

2. Bonding to Equipment Mounted on Vibration Isolation Hangers and Supports: Install bonding so vibration is not transmitted to rigidly mounted equipment.

3.3 CORROSION PROTECTION

A. Do not combine materials that can form an electrolytic couple that will accelerate corrosion in the presence of moisture unless moisture is permanently excluded from junction of such materials.

B. Use conductors with protective coatings where conditions would cause deterioration or corrosion of conductors.

3.4 FIELD QUALITY CONTROL

A. Special Inspections: Engage a qualified third-party special inspector to perform the following special inspections:
   1. Perform inspections as required to obtain a UL Master Label for system.
   2. Perform inspections to obtain an LPI certification.

B. Upon completion of installation of lightning protection system, test resistance-to-ground with resistance tester. Where tests show resistance-to-ground is over 25 ohms, take appropriate action to reduce resistance to 25 ohms, or less, by driving additional ground rods. Provide to the Owner and Engineer a certificate of compliance upon completion of testing.

C. Prepare test and inspection reports and certificates.

END OF SECTION

SECTION 264300 - SURGE PROTECTION DEVICES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. Description: The Contractor shall provide the necessary labor, materials, wiring and services necessary to provide the complete electrical surge protection systems as specified herein. This work shall include but is not necessarily limited to provision of Surge Suppression Units at certain points in the power distribution network and proper installation in accordance with manufacturer’s instructions.

B. Section includes:
   1. Requirements for both field mounted SPDs (externally mounted), and integrated SPDs (installed from the factory) for low voltage power distribution and control equipment.

1.3 REFERENCES

A. Abbreviations
   1. MCOV: Maximum continuous operating voltage.
   2. OCPD: Overcurrent protective device.
   3. SCCR: Short-circuit current rating.
   4. SPD: Surge protective device.
   5. VPR: Voltage protection rating.

B. Definitions
   1. Inominal: Nominal discharge current.
   2. Mode(s), also Modes of Protection: The pair of electrical connections where the VPR applies.
   3. MOV: Metal-oxide varistor; an electronic component with a significant non-ohmic current-voltage characteristic.
   4. Type 1 SPDs: Permanently connected SPDs intended for installation between the secondary of the service transformer and the line side of the service disconnect overcurrent device.
   5. Type 2 SPDs: Permanently connected SPDs intended for installation on the load side of the service disconnect overcurrent device, including SPDs located at the branch panel.
   6. Type 3 SPDs: Point of utilization SPDs.

C. Reference Standards: The following publications are referred to in the text by the basic designation only. The edition/revision of the referenced publications shall be the latest date as of the date of the Contract Documents, unless otherwise specified.
   1. Institute of Electrical and Electronics Engineers, Inc. (IEEE):
      a. ANSI/IEEE C62.41.1, “Guide on the Surges Environment in Low Voltage (1000 V and Less) AC Power Circuits.”
      b. ANSI/IEEE C62.41.2, “Recommended Practice on Characterization of Surges in Low Voltage (1000 V and Less) AC Power Circuits.”
      c. ANSI/IEEE Standard C62.45, “Guide on Surge Testing for Equipment Connected to Low-Voltage Ac Power Circuits.”
   2. Underwriters Laboratories, Inc. (UL)
      a. UL 1283, “Standard for Safety for Electromagnetic Interference Filters.”
      b. UL 1449, “Standard for Surge Protective Devices.”

1.4 WARRANTY

A. Manufacturer's Warranty: Manufacturer agrees to replace or replace SPDs that fail in materials or workmanship within a period of ten years from the date of Substantial Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. ABB/General Electric Company.
   2. Eaton Electrical Inc.; Cutler-Hammer Business Unit.
   3. Square D; a brand of Schneider Electric.
   4. Siemens

B. Source Limitations: SPDs installed internal to the distribution system shall be of the same manufacturer as the equipment. The equipment shall be fully tested and certified in accordance with UL standards.

2.2 GENERAL SPD REQUIREMENTS

A. SPD with Accessories: Listed and labeled as defined in NFPA 70, Article 100, by a testing agency acceptable to authorities having jurisdiction, and marked for intended location and application.

B. SPDs: Comply with UL 1449
   1. Provide Type 1 SPDs installed on the line side of the service entrance OCPD and Type 2 SPDs installed on the load side of the service entrance OCPD.

C. Electrical Noise Filter: Comply with UL 1283 for Type 2 SPDs.

1. Each Type 2 unit shall include a high-performance EMI/RFI noise rejection filter. Noise attenuation for electric line noise shall be up to 50 dB from 10 kHz to 100 MHz

D. Unit Operating Voltage: Refer to drawings.

E. MCOV of the SPD shall not be less than 115% of the nominal system voltage.

F. The suppression system shall incorporate thermally protected MOVs as the core surge suppression component for all distribution levels. Each MOV shall be individually fuse-protected to avoid cascading faults. The thermal protection assembly shall disconnect the MOV(s) from the system in a fail-safe manner should a condition occur that would cause them to enter a thermal runaway condition.

G. SPDs shall be provided with the following features and accessories:
1. Integral disconnect switch for externally mounted SPDs. SPDs integrated into factory supplied equipment shall have an input disconnect switch or circuit breaker unless indicated on the equipment drawings/data sheets.
2. Internal fusing that disconnects the SPD before damaging internal suppressor components.
3. Indicator light display (Red and Green) for power and protection status with push-to-test capabilities.
4. Audible alarm with silencing switch. Alarm shall activate when any one of the surge current modules has faulted or reached an end-of-life condition.
5. Form-C contacts, one normally open and one normally closed, for remote monitoring of protection status. Contacts shall reverse on failure of any surge diversion module or on opening of any current-limiting device.
6. Surge counter with LCD display, reset switch, non-volatile memory, and battery backup to retain memory upon loss of AC power.

H. All SPDs shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category C, B, and A environments.

I. Peak Surge Current Rating: The minimum single-pulse surge current withstand rating per phase shall not be less than the following values. The peak surge current rating shall be the arithmetic sum of the ratings of the individual MOVs in a given mode.
1. Category C, Service Entrance larger than 1200A: 400 kA/phase.
2. Category C, Service Entrance 1200A and below: 240 kA/phase.
3. Category B, Distribution larger than 1200A: 300 kA/phase.
4. Category B, Distribution 1200A and below: 160 kA/phase.
5. Category B, Branch: 120kA/phase.

J. Protection modes and UL 1449 VPR for grounded wye circuits shall not exceed the following:
1. Line to Neutral: 1200 V for 480Y/277 V and 700 V for 208Y/120 V.
2. Line to Ground: 1200 V for 480Y/277 V and 700 V for 208Y/120 V.
3. Neutral to Ground: 1200 V for 480Y/277V and 700 V for 208Y/120 V.
4. Line to Line: 2000 V for 480Y/277 V and 1200 V for 208Y/120 V.

K. SCCR: The short circuit current rating of the SPD shall be a minimum of 200kA and equal to or greater than the available short circuit current at the point on the system where installed.

L. Minimum Inominal Rating: 20 kA

2.3 SURGE SUPPRESSION FOR PANELBOARDS

A. All emergency system switchgear, distribution panels and branch panelboards shall be provided with surge protection devices in accordance with the NEC.

2.4 TELEPHONE AND TELEVISION SURGE SUPPRESSION

A. As a part of this section of work, the Contractor shall provide or arrange for the installation of U.L. listed lightning and surge arrestors on the incoming telephone and television service lines, as well as on AM-FM- antenna downleads coming into the building from satellite dish antennas and all other types of exterior antennas installed by the Contractor or Owner.

B. Arrestors shall be U.L. listed, properly grounded per N.E.C., and shall be located at the service entrance points for each cable installed by a utility company or at the point of building entry for Contractor-installed cables leading in from antennas. Also provide surge arrestors of the proper type for any copper cables that are installed between buildings by the Contractor, if such a condition occurs within the project.

C. The Contractor shall arrange for the telephone company to install M-O-V, gas-type or other U.L. listed lightning arrestors on each of their incoming telephone circuits that are terminated for building use.

D. Devices as manufactured by Lucent Technologies, Winegard or Liebert Corporation will be acceptable.

E. Provide a ground lug for individual surge suppression unit installations, with the recommended ground wire size routed back to the building main electrical ground or ground bar in wiring closet.

F. Where multiple surge suppression units are installed, as at service entrance locations, provide a ground bar, copper, with multiple tapped holes and a properly sized ground lead routed back to the building main electrical ground.

2.5 SURGE SUPPRESSORS FOR OTHER SYSTEMS

A. Refer to specific specification sections for additional information on surge suppressors related to other building systems.

2.6 ENCLOSURES

A. Enclosure shall meet or exceed the ratings for the environment to be installed as indicated on drawings.
   1. Indoor locations: NEMA 250, Type 1.
   2. Outdoor or wet locations: NEMA 250, Type 3R.

3. Corrosive Environnments: NEMA 250, Type 4X.

2.7 CONDUCTORS AND CABLES

B. Power Wiring: Provide sizes to match SPD leads, complying with Section 260519 "Low-Voltage Electrical Power Conductors and Cables."

PART 3 - EXECUTION

3.1 INSTALLATION

A. Comply with NECA 1.

B. Factory install integral SPDs as part of the distribution equipment and connect through a disconnect.
1. SPDs shall be installed immediately following the load side of the main breaker. SPDs installed in main lug only panelboards shall be installed immediately following the incoming main lugs.

C. Provide an OCPD as required to comply with the UL listing of the SPD and selected to comply with power system study. Minimum 30A circuit breaker shall be provided. Refer to panel schedules in contract documents.

D. Install SPDs with properly rated conductors between suppressor and points of attachment as short and straight as possible with no sharp bends and adjust circuit-breaker positions to achieve shortest and straightest leads.

E. Do not splice and extend SPD leads unless specifically permitted by manufacturer.

F. Do not exceed manufacturer's recommended lead length. Do not bond neutral and ground.

G. Twist input conductors together to reduce the input inductance.

H. Use crimped connectors and splices only. Wire nuts are not acceptable.

3.2 FIELD QUALITY CONTROL

I. Perform the following tests and inspections:
1. Compare equipment nameplate data for compliance with Drawings and Specifications.
2. Inspect anchorage, alignment, grounding, and clearances.
3. Verify that electrical wiring installation complies with manufacturer's written installation requirements.

J. An SPD will be considered defective if it does not pass tests and inspections.

K. Prepare test and inspection reports.

3.3 STARTUP SERVICE

L. Complete startup checks according to manufacturer's written instructions.

M. Do not perform insulation-resistance tests of the distribution wiring equipment with SPDs installed. Disconnect SPDs before conducting insulation-resistance tests and reconnect them immediately after the testing is over.

N. Energize SPDs after power system has been energized, stabilized, and tested.

3.4 DEMONSTRATION

O. Train Owner's maintenance personnel to operate and maintain SPDs.

END OF SECTION

SECTION 265000 - LIGHTING FIXTURES

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General, Special and Supplementary Conditions, Division 01 Specification Sections, and Section 260010 “General Requirements for Electrical Systems” apply to this Section.

1.2 SUMMARY

A. This section covers general lighting fixtures, back of house (BOH) lighting fixtures, exit signs, and site lighting pole mounted fixtures.

1.3 REFERENCES

A. Abbreviations
   1. CRI: Color Rendering Index
   2. LED: Light Emitting Diode

PART 2 - PRODUCTS

2.1 GENERAL

A. Provide lighting fixtures, equipment and components where shown on Drawings, as listed in fixture schedules and as specified, wired and assembled. Provide approved aligned canopies, hangers and other appurtenances as required, for a complete and functional system.

B. All new lighting fixtures shall be UL listed and shall have an individual IES test report indicating fixture performance.

C. Coordinate fixture mountings with ceiling types and provide the required components for correct mounting of the fixture, including plaster frames, slope adjusters, etc. Review architectural reflected ceiling drawings and notify Architect of discrepancies prior to ordering fixtures or submitting shop drawings. No additional compensation will be allowed if wrong fixtures are ordered because coordination was not performed.

2.2 LED FIXTURES

A. LED SOURCES
   1. LED’s shall be manufactured by a manufacturer who has produced commercial LEDs for a minimum of five (5) years.

2. Lumen Output – minimum initial delivered lumen output of the luminaire shall be as follows for the lumens exiting the luminaire in the 0-360 degree zone - as measured by IESNA Standard LM-79-08 in an accredited lab. Exact tested lumen output shall be clearly noted on the shop drawings.
3. Lumen output shall not decrease by more than 20% over the minimum operational life of 50,000 hours at the rated ambient operating temperature.
4. Individual LEDs shall be connected such that a catastrophic loss or the failure of one LED will not result in the loss of the entire luminaire.
5. LED Boards shall be suitable for field maintenance and have with plug-in connectors. LED boards shall be upgradable
6. Light Color/Quality:
    a. Correlated Color temperature (CCT) range as per specification, between 3000K, 3500K and 4000K shall be correlated to chromaticity as defined by the absolute (X,Y) coordinates on the 2-D CIE chromaticity chart.
    b. Color shift over 6,000 hours shall be <0.007 change in u' v' as demonstrated in IES LM80 report.
    c. The color rendition index (CRI) shall be 80 or greater
    d. LED boards to be tested for color consistency and shall be within a space of 2.5 MacAdam ellipses on the CIE chromaticity chart.

B. LED DRIVERS
1. Ten-year expected life while operating at maximum case temperature and 90 percent non-condensing relative humidity.
2. Driver should be UL Recognized under the component program and shall be modular for simple field replacement.
3. Electrical characteristics: 120 – 277 volt, UL Listed, CSA Certified, Sound Rated A+. Driver shall be > 80% efficient at full load across all input voltages. Input wires shall be 18AWG solid copper minimum.
4. Dimming: Driver shall be suitable for full-range dimming. The luminaire shall be capable of continuous dimming without perceivable flicker over a range of 100 percent to 0.1 percent of rated lumen output with a smooth shut off function.
5. Dimming shall be controlled by a 0-10V signal, or if require "DMX".
6. Driver shall include ability to provide no light output when the control signal drops below 0.5 V, and shall consume 0.5 watts or less in this standby.
7. Driver shall be capable of configuring a linear or logarithmic dimming curve.
8. Drivers shall track evenly across multiple fixtures at all light levels, and shall have an input signal to output light level that allows smooth adjustment over the entire dimming range regardless of the controller type
9. Flicker: Driver and luminaire electronics shall deliver illumination that is free from objectionable flicker as measured by flicker index (ANSI/IES RP-16-10). At all points within the dimming range from 100-0.1 percent luminaire shall have: Less than 1 percent flicker index at frequencies below 120 Hz and less than 12 percent flicker index at 120 Hz, and shall not increase at greater than 0.1 percent per Hz to a maximum of 80 percent flicker index at 800Hz
10. Driver disconnect shall be provided where required to comply with codes.

C. LED ELECTRICAL
1. THD: Total harmonic distortion (current and voltage) induced into an AC power line by a luminaire shall not exceed 20 percent at any standard input voltage and meet ANSI C82.11 maximum allowable THD requirements.

2. Surge Suppression: The luminaire shall include surge protection to withstand high repetition noise and other interference. Withstand up to a 1,000 volt surge without impairment of performance as defined by ANSI C62.41 Category A. To reduce false circuit breaker tripping due to turn on inrush, the following statement ensures that electronic dimming driver will meet NEMA inrush recommendations.
3. Rush Current: Meet or exceed NEMA 410 driver inrush standard of 430 Amps per 10 Amps load with a maximum of 370 Amps2 – seconds.
4. RF Interference: The luminaire and associated on-board circuitry must meet Class A emission limits referred in Federal Communications Commission (FCC) Title 47, Subpart B, Section 15 Non-Consumer requirements for EMI/RFI emissions
5. Driver must support automatic adaptation, allowing for future luminaire upgrades and enhancements and deliver improved performance.
6. Power Factor: The luminaire shall have a power factor of 90% or greater at all standard operating voltages and full luminaire output.

D. EXIT SIGNS
1. General requirements: Comply with UL 924, NFPA 70, AND NFPA 101.
2. All exit signs shall be LED type.
3. Provide single or double face as scheduled, indicated on plans or as required by the local Authority Having Jurisdiction. Adjust installation position if required for clear visibility, in accordance with applicable codes.
4. Provide directional arrows (chevrons) as indicated on floor plans and to suit the means of egress or as required by the local Authority Having Jurisdiction.
5. Complete unit to be furnished in color/finish as selected by the Architect.

2.3 GENERAL REQUIREMENTS FOR POLES AND SUPPORT COMPONENTS

A. Provide poles designed for site specific wind loading (minimum of 120 miles per hour) determined in accordance with AASHTO LTS while supporting luminaires and all other appurtenances indicated. The effective projected areas of luminaires and appurtenances used in calculations shall be specific for the actual products provided on each pole. Poles shall be anchor-base type designed for use with underground supply conductors. Poles shall have full base metal covers with matching finish to conceal the mounting hardware, pole-base welds, and anchor bolts.

B. Structural Characteristics: Comply with AASHTO LTS
1. Wind-Load Strength of Poles: Adequate at indicated heights above grade without failure, permanent deflection, or whipping in steady winds of speed indicated in "Structural Analysis Criteria for Pole Selection" Article.
2. Strength Analysis: For each pole, multiply the actual equivalent projected area of luminaires and brackets by a factor of 1.3 to obtain the equivalent projected area to be used in pole selection strength analysis.

C. Luminaire Attachment Provisions: Comply with luminaire manufacturers' mounting requirements. Use stainless-steel fasteners, unless otherwise indicated.

D. Mountings, Fasteners, and Appurtenances: Corrosion-resistant items compatible with support components.
1. Materials: Shall not cause galvanic action at contact points.

2. Anchor Bolts, Leveling Nuts, Bolt Caps, and Washers: Hot-dip galvanized after fabrication unless otherwise indicated.
3. Anchor-Bolt Template: Plywood or steel.

E. Handhole: Oval-shaped, with minimum clear opening of 2-1/2 by 5 inches, with cover secured by stainless-steel captive screws.

F. Pole Base Concrete Foundations:
1. Cast in place, with anchor bolts to match pole-base flange. Anchor bolts shall be steel rod having minimum yield strength of 50,000 psi and shall be galvanized in accordance with ASTM A153/A153M. Concrete shall be as specified in Division 03 Section, Cast-In-Place Concrete.
1. Use 4000-psi, 28-day compressive-strength concrete unless otherwise noted. Comply with Division 03 Section "Cast-in-Place Concrete" and ACI standards for subbase requirements, concrete materials, reinforcement, placement, and cover requirements.

G. Breakaway Supports: Provide frangible breakaway supports where noted on plans, tested by an independent testing agency acceptable to authorities having jurisdiction, according to AASHTO LTS.

H. Brackets and Supports
1. ANSI C136.3, ANSI C136.13, and ANSI C136.21, as applicable. Pole brackets shall be not less than 1-1/4 inch secured to pole. Slip-fitter or pipe-threaded brackets may be used, but brackets shall be coordinated to luminaires provided, and brackets for use with one type of luminaire shall be identical. Brackets for pole-mounted street lights shall correctly position luminaire no lower than mounting height indicated. Mount brackets not less than 24 feet above street. Special mountings or brackets shall be as indicated and shall be of metal which will not promote galvanic reaction with luminaire head. Detachable, cantilever, without underbrace.

I. Cable Support Grip: Wire-mesh type with rotating attachment eye, sized for diameter of cable and rated for a minimum load equal to weight of supported cable times a 5.0 safety factor.

J. Grounding and Bonding Lugs: Welded 1/2-inch threaded lug, complying with requirements in Division 26 Section "Grounding and Bonding for Electrical Systems," listed for attaching grounding and bonding conductors of type and size listed in that Section, and accessible through handhole. Provide a pole grounding connection designed to prevent electrolysis when used with copper ground wire.

K. Finish: Same as luminaire.

PART 3 - EXECUTION

3.1 GENERAL

A. Lamps of the type, wattage, and voltage rating indicated shall be delivered to the project in the original cartons and installed in the fixtures just prior to the completion of the project.

B. Lamps shall be handled with cotton gloves to avoid fingerprint markings.

3.2 FIXTURES

A. Accessories
   1. Accessories such as straps, mounting plates, nipples, or brackets shall be provided for proper installation.

B. Suspended Fixtures
   1. Suspended fixtures shall be provided with swivel hangers in order to ensure a plumb installation. Pendants, rods, or chains 4 feet or longer excluding fixture, shall be braced to limit swinging. Bracing shall be 3 directional, 120 degrees apart. Maximum distance between adjacent tubing or stems shall be 10 feet. Rods shall be of not less than 3/16 inch diameter. Flexible raceway shall be installed to each fixture from an overhead junction box unless flexible cord specified on the schedule.
   2. Fixture to fixture wiring installation is allowed only when fixtures are installed end to end in a continuous run.

C. Ceiling Fixtures
   1. Ceiling fixtures shall be coordinated with and suitable for installation in, on, or from the suspended ceiling provided under other sections of these specifications. Installation and support of fixtures shall be in accordance with the NFPA 70 and manufacturer's recommendations. Where seismic requirements are specified herein, fixtures shall be supported as shown or specified. Recessed fixtures shall have adjustable fittings to permit alignment with ceiling panels. Recessed fixtures installed in fire-resistive type of suspended ceiling construction shall have the same fire rating as the ceiling or shall be provided with fireproofing boxes having materials of the same fire rating as the ceiling panels, in conformance with UL-03.
   2. Lighting fixtures installed in suspended ceilings shall also comply with the requirements of Division 09 Specification Sections for ceilings.
   3. Support fixtures with four (4) wires with one (1) at each corner.
   4. Hanger wires: Install within 15 degrees of plumb or additional support shall be provided. Wires shall be attached to fixture body and to the building structure (not to the supports of other work or equipment). Where building structure is located such that 15 degrees cannot be maintained, provide "strut" or similar supports secured to structure to meet this requirement.
   5. Support Clips: Provide four (4) clips per fixture minimum. Fasten to light fixtures and to ceiling grid members at or near each fixture corner with clips that are UL listed for the application. Install clips per manufacturer's requirements. If screws are required, they shall be provided. Installation shall meet applicable seismic codes.
   6. Where fixtures of sizes less than the ceiling grid are indicated to be centered in the acoustical panel, support such fixtures independently and provide at least two 3/4-inch metal channels spanning, and secured to, the ceiling tees for centering and aligning the fixture.
   7. Downlights, exit signs and battery pack supported by or attached to ceiling grid or tile shall be provided with one hanger wire at each end. Provide a minimum of two, located at opposite corners.
   8. Round fixtures or fixtures smaller in size than the ceiling grid shall be independently supported from the building structure by a minimum of four wires per fixture spaced

approximately equidistant around the fixture. Do not support fixtures by ceiling acoustical panels.

D. Wall mounted fixtures:
   1. Do not attach light fixtures directly to gypsum board.
   2. Attach to structural members in walls or backing plate attached to wall structural members.

E. Do not install fixtures until work of other trades that may damage fixtures is completed.

F. Provide plaster frames for fixtures recessed in gypsum board or a plaster ceiling.

G. Do not suspend or support lighting fixtures or safety chains from hung ceiling, conduit or duct. Support fixtures with safety chain from structural members only.

H. Provide unistrut below ducts where fixture locations coincide with HVAC duct or mechanical piping runs. Provide threaded rods to support unistrut.

I. Support luminaries at least two points to prevent rotation.

J. Handling of reflectors shall be done only with cotton gloves to avoid imprinting fingerprints on reflective surfaces.

K. Exterior Fixtures:
   1. Exterior building mounted light fixtures shall not be installed until after the building exterior has been rinsed clean of any corrosive cleaning materials. Damaged fixtures shall be replaced by the Contractor at no cost.
   2. Provide exterior rated weather proof junction boxes for all fixtures and splices.
   3. Utilize weatherproof silicone filled wire nuts and seal all junction boxes and conduit with potting compound to create waterproof barriers. Inspect all splices and fixtures for continuity prior to potting.
   4. Lubricate all threaded parts with a high temperature waterproof anti-seize lubricant to prevent seizing and corrosion.
   5. All low-voltage wiring to be UV resistant, UL approved for use without conduit, stranded low-voltage wire for use in outdoor and underground applications, gauge as appropriate to avoid voltage drop.
   6. Provide surface mounted fixtures with conduit hub for end of fixture entrance.

L. Transformers (applies to all transformers including (but not limited to) low voltage, neon, remote ballast, LED power supplies, exterior locations):
   1. Electrical Contractor to locate all transformers (including low voltage, neon, remote ballasts, led power supplies, etc.) near fixtures in a well-ventilated and accessible location. Transformers must be installed (per codes) in accessible areas large enough to dissipate the heat of the transformer. Temperatures should not exceed 100°F (38°C) or that required by manufacturer if more stringent.
   2. Electrical Contractor to determine wire size according to load and wire length to eliminate voltage drop. If voltage drop is a problem after installation, the Electrical Contractor is responsible for reinstallation (at no additional cost) of transformer and wire to solve problem.
   3. Electrical Contractor to label front of transformer/driver. Example: “Large Display Case @ Entry to Main Dining Room.”

M. Spare inventory:

N. The contractor shall provide at least five (5) spare fixtures for each fixture used in the common areas as part of the spare inventory .

3.3 POLE, LIGHT COLUMN AND BOLLARD INSTALLATION

A. Alignment: Align foundations, poles light columns and bollards for optimum directional alignment of luminaires and their mounting provisions on the pole.

B. Clearances: Maintain the following minimum horizontal distances of poles from surface and underground features unless otherwise indicated on Drawings:
   1. Fire Hydrants and Storm Drainage Piping: 60 inches
   2. Water, Gas, Electric, Communication, and Sewer Lines: 10 feet
   3. Trees: 15 feet from tree trunk.

C. Excavation: Restrict excavation in size to that which will provide sufficient working space for installation of concrete forms. Should soil conditions at the bottom of the excavation be unsuitable as a foundation, as determined by the Architect, take the excavation down to firm soil and fill to required grade with concrete or satisfactory soil materials as directed.

D. Backfill: Thoroughly compact backfill with compacting arranged to prevent pressure between conductor, jacket, or sheath and the end of conduit ell.

E. Concrete Pole Foundations:
   1. Concrete materials, installation, and finishing requirements are specified in Division 03 Section "Cast-in-Place Concrete."
   2. Concrete Pole Foundations shall be cast-in-place concrete, having 3000 psi minimum 28-day compressive strength.
   3. Set anchor bolts according to anchor-bolt templates furnished by pole manufacturer.
   4. Formwork: Construct forms of wood, plywood, steel, or other acceptable materials fabricated to conform to the configuration, line, and grade required. Reinforce formwork to prevent deformation while concrete is being placed and consolidated. Wet or coat formwork with a parting agent before placing concrete.
   5. Cast conduit into concrete pole foundations.
   6. Prior to concrete pour, install a ground rod and a separate insulated equipment grounding conductor at each pole, light column and bollard in addition to grounding conductor installed with branch-circuit conductors.
   7. Finish by troweling and rubbing smooth. Round all above-grade concrete edges to approximately 0.25” radius.
   8. Refer to Pole Base Detail on drawings for additional requirements.

F. Foundation-Mounted Poles:
   1. Install according to pole manufacturer's instructions using a template supplied by pole manufacturer in accordance with the lighting standard manufacturer's recommendations.
   2. Use galvanized steel anchor bolts, threaded at the top end and bent 90 degrees at the bottom end, and nuts selected to resist seismic forces defined for the application and approved by manufacturer.
   3. Grout void between pole base and foundation. Use non-shrink or expanding concrete grout

firmly packed to fill space.

4. Mount pole with leveling nuts and tighten top nuts to torque level recommended by pole manufacturer. Provide base covers.

G. Poles and Pole Foundations Set in Concrete Paved Areas (Slabs): Install poles with minimum of 6-inch wide, unpaved gap between the pole or pole foundation and the edge of adjacent concrete slab. Fill unpaved ring with pea gravel to a level 1 inch below top of concrete slab.

H. Raise and set poles using web fabric slings (not chain or cable). Adjust poles as necessary to provide a permanent vertical position with the bracket arm in proper position for luminaire location. Alterations to poles after fabrication will void manufacturer's warranty and shall not be allowed.

I. Bollard and light column luminaire installation:

1. Install on concrete base with top level with finished grade or surface at luminaire location. Shape base to match shape and diameter of bollard and/or light column base.

3.4 GROUND-MOUNTING LUMINAIRE INSTALLATION

A. Align units for optimum directional alignment of light distribution.

B. Install on concrete base with top 4 inches above finished grade or surface at luminaire location.

3.5 IN-GRADE LUMINAIRE INSTALLATION

A. All in-grade fixtures shall be installed per manufacturer’s installation instructions.

B. Verify design type, Flow Through or Sealed, prior to installation.

C. Flow Through in-grades fixtures shall have drainage system installed below fixture per manufacturer’s requirements. If site has poor drainage soil, a sealed in-grade shall be installed. Coordinate soil type with civil engineer prior to submittals.

D. Provide all conduit connections to in-grade fixture with seal off compound.

3.6 CORROSION PREVENTION

A. Aluminum: Do not use in contact with earth or concrete. When in direct contact with a dissimilar metal, protect aluminum by insulating fittings or treatment.

3.7 GROUNDING

A. Comply with Section 260526 “Grounding and Bonding for Electrical Systems.”

B. Bond luminaires and metal accessories to the grounding system per NEC.

C. Ground noncurrent-carrying parts of equipment including metal poles, luminaires, mounting arms, brackets, and metallic enclosures. Where copper grounding conductor is connected to a metal other than copper, provide specially treated or lined connectors suitable for this purpose.

D. At each light pole, light column, light bollard and support structures, provide a driven ground rod into the earth so that after the installation is complete, the top of the ground rod will be approximately 1 foot below finished grade. Install grounding conductor pigtail in the base for connecting luminaire to grounding system.

3.8 IDENTIFICATION

A. Comply with Section 260553 "Identification for Electrical Systems."
   1. Light fixtures served from multiple power sources, such as emergency fixtures fed from emergency transfer relay or split wired fixtures, shall have the following label affixed to it: “DANGER - ELECTRICAL SHOCK HAZARD - LIGHT FIXTURE HAS MULTIPLE POWER SOURCES”

3.9 CLEANING

A. At completion of each phase and the time of final acceptance by the Owner, all lighting fixtures shall have been thoroughly cleaned with materials and methods recommended by the manufacturer.

B. All fingerprints, dirt, tar, smudges, drywall mud and dust, etc. shall be removed by the Contractor from the luminaire bodies, reflectors, trims, and lens/louvers prior to final acceptance. Cleaned with solvent recommended by the manufacturer to a like-new condition or replaced. All reflectors shall be free of paint other than factory-applied, if any.

END OF SECTION

SECTION 25116 - NETWORK LIGHTING SYSTEMS

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions, Division 00 and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. The lighting control system specified in this section shall provide time-based, sensor-based (occupancy), and manual lighting control.

B. The system shall be capable of turning lighting loads on/off as well as dimming lights (if lighting load is capable of being dimmed)

C. The system architecture shall provide stand-alone groups (rooms) of devices to function.

D. The system should not require any centrally hardwired switching equipment.

E. The system should be wired architecture, but can be capable to support wireless.

1.3 MAINTENANCE MATERIAL SUBMITTALS

A. Operation and Maintenance Data: For lighting controls to include in emergency, operation, and maintenance manuals.

1.4 QUALITY ASSURANCE

A. Retain the “Testing Agency Qualifications" Paragraph below if Contractor selects testing agency or if Contractor is required to provide services of a qualified testing agency in "Field Quality Control" Article. Qualification requirements are in addition to those specified in Section 01 40 00 "Quality Requirements," which also defines "NRTL" (nationally recognized testing laboratory).

B. All steps in the sensor manufacturing process shall occur in the USA, including population of all electronic components on circuit boards, soldering, programming, wiring, and housing.

C. All components and the manufacturing facility where the product was manufactured must be ROHS compliant.

D. In high humidity or cold environments, the sensors shall be conformably coated and rated for condensing humidity and -40-degree Fahrenheit (and Celsius) operation.

E. All applicable products must be UL/CUL Listed or other acceptable national testing organization.

1.5 DELIVERY, STORAGE, AND HANDLING

A. Handle and prepare panels for installation according to NECA 407.

1.6 COORDINATION

A. Coordinate lighting control components to form an integrated interconnection of compatible components.

B. The installation contractor shall be responsible for a complete and functional system in accordance with all applicable local and national codes.

1.7 WARRANTY

A. All devices in the lighting control system shall have a 5-year warranty. The warranty shall start at Final Project Completion.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. This specification is based on the nLight Stand Alone Control System from Sensor Switch, equals by Watt Stopper, Cooper Controls, Lutron, or Hubbell.

2.2 SYSTEM REQUIREMENTS

A. System shall have an architecture that is based upon two main concepts: 1) intelligent lighting control devices 2) standalone lighting control zones

B. Intelligent lighting control devices shall consist of one or more basic lighting control components; occupancy sensors, photocell sensors, relays, dimming outputs, manual switch stations, and manual dimming stations. Combining one or more of these components into a single device enclosure should be permissible so as to minimize overall device count of system.

C. System must interface directly with intelligent LED luminaires such that only CAT-5 cabling is required to interconnect luminaires with control components such as sensors and switches.

D. Intelligent lighting control devices shall communicate digitally, require <4 mA of current to function (Graphic wall stations excluded), and possess RJ-45 style connectors.

E. Lighting control zones shall consist of one or more intelligent lighting control components, capable of stand-alone operation.

F. Devices within a lighting control zone shall be connected with CAT-5 low voltage cabling in any order.

G. The lighting control zone shall be capable of automatically configuring itself for default operation without any start-up labor required.

H. Power for devices within a lighting control zone shall come from either resident device already present for switching (relay device) or dimming purposes. Standalone "bus power supplies" shall not be required in all cases.

I. All switching and dimming for a specific lighting zone shall take place within the devices located in the zone itself (i.e. not in remotely located devices such as panels) to facilitate system robustness and minimize wiring requirements. Specific applications that require centralized or remote switching shall be capable of being accommodated.

J. Individual lighting zones shall be capable of being segmented into several "local" channels of occupancy, photocell, and switch functionality for more advanced configurations and sequences of operation.

K. Devices located in different lighting zones shall be able to communicate occupancy, photocell, and switch information.

L. System shall be capable of operating a lighting control zone according to several sequences of operation. The system shall be able to change a spaces sequence of operation according to a time schedule so as to enable customized time-of-day, day-of-week utilization of space. Note operating modes should be utilized only in manners consistent with local energy codes.

M. The system shall provide the option of having pre-terminated plenum rated CAT-5 cabling supplied with hardware.

2.3 INDIVIDUAL DEVICE SPECIFICATIONS

A. Stand Alone Occupancy Sensors
   1. Occupancy sensors system can sense the presence of human activity within the desired space and fully control the on/off function of the lights.
   2. Sensors should utilize passive infrared (PIR) technology, which detects occupant motion, to initially turn lights on from an off state; thus, preventing false on conditions. Ultrasonic or Microwave based sensing technologies shall not be accepted.
   3. For applications where a second method of sensing is necessary to adequately detect maintained occupancy (such as in rooms with obstructions), a sensor with an additional "dual" technology shall be used.
   4. Dual technology sensors shall have one of its two technologies that do not require motion to detect occupancy. Acceptable dual technology includes PIR/Microphonics (also known as Passive Dual Technology or PDT) which both looks for occupant motion and listens for sounds indicating occupants. Sensors where both technologies detect motion (PIR/Ultrasonic) shall not be acceptable. Provide this type of sensor in all group restrooms.
   5. All sensing technologies shall be acoustic passive, meaning they do not transmit sounds waves of any frequency (for example in the Ultrasonic range), as these technologies have the potential for interference with other electronic devices within the space (such as electronic whiteboard readers). Acceptable detection technologies

include Passive Infrared (PIR), and/or Microphonics technology. Ultrasonic or Microwave based sensing technologies shall not be accepted.

6. Sensors should be including two integrated Class 1 switching relays, and up to one 0-10 VDC dimming output. Sensors shall be capable of switching 120 / 277 /
7. 347 VAC. Load ratings shall be 800 W @ 120 VAC, 1200 W @ 277 VAC, 1500 W @
8. 347 VAC, and ¼ HP motor. Relays shall be dry contacts.
9. Sensors shall be available with one or two occupancy "poles", each of which provides a programmable time delay.
10. Sensors should be available in multiple lens options which are customized for specific applications.
11. Communication and Class 2 low voltage power shall be delivered to each device via standard CAT-5 low voltage cabling with RJ-45 connectors.
12. All sensors shall have two RJ-45 ports or capable of utilizing a splitter.
13. All sensors shall have the ability to detect when it is not receiving valid communication (via CAT-5 connections) and blink its LED in a pattern to visually indicate of a potential wiring issue
14. All occupancy/vacancy sensors shall be dual-contact for integration with the HVAC system. For integration into the building automation system, ATC contractor shall wire dual contact to HVAC system.
15. Every sensor parameter shall be available and configurable remotely from the software and locally via the device push-button.
16. Sensors shall be able to function together with other sensors in order to provide expanded coverage areas by simply daisy-chain wiring together the units with CAT-5 cabling.
17. Wall switch sensors should recess into single-gang switch box and fit a standard GFI opening.
18. Wall switch sensors must meet NEC grounding requirements by providing a dedicated ground connection and grounding to mounting strap. Line and load wire connections shall be interchangeable. Sensor shall not allow current to pass to the load when sensor is in unoccupied (Off) condition.
19. Wall switch sensors have optional features for photocell/daylight over, vandal resistant lens, and low temperature/high humidity operation.
20. Wall switch sensors shall be available in four standard colors (Ivory, White, Light Almond, Gray). Wall plates shall be brushed stainless steel
21. Wall switch sensors shall be available with optional raise/lower dimming adjustment controls
22. Fixture mount sensors shall be capable of powering themselves via a line power feed.
23. Sensors have optional features for photocell/daylight override, dimming control, and low temperature/high humidity operation.
24. Sensors with dimming can control 0 to 10 VDC dimmable ballasts by sinking up to 20 mA of Class 2 current (typically 40 or more ballasts).
25. Embedded sensors shall have an optional photocell and 0-10 VDC dimming output

B. Stand Alone Daylight (Photocell and or Dimming) Sensors

1. Photocell shall provide for an on/off set-point, and a deadband to prevent the artificial light from cycling. Delay shall be incorporated into the photocell to prevent rapid response to passing clouds.
2. Photocell and dimming sensor's set-point and deadband shall be automatically calibrated through the sensor's microprocessor by initiating an "Automatic Set-point Programming" procedure. Min and max dim settings as well as set-point may be manually entered.

3. Deadband setting shall be verified and modified by the sensor automatically every time the lights cycle to accommodate physical changes in the space (i.e., furniture layouts, lamp depreciation, or lamp outages).
4. Dimming sensors shall control 0 to 10 VDC dimmable ballasts by sinking up to 20 mA of class 2 current (typically 40 or more ballasts).
5. Combination units that have all features of on/off photocell and dimming sensors should also be available.
6. A dual zone option shall be available for on/Off Photocell, Automatic Dimming Control Photocell, or Combination units. The second zone shall be capable of being controlled as an "offset" from the primary zone.
7. Line voltage versions of the above-described photocell and combination photocell/dimming sensors shall be capable of switching both 120 VAC, 277 VAC, and 347 VAC. Load ratings shall be 800 W @ 120 VAC, 1200 W @ 277 VAC, 1500 W @ 347 VAC, and ¼ HP motor load. Relays shall be dry contacts.

C. Stand Alone Metering Power (Relay) Packs
1. Power Pack shall incorporate one or more Class 1 relays and contribute low voltage power to the rest of the system. Secondary Packs shall incorporate the relay(s), shall have an optional 2nd relay, 0-10 VDC dimming output, or line voltage dimming output, but shall not be required to contribute system power. Power Supplies shall provide system power only but are not required to switch line voltage circuit. Auxiliary Relay Packs shall switch low voltage circuits only.
2. Power Packs shall accept 120 or 277 VAC, be plenum rated, and provide Class 2 power to the system and come capable of metering connected load.
3. All devices shall have two RJ-45 ports.
4. Every Power Pack parameter shall be available and configurable remotely from the software and locally via the push-button.
5. Power Pack shall securely mount to junction location through a threaded ½ inch chase nipple or be capable of being secured within a luminaire ballast channel. Plastic clips into the junction box shall not be accepted. All Class 1 wiring shall pass through chase nipple into adjacent junction box without any exposure of wire leads. Note: UL Listing under Energy Management or Industrial Control Equipment automatically meets this requirement, whereas Appliance Control Listing does not meet this safety requirement.
6. When required by local code, Power Pack must install inside standard electrical enclosure and provide UL recognized support to junction box. All Class 1 wiring is to pass through chase nipple into adjacent junction box without any exposure of wire leads.
7. Power (Secondary) Packs shall be available that provide up to 16 Amp switching of all lighting load types.
8. Power (Secondary) Packs shall be available that provide up to 5 Amps switching of all lighting load types as well as 0-10 VDC dimming of LED drivers.
9. Specific Secondary Packs shall be available that provide up to 5 Amps of switching as well as 0-10 VDC dimming of LED drivers.
10. Specific Secondary Packs shall be available that provide up to 5 Amps of switching of dual phase (208/240/480 VAC) lighting loads.
11. Specific Secondary Packs shall be available that require a manual switch signal (via a networked Wall Station) in order to close its relay.
12. Specific Power/Secondary Packs shall be available that are UL924 listed for switching of Emergency Power circuits.

D. Stand Alone Wall Switches & Dimmers

1. Devices shall recess into single-gang switch box and fit a standard GFI opening.
2. Devices shall be available with zero or one integrated Class 1 switching relay.
3. Communication and low voltage power shall be delivered to each device via standard CAT-5 low voltage cabling with RJ-45 connectors.
4. All sensors shall have two RJ-45 ports.
5. All devices shall provide toggle switch control. Dimming control and low temperature/high humidity operation are available options.
6. Devices shall be available in four colors (Ivory, White, Light Almond, Gray).
7. Devices with dimming control outputs can control 0-10 VDC
8. Devices with capacitive touch buttons shall provide audible user feedback with different sounds for on/off, raise/lower, start-up, and communication offline.
9. Devices with mechanical push-buttons shall provide tactile and LED user feedback.
10. Devices with mechanical push-buttons shall be made available with custom button labeling
11. Devices with a single on button shall be capable of selecting all possible lighting combinations for a bi-level lighting zone such that the user confusion as to which of two buttons (as is present in multi-button scenarios) controls which load is eliminated.

E. Stand Alone Graphic Wall Station
1. Device shall have a 3.5” full color touch screen for selecting up to 8 programmable lighting control presets or acting as up to 16 on/off/dim control switches.
2. Device shall enable configuration of lighting presets, switched, and dimmers via password protected setup screens.
3. Device shall enable user supplied .jpg screen saver image to be uploaded.
4. Device shall surface mount to single-gang switch box
5. Device shall have a micro-USB style connector for local computer connectivity.
6. Device shall have two RJ-45 ports for communication

PART 3 - EXECUTION

3.1 EXAMINATION

A. Receive, inspect, handle, and store panels according to NECA 407.

B. Examine panels before installation. Reject panels that are damaged or rusted or have been subjected to water saturation.

C. Examine elements and surfaces to receive panels for compliance with installation tolerances and other conditions affecting performance of the Work.

D. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 INSTALLATION

A. Install equipment in accordance with the manufacturer’s installation instructions.

B. Provide complete installation of system in accordance with Contract Documents.

C. Provide equipment at locations and in quantities indicated on Drawings. Provide any additional equipment required to provide control intent.

D. Define each dimmer's/relay's load type, assign each load to a zone, and set control functions.

E. Install plenum cable in environmental air spaces, including plenum ceilings.

F. Comply with requirements for raceways and boxes specified in Section 26 05 33 "Raceways and Boxes for Electrical Systems."

G. Wiring Method: Conceal conductors and cables in accessible ceilings, walls, and floors where possible.

H. Wiring within Enclosures: Bundle, lace, and train conductors to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

3.3 IDENTIFICATION

A. Identify system components, wiring, cabling, and terminals.

B. Identify field-installed conductors, interconnecting wiring, and components; provide warning signs.

C. Create a directory to indicate loads served by each relay; incorporate Owner's final room designations. Obtain approval before installation. Use a PC or typewriter to create directory; handwritten directories are unacceptable.

3.4 FIELD QUALITY CONTROL

A. Manufacturer's Field Service: Engage a factory-authorized service representative to test and inspect components, assemblies, and equipment installations, including connections.

B. Perform the following tests and inspections with the assistance of a factory-authorized service representative:
   1. Perform each visual and mechanical inspection and electrical test stated in NETA Acceptance Testing Specification. Certify compliance with test parameters.
   2.
   3. Correct malfunctioning units on-site, where possible, and retest to demonstrate compliance; otherwise, replace with new units and retest.

C. Acceptance Testing Preparation:
   1. Test continuity of each circuit.

3.5 STARTUP SERVICE

A. Engage a factory-authorized service representative to perform startup service.
   1. Complete installation and startup check according to manufacturer's written instructions.

B. Required factory-trained personnel site visits:
   1. Pre-installation: The system shall be provided with visits from factory-trained technician(s) for a pre-installation visit with the contractor prior to system installation.
   2. Commissioning and Programming: A second visit shall be included for commissioning and programming of the system including testing of switches and sensors.
   3. Owner Training: A third visit shall be provided for owner training after the owner has occupied the building. Minimum four-hour training to be video recorded.
   4. Owner Re-Training and System Adjustment: A fourth visit 6 months after the owner has occupied the building shall be provided to tweak the system for occupant preferences and for additional training.

3.6 ADJUSTING

A. Occupancy Adjustments: When requested within 12 months from the date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

3.7 SEQUENCE OF OPERATION

A. Classrooms, Science Classrooms, Health Classrooms, Band Room, Chorus Room, Business/Finance Classrooms, Vibe Classroom, Marketing/Web Animation Rooms, CTE Seminar Rooms:
   1. Control Switch: 4-scene controller
   2. Automatic Controls: Automatic off via vacancy sensor after 20 minutes of vacancy.
   3. Sensors: Dual technology Vacancy, Daylighting
   4. Dimming: 0-10V
   5. Scenes:
      a. Scene 1: The first preset shall be labeled “AV” and shall turn the lighting closest to the teaching wall to 10% output with the rest of the lighting at 30% output.
      b. Scene 2: The second preset shall be labeled “Full” with all lighting at 80% output.
      c. Scene 3: The third preset shall be labeled “Low” and shall be all lighting at 10% output.
      d. Scene 4: TBD
   6. Plug Load Control: Yes
   7. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

B. Art Classrooms, Graphics/Photoshop Rooms:
   1. Control Switch: 4-scene controller
   2. Automatic Controls: Automatic off via vacancy sensor after 20 minutes of vacancy.
   3. Sensors: Dual technology Vacancy, Daylighting
   4. Dimming: 0-10V
   5. Scenes:
      a. Scene 1: Track Lighting only, track lights at 60% output.
      b. Scene 2: The second preset shall be labeled “Full” of all lighting at 80% output.
      c. Scene 3: The third preset shall be labeled “Low” and shall be all lighting at 10% output.
      d. Scene 4: Drawing Study, all downlights off, spotlight track on at 75% output.

6. Plug Load Control: Yes
7. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

C. Wellness Room:
1. Control Switch: On/Off, Raise/Lower switch
2. Automatic Controls: Automatic upon occupancy, and automatic off after 20 minutes of vacancy.
3. Sensors: Dual technology Occupancy, Daylighting
4. Dimming: 0-10V
5. Scenes: N/A
6. Plug Load Control: N/A
7. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

D. Prep Rooms, Art Rooms, Makerspace:
1. Control Switch: On/Off, Raise/Lower switch
2. Automatic Controls: Automatic off via vacancy sensor after 20 minutes of vacancy.
3. Sensors: Dual Technology Vacancy, Daylighting
4. Dimming: 0-10V
5. Plug Load Control: Yes
6. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

E. Corridor/Lobbies/Vestibules:
1. Control Switch: Timeclock and 2-scene controller
2. Automatic Controls: Timeclock shall turn on all lighting during business hours, TBD by MHHS. Outside of business hours, the dual technology occupancy sensor shall turn the lighting on/off, when no occupancy has been detected for 20 minutes the lights shall turn off.
3. Sensors: Timeclock, Dual Technology Occupancy, Daylighting
4. Dimming: 0-10V
5. Scenes:
   a. Scene 1: Daytime: The first preset shall be labeled “Full” with all lighting at 80% output.
   b. Scene 2: Evening: The second preset shall be labeled “Evening” with wall lights set to 80% output and general lighting set to 60% output.
6. Plug Load Control: No
7. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

F. Admin Areas- Reception, Waiting:
1. Control Switch: On/Off, Raise/Lower Switch
2. Automatic Controls: Automatic upon occupancy, and automatic off after 20 minutes of vacancy.
3. Sensors: Dual Technology Occupancy, Daylighting
4. Dimming: 0-10V
5. Scenes: N/A
6. Plug Load Control: Yes

7. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

G. Offices/Conference Rooms:
1. Control Switch: On/Off, Raise/Lower Switch
2. Automatic Controls: Automatic off via vacancy sensor after 20 minutes of vacancy.
3. Sensors: Dual Technology Vacancy, Daylighting
4. Dimming: 0-10V
5. Scenes: N/A
6. Plug Load Control: Yes
7. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

H. Large Restrooms, :
1. Control Switch: N/A
2. Automatic Controls: Automatic on upon occupancy, and automatic off after 20 minutes of vacancy.
3. Sensors: Dual Technology Occupancy
4. Dimming: 0-10V
5. Scenes: N/A
6. Plug Load Control: No
7. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

I. Small Restrooms, Single Shower, Coaches Restrooms/Shower:
1. Control Switch: On/Off, Raise/Lower Switch
2. Automatic Controls: Automatic off via vacancy sensor after 20 minutes of vacancy.
3. Sensors: Dual Technology Vacancy
4. Dimming: 0-10V
5. Scenes: N/A
6. Plug Load Control: No
7. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

J. Locker Room:
1. Control Switch: On/Off, Raise/Lower Switch located in remote location (Coaches Room, Athletic Directors office)
2. Automatic Controls: Automatic on upon occupancy, and automatic off after 20 minutes of vacancy.
3. Sensors: Dual Technology Occupancy
4. Dimming: 0-10V
5. Scenes: N/A
6. Plug Load Control: No
7.
8. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

K. BOH Rooms (Storage, MEP, Janitor):
1. Control Switch: On/Off Switch with integral sensor. MEP rooms to have switch only.
2. Automatic Controls: Automatic off via vacancy sensor after 20 minutes of vacancy.

3. Sensors: Dual Technology Vacancy
4. Dimming: 0-10V
5. Scenes: N/A
6. Plug Load Control: No
7. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

L. Gym:
1. Control Switch: On/Off Switch & 5-scene controller
2. Automatic Controls: Automatic on upon occupancy, and automatic off after 20 minutes of vacancy.
3. Sensors: Dual Technology Occupancy, Daylighting
4. Dimming: 0-10V
5. Scenes:
   a. Scene 1: Daytime: The first preset shall be labeled “Full” with all lighting at 80% output.
   b. Scene 2: Game: The second preset shall be labeled “Game” with downlighting at 90% output and wall-wash lighting at 75% output
   c. Scene 3: The third preset shall be labeled “Assembly” with downlighting at 65% output and wall-wash lighting at 50% output.
   d. Scene 4: TBD
   e. Scene 5: TBD
6. Plug Load Control: No
7. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

M. Auditorium:
1. Control Switch: On/Off Switch & 5-scene controller. Provide one switch at each entry.
2. Automatic Controls: Automatic on upon occupancy, and automatic off after 20 minutes of vacancy.
3. Sensors: Dual Technology Occupancy, Daylighting
4. Dimming: 0-10V
5. Scenes:
   a. Scene 1: Daytime: The first preset shall be labeled “Full” with down-lighting at 80% output., wall-wash lighting at 60% output, proscenium lighting at 70% output, step lights off.
   b. Scene 2: Assembly: The second preset shall be labeled “Assembly” with down-lighting at 65% output., wall-wash lighting at 50% output, proscenium lighting at 50% output, step lights off.
   c. Scene 3: with down-lighting at 30% output., wall-wash lighting at 30% output, proscenium lighting at 50% output, step lights off.
   d. Scene 4: TBD
   e. Scene 5: TBD
6. Plug Load Control: N/A
7. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.
8. Additional Notes: Provide one fixed touchscreen at the control station in gymnasium, refer to drawings, capable of controlling up to 5-scenes. Each fixture shall be individually Addressed.

N. Recording Studio, Video Broadcast Control Room:
1. Control Switch: On/Off Raise Lower Switch
2. Automatic Controls: Automatic on upon occupancy, and automatic off after 20 minutes of vacancy.
3. Sensors: Dual Technology Occupancy, Daylighting
4. Dimming: 0-10V
5. Scenes: N/A
6. Plug Load Control: Yes
7. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

O. Video Broadcast Classroom and Studio:
1. Control Switch: On/Off Switch & DMX Touch Screen controller with 4 scenes, additional switch for On-Air Light
2. Automatic Controls: Automatic on upon occupancy, and automatic off after 20 minutes of vacancy.
3. Sensors: Dual Technology Occupancy, Daylighting
4. Dimming: 0-10V
5. Scenes:
6. Scene 1: Daytime: The first preset shall be labeled “Full” with all lighting at 80% output.
7. Scene 2: Low
8. Scene 3: AV
9. Scene 4: Recording
10. Plug Load Control: Yes
11. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

P. Dressing Room:
1. Control Switch: On/Off, Raise/Lower Switch
2. Automatic Controls: Automatic off via vacancy sensor after 20 minutes of vacancy.
3. Sensors: Dual Technology Vacancy, Daylighting
4. Dimming: 0-10V
5. Scenes: Separate switch for downlights and mirror lights
6. Plug Load Control: N/A
7. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

Q. Cafeteria:
1. Control Switch: 4-scene controller
2. Automatic Controls: Timeclock shall turn on all lighting during business hours, TBD by MHHS. Outside of business hours, the dual technology occupancy sensor shall turn the lighting on/off, when no occupancy has been detected for 20 minutes the lights shall turn off.
3. Sensors: Timeclock, Dual Technology Occupancy, Daylighting
4. Dimming: 0-10V
5. Scenes:
    a. Scene 1: Daytime: The first preset shall be labeled “Full” with all lighting at 80% output.
    b. Scene 2: Evening: The second preset shall be labeled “Evening” with all lighting at 65% output

c. Scene 3: Event: The third preset shall be labeled “Event” with all lighting at 50% output.
d. Scene 4: TBD

6. Plug Load Control: No
7. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

R. Kitchen, Servery:
1. Control Switch: On/Off, Raise/Lower switch
2. Automatic Controls: Automatic off via vacancy sensor after 20 minutes of vacancy.
3. Sensors: Dual Technology Vacancy, Daylighting
4. Dimming: 0-10V
5. Scenes:
a. Scene 1: The first preset shall be labeled “Full” with all lighting at 80% output.
b. Scene 2: The second preset shall be labeled “Low” and shall be all lighting at 10% output.
c. Scene 3: TBD
6. Plug Load Control: N/A
7. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

S. Media Center:
1. Control Switch: 3-scene controller
2. Automatic Controls: Automatic off via vacancy sensor after 20 minutes of vacancy.
3. Sensors: Dual technology Vacancy, Daylighting
4. Dimming: 0-10V
5. Scenes:
a. Scene 1: The first preset shall be labeled “Full” with all lighting at 80% output.
b. Scene 2: The second preset shall be labeled “Evening” and shall be all lighting at 10% output.
c. Scene 3: TBD
6. Plug Load Control: Yes
7. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL924 relay.

T. Stairs:
1. Control Switch: Timeclock
2. Automatic Controls: Timeclock shall turn on all lighting during business hours, TBD by MHHS. Outside of business hours, the dual technology occupancy sensor shall turn the lighting on/off, when no occupancy has been detected for 20 minutes the lights shall turn off.
3. Sensors: Timeclock, Dual Technology Occupancy, Daylighting
4. Dimming: 0-10V
5. Scenes: N/A
6. Plug Load Control: N/A
7. Emergency Control: Upon loss of power, lights denoted as emergency shall go to 100% output via UL 924 relay.

U.

V. Exterior:
   1. Control Switch: Astronomical Timeclock and Occupancy Sensors for canopy mounted fixtures
   2. Automatic Controls: Lights shall automatically turn on at dusk and turn off at dawn. Between one hour after school closing and one hour before school opening, all lights shall be set to 50% output. During dark times, dual technology occupancy sensor shall turn the lighting on/off, when no occupancy has been detected for 20 minutes the lights shall turn off.
   3. Sensors: Astronomical Timeclock, Occupancy Sensors
   4. Dimming: 0-10V
   5. Scenes: N/A
   6. Plug Load Control: N/A
   7. Emergency Control: N/A

3.8 SERVICE AND SUPPORT

A. A Digital-Network Lighting Control System requires multiple site visits for proper startup. The first site visit ensures that the contractor is trained to install the system correctly. The second visit starts up the system and ensures that the system is operating per specification. The third visit trains the owner/end user on system operation and functionality.

B. Provide factory certified field service engineer to make minimum of three site visits to ensure proper system installation and operation under following parameters
   1. Qualifications for factory certified field service engineer:
      a. Minimum experience of 2 years training in the electrical/electronic field.
      b. Certified by the equipment manufacturer on the system installed.
   2. Make my first visit prior to installation of wiring. The contractor must schedule a meeting with the Electrical Engineer and Manufacturer representative to review system and functionality prior to installation of wire and equipment.
   3. Make a second visit upon completion of installation of Lighting Control System for system start up. Schedule start up with owner and engineer with 2 weeks prior notice.
   4. A total two (2) Owner training session with the electrical contractor, the lighting controls contractor, the factory authorized representative, engineer of record, and the owner (and staff) shall be conducted at the project site. The training session shall be scheduled for a minimum of 2 weeks prior. The training session shall not be conducted until the lighting controls system has been programmed and is fully operational.
   5. A total of two (2) walk thrus shall be conducted after completion of construction to assure that the system is fully operational. The walk thrus shall be schedule a minimum of 2 weeks prior and shall be conducted at the request of the owner or engineer of record. In lieu of a formal request from the owner or engineer of record the walk thrus shall be conducted 3 months and 9 months after completion of construction. Reports shall be issued at each walk-thru.

END OF SECTION

SECTION 265600 – SITE LIGHTING

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawing and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

B. Section 312333 Trench Excavation for Utilities

C. Section 321216 Asphaltic Concrete Paving

D. Site Electrification

E. Construction Documents

1.2 SCOPE OF WORK

A. Exterior luminaries and accessories, underground conduit, wiring, and termination.

B. Poles and foundations.

C. Component installation and system testing.

D. Removal of existing overhead wires, light fixtures, and light poles as shown on the Drawings.

1.3 REFERENCE STANDARDS

A. ANSI C78.379 - Electrical Lamps - Incandescent and High-Intensity Discharge Reflector Lamps - Classification of Beam Patterns

B. ANSI/NFPA 70 - National Electrical Codes

C. ANSI/IES RP-8 - Recommended Practice for Roadway Lighting

D. ANSI/IES RP-20 - Lighting for Parking Facilities

E. IES Lighting Handbook - Current Edition

F. NEMA – Best practices for metal halide lighting systems

G. IES DG-5-94 – Recommended lighting for walkways and class I bikeways

H. NECA/IESNA 501-2000 – Recommended practice for installing exterior lighting systems.

I. IESNA G-1-02 – Guideline for security lighting for people, property and public spaces

J. IESNA RP-06-01 – Recommended practice for sports and recreational area lighting

K. AASHTO – Standard specifications for structural supports for highway signs, luminaries and traffic signals, 4th edition (2003 interim)

L. IESNA LM-79 - Electrical and Photometric Measurements of Solid-State Lighting Products

M. IESNA LM-80 - Approved Method for Measuring Lumen Maintenance of LED Light Sources

1.4 HIGH PERFORMANCE BUILDING GENERAL REQUIREMENTS

A. Implement practices and procedures to meet the project's environmental goals, which include complying with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools. Specific project goals which may impact this and the other sections of this specification include: use of recycled-content materials; use of locally-manufactured materials; use of low-emitting materials; use of certified wood products; construction waste recycling; and the implementation of a construction indoor air quality management plan. Ensure that the requirements related to these goals, as defined in this Section and other Sections of the contract documents, are implemented to the fullest extent. Substitutions or other changes to the work shall not be allowed if such changes substantially compromise the stated High Performance Building criteria.

B. Comply with Connecticut Standard Guidelines Compliance Manual for High Performance Buildings, September 2011 with additional mandatory building project requirements for schools and the Department of Administrative Services / Office of School Construction Grants & Review High Performance School Construction Bulletin, June 2017.

1.5 QUALITY ASSURANCE

A. Contractor to verify that all specified site lighting satisfies all applicable guidelines and regulations of local utility provider.

B. Once Shop Drawings, are approved, all lighting is to be ordered in a timely manner. The Contractor is then to inform the Landscape Architect/Engineer immediately, in writing, the date when equipment orders are completed and delivery scheduled.

C. The Owner reserve the right to request standard production model fixture samples for inspection and to order such tests as the Owner deems necessary to insure compliance with these specifications and to reject those luminaires failing such tests, or those luminaries with improper or inadequate light distributions. The Owner shall be the sole judge as to acceptability.

1.6 SUBMITTALS

A. Contractor shall submit 3 color samples for all new light fixtures and poles to the Landscape Architect for approval.

B. When required by the Owner, each submittal transmitted for approval shall contain:

C. Computer prepared photometric layout of the proposed lighted area, which indicates by isofootcandle readings the system performance.

D. A photometric report from a national independent testing laboratory with report number, date, fixture catalog number, luminaire and lamp specifications; IES calculations, candlepower tabulations, zone lumen summary and isolux plot.

E. The Underwriters Laboratory listing and file number for the specific fixture(s) to be utilized.

F. Pole manufacturer AASHTO calculations indicating the pole and anchor bolts being submitted are capable of supporting the pole and fixture systems being utilized in accordance with specifications.

G. Catalog cuts proving complete conformance to the specifications.

1.7 SYSTEMS PERFORMANCE

A. All luminaries as indicated on the drawings shall be "cut-off luminaries". A "cut-off luminaire" is defined by the following limitations of light distributions:

B. At any lateral angle around the luminaire, the candle power per 1000 lumens shall not exceed 25 lumens at an angle of 90 degrees above horizontal and 100 lumens at a vertical angle 80 degrees above horizontal.

C. All site lighting shall minimize light trespass and spillover onto adjacent properties. Internal house-side shields shall be incorporated on all pole-mounted luminaries abutting adjacent properties.

1.8 WARRANTY

A. Provide Owner with one year warranty certificate signed by Contractor and by the company providing actual warranty labor. This certificate must be received by the Owner prior to final payment.

PART 2 - PRODUCTS

2.1 HIGH INTENSITY DISCHARGE LAMPS (HID)

A. Lamps shall be provided from the following manufacturers or approved equal. The Contractor is responsible that all lamps conform to the site lighting schedule and luminaire manufacturer specifications. If any discrepancies exist, the Contractor shall notify the owner’s representative, or Project Landscape Architect.

1. Venture lighting international, 3200 Aurora Road, Solon, OH 44139, Phone: (800) 451-2606.
2. Eye Lighting International of North America, Inc. Phone: (888) 665-2677.
3. Phillips Lighting Company, 200 Franklin Square Drive, P.O. Box 6800, Somerset, NJ 08875-6800, Phone: (800) 555-0050.

4. GE Lighting, Phone (800) GE Lamps.
5. Sylvania, 100 Endicott Street, Danvers, MA, Phone (978) 777-1900.

2.2 DRIVERS FOR LED LAMPS

A. General Requirements

1. LED Engines / Drivers: Comply with UL 1993, UL 8760.
2. Designed for type and quantity of lamps served.
3. Designed for the full light output unless dimmable controls are indicated.

B. Dimmable control shall pulse width modulation or other approved technology.

C. Power Factor: 0.90 or higher unless otherwise indicated.

D. Total Harmonic Distortion: Less than 20 percent.

E. Transient Voltage Protection: IEEE C62.42.1. and IEEE C62.42.2, Category A or better.

F. Interference: Comply with 47 CFR 18, Ch. 1, Subpart b, for regulations concerning the emission of electronic noise.

2.3 LED LAMPS

A. General Requirements

1. Integral LED lamps: Comply with UL 1993, UL 8750.
2. LED packages and LED arrays: Comply with UL 8750.
3. Color temperature as indicated

B. LEDs shall utilize appropriate technology to achieve the indicated color.

C. Average rated life shall be a minimum 50,000 hours unless otherwise indicated.

D. LEDs shall be wired so that a failure of one LED will not adversely affect output of the lamp.

E. Circuitry shall prevent perceptible flicker over the operating voltage range even when in dimmable mode.

F. LED’s shall meet the LM-80 testing criteria as set forth by the Federal Department of Energy

2.4 LED LUMINAIRES

A. Refer to site lighting plan and schedule on contract documents for luminaire locations, additional specifications, accessories, and specific model numbers.

B. LED Light Fixtures shall meet the LM-79 testing criteria as set forth by the Federal Department of Energy.

C. LED Fixtures must have a lighting facts report to confirm efficacy and energy consumption.

D. Integral and remote Emergency Battery pack must be approved by the Light Fixture Manufacturer unless otherwise noted.

E. An L-70 or greater rating shall be published by the manufacturer to confirm expected life/ performance.

2.5 HIGH INTENSITY DISCHARGE LUMINAIRES

A. Refer to site lighting plan and schedule on contract documents for luminaire locations, additional specifications, accessories, and specific model numbers.

2.6 POLES, SUPPORT ARMS AND BRACKETS

A. Poles: Refer to site lighting plan and schedule on contract documents for luminaire locations, additional specifications, accessories, and specific model numbers.

2.7 PRE-CAST CONCRETE FOUNDATIONS

A. Pre-cast concrete light pole foundations shall be supplied by the following manufacturer(s){OR APPROVED EQUAL}:

Cromwell Concrete
P.O. Box 99
Cromwell, CT 06416-1429
Phone: (860) 635-5146
Fax: (860) 635-7469

Modern Concrete, Inc.
3900 Clover Road
Easton, PA 18040
Phone: (484) 548-6200
Fax: (610) 258-8165

B. All pre-cast foundations shall be reinforced per the Contract Documents.

2.8 ROUND CONCRETE FORMS

A. Concrete forms shall be supplied by the following manufacturer:

Sonoco Products Company
One North Second Street
Hartsville, SC 29550

2.9 Sonotube Concrete Forms

1. Description: Multiple layers of 100 percent recycled paperboard, spirally wound, and laminated with adhesive.
2. Interior Surface: Smooth with spiral seam. Alathon release and moisture barrier coating.
3. Exterior Surface: Micryl moisture barrier coating.
4. Spiral Mark: Impact visible spiral mark on concrete columns.
5. 1-piece, 1-time-use forms.
6. Recyclable.
7. Inside Diameter: As indicated on the Drawings.

PART 3 - EXECUTION

3.1 INSTALLATION

A. Provide concrete base for light poles at location indicated on the construction documents.

B. Install poles plumb. Provide shims or double nuts where necessary to adjust plumb. Grout around each base.

C. Install lamps in each luminaire. Contractor shall exercise caution when handling lamps. Contractor shall avoid handling lamps without clean gloves or a protective cloth wrap.

D. Bond luminaries, metal accessories and metal poles to branch circuit equipment grounding conductor. Provide supplementary grounding electrode at each pole.

3.2 FIELD QUALITY CONTROL

A. Operate each luminaire after installation and connection. Inspect for improper connections and operation.

B. Measure illumination levels to verify conformance with performance requirements as specified on the construction drawings and/or local ordinances.

C. Take measurements during the night sky, without moon or with heavy overcast clouds effectively obscuring the moon.

D. Aim and adjust luminaire to provide illumination levels and distribution as indicated on the construction drawings or as directed.

3.3 CLEANING

A. Clean electrical parts to remove conductive and deleterious materials.

B. Remove dirt and debris from enclosure.

C. Clean photometric control surfaces as recommended by manufacturer.

D. Clean finishes and touch up damage.

3.4 PROTECTION OF FINISHED WORK

A. Contractor shall protect all work while construction is in progress. Contractor is responsible for any damage incurred during construction.

B. Relamp luminaries which have failed or been damaged during construction at substantial completion.

3.5 TESTING

A. Perform and record voltmeter measurements according to standard testing procedures. In addition, provide labor, material, and energy to conduct a parking lot light test at least 30 days prior to Substantial Completion date. This test shall consist of continuous operation of fixtures and lamps for a time period of 100 hours. Contractor shall witness and certify the continuous operation and time duration of the test. At the end of the testing period, immediately request warranty parts and replace defective components at least three days prior to Substantial Completion date.

END OF SECTION

SECTION 266100 – PHOTOVOLTAIC SYSTEM

PART 1 - GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 1 Specification Sections, apply to this Section.

1.2 SUMMARY

A. This Section includes the minimum requirements for a Turn-Key Photovoltaic System.

B. This Section includes, but is not limited to the following:

1. Photovoltaic Modules
2. Photovoltaic Inverters
3. Photovoltaic Monitoring and Reporting System, Software and Services
4. Infrastructure, Wiring, Connections, and Testing
5. Identifications and Signs

C. Provide all labor and materials, and make all necessary connections, so that a complete and fully operational system shall be turned over to the owner. Any errors, omissions, or ambiguities concerning the photovoltaic (PV) system specifications shall be brought to the Engineers attention ten (10) working days prior to bid.

1.3 SCOPE OF WORK

A. For all work associated with the new photovoltaic system including photovoltaic modules, mounting rails, inverters, wire management system, photovoltaic monitoring and reporting services, disconnects, cabling, installation, terminations and devices shall be provided and performed by a qualified Photovoltaic System Contractor for a complete and operational photovoltaic system.

B. Photovoltaic System Contractor shall provide a functioning photovoltaic (PV) system with the minimum requirements of this section.

C. Mounting system: Contractor shall provide racking system as indicated on drawings. System shall be galvanized steel or aluminum. Mounting system shall not void the roof warranty. PV modules shall be installed and located to avoid shadowing from skylights, tubular daylighting devices, HVAC equipment and parapets.

D. Roof penetrations: Contractor shall minimize roof penetrations and shall not void the roof warranty.

E. Inverters: Inverters shall be IEEE 929 compliant and shall be inspected by utility company before commissioning, testing and operation of the system.

F. Electrical interconnection: Contractor shall install conductors, conduit, pull boxes, etc per NEC and requirements of specifications and drawings. All DC conductors shall be copper and 90 degree C, wet location rated with USE-2 insulation.

G. All membrane roof mounted conduits shall be supported off the roof with Cooper B-Line Dura-Blok rooftop support system.

H. All work shall be in accordance with the NEC and local codes.

I. All equipment shall be listed and labeled per UL and installed per the listing requirements and the manufacturer's instructions.

J. All outdoor equipment shall be minimum NEMA 3R.

K. All equipment shall be properly grounded per NEC 250 and NEC 690.

L. All circuits connected to more than one source shall have overcurrent devices located so as to provide overcurrent protection from all sources. NEC 690.9 (a)

M. Installation of PV panel arrays shall resist sliding and pop-up resulting from seismic events and shall comply with ASCE standard 7-05, chapter 13.

N. PV System Contractor shall coordinate all work with the Engineer, Architect, General Contractor, Electrical Contractor and all other contractors to ensure the PV system is installed and coordinated with the contract documents.

O. All roof penetrations and associated labor costs shall be at the expense of the PV contractor, but shall be installed by the roofing contractor in order to maintain any applicable roof warranties. Any deviations necessary by this contractor shall first be submitted to the Architect's office for review. Any costs associated with changes to this system that are a result of proposed details not being acceptable to the Owner, Architect or Engineer shall be at the expense of the PV Contractor. All required connection devices shall be reviewed by the architect and engineer. Penetration devices through standing seam metal roof areas shall be provided by the sheet metal roofing contractor.

P. Provide all necessary electrical distribution equipment, feeders, branch circuits, etc as required for a complete and functioning system.

1.4 PERFORMANCE REQUIREMENTS

A. Material Compatibility: Provide photovoltaic, electrical and mounting materials that are compatible with one another under conditions of service and application required, as demonstrated by photovoltaic manufacturer based on testing and field experience.

1.5 SUBMITTALS

A. Product Data: For each type of product indicated.
   1. Preparation instructions and recommendations.
   2. Storage and handling requirements and recommendations.
   3. Installation methods.

B. Shop Drawings: Provide on standard 30” by 42” size for photovoltaic system shall include but not limited to:

   1. Plans, elevations, sections, details, and attachments to other Work.
   2. All diagrams must be submitted by the approved Contractor along with a point to point PV system interconnection diagram. Diagram shall identify all DC and AC components, conduit and wiring characteristics,
   3. Site plan showing infrastructure layouts, PV array locations, and identifiable features.
   4. Annual yield simulation report from Helioscope or similar software.
   5. Riser diagram and General Notes:
      a. Connection to utility AC disconnects and main electrical switchboard.
      b. Indicate conduits, power and communication wires, and combiners, disconnects, inverters, meters, etc.
      c. Provide PV system(s) power production calculations and total system(s) rating.

   6. Assembly Details. Provide as minimum the following details:
      a. Array attachment details.
      b. Support details and spacing dimensions.
      c. Roof mounted conduit supports and roof penetrations.
      d. Indicate all system(s) interface connections.
      e. Provide AC and DC wiring plans.
      f. Provide electrical equipment room layouts and equipment elevation details.

   7. Complete point to point PV System interconnection diagram(s):
      a. Identify all DC and AC components.
      b. Indicate conduit and wire characteristics, sizes and quantities.
      c. Indicate conduit fill and voltage drops.
      d. Provide combiner box schedule.
      e. Provide list of all materials.
      f. System monitoring details.

   8. Warranties: Sample copy of Warranties and Special Warranties to be issued with submittal.

C. Inspection Report: Copy of photovoltaic system manufacturer's inspection report of completed photovoltaic installation.

D. Manufacturer Approval of Testing Agency: Copy of manufacturer’s letter indicating acceptance of qualifications of testing agency to perform inspections specified under Part 3 Article “Field Quality Control,” including manufacturer’s compliance with testing agency’s requirements for final roofing inspection and manufacturer’s warranty certification.

1.6 QUALITY ASSURANCE

A. Installer Shall: Be certified by the North American Board of Certified Energy Practitioners (NABCEP)

B. Manufacturer Qualifications: A qualified manufacturer that has testing listings for photovoltaic system for this Project.

1. Photovoltaic modules shall comply with the latest revision of the following standards and the Contractor shall provide evidence of certification to the Engineer:
   a. UL Listed to 1000 Vdc
   b. Meet IEC 61646
   c. UL 1703
   d.
   e. Inverters shall comply with the latest revision of the following standards and the Contractor shall provide evidence of certification to the Engineer:
   f. UL 1741
   g. IEEE 1547 Standard for Interconnecting Distributed Resources with Electric Power Systems (including use of IEEE 1547.1 testing protocols to establish conformity)
   h. IEEE 1547.1 Standard Conformance Test Procedures for Equipment Interconnecting Distributed Resources with Electric Power Systems
   i. UL 1741 Inverters, Converters, and Controllers for Use in Independent Power Systems
   j. NFPA 70 - National Electrical Code
   k. ANSI 62.41
   l. IEEE 929-2000
   m. Inverters shall be considered certified for interconnected operation if the generation equipment and all related interconnection components have been tested and listed by a Nationally Recognized Testing Laboratory (NRTL certification by Department of Labor) for continuous interactive operation with an electric distribution system in compliance with the codes and standards outlined above.
   n. “Utility-Interactive” Labeled

2. Electric Installation
   a. NFPA 70: National Electric Code

C. Electrical and Fire Safety Characteristics: Provide photovoltaic materials with the electrical and fire safety characteristics for use in systems up to 1000 Vdc as determined by UL. Materials shall be identified with appropriate markings of applicable testing and inspecting agency.
1. Exterior Fire-Test Exposure: Class A for slopes up to 2:12 and Class C for unlimited slopes.

D. Pre-installation Conference: Conduct conference at Project site. Review methods and procedures related to roofing system including, but not limited to, the following:
1. Meet with Owner, Architect and Engineer, photovoltaic installer, roofing installer, lightning protection installer, mechanical contractor and other installers whose work interfaces with or affects photovoltaic installation including installers of electrical components.

2. Review methods and procedures related to photovoltaic installation, including manufacturer's written instructions.
3. Review and finalize construction schedule and verify availability of materials, Installer's personnel, equipment, and facilities needed to make progress and avoid delays.
4. Examine substrate conditions and finishes for compliance with requirements, including flatness and fastening.
5. Review governing regulations and requirements for insurance and certificates if applicable.
6. Review temporary protection requirements for roofing system during and after installation.

1.7 QUALITY CONTROL

A. Contractor shall have adequate experience installing systems of similar size and complexity.

B. Qualifications of Installer: Minimum 5 years of experience installing products and systems of similar scope and complexity.

C. Installer shall have completed at least one (1) project of similar products and 300kW minimum project size and two (2) additional projects of similar products and 100kW minimum project size.

D. Installer shall submit certification from the equipment manufacturer indicating that installer is an authorized representative of the equipment manufacturer and/or is trained on the installations of the specified PV system products.

E. Installer shall maintain a fully equipped service organization capable of furnishing repair service to the equipment.

F. Installer shall furnish a letter from manufacturer of equipment certifying equipment has been installed according to factory standards and that system is operating properly.

G. Contractor shall have completed and commissioned a minimum of one (1) service agreement that provides similar support services to those needed for this project.

H. System startup and testing shall be performed by a factory engineer under the direct observation of the Engineer and Owner.

I. The installer shall provide the system components required by code and for the life safety of the service personnel.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Deliver photovoltaic materials to Project site in original containers with seals unbroken and labeled with manufacturer's name, product brand name and type, and directions for storing and mixing with other components. Ensure that any materials temporarily stored on roof do not damage membrane if applicable.

1.9 PROJECT CONDITIONS

A. Weather Limitations: Proceed with installation only when existing and forecasted weather conditions permit photovoltaic system to be installed according to manufacturer's written instructions and warranty requirements.

1.10 WARRANTY

A. System Warranty: Contractor shall provide an unconditional warranty for the complete installed system for a period of five (5) years following acceptance of the completed project. Warranty shall include labor and materials to repair, reprogram, or replace components at no charge to the Owner during the warranty period. All corrective work or system modifications shall be updated on all user documentation.

1. Warranty shall include annual on-site inspection, including: system testing (operating current of each electrical system), system adjustments and routine maintenance. Annual inspection shall take place during Spring.
2. Warranty shall include repair and/or replacement of defective parts.
3. System performance monitoring and historical data access for customer via secure website. Data is required to include: system energy and power production.
4. Monthly system monitoring by vendor, including reporting of problems to customer and dispatch of resources for expeditious resolution of problems.
5. The warranty shall include a response time of 24 hours for major system failures (emergency service), and 72 hours for minor repairs (routine service). Proposed agreement shall include annual site visits for preventative maintenance inspection so that all systems are validated prior to the warranty expiration date.
6. Provide a list of all applicable warranties for all equipment and components, this list shall include warranty information, names, addresses, telephone numbers, and procedures for filing a claim and obtaining warranty services.
7. Contractor shall respond to the Owner’s request for warranty service within 24 hours during normal business hours. For all calls, the Contractor shall submit records of the nature of the call, the work performed, and the parts replaced or service rendered.

B. Component Warranty:
1. Crystalline photovoltaic panels: Manufacturer shall provide a 12 year performance warranty at 90% of its rated power output, 25 years at 80% of its rated power output. Warranty shall include all travel, labor and materials to repair, reprogram, or replace components at no charge to the Owner during the warranty period.
2. AC/DC inverters: 5 year material. Warranty shall include all travel, labor and materials to repair, reprogram, or replace components at no charge to the Owner during the warranty period.

1.11 INSPECTIONS AND PREVENTATIVE MAINTENANCE

A. Service and Maintenance Agreement: Provide biannual inspection, cleaning and maintenance during the warranty period of five (5) years following Owner acceptance of the completed project. Provide the following:

1. Inverter maintenance: Visual inspection and verify performance via monitoring service.
2. Photovoltaic panel and wiring maintenance: Check electrical connections at combiner boxes, check electrical output at combiner boxes with volt meter to ensure proper electrical output.

PART 2 - PRODUCTS

2.1 MANUFACTURERS

A. In other Part 2 articles where titles below introduce lists, the following requirements apply for product selection:
   1. Manufacturers: Subject to compliance with requirements, provide products the manufacturers specified.

B. Photovoltaic modules: as indicated on drawings.

C. Inverters: as indicated on drawings.

D. Self-Ballasted Mounting System: as indicated on drawings.

E. Photovoltaic Monitoring and Reporting Services: SolarEdge or equal. Contractor shall include a minimum of five (5) years of monitoring service for the entire system. Monitoring service shall generate daily report comparing yield by inverter. System shall automatically send an email to provided recipients if standard deviation of any single inverter exceeds 25%.

PART 3 - EXECUTION

3.1 SYSTEM INSTALLATION

A. Install equipment and all required wiring. Provide required conductor terminations to devices for a complete system to function as specified and indicated on Drawings.

B. Terminations shall be in terminal cabinets or on equipment terminals.

C. Conductors shall be installed within conduits, boxes, and terminal cabinets in a totally enclosed installation. Furnish and install conductors required to connect incoming and outgoing circuits.

D. Wiring within equipment and terminal cabinets shall be installed to conform to contract documentation and NFPA 72 standards. Wiring shall be cabled, laced, and securely fastened in place so that no weight is imposed on equipment or terminals.

E. Conductors shall be color-coded per specifications and tagged with code markers at terminal cabinets, and equipment. A wire index shall be typed and installed on terminal cabinet doors.

Index shall be covered with clear plastic adhesive covers. Wiring shall be identified as to building and location of devices.

F. Complete installation shall comply with local building codes, manufacturer's instructions, and applicable industry standards.

G. Do not scale Drawings to determine locations and routing of conduits. Location of the infrastructure and equipment shall conform to architectural features of the building and other Work already in place, and must be ascertained in the field before the start of Work.

H. Drawings generally indicate Work to be provided, but do not indicate all bends, transitions or special fittings required to clear beams, girders or other Work already in place. Investigate conditions where conduits are to be installed, and furnish and install required fittings.

I. The roof shall be inspected prior to start of any work. Any observed deficiencies shall be brought up to the attention of the Engineer and Architect prior to commencing any work.

J. Prepare framing to receive PV modules in accordance with manufacturer's recommendations and in compliance with accepted shop drawings.

K. Adequate ventilation shall be provided to ensure that all system components are operated within their environmental ratings.

L. Provide warning signs as required by NEC, drawings, specifications and applicable codes.

M. Solar panel connectors and wiring shall be supported.

N. Provide minimum 60 mil (.060) protective slip-sheets (sacrificial membrane) beneath the ballast blocks/trays using "like" material conforming to the current/new roof system. Coordinate exact requirements with roofing contractor.

3.2 LABELING

A. Provide a permanent plaque providing the location of the service disconnecting means and the photovoltaic system disconnecting means at each location. NEC 690.56

B. Each AC disconnect shall be labeled with "PHOTOVOLTAIC SYSTEM AC DISCONNECT".

3.3 TESTING

A. A ten (10) day notice shall be provided to the Owner, Engineer and Commissioning Agent before final testing.

B. Demonstrate in presence of the Engineer and Commissioning Agent that circuit and wiring tests are free of shorts and grounds and that installation performs as specified herein and within manufacturer's guidelines.

C. PV modules shall be factory tested for design performance.

D. Inverters shall be factory tested for performance.

E. Provide commissioning and system startup.

F. Installer is responsible for identifying required tests, coordinating, scheduling, and conducting tests before Substantial Completion. Tests shall include the following:
   1. System response, data logging and transmission, and performance.
   2. System features and components under normal operation.
   3. System shutdown from utility override switches.
   4. Before energizing the cables and wires, check for correct connections and test for short circuits, ground faults, continuity, and insulation.
   5. When the system is equipped with optional features, consult the manufacturer manual to determine proper testing procedures.

G. All defects resulting from tests shall be corrected prior to substantial completion.

3.4 SYSTEM START-UP

A. Provide the service of the manufacturer trained certifier who shall visit the site and verify the following:
   1. Verify AC Voltage and that grid AC cables have been installed correctly.
   2. Verify DC conductors terminated correctly to all MPPT inputs.
   3. Apply Grid Voltage. Verify all enclosure doors are closed and locked. Closed AC disconnect switch. Look, listen and smell for signs of defects.
   4. Confirm AC operational parameters. Verify inverter AC limit.
   5. Confirm DC operational parameters. Verify inverter PV settings.
   6. Confirm power tracker configuration operational parameters. Verify inverter power tracker configurations.
   7. Completed commissioning. Save test report to file. Send completed report to inverter manufacturer. Send copy of product registration to inverter manufacturer.
   8. Electrical Inspection and Approval. Using post-installation checklist and maintenance checklist included in the Operation and Maintenance Manual.

3.5 TRAINING: Contractor shall provide full instructions to Owner in the system's operation, maintenance, and programming. Training shall be specifically oriented to installed equipment systems.

A. Provide 8 hours of onsite owner familiarization and training for the installed system. Training shall include system overview, override commands, normal and emergency operation and response, programming features and report generation. District employees attending this training session shall be provided with the following documentation:
   1. System layout point to point connection diagram.
   2. System components cut sheets.
   3. Operations and maintenance data.
   4. Safety rules for the operations and maintenance of PV systems.

3.6 SERVICE MANUALS:

A. Contractor shall deliver to the Owner and Engineer, three (3) copies of the service manuals. Each manual shall include the following:

1. Installation manuals, programming manuals, user manuals, and part numbers if applicable for every major system component. Catalog cut sheets alone are not acceptable.
2. A printed copy of the system configuration, including all system labeling codes, and passwords.
3. Two (2) electronic copies of the system configuration program on USB drive.
4. Final test report.
5. Detailed explanation of the operation of the system.
6. Instructions for routine maintenance.
7. Detailed wiring diagrams and updated shop drawings that include all revisions made in the field via plan changes, RFIs, Field Change Directives, and any other construction change documents including interface details with other systems.
8. Provide a USB drive electronic copy of the updated system As-Built Drawings to the Owner, prepare this copy in the latest version of AutoCAD; along with the electronic copy provide a full-size bond copy. Include one USB drive with the up-dated As-Built Drawings with each of the Service Manuals. USB drive and folded drawings shall be secured and inserted into the Service Manuals via a three-hole punched protective case and protective envelopes for the drawings.
9. All materials and required deliverables shall be submitted to the Owner.

END OF SECTION

SECTION 270500 - COMMON WORK RESULTS FOR COMMUNICATIONS SYSTEMS

PART 1 GENERAL

1.1 SUMMARY DESCRIPTION

A. This Section contains requirements for equipment that is common to multiple sections of Division 27. Additionally, this section contains requirements common to all sections of Division 27.

1.2 RELATED REQUIREMENTS

A. 270526 - Grounding And Bonding For Communications Systems

B. 270528 - Pathway for Communications Systems

C. 270529 - Hangers and Supports for Communications Systems

D. 270533 - Identification for Communications Systems

E. 270536 - Cable Trays for Communications Systems

F. 270543 - Underground Ducts and Raceways for Communications Systems

G. 270544 - Sleeves and Sleeve Seals for Communications Pathways and Cabling

H. 271100 - Communications Equipment Room Fittings

I. 271116 - Communications Cabinets, Racks, Frames, and Enclosures

J. 271323 - Communications Optical Fiber Backbone Cabling

K. 271513 - Communications Copper Horizontal Cabling

1.3 REFERENCE STANDARDS

A. BICSI TDMM - Telecommunications Distribution Methods Manual, 15th Edition; 2024.

B. ICC (IBC) - International Building Code; Most Recent Edition Adopted by Authority Having Jurisdiction, Including All Applicable Amendments and Supplements.

C. ICC (IFC) - International Fire Code; Most Recent Edition Adopted by Authority Having Jurisdiction, Including All Applicable Amendments and Supplements.

D. ISO 9001 - Quality Management Systems — Requirements; 2015, with Amendment (2024).

E. NECA/BICSI 607 - Standard for Telecommunications Bonding and Grounding Planning and Installation Methods for Commercial Buildings; 2011.

F. NFPA 70 - National Electrical Code; Most Recent Edition Adopted by Authority Having Jurisdiction, Including All Applicable Amendments and Supplements.

G. NFPA 72 - National Fire Alarm and Signaling Code; Most Recent Edition Cited by Referring Code or Reference Standard.

H. NFPA 1225 - Standard for Emergency Services Communications; 2022.

I. TIA-568.0 - Generic Telecommunications Cabling for Customer Premises; 2020e, with Addendum (2022).

J. TIA-568.1 - Commercial Building Telecommunications Infrastructure Standard; 2020e, with Addendum (2023).

K. TIA-568.2 - Balanced Twisted-Pair Telecommunications Cabling and Components Standards; 2024e.

L. TIA-568.3 - Optical Fiber Cabling and Components Standard; 2022e.

M. TIA-607 - Telecommunications Bonding and Grounding (Earthing) for Customer Premises; 2024e.

N. UL 444 - Communications Cables; Current Edition, Including All Revisions.

O. UL 497 - Standard for Protectors for Paired-Conductor Communications Circuits; Current Edition, Including All Revisions.

P. UL 514A - Metallic Outlet Boxes; Current Edition, Including All Revisions.

Q. UL 514B - Conduit, Tubing, and Cable Fittings; Current Edition, Including All Revisions.

R. UL 514C - Nonmetallic Outlet Boxes, Flush-Device Boxes, and Covers; Current Edition, Including All Revisions.

S. UL 1863 - Communications-Circuit Accessories; Current Edition, Including All Revisions.

T. UL 2043 - Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces; Current Edition, Including All Revisions.

1.4 SUBMITTALS

A. Action Submittals:
   1. Product Data:
      a. Submit product data in .pdf format for review no later than 60 days before beginning work. Submit similar product groups concurrently.

b. Products ordered or installed before receiving reviewed and returned submittals are subject to removal and replacement at the Contractor's expense.
c. Submit product data individually for each specification section under separate cover. Product data submittal shall include all certificates and material listed in the specification section.
    1) Submit cut sheets with part numbers, model numbers, and brief descriptions, including color, size, and other attributes to allow submitted products to be reviewed. Clearly indicate the product on each product data sheet using yellow highlighter.
d. Include a title sheet with the following information:
    1) Contractor name and contact information
    2) Date of submittal
    3) Project name
    4) Project number
    5) Sequential submittal number
    6) Specification section reference
e. Full-line and short-form catalogs are not acceptable.
f. Remove pages without part numbers and basic product descriptions, extraneous pages, blank pages, and repeated information.
g. Keep information pertinent to technical data only and as brief as possible.
h. Submittals will be reviewed for general compliance, not quantities. Individual submittals reviewed more than twice may result in back charges against the Contractor.
i. Resubmittals shall be designated with a revision number beginning with R1 and increasing consecutively. Resubmittals shall include a cover sheet with a written explanation of how each review comment has been addressed.
j. Combined submittals, submittals submitted under the incorrect specification section, submittals with extraneous pages, submittals with incorrect product data, or unapproved substitutions will be rejected.
k. Identify products with long lead times and anticipated ship dates that may affect the project schedule.
l. Work shall not commence before product data submittals have been reviewed and returned.

2. Shop Drawings:
    a. Submit shop drawings in .pdf format, similar to the contract drawings, for review no later than 60 days before beginning work.
    b. Create shop drawings from project Revit backgrounds. Shop drawings created using design team-issued contract drawings will not be accepted.
    c. Shop drawings can be submitted as 1 complete set per discipline.
        1) Include the MDF, each IDF, cable tray pathways, conduit pathways, underground pathways, telecommunications outlet locations with field labeling, rack elevations, and backbone and bonding riser diagrams. Drawings and elevations created with Microsoft Visio are not permitted.

d. Include a title sheet with the following information:
   1) Contractor name and contact information
   2) Date of submittal
   3) Drawing reference
   4) Project name
   5) Project number
   6) Sequential submittal number
e. Submit shop drawings on 30-inch by 42-inch (Architectural size E1) sheets.
f. Scale shop drawings at an appropriate scale, but not smaller than 1/8-inch equals 1 foot.
g. Include sufficient information to describe the work being performed.
h. Shop drawings will be reviewed for general compliance, not dimensions or quantities. Shop drawings reviewed more than twice may result in back charges being levied against the Contractor.
i. Work shall not commence before shop drawings have been reviewed and returned.

B. Informational Submittals:
1. Certificates:
   a. Submit certificates in .pdf format for review no later than 60 days before beginning work.
   b. Submit certificates for each specification section with the associated product data.
      1) BICSI:
         a) RCDD
         b) Technician
         c) Installer 1 or 2
      2) Manufacturer:
         a) Cable and connectivity manufacturer certification for the company, Project Manager, and ICT installers.
         b) ISO 9001 Certification where available.

C. Closeout Submittals:
1. Format:
   a. Submit closeout submittals in .pdf format to the Owner and Consultant for review and approval as soon as they are complete, but no later than 60 days before the date of substantial completion.
      1) Include the following:
         a) Warranty documentation:
            (1) Manufacturer warranty certificate(s)
         b) Record documentation:
            (1) As-builts
         c) Test reports:
            (1) Copper cable test results
            (2) Optical fiber test results
         d) Cable Matrix:

(1) See Section 271513 - Communications Copper Horizontal Cabling, for more information.

2. Warranty Documentation:
   a. Submit authorized manufacturer warranty documentation as specified in other sections.
3. Record Documentation:
   a. As-builts:
      1) Include the MDF, each IDF, cable tray pathways, conduit pathways, underground pathways, and telecommunications outlet locations, including AV and VSS, with field labeling, elevations, and riser diagrams. Remove keynotes and references to project changes.
      2) Submit 1 soft copy set of As-builts to the Owner after the review and approval process is complete. Create As-builts on 24-inch by 36-inch (Architectural size D) sheets.
      3) Create As-builts from project Revit backgrounds. As-builts created from .pdf documents or other means will not be accepted.
      4) Submit As-builts in .pdf and .rvt format.
      5) Submit redlined specification changes in .pdf format.
   b. Record Drawings:
      1) Maintain a complete set of drawings and specifications at the job site to clearly and permanently mark changes made. Transfer changes to As-builts.
      2) Create record drawings from project Revit files. Record drawings created using design team-issued contract drawings will not be accepted.
      3) Submit redlined record drawings in .pdf and .rvt format.
      4) Submit redlined specification changes in .pdf format.
4. Test Reports:
   a. See Section 271323 - Communications Optical Fiber Backbone Cabling, for test report information.
   b. See Section 271513 - Communications Copper Horizontal Cabling, for test report information.

1.5 QUALITY ASSURANCE

A. Qualifications:
   1. Installers:
      a. The project requires certified installers experienced with similar installations in size and complexity.
   2. Certifications:
      a. Division 27 Cabling Contractor:
         1) Minimum 1 current BICSI RCDD on staff as a full-time employee that shall regularly inspect work, stamp shop drawings, and review and stamp test results.
         2) Minimum 1 current BICSI Technician on staff as a full-time employee who shall serve as the Project Manager.

3) Minimum 1 current BICSI Installer 1 or 2 involved with the installation.
4) Current cable manufacturer certification is required for the company, Project Manager, and installers. Clearly indicate which certified employee will be the Project Manager.

3. Project Management:
   a. Assign a Project Manager to the project. Project Manager responsibilities include:
      1) Completing and submitting the required documentation.
      2) Continuously overseeing and directing the work and performance of employees and subcontractors.
      3) Documenting and completing the punch list.
      4) Ensuring completion of the scope of work on time.
      5) Ensuring compliance with the contract documents.
      6) Regularly inspecting work.
      7) Reporting unexpected conditions that may result in delays or additional costs.
      8) Scheduling cutovers or tie-ins.
   b. Maintain the same Project Manager and project team for the duration of the project unless the Architect, Owner, or Consultant request a change.

B. Construction Observation:
   1. The failure of the Consultant or another representative of the Architect or Owner to condemn any defective work or material shall not release the Contractor from the obligation to tear out, remove, repair, or replace upon discovery of non-conforming work or material at any time during the project.

1.6 ABREVIATIONS AND DEFINITIONS

A. Abbreviations and Acronyms:
   1. AHJ – Authority Having Jurisdiction
   2. ANSI – American National Standards Institute
   3. AV – Audio Video
   4. BABA – Build America Buy America
   5. BICSI – Building Industry Consulting Services International
   6. COO – Country of Origin
   7. EPD – Environmental Product Declaration
   8. ESS – Electronic Safety and Security
   9. HPD – Health Product Declaration
   10. IBC – International Building Code
   11. ICT – Information and Communications Technology
   12. IDF – Intermediate Distribution Frame
   13. IFC – International Fire Code
   14. ISO – International Organization for Standardization
   15. LEED – Leadership in Energy and Environmental Design
   16. MDF – Main Distribution Frame
   17. NFPA – National Fire Protection Association
   18. OSHA – Occupational Safety and Health Administration

19. TAA – Trade Agreements Act
20. TDMM – Telecommunications Distribution Methods Manual
21. TIA – Telecommunications Industry Association
22. TR – Telecommunications Room
23. UL – Underwriters Laboratories
24. VSS – Video Surveillance System

B. Definitions:
1. As-built – The documentation of measurements, location, and quantities of material work performed.
2. Basis-of-Design – A device representing the benchmark or minimum requirements in the specifications or drawings for the project. This shall not be interpreted as a sole-source requirement, unless it is stated that substitutions are not permitted.
3. Comply – To conform, submit, or adapt as required or requested.
4. Consultant – A specialist who provides services to the design team headed up by an architect or engineer under contract with a client.
5. Contract – A written document covering the understanding between the customer and the contractor.
6. Contract documents – Plans, specifications, and other documents that together set forth the requirements of the contract and become legally enforceable when the agreement is signed. Executed agreements between the owner and contractor that become part of a contract when the agreement is signed.
7. Coordinate – To bring into a common action, movement, or condition.
8. Deferred Submittal – A building code issue that allows the final design to be submitted after the permit has been issued. Deferred submittals are portions of the design that are not submitted by the design team at the time of building permit application. They are typically performed by a specialty engineer.
9. Delegated Design – A contractual issue between the owner and the contractor. The design professional or architect of record establishes the performance requirements for an element of a building, and a contractor assumes the responsibility of designing that element.
10. Furnish – To supply and deliver to the project site, ready for installation.
11. Install – To place in a position of service or use.
12. Pathway – Any physical method of supporting, enclosing, protecting, or otherwise transporting wiring systems.
13. Provide – To furnish and install, complete and ready for intended use.
14. Punch list – A short list of tasks that are required to be completed in order to close out a work order or project.
15. Raceway – Any enclosed physical pathway designed to protect or shield premises wiring systems.
16. Record drawings – Construction drawings revised to reflect and represent the actual conditions of the project as it was constructed, usually based on marked-up prints, drawings, and other data furnished by the contractor to the architect.
17. Shall – Frequently used in codes and standards publications, the term indicates a mandatory requirement.
18. Shop drawings – Drawings, diagrams, schedules, and other data specially prepared for the work by the Contractor or a subcontractor, sub-subcontractor, manufacturer, supplier, or distributor to illustrate some portion of the work.
19. Should – Indicates a recommendation or that which is advised but not required.

20. Submittal – Information, documentation, or samples that a contractor may be requested to submit to the design team for review and approval before the commencement of work.
21. Substantial completion – A stage of construction or a building project that is sufficiently complete, in accordance with the contract documents, so that the owner may use or occupy the building project.

1.7 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
1. Examine drawings and specifications for the entire project. Notify the Architect, General Contractor, or Consultant of discrepancies upon discovery.
2. Coordinate shut-downs, cutovers, or tie-ins with the Owner as required. Submit schedule for approval at least 2 weeks in advance.
3. Coordinate work with the Architect, General Contractor, and Subcontractors:
    a. Converged cabling responsibilities:
        1) Division 27 AV Contractor
        2) Division 28 ESS Contractor
    b. Deliverables:
        1) General Contractor
        2) Owner
    c. Inspections:
        1) AHJ
    d. MDF/IDF:
        1) Division 21 Contractor, for sprinkler head locations
        2) Division 23 Contractor, for cooling requirements
        3) Division 26 Contractor, for electrical, lighting, and bonding requirements
        4) Division 27 and 28 Contractors, for equipment locations
        5) General Contractor, for plywood backboard installation requirements
    e. Rough-in, receptacle, conduit, cable tray, and underground pathway requirements:
        1) Division 26 Contractor

B. Pre-installation meetings:
1. Convene pre-installation meetings with the Owner, Architect, Consultant, General Contractor, and other Subcontractors within 30 days before beginning work.
2. Meetings shall consist of construction drawing and specification review, submittal expectations, and project review.

C. Scheduling:
1. Coordinate, plan, and execute work according to the project schedule.
2. Adhere to project milestones and implementation schedule.
3. Within 30 days before beginning work, submit a detailed schedule of installation milestones in the form of a Gantt chart to the design team and General Contractor.

1.8 DELIVERY, STORAGE, AND HANDLING

A. Delivery and Acceptance Requirements:
   1. Coordinate with the General Contractor for any equipment, products, and materials to be delivered on-site.

B. Storage and Handling Requirements:
   1. Coordinate with the General Contractor for any equipment, products, and materials to be stored on-site.
   2. Store and protect products and materials following manufacturer recommendations.
   3. Provide secure storage for equipment, products, and materials stored on-site.
   4. Follow manufacturer guidelines on proper storage for material.

1.9 WARRANTY

A. Manufacturer Warranty:
   1. The cable manufacturer shall have a minimum of a 20-year warranty on its products. The warranty shall cover the cable and associated components against defects in material and workmanship under normal use.

PART 2 PRODUCTS

2.1 COMPONENTS

A. Manufacturers:
   1. See Division 27 specification sections for product and material requirements.
   2. Products shall be new, unused, and in the original packaging.
   3. Products and material specified within this Division shall be listed by UL and bear the appropriate mark. Materials shall comply with the most recent editions of applicable UL standards such asUL 444, UL 497, UL 514A, UL 514B, UL 514C, UL 1863, and UL 2043.
   4. Generic telecommunications cabling shall meet or exceed TIA-568.0.
   5. Telecommunications Infrastructure shall meet or exceed TIA-568.1.
   6. Network cable shall meet or exceed TIA-568.2.
   7. Optical fiber cable shall meet or exceed TIA-568.3.
   8. Grounding and bonding shall meet or exceed TIA-607 or NECA/BICSI 607.
   9. Products and materials used to accomplish project goals shall meet or exceed listed standards.
   10. Products specified are intended to establish a baseline for operational, functional, and performance-based standards that proposed products shall meet or exceed by functionality and quality.
   11. Products listed within Division 27 specifications shall be provided as part of a complete and functional system unless determined otherwise by the Owner, Architect, or Consultant during the submittal process.
   12. Provide incidental items required for a complete installation regardless of whether they are specified.

B. Substitution Limitations:
   1. Specified products and materials establish the overall performance level and provide the physical appearance, part quality, construction quality, and background of proven reliability desired by

the Owner and therefore define the minimum standards of quality required for the project. Certain products are not permitted to be substituted and are listed as "Substitutions: Not permitted." Provide substitution requests for products permitted to be substituted. Substitution requests must contain sufficient information verifying equivalency to specified items or can be procured at a lower price to be considered for an approved substitution and shall be submitted before the bid date. Substitution requests submitted after the bid has been awarded will not be accepted without justification. See Division 1 Substitution Procedures, for pre-or post-bid substitution forms and requirements.

2. Installed products or materials that deviate from specified or submitted make, model, color, or other significant characteristics will be replaced by the Contractor with specified or submitted products at no additional cost and without impact on the construction schedule.

C. Product Options:
   1. Procure material from local distribution sources. Utilize multiple local distribution sources to avoid procuring material from non-local sources.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verification of Conditions:
   1. Perform a site survey before beginning work. Site surveys shall include pathways, raceways, space allocations, installation tolerances, installation hazards, and impediments affecting the installation.
   2. Notify the Contractor of conflicts, discrepancies, or omissions promptly upon discovery. Failure to adequately complete a site survey will not provide a basis for additional compensation.
   3. Commencement of work without providing notification to the Contractor indicates acceptance of conditions.
   4. Errors and omissions in the drawings or specifications do not relieve the Contractor from performing omitted details of the work.
   5. Verify quantities for equipment, cabling, components, and materials before submitting the bid.

3.2 INSTALLATION

A. Systems Integration:
   1. Field measure indicated mounting heights, as shown on the contract drawings. If mounting heights or other location criteria are not indicated, arrange, and install components and equipment to provide maximum headroom and working clearance.
   2. Furnish labor, materials, tools, equipment, and services for the installation under general provisions of contract documents.
   3. Provide supplementary or miscellaneous items and incidental devices necessary for a complete installation, whether specifically indicated in the contract documents.
   4. Install products, materials, and equipment to facilitate service, repair, or replacement.
   5. Execute work following NFPA 70 (NEC), OSHA, Fire Code NFPA 72 and ICC (IFC), NFPA 1225 and BICSI TDMM standards, manufacturer written instructions or recommendations, and

other applicable codes (i.e., ICC (IBC)). Where modifications are required due to code, regulations, or authorities, such changes shall be made without additional cost.

6. Follow industry standards of good practice for installations.
7. Products and materials shall be installed plumb, level, square, permanently attached, and held firmly in place.
8. Verify conduit, back boxes, junction boxes, pathways, raceways, and electrical requirements meet size and project requirements.

3.3 FIELD QUALITY CONTROL

A. Field Tests and Inspections:
   1. Tests:
      a. Test bonding, optical fiber, and copper cabling as specified in the following sections:
         1) Section 271323 - Communications Optical Fiber Backbone Cabling.
         2) Section 271513 - Communications Copper Horizontal Cabling.
   2. Inspections:
      a. Inspections for appropriate installation practices are the responsibility of the Project Manager.
      b. At the discretion of the Owner, Architect, or Consultant, provide personnel for periodic inspections, including a final inspection, at mutually agreed-upon times at no additional cost.
      c. Scheduled inspections in which the work is deemed incomplete, unfinished, or otherwise not ready for inspection are subject to back charges being levied against the Contractor.

B. Non-Conforming Work:
   1. Work found to be incomplete, of unsatisfactory quality, failing to meet specifications, or unacceptable to the Owner, Architect, or Consultant will be documented as a non-conforming work notice, field observation, or punch list and provided to rectify at no additional cost. Provide written notification with pictures upon completion. Incomplete lists will be rejected.
   2. The non-conforming work notice, field observation, or punch list will be considered complete only after being signed off by the Owner, Architect, or Consultant.

3.4 CLEANING

A. Waste Management:
   1. Remove trash and refuse after each workday. Telecommunications rooms shall be kept clean throughout the entire life of the project.
   2. Coordinate with the General Contractor for disposal of packaging and waste materials created during work to an approved common trash or recycling point or receptacle.
   3. Keep work area neat, tidy, and free from accumulating waste materials.
   4. Remove foreign material, dust, dirt, paint, unneeded labels, and stickers from equipment after completion.

3.5 CLOSEOUT ACTIVITIES

A. See other Division 27 sections for additional closeout activities.

END OF SECTION

SECTION 270526 - GROUNDING AND BONDING FOR COMMUNICATIONS SYSTEMS

PART 1 GENERAL

1.1 SUMMARY DESCRIPTION

A. This Section addresses gounding and bonding requirements for communication systems to includes busbars, bonding clamps, conductors, taps and ground rods.

1.2 RELATED REQUIREMENTS

A. 260526 - Grounding and Bonding for Electrical Systems.

B. 270536 - Cable Trays for Communications Systems.

C. 270553 - Identification for Communications Systems.

D. 271116 - Communications Cabinets, Racks, Frames, and Enclosures.

E. 271119 - Communications Termination Blocks and Patch Panels.

F. 271123 - Communications Cable Management and Ladder Rack.

G. 271323 - Communications Optical Fiber Backbone Cabling.

H. 271513 - Communications Copper Horizontal Cabling.

I. 271543 - Communications Faceplates and Connectors.

1.3 REFERENCE STANDARDS

A. TIA-607-E, Telecommunications Bonding and Grounding (Earthing) for Customer Premises

B. BICSI TDMM (current edition

C. ISO/IEC 30129:2015, Information Technology – Telecommunications bonding networks for buildings and other structures

D. NFPA 70®, National Electrical Code® (NEC) (currently adopted edition)

E. NFPA 70E, Standard for Electrical Safety in the Workplace

F. UL 467, Grounding and Bonding Equipment

G. UL 869, Standard for Reference Standard for Service Equipment

1.4 DEFINITIONS

A. BBC: Backbone bonding conductor, for connecting multiple TBBs serving the same floor.

B. PBB (TMGB): Primary bonding busbar, located in main distribution frame room, ideally near electrical service entrance.

C. RBB: Rack bonding busbar, located in equipment cabinets and racks.

D. SBB (TGB): Secondary bonding busbar, located in intermediate distribution frame rooms.

E. TBB: Telecommunications bonding backbone, for connecting SBBs to PBB.

F. TBC: Telecommunications bonding conductor, for connecting PBB to intersystem bonding termination device or busbar at electrical service entrance.

G. TEBC: Telecommunications equipment bonding conductor, for connecting RBBs to SBBs or PBB.

H. UBC: Unit bonding conductor, for connecting individual communications equipment to RBBs or SBBs.

1.5 ABBREVIATIONS

A. AC – Alternating Current

B. ACEG – Alternating Current Equipment Ground

C. AFF – Above Finished Floor

D. AWG – American Wire Gauge

E. BBC – Backbone Bonding Conductor

F. FOP – Fall-of-Potential

G. IDF – Intermediate Distribution Frame

H. MDF – Main Distribution Frame

I. PBB – Primary Bonding Busbar

J. RBB – Rack Bonding Busbar

K. RBC – Rack Bonding Conductor

L. SBB – Secondary Bonding Busbar

M. TBB – Telecommunications Bonding Backbone

N. TBC – Telecommunications Bonding Conductor

O. TEBC – Telecommunications Equipment Bonding Conductor

1.6 SUBMITTALS

A. Action Submittals
   1. Product Data:
      a. Submit product data in .pdf format for review no later than 60 days before beginning work.
      b. Bonding busbars (submitted by Division 26 Contractor)
      c. Rack bonding busbars (submitted by Division 27 Contractor)
      d. Bonding beam clamp (submitted by Division 27 Contractor)
         1) Compression lugs (submitted by Division 27 Contractor)
         2) Conductors (submitted by Division 27 Contractor)
         3) Taps (submitted by Division 27 Contractor)
         4) Ground rods (submitted by Division 27 Contractor)
   2. Shop Drawings:
      a. Bonding riser diagram, including Telecommunications Room numbers and conductor gauges.
      b. Include plans, elevations, sections, details, and attachments to other work.

B. Informational Submittals:
   1. Manufacturers' Published Instructions: Record copy of official installation and testing instructions issued to Installer by manufacturer for the following:
      a. Installing wire connector on conductor.
      b. Recommended torque values.

C. Closeout Submittals:
   1. Field Quality Control Submittals:
      a. Field quality-control reports.
   2. Test Reports:
      a. Provide test reports in Microsoft Excel format.
   3. Record Documentation:
      a. As-builts:
         1) Bonding riser diagram, including Telecommunications Room numbers and conductor gauges.
         2) Project record documents in accordance with Section 017839 "Project Record Documents" must include locations of PBB and SBBs, and routing of TBC, TBBs, and BBCs.

D. See Section 270500 - Common Work Results for Communications Systems, for additional submission requirements.

1.7 QUALITY ASSURANCE

A. Qualifications:
   1. Installers:
      a. The project requires installers experienced in correct bonding techniques.

1.8 ADMINISTRATIVE REQUIREMENTS

A. IDF – Intermediate Distribution Frame:
   1. Coordinate bonding locations, busbars, and TBC gauges with the Division 26 Contractor.

B. MDF – Main Distribution Frame
   1. Coordinate bonding locations, busbars, and TBC gauges with the Division 26 Contractor.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.1 GENERAL

A. The Division 26 Contractor shall provide the TBC to the electrical panel, building steel, and the permanent connection to the busbar.

B. MDF and IDF copper bonding conductor sheaths shall be green in color and rated for the environment.

C. MDF and IDF bonding conductors shall be stranded copper.

D. Bonding conductors shall remain the same gauge throughout the bonding path.

E. Install bonding conductors in a straight line for as long as possible. Cross obstructions perpendicularly.

F. Bonding conductor bend radius shall be less 90 degrees at any point. Bend radius shall not be smaller than 8 times the outside diameter of the conductor. Sharp bends are not permitted. Use sweeping bends when a change of direction is required.

G. Bond cabinets, racks, cable runway, and other metallic components to the nearest bonding busbar. Bond racks and cabinets using the manufacturer provided bonding lug.

H. Install bolts through each hole of compression lugs and tighten with a lock washer and nut. Secure tightly. Self-tapping screws or similar fasteners are not permitted.

I. Stacking of conductors/lugs under a single bolt is not permitted.

J. One-hole compression lugs are only permitted to be installed onto equipment designed for one-hole lugs, such as network electronics and rack bonding busbars. Two-hole compression lugs are required for metallic components located within the MDF and IDF. Copper conductors shall be visible in the inspection port of each compression lug.

K. Connections for the bonding conductors shall be permanent and made with irreversible connections. Screw-type connections are not permitted.

L. Completely and neatly remove paint or powder coat to expose bare metal and apply antioxidant joint compound before making bonding connections.

M. See Section 270536 - Cable Trays for Communications Systems, for cable tray bonding requirements.

3.2 EXAMINATION

A. Verification of Conditions:
1. Bond the telecommunications bonding system to the nearest effective power grounding system to ensure equal potential between systems. A qualified electrician shall make the connections.
2. Request and review the electrical Three-Point FOP or clamp-on ground resistance tester test results before connecting the communications system bonding electrode system to the power grounding system.
3. Verify the TBC to the PBB and SBB is permanently installed from the AC electrical panel serving the electrical receptacles in the MDF or IDF and to building steel using the same conductor gauge as the AC electrical grounding conductor (minimum of 6 AWG.)

B. Examine facility's grounding electrode system and equipment grounding for compliance with requirements for maximum ground-resistance level and other conditions affecting performance of grounding and bonding of electrical system.

C. Inspect test results of grounding system measured at point of TBC connection.

D. Prepare written report, endorsed by Installer, listing conditions detrimental to performance of the work.

E. Proceed with connection of TBC only after unsatisfactory conditions have been corrected.

3.3 SELECTION OF COMMUNICATIONS BUSBARS

A. Unless otherwise indicated in this Section or on Drawings, provide products specified in 260526 - Grounding and Bonding for Electrical Systems.

B. PBB:
1. Dimensions: 1/4" Thick by 20" Wide .
2. Stand-Off Distance: 4 inch .
3. Insulated standoffs.
4. Hole Pattern: 2-Hole lugs per ANSI/BICSI N3-20 and ANSI/TIA-607.

C. SBB:
1. Dimensions: 1/4" Thick by 12" Wide .
2. Stand-Off Distance: 2 inch .
3. Insulated standoffs.
4. Hole pattern: 2-Hole lugs per ANSI/BICSI N3-20 and ANSI/TIA-607.

D. RBB:
   1. Horizontally oriented.
   2. Rack-Mounted.
   3. Horizontal RBB Dimensions: 3/16"-thick x 3/4"H x 19" W.
      a. Eight #6-32 tapped lug mounting holes on 1" centers and two pairs of 5/16" diameter holes spaced 3/4" apart for attaching jumpers.

3.4 SELECTION OF COMMUNICATIONS BONDING CONDUCTORS

A. Unless otherwise indicated in this Section or on Drawings, provide products specified in 260526 - Grounding and Bonding for Electrical Systems.

B. Communications Busbar Connections:
   1. TBC: Not smaller than 1/0 AWG and no smaller than largest TBB.
   2. TBB: Not smaller than 2 kcmil per linear ft of conductor length, but not larger than 750 kcmil, unless otherwise indicated on Drawings.
   3. BBC: Not smaller than largest TBB to which it is connected unless otherwise indicated on Drawings.
   4. TEBC: Not smaller than 2 AWG unless otherwise indicated on Drawings. Provide bolted connectors.
   5. UBC: Not smaller than 6 AWG unless otherwise indicated on Drawings. Provide bolted connectors.
   6. Bonding Conductors to Structural Steel: Not smaller than 6 AWG unless otherwise indicated on Drawings. Provide bolted clamp connectors.

C. Cable Tray Connections:
   1. Cable Tray Equipment Grounding Conductor: 6 AWG .
   2. Cable Tray Bonding Jumper: If not supplied by cable manufacturer, provide bonding jumper not smaller than 6 AWG and not longer than 12 inch. If jumper is wire, it must be terminated with lug having two holes and long barrel for two crimps. If jumper is flexible braid, it must be terminated with one- or two-hole ferrule . Attach with bonding screw or connector provided by cable tray manufacturer.

D. Underground Connections: Not smaller than 2 AWG . Provide welded connectors, except bolted connectors may be used in handholes or manholes and as otherwise indicated on Drawings.

3.5 INSTALLATION

A. Installation of Busbars:
   1. Primary Bonding Busbar:
      a. Install horizontally in the MDF no higher than 8 feet AFF.
      b. Remove dust, dirt, or other foreign materials and apply antioxidant joint compound before fastening lugs.
      c. Install onto plywood backboard using lag-type bolts through each of the 4 mounting holes located on the mounting bracket.

d. Pre-drilled holes for use with lugs specified.

2. Secondary Bonding Busbar:
   a. Install horizontally in each IDF no higher than 8 feet AFF.
   b. Remove dust, dirt, or other foreign materials and apply antioxidant joint compound before fastening lugs.
   c. Install onto plywood backboard using lag-type bolts through each of the 4 mounting holes located on the mounting bracket.
   d. Pre-drilled holes for use with lugs specified.
3. Rack Bonding Busbar:
   a. Provide an RBB in each cabinet or rack.
   b. Install the RBB in each cabinet or rack using electrically isolating hardware.
   c. Bond the RBB to the PBB or SBB using a minimum 6 AWG conductor and the correctly sized lug.
   d. Remove dust, dirt, or other foreign materials and apply antioxidant joint compound before fastening lugs.
   e. Pre-drilled holes for use with lugs specified.

B. Installation of Bonding conductors:
1. Install and route so that personnel safety is not compromised.
2. No longer than required to achieve their purpose. Do not create service loops with bonding conductors.
3. Attached to surfaces in such a way that they do not become damaged or disconnected.
4. Fastened in such a way that permits associated equipment to be easily serviced.
5. Secured at intervals no greater than 3 feet.
6. Make mechanical connections accessible for inspection.
7. Make crimped connections free of other metals and with the correct tool.
8. Daisy-chaining is not acceptable.
9. Avoid installing within ferrous metallic conduit. When installing bonding conductors within metallic conduit, the conduit shall be terminated on each end with a bonding bushing and bonded to building steel or the nearest busbar.
10. Follow the following TIA chart for sizing bonding conductors:

TBB/BBC Linear Length m (ft)	Conductor Size (AWG)
Less than 4 (13)	6
4 - 6 (14 - 20)	4
6 - 8 (21 - 26)	3
8 - 10 (27 - 33)	2
10 - 13 (34 - 41)	1
13 - 16 (42 - 52)	1/0
16 - 20 (53 - 66)	2/0
20 - 26 (67 - 84)	3/0
26 - 32 (85 - 105)	4/0
32 - 38 (106 - 125)	250 kcmil

38 - 46 (126 - 150)	300 kcmil
46 - 53 (151 - 175)	350 kcmil
53 - 76 (176 - 250)	500 kcmil
76 - 91 (251 - 300)	600 kcmil
Greater than 91 (301)	750 kcmil
This TIA table applies to the bonding conductors that connect SBBs to the PBB and SBBs to each other.	

3.6 FIELD QUALITY CONTROL

A. Inspections:

B. Inspection for the correct installation of the grounding and bonding system conductors and connections is the responsibility of the Project Manager.

END OF SECTION

SECTION 270528 - PATHWAY FOR COMMUNICATIONS SYSTEMS

PART 1 GENERAL

1.1 SUMMARY DESCRIPTION

A. This Section addresses the pathway requirements including conduits back boxes, and cable trays for the Communication Systems.

1.2 RELATED REQUIREMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

B. 270500 - Common Work Results for Communications Systems

C. 270526 - Grounding And Bonding For Communications Systems

D. 270533 - Identification for Communications Systems

1.4 SUBMITTALS

A. Action Submittals:
   1. Product data for the following:
      a. Surface pathways
      b. Wireways and fittings.
      c. Tele-power poles.
      d. Boxes, enclosures, and cabinets.
      e. Innerducts.
   2. Sustainable Design Submittals:
      a. Product Data: For adhesives and sealants, indicating VOC content.
      b. Laboratory Test Reports: For adhesives and sealants, indicating compliance with requirements for low-emitting materials.
   3. Shop Drawings: For custom enclosures and cabinets and custom underground handholes and boxes. Include plans, elevations, sections, and attachment details.

B. Informational Submittals
   1. Coordination Drawings: Pathway routing plans, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of items involved:
      a. Structural members in paths of pathway groups with common supports.
      b. HVAC and plumbing items and architectural features in paths of conduit groups with common supports.

c. Underground ducts, piping, and structures in location of underground enclosures and handholes.

2. Qualification Data: For professional engineer.

3. Seismic Qualification Data: Seismic rating Provide seismic bracing for all pathway racks, enclosures, cabinets, equipment racks, and their mounting provisions, including those for internal components, from manufacturer.
   a. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   b. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   c. Detailed description of equipment anchorage devices on which certification is based and their installation requirements.
   d. Detailed description of conduit support devices and interconnections on which certification is based and their installation requirements.

4. Source quality-control reports.

1.5 DEFINITIONS

A. ARC - Aluminum Rigid Conduit.

B. GRC - Galvanized Rigid Conduit

C. EMT - Electrical Metallic Tubing.

D. IMC - Intermediate Metallic Conduit.

E. RTRC - Reinforced Thermosetting Resin Conduit.

PART 2 PRODUCTS

2.1 METAL CONDUITS AND FITTINGS

A. Description: Metal raceway of circular cross section with manufacturer-fabricated fittings.

B. Manufacturers: Subject to compliance with requirements, provide one of the following: Allied Tube & Conduit; Atkore International, O-Z/Gedney; brand of Emerson Electric Co., Automation Solutions, Appleton Group, or Southwire Company, LLC

C. General Requirements for Metal Conduits and Fittings:
   1. Listed and labeled as defined in NFPA 70, by a nationally recognized testing laboratory, and marked for intended location and application.
   2. Comply with TIA-569-D.

D. GRC: Comply with ANSI C80.1 and UL 6.
   1. Rigid metal conduit shall be galvanized steel. Connectors and couplings shall be threaded galvanized malleable iron or steel. Locknuts shall be of the type with sharp edges that bite into

enclosure where connected. Plastic insulating bushings shall be high temperature type. Sealing bushings shall have galvanized malleable iron locking ring with molded neoprene sealing ring with predrilled holes to accommodate each individual conductor, stainless steel screws and washers, PVC-coated pressure discs, and factory-installed lay-in grounding conductor lugs. Hub fittings shall be 2-piece, insulated throat, liquidtight type of steel or malleable construction.

E. EMT: Comply with ANSI C80.3 and UL 797.
1. Electrical metallic tubing shall be galvanized steel. Connectors and couplings shall be malleable iron or steel, galvanized or cadmium-plated, compression type. Connectors shall have insulated throats.

F. Fittings for Metal Conduit: Comply with NEMA FB 1 and UL 514B.
1. Conduit Fittings for Hazardous (Classified) Locations: Comply with UL 1203 and NFPA 70.
2. Fittings for EMT:
   a. Material: Steel .
   b. Type: compression.
3. Expansion Fittings: PVC or steel to match conduit type, complying with UL 467, rated for environmental conditions where installed, and including flexible external bonding jumper.
4. Coating for Fittings for PVC-Coated Conduit: Minimum thickness of 0.040 inch, with overlapping sleeves protecting threaded joints.

G. Joint Compound for IMC, GRC, or ARC: Approved, as defined in NFPA 70, by authorities having jurisdiction for use in conduit assemblies, and compounded for use to lubricate and protect threaded conduit joints from corrosion and to enhance their conductivity.

H. Flexible metal conduit shall be galvanized steel. Connectors shall be of the twist-in, insertion or totally enclosed clamp type, galvanized malleable iron or steel, with insulated throats.

I. Liquidtight flexible metal conduit shall be extra flexible type, neoprene-jacketed. Connectors shall be watertight, of the twist-in, insertion type, galvanized malleable iron or steel, with insulated throats.

2.2 NONMETALLIC CONDUITS AND FITTINGS

A. Description: Nonmetallic raceway of circular section with manufacturer-fabricated fittings.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: Allied Tube & Conduit; Atkore International

C. General Requirements for Nonmetallic Conduits and Fittings:
1. Rigid nonmetallic conduit shall be rigid polyvinyl chloride, nonburning, high impact. Couplings and connectors shall be rigid polyvinyl chloride, high impact. Cement for connections of conduit shall be approved by the conduit manufacturer.
2. Listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and application.
3. Comply with TIA-569-D.

D. RNC: Type EPC-40-PVC , complying with NEMA TC 2 and UL 651 unless otherwise indicated.

E. Continuous HDPE: Comply with UL 651A.

F. Fittings: Comply with NEMA TC 3; match to conduit or tubing type and material.

G. Solvents and Adhesives: As recommended by conduit manufacturer.

2.3 HOOKS

A. Description: Prefabricated sheet metal cable supports for telecommunications cable.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: MonoSystems, Inc., nVent., Panduit Corp., and Wiremold; Legrand North America, LLC. .

C. Listed and labeled as defined in NFPA 70, by an NRTL, and marked for intended location and application.

D. Non-continuous cable supports shall be available in multiple sizes, styles and materials. Rigid supports shall be equipped with flared edges and pre-configured bend radius controls.

E. Provide drop wire supports and threaded rod assemblies in areas where structural mounting surfaces are non-functional or inaccessible.

F. Sling assemblies/cable straps shall provide a bearing surface of sufficient width to comply with required bend radii of high-performance UTP and optical fiber cables. Support slings shall have a static load limit of 100 lbs.

G. Non-continuous cable supports sized 1 5/16” and larger shall have a cable retainer strap to provide containment of cables within the hanger. The cable retainer strap shall be removable and reusable.

H. Select approved non-continuous cable supports suitable for specific installation environments and/or air handling (plenum) spaces.

I. Multi-Tier Assembly:
   1. Utilize manufacturer hardware to allow for multiple tiers of cable supports as indicated on the project drawings.
   2. Continuous cable division shall be fully maintained within each open top cable support.

J. Comply withTIA-569-D.

K. Galvanized steel.

L. J shape.

2.4 ADJUSTABLE CABLE SUPPORTS

A. Description:
   1. Non-continuous cable supports designed to manage high-performance data and communication cables. The system shall provide structured support, ensuring proper bend radius and preventing cable damage in overhead or wall-mounted applications.
   2. Large capacity non-continuous pathway support with adjustable fabric/steel construction.

B. Manufacturer: nVent Caddy 425 or equal)

C. Features:
   1. Adjustable strap enables flexible configuration, reducing inventory needs.
   2. Simple locking/unlocking mechanism allows for easy addition of cables post-installation.
   3. Broad base design prevents overbending and kinking of high-performance cables.
   4. Material: Steel and Polyethylene.
   5. Finish: Electrogalvanized.
   6. Diameter: Adjustable, 4" to 6"
   7. Static Load Rating: 100 lb.
   8. Cable Capacity:
      a. Cat 6: ~325 cables
      b. Cat 6A: ~210 cables.

D. Mounting: Utilize appropriate CADDY clips for attachment to beams, threaded rods, or walls.

E. Ensure the cable support is securely locked after cable installation.

2.5 BOXES, ENCLOSURES, AND CABINETS

A. Description: Enclosures for communications.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: FSR Inc., Hoffman; brand of nVent Electrical plc., O-Z/Gedney; brand of Emerson Electric Co., Automation Solutions, Appleton Group., or Wiremold; Legrand North America, LLC.

C. General Requirements for Boxes, Enclosures, and Cabinets:
   1. Comply with TIA-569-D.
   2. Boxes, enclosures, and cabinets installed in wet locations shall be listed and labeled as defined in NFPA 70, by an NRTL, and marked for use in wet locations.
   3. Box extensions used to accommodate new building finishes shall be of same material as recessed box.NFPA 70.
   4. Device Box Dimensions: 4-11/16" inches square by 2-1/8 inches deep.
   5. Gangable boxes are prohibited.

D. Sheet Metal Outlet and Device Boxes: Comply with NEMA OS 1 and UL 514A.

E. Cast-Metal Outlet and Device Boxes: Comply with NEMA FB 1, ferrous alloy , Type FD, with gasketed cover.

F. Outlet boxes shall be constructed of code-gauge galvanized steel, unless otherwise specified herein. Where installed in hazardous locations or exposed to corrosive atmosphere, rain or spray, boxes shall be corrosion resistant cast metal with threaded entrances, removable covers, gaskets, and corrosion resistant screws.
   1. Outlet boxes recessed in plaster or gypsum board walls or columns shall be 4" or 4.688" square, 2.125" deep with plaster rings.
   2. Outlet boxes for devices recessed in metal door jambs shall be sheet metal partition boxes sized for the application.
   3. Outlet boxes recessed in masonry walls shall be square cornered masonry boxes or standard 4" square boxes fitted with square cornered tile covers of proper depth for block. Both type boxes shall be 2.125" minimum depth.
   4. Outlet boxes recessed in ceilings shall be 4" octagonal or square, 2.125" depth.
   5. Outlet boxes recessed in concrete shall be UL approved for the application.
   6. Through-wall type outlet boxes are not acceptable.
   7. Where special purpose devices require a larger outlet box than specified herein, provide outlet boxes for each specific device.
   8. Boxes containing low voltage and line voltage devices shall have metal barriers.

G. Metal Floor Boxes:
   1. Material: Cast Metal or Sheet Metal .
   2. Type: Fully adjustable.
   3. Shape: Rectangular.
   4. Metal floor boxes shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
   5. Floor boxes in slabs above grade shall be 4.688" square, 2.125" deep, constructed of galvanized steel with flush knockouts on sides and bottom. Boxes shall be concrete-tight and fully adjustable. A leveling plate with screws at each corner shall be factory welded to the bottom of each box for rough leveling. Adjusting rings mounted to the top of each box shall provide a 0.5" vertical or angular adjustment of the top after concrete pour and installation of wiring devices.
   6. Floor boxes for slabs on grade shall be zinc-coated cast iron with integral threaded conduit openings. Boxes shall be watertight, fully adjustable, and constructed cast metal or sheet metal to prevent the free entrance of both surface and sub-surface water when the box is embedded in concrete. Boxes shall be provided with a minimum of 2 integral leveling screws for rough leveling. Adjusting rings shall provide a minimum 0.75" vertical or angular adjustment of the top after concrete pour and installation of wiring devices. A cap shall be provided over the top of each box to protect adjusting ring during concrete pour.
   7. Floor plates shall be of aluminum construction, configuration as indicated on the Drawings. Carpet flanges shall be of aluminum construction.

H. Nonmetallic Floor Boxes: Nonadjustable, rectangular.
   1. Nonmetallic floor boxes shall be listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

I. Small Sheet Metal Pull and Junction Boxes: NEMA OS 1.
   1. Boxes shall be the type, size and configuration required for its specific use, location, device, and number, size, and arrangement of raceways connecting thereto.

J. Cast-Metal Access, Pull, and Junction Boxes: Comply with NEMA FB 1 and UL 1773, cast aluminum with gasketed cover.

K. Nonmetallic Outlet and Device Boxes: Comply with NEMA OS 2 and UL 514C.

L. Hinged-Cover Enclosures: Comply with UL 50 and NEMA 250 Type 1 , with continuous-hinge cover with flush latch unless otherwise indicated.
1. Metal Enclosures: Steel, finished inside and out with manufacturer's standard enamel.
2. Interior Panels: Steel; all sides finished with manufacturer's standard enamel.

2.6 INNERDUCT

A. Fabric Innerduct: Continuous, polyester, multi-pocket fabric innerduct, with internal pull tape.
1. Manufacturers: Subject to compliance with requirements, provide products by the following:
a. MaxCell
2. Indoor Textile Innerduct (Riser-listed): Micro, 2-inch, 3-inch and 4-inch single or multi-cell nylon textile innerduct containing 1250lb polyester flat woven pull tape which meets UL 2024A for flame propagation and smoke density values for general applications.
3. Plenum-Listed Textile Innerduct: Micro, 2-inch and 3-inch single or multi-cell nylon textile innerduct containing 200lb nylon-resin flat woven pull tape which meets UL2024A for flame propagation and smoke density values for use in air handling spaces.

2.7 SOURCE QUALITY CONTROL FOR UNDERGROUND ENCLOSURES

A. Handhole and Pull-Box Prototype Test: Test prototypes of handholes and boxes for compliance with SCTE 77 . Strength tests shall be for specified tier ratings of products supplied.
1. Tests of materials shall be performed by an independent testing agency.
2. Strength tests of complete boxes and covers shall be by either an independent testing agency or manufacturer. A qualified registered professional engineer shall certify tests by manufacturer.
3. Testing machine pressure gages shall have current calibration certification complying with ISO 9000 and ISO 10012, and traceable to NIST standards.

PART 3 EXECUTION

3.1 PATHWAY APPLICATION

A. Outdoors: Apply pathway products as specified below unless otherwise indicated:
1. Exposed Conduit: GRC .
2. Concealed Conduit, Aboveground: GRC .
3. Underground Conduit: RNC, Type EPC-40-PVC , direct buried.
4. Boxes and Enclosures, Aboveground: NEMA 250, Type 4X.

B. Indoors: Apply pathway products as specified below unless otherwise indicated:
1. Exposed, Not Subject to Physical Damage: EMT.
2. Exposed, Not Subject to Severe Physical Damage: EMT.

3. Exposed and Subject to Severe Physical Damage: GRC or IMC. Pathway locations include the following:
   a. Loading dock.
   b. Corridors used for traffic of mechanized carts, forklifts, and pallet-handling units.
   c. Mechanical rooms.
   d. Gymnasiums.
4. Concealed in Ceilings and Interior Walls and Partitions: EMT or innerduct.
5. Damp or Wet Locations: GRC .
6. Pathways for Optical-Fiber or Communications Cable in Spaces Used for Environmental Air: Plenum-type, optical-fiber-cable pathway .
7. Pathways for Optical-Fiber or Communications-Cable Risers in Vertical Shafts: Riser-type, optical-fiber-cable pathway .
8. Pathways for Concealed General-Purpose Distribution of Optical-Fiber or Communications Cable: EMT .
9. Boxes and Enclosures: NEMA 250 , Type 1, except use NEMA 250, Type 4 stainless steel units in institutional and commercial kitchens and damp or wet locations.

C. Minimum Pathway Size: 1 inch trade size for copper and aluminum cables, and 1 inch for optical-fiber cables.

D. Pathway Fittings: Compatible with pathways and suitable for use and location.
1. Rigid and Intermediate Steel Conduit: Use threaded rigid steel conduit fittings unless otherwise indicated. Comply with NEMA FB 2.10 NEMA FB.
2. PVC Externally Coated, Rigid Steel Conduits: Use only fittings listed for use with this type of conduit. Patch and seal all joints, nicks, and scrapes in PVC coating after installing conduits and fittings. Use sealant recommended by fitting manufacturer and apply in thickness and number of coats recommended by manufacturer.
3. EMT: Use compression , steel fittings. Comply with NEMA FB 2.10.

E. Do not install aluminum conduits, boxes, or fittings in contact with concrete or earth.

F. Install surface pathways only where indicated on Drawings.

G. Do not install nonmetallic conduit where ambient temperature exceeds 120 deg F .

3.2 INSTALLATION

A. Comply with the following standards for installation requirements except where requirements on Drawings or in this Section are stricter:
1. NECA 1
2. NECA/BICSI 568
3. TIA-569-D
4. NECA 101
5. NECA 102
6. NECA 105
7. NECA 111

B. Comply with NFPA 70 limitations for types of pathways allowed in specific occupancies and number of floors.

C. Comply with requirements in Section 270529 - Hangers and Supports for Communications Systems for hangers and supports.

D. Comply with requirements in Section 270544 - Sleeves and Sleeve Seals for Communications Pathways and Cabling for sleeves and sleeve seals for communications.

E. Keep pathways at least 6 inches away from parallel runs of flues and steam or hot-water pipes. Install horizontal pathway runs above water and steam piping.

F. Complete pathway installation before starting conductor installation.

G. The approximate locations of outlets are indicated on the Drawings. The exact locations shall be determined during construction. The right is reserved to change the exact location of any outlet box in any room before it is permanently installed, without additional cost to the Owner and as approved by the Architect and/or Engineer.

H. Arrange stub-ups so curved portions of bends are not visible above finished slab.

I. Install no more than the equivalent of two 90-degree bends in any pathway run. Support within 12 inches of changes in direction. Utilize long radius ells for all optical-fiber cables.

J. Conceal rigid conduit within finished walls, ceilings, and floors unless otherwise indicated. Install conduits parallel or perpendicular to building lines.

K. Support conduit within 12 inches of enclosures to which attached.

L. Pathways Embedded in Slabs:
   1. Run conduit larger than 1-inch trade size, parallel or at right angles to main reinforcement. Where at right angles to reinforcement, place conduit close to slab support. Secure pathways to reinforcement at maximum 10-foot intervals.
   2. Arrange pathways to cross building expansion joints at right angles with expansion fittings. Comply with requirements for expansion joints specified in this article.
   3. Arrange pathways to keep a minimum of 2 inches of concrete cover in all directions or as otherwise directed by structural engineer.
   4. Do not embed threadless fittings in concrete unless specifically approved by Architect for each specific location.
   5. Change from nonmetallic conduit and fittings to GRC and fittings before rising above floor.

M. Stub-ups to Above Recessed Ceilings:
   1. Use EMT or RMC for pathways.
   2. Use a conduit bushing or insulated fitting to terminate stub-ups not terminated in hubs or in an enclosure.

N. Threaded Conduit Joints, Exposed to Wet, Damp, Corrosive, or Outdoor Conditions: Apply listed compound to threads of pathway and fittings before making up joints. Follow compound manufacturer's written instructions.

O. Coat field-cut threads on PVC-coated pathway with a corrosion-preventing conductive compound prior to assembly.

P. Terminate threaded conduits into threaded hubs or with locknuts on inside and outside of boxes or cabinets. Install insulated bushings on conduits terminated with locknuts.

Q. Install pathways square to the enclosure and terminate at enclosures with locknuts. Install locknuts hand tight plus one additional quarter-turn.

R. Do not rely on locknuts to penetrate nonconductive coatings on enclosures. Remove coatings in the locknut area prior to assembling conduit to enclosure, to assure a continuous ground path.

S. Cut conduit perpendicular to the length. For conduits of 2-inch trade size and larger, use roll cutter or a guide to ensure cut is straight and perpendicular to the length.

T. Install pull wires in empty pathways. Use polypropylene or monofilament plastic line with not less than 200-lb tensile strength. Leave at least 12 inches of slack at each end of pull wire. Secure pull wire, so it cannot fall into conduit. Cap pathways designated as spare alongside pathways in use.

U. Surface Pathways:
   1. Install surface pathway for surface telecommunications outlet boxes only where indicated on Drawings.
   2. Install surface pathway with a minimum 2-inch radius control at bend points.
   3. Secure surface pathway with screws or other anchor-type devices at intervals not exceeding 48 inches and with no less than two supports per straight pathway section. Support surface pathway according to manufacturer's written instructions. Tape and glue are not acceptable support methods.

V. Pathways for Optical-Fiber and Communications Cable: Install pathways, metal and nonmetallic, rigid and flexible, as follows:
   1. 3/4-Inch Trade Size and Smaller: Install pathways in maximum lengths of 50 feet.
   2. 1-Inch Trade Size and Larger: Install pathways in maximum lengths of 75 feet.
   3. Install with a maximum of two 90-degree bends or equivalent for each length of pathway unless Drawings show stricter requirements. Separate lengths with pull or junction boxes or terminations at distribution frames or cabinets where necessary to comply with these requirements.

W. Install pathway-sealing fittings at accessible locations according to NFPA 70 and fill them with listed sealing compound. For concealed pathways, install each fitting in a flush steel box with a blank cover plate having a finish similar to that of adjacent plates or surfaces. Install pathway-sealing fittings according to NFPA 70.

X. Install devices to seal pathway interiors at accessible locations. Locate seals, so no fittings or boxes are between the seal and the following changes of environments. Seal the interior of all pathways at the following points:
   1. Where conduits pass from warm to cold locations, such as boundaries of refrigerated spaces.
   2. Where an underground service pathway enters a building or structure.
   3. Where otherwise required by NFPA 70.

Y. Comply with manufacturer's written instructions for solvent welding PVC conduit and fittings.

Z. Expansion-Joint Fittings:
1. Install in each run of aboveground RNC that is located where environmental temperature change may exceed 30 deg F, and that has straight-run length that exceeds 25 feet. Install in each run of aboveground RMC and EMT that is located where environmental temperature change may exceed 100 deg F, and that has straight-run length that exceeds 100 feet.
2. Install type and quantity of fittings that accommodate temperature change listed for each of the following locations:
   a. Outdoor Locations Not Exposed to Direct Sunlight: 125 deg F temperature change.
   b. Outdoor Locations Exposed to Direct Sunlight: 155 deg F temperature change.
   c. Indoor Spaces Connected with Outdoors without Physical Separation: 125 deg F temperature change.
   d. Attics: 135 deg F temperature change.
3. Install fitting(s) that provide expansion and contraction for at least 0.00041 inch per foot of length of straight run per deg F of temperature change for PVC conduits. Install fitting(s) that provide expansion and contraction for at least 0.000078 inch per foot of length of straight run per deg F of temperature change for metal conduits.
4. Install expansion fittings at all locations where conduits cross building or structure expansion joints. Raceways shall be installed parallel or at right angles with building walls.
5. Install each expansion-joint fitting with position, mounting, and piston setting selected according to manufacturer's written instructions for conditions at specific location at time of installation. Install conduit supports to allow for expansion movement.

AA. Hooks and Adjustable Cable Supports:
1. Follow manufacturer’s instructions and recommended industry standards and guidelines.
2. Must be an independent support structure for the voice/data communication system.
3. Size to allow a minimum of 25 percent future capacity without exceeding design capacity limits.
4. Shall be supported by dedicated support wires. Do not use ceiling grid support wire or support rods.
5. Shall be installed using threaded rods secured to the slab above, manufacturer approved clips/clamps secured to structure or wall mounted to support the telecommunications cable infrastructure parallel to the slab throughout the cable plant, unless site conditions dictate a non-parallel installation.
6. Hook spacing shall allow no more than 6 inches of slack. The lowest point of the cables shall be no less than 6 inches adjacent to ceilings, mechanical ductwork and fittings, luminaires, power conduits, power and telecommunications outlets, and other electrical and communications equipment.
7. Space hooks no more than 5 feet o.c.
8. Provide a hook at each change in direction. Must be routed to follow existing corridors, and parallel or 90 degree angles from all walls and/or the cable tray whenever possible.
9. Draping cables over other structures in the ceiling is unacceptable. Water pipes, ceiling grid, sprinkler system, electrical supports, air ducts or any other in-ceiling structure may not be used for cable support.
10. Contractor installed supports shall be used to supplement the main cable support system when any cabling leaves the main support system or is unsupported for more than three feet (3’).

BB. Mount boxes at heights indicated on Drawings. If mounting heights of boxes are not individually indicated, give priority to ADA requirements. Install boxes with height measured to center of box unless otherwise indicated.

CC. Recessed Boxes in Masonry Walls: Saw-cut opening for box in center of cell of masonry block, and install box flush with surface of wall. Prepare block surface to provide a flat surface for a raintight connection between box and cover plate or supported equipment and box.
1. Set outlet boxes for flush-mounted devices to within 0.125" of finished wall.
2. Adjust mounting heights of boxes in masonry walls to minimize cutting and patching of masonry.
3. Install outlet boxes in one vertical line when indicated adjacent on the Drawings but at different mounting heights.
4. Covers on recessed ceiling outlet boxes shall be painted to match the ceiling.

DD. Horizontally separate boxes mounted on opposite sides of walls, so they are not in the same vertical channel.
1. Outlet boxes shall not be installed back-to-back. Maintain minimum 24" separation between outlet boxes on opposite sides of rated walls, and minimum 6" separation in nonrated walls.

EE. Support boxes of three gangs or more from more than one side by spanning two framing members or mounting on brackets specifically designed for the purpose.

FF. Fasten junction and pull boxes to or support from building structure. Do not support boxes by conduits. Install boxes level, plumb, and square to the structure

GG. Set metal floor boxes level and flush with finished floor surface.

HH. Set nonmetallic floor boxes level. Trim after installation to fit flush with finished floor surface.

II. Where raceways must pass through structural members, obtain approval from the Architect and/or Engineer regarding location and size of openings prior to drilling. Lateral raceways in masonry shall not exceed 0.75".

JJ. Raceways shall be secured in place and protected to prevent damage to the work during construction. Open ends of raceways shall be taped or capped after installation to prevent entry of dirt and debris during construction prior to pulling wire. Installation of raceways shall be complete and shall be blown-out and swabbed clear of water and trash prior to pulling wire.

KK. Rigid metal conduit shall be installed for applications not otherwise specified herein. Rigid metal conduit shall be secured to metal enclosures using hub fittings. Insulated bushings or fittings shall be installed at connections to cabinets and boxes. Terminate stub-ups not attached to enclosures with an insulated throat grounding bushing. Commercial pipe joint compound shall be applied to the male threads on threaded joints and fittings. Connections shall be wrench-tight, and where subject to ground water, rain or spray shall be watertight.

LL. Service provider raceways shall be installed as indicated on the Drawings and shall be coordinated with the local telephone company or other service provider. Raceways terminated at plywood backboards shall be turned-up out of the floor slab to 12" above the finished floor if routed from below, and turned down and terminated at the top of the backboard if routed from above.

3.3 SLEEVE AND SLEEVE-SEAL INSTALLATION FOR COMMUNICATIONS PENETRATIONS

A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies. Comply with requirements in Section 270544 - Sleeves and Sleeve Seals for Communications Pathways and Cabling.

3.4 FIRESTOPPING

A. Install firestopping at penetrations of fire-rated floor and wall assemblies. Comply with requirements in Section 078413 "Penetration Firestopping."

B. Inspect fire stopping installation by others between building structure and conduit, wire way, and cable tray to verify integrity of installation.

C. Protect adjacent surfaces from damage during water seal or fire stop installation. Repair any damage.

3.5 INSTALLATION OF INNERDUCT

A. Protect products from the effects of moisture, UV exposure, corrosion and physical damage during construction.

B. Select approved innerduct suitable for specific installation environments and/or air handling (plenum) spaces.

C. Exposed Textile Innerduct Penetrations: Install conduit sleeves or fire barrier sealing systems in all openings where open and exposed textile innerduct passes through fire-rated walls and floors. After installation, install intumescent fire barrier penetration sealing material between textile innerduct and sleeves or fire barrier system.

D. Raceway Penetrations: After textile innerduct installation, install intumescent fire barrier penetration sealing material between textile innerduct and conduit or wire way at all exposed penetration locations.

E. When appropriate, use the following cable ties to secure textile innerduct through previously created incisions:
   1. Plenum areas: plenum-rated plastic or stainless steel
   2. Non plenum areas: Hook and loop style ties (or Velcro)

3.6 PROTECTION

A. Protect coatings, finishes, and cabinets from damage or deterioration.
   1. Repair damage to galvanized finishes with zinc-rich paint recommended by manufacturer.
   2. Repair damage to PVC coatings or paint finishes with matching touchup coating recommended by manufacturer.

END OF SECTION

SECTION 270529 - HANGERS AND SUPPORTS FOR COMMUNICATIONS SYSTEMS

PART 1 GENERAL

1.1 SUMMARY DESCRIPTION

A. This Section addresses requirements for hangers and supports for communications systems to include beam clamps, grid wire, J-Hooks, single slotted channel, and threaded rod.

1.2 RELATED REQUIREMENTS

A. 270505 - Selective Demolition for Communications Systems.

B. 270526 - Grounding And Bonding For Communications Systems.

C. 270528 - Pathway for Communications Systems.

D. 270533 - Identification for Communications Systems.

E. 270536 - Cable Trays for Communications Systems.

1.3 REFERENCE STANDARDS

A. ASTM D635 - Standard Test Method for Rate of Burning and/or Extent and Time of Burning of Plastics in a Horizontal Position; 2022.

B. ASTM E84 - Standard Test Method for Surface Burning Characteristics of Building Materials; 2026.

C. AWS D1.1/D1.1M - Structural Welding Code - Steel; 2025.

D. MFMA-4 - Metal Framing Standards Publication; 2004.

E. MSS SP-58 - Pipe Hangers and Supports - Materials, Design, Manufacture, Selection, Application, and Installation; 2025.

F. NECA 1 - Standard for Good Workmanship in Electrical Construction; 2023.

G. NECA 101 - Standard for Installing Steel Conduits (Rigid, IMC, EMT); 2020.

H. NECA 105 - Standard for Installing Metal Cable Tray Systems (ANSI); 2015.

I. NFPA 70 - National Electrical Code; Most Recent Edition Adopted by Authority Having Jurisdiction, Including All Applicable Amendments and Supplements.

J. SSPC-PA 1 - Shop, Field, and Maintenance Coating of Metals; 2024, with Errata (2025).

K. TIA-568.0 - Generic Telecommunications Cabling for Customer Premises; 2020e, with Addendum (2022).

L. TIA-569 - Telecommunications Pathways and Spaces; 2019e, with Addendum (2022).

1.4 ABREVIATIONS

A. Abbreviations and Acronyms:
   1. EMI – Electromagnetic Interference
   2. IBC - International Building Code

1.5 SUBMITTALS

A. Action Submittals:
   1. Product Data:
      a. Submit product data in .pdf format for review no later than 60 days before beginning work.
         1) Beam clamps
         2) Grid wire
         3) J-hooks
         4) Slotted channel
         5) Threaded rod
   2. Shop Drawings: Signed and sealed by a qualified professional engineer. For fabrication and installation details for communications hangers and support systems.
      a. Trapeze hangers. Include product data for components.
      b. Steel slotted-channel systems.
      c. Aluminum slotted-channel systems.
      d. Nonmetallic slotted-channel systems.
      e. Equipment supports.
      f. Vibration Isolation Base Details: Detail fabrication, including anchorages and attachments to structure and to supported equipment. Include adjustable motor bases, rails, and frames for equipment mounting.
   3. See Section 270500 - Common Work Results for Communications Systems, for submission requirements.

B. Informational Submittals:
   1. Provide Coordination drawings in accordance with Division 1 requirements.
   2. Seismic Qualification Data: Certificates, for hangers and supports for communications equipment and systems, accessories, and components, from manufacturer.
      a. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
      b. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.

c. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Closeout Submittals (Not Used)

1.6 QUALITY ASSURANCE (NOT USED)

1.7 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
1. Coordinate above ceiling pathways with Division 22, 23, 26, and 28 Contractors.

PART 2 PRODUCTS

2.1 COMPONENTS

A. Manufacturers:
1. Beam clamps 1 inch: Eaton (530), nVent/Caddy (BC), or Thomas and Betts (502) .
2. Grid wire: Dottie (CWSx) .
3. Single slotted channel: B-Line (B22SH-120HDG), Caddy (A12H1000HD), or Unistrut (CJ32H) .
4. Threaded rod: B-Line (ATR 1/4X120 ZN) or Dottie (ROD14) .

B. Substitutions: Submit for approval per Section 270500 - Common Work Results for Communications Systems.

2.2 PERFORMANCE REQUIREMENTS

A. Surface-Burning Characteristics: Comply with ASTM E84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
1. Flame Rating: Class 1.
2. Self-extinguishing according to ASTM D635 .

2.3 SUPPORT, ANCHORAGE, AND ATTACHMENT COMPONENTS

A. Steel Slotted Support Systems: Preformed steel channels and angles with minimum 13/32-inch-diameter holes at a maximum of 8 inches o.c. in at least one surface.
1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: CADDY; brand of nVent Electrical plc, Cooper B-line; brand of Eaton, Electrical Sector, or Unistrut; Atkore International
2. Standard: Comply with MFMA-4 factory-fabricated components for field assembly.
3. Material for Channel, Fittings, and Accessories: Galvanized Steel, Plain Steel, Stainless Steel Type 304, and Stainless Steel Type 316 .

4. Channel Width: Selected for applicable load criteria 1-5/8 inches, 1-1/4 inches, and 13/16 inches .
5. Metallic Coatings: Hot-dip galvanized after fabrication and applied according to MFMA-4.
6. Painted Coatings: Manufacturer's standard painted coating applied according to MFMA-4.
7. Protect finishes on exposed surfaces from damage by applying a strippable, temporary protective covering before shipping.
8. Channel Dimensions: Selected for applicable load criteria.

B. Conduit and Cable Support Devices: Steel clamps, hangers, and associated fittings, designed for types and sizes of raceway or cable to be supported.

C. Support for Conductors in Vertical Conduit: Factory-fabricated assembly consisting of threaded body and insulating wedging plug or plugs for nonarmored communications conductors or cables in riser conduits. Plugs shall have number, size, and shape of conductor gripping pieces as required to suit individual conductors or cables supported. Body shall be made of malleable iron.

D. Mounting, Anchoring, and Attachment Components: Items for fastening electrical items or their supports to building surfaces include the following:
1. Powder-Actuated Fasteners: Threaded-steel stud for use in hardened portland cement concrete, steel, or wood, with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.
a. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: Hilti, Inc., ITW Ramset/Red Head; Illinois Tool Works, Inc., or MKT Fastening, LLC .
2. Mechanical-Expansion Anchors: Insert-wedge-type zinc-coated steel for use in hardened portland cement concrete, with tension, shear, and pullout capacities appropriate for supported loads and building materials where used.
a. Manufacturers: Subject to compliance with requirements, provide products by one of the following: Cooper B-line; brand of Eaton, Electrical Sector, Hilti, Inc., ITW Ramset/Red Head; Illinois Tool Works, Inc., or MKT Fastening, LLC .
3. Concrete Inserts: Steel or malleable-iron, slotted support system units are similar to MSS Type 18 units and comply with MFMA-4 or MSS SP-58.
4. Clamps for Attachment to Steel Structural Elements: MSS SP-58 units are suitable for attached structural element.
5. Hanger Rods: Threaded steel.

2.4 FABRICATED METAL EQUIPMENT SUPPORT ASSEMBLIES

A. Description: Welded or bolted structural-steel shapes, shop or field fabricated to fit dimensions of supported equipment.

B. Materials: Comply with requirements in Section 055000 "Metal Fabrications" for steel shapes and plates.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verification of Conditions:
   1. Verify proposed J-hook pathways before installation to confirm the absence of obstructions, EMI sources, or other detriments.

3.2 APPLICATION

A. Comply with the following standards for application and installation requirements of hangers and supports, except where requirements on Drawings or in this Section are stricter:
   1. NECA 1.
   2. NECA/BICSI TIA-568.0.
   3. TIA-569.
   4. NECA 101.
   5. NECA 105.

B. Comply with requirements in Section 078413 "Penetration Firestopping" for firestopping materials and installation for penetrations through fire-rated walls, ceilings, and assemblies.

C. Comply with requirements for pathways specified in Section 270528 - Pathway for Communications Systems.

D. Maximum Support Spacing and Minimum Hanger Rod Size for Raceway: Space supports for EMTs, IMCs, and RMCs as scheduled in NECA 1, where its Table 1 lists maximum spacings that are less than those stated in NFPA 70. Minimum rod size shall be 3/8 inch in diameter.

E. Multiple Raceways or Cables: Install trapeze-type supports fabricated with steel slotted or other support system, sized so capacity can be increased by at least 50 percent in future without exceeding specified design load limits.
   1. Secure raceways and cables to these supports with two-bolt conduit clamps or single-bolt conduit clamps, using spring friction action for retention in support channel.

F. Spring-steel clamps designed for supporting single conduits without bolts may be used for 1-1/2-inch and smaller raceways serving branch circuits and communication systems above suspended ceilings and for fastening raceways to trapeze supports.

3.3 INSTALLATION

A. General:
   1. Maintain parallel pathways with walls or other fixed objects along the pathway.
   2. Communications conduit is permitted to share trapeze-style hangers and supports with other disciplines, including electrical systems, provided distances between conduits are met per the NFPA 70 (NEC).

B. Beam clamps:
   1. Install tightly onto building steel making a complete connection.

C. Grid wire and threaded rod:

1. Support by mechanical means to the structure.
2. Use grid wire or threaded rod as support for installing j-hooks when mounting to structure is unavailable.
3. When installing grid wire for J-hook supports, both ends of the grid wire are required to be supported.

D. Slotted channel:
1. Create cable tray trapeze support using slotted channel and threaded rod when not using wire basket clips or wall supports.
2. Paint slotted channel and associated hardware to match adjacent surfaces when installed exposed.

E. Threaded rod:
1. Paint threaded rod and associated hardware to match slotted channel when installed exposed.

3.4 SUPPORT INSTALLATION

A. Raceway Support Methods: In addition to methods described in NECA 1, EMT may be supported by openings through structure members, according to NFPA 70.

B. Strength of Support Assemblies: Where not indicated, select sizes of components, so strength will be adequate to carry present and future static loads within specified loading limits. Minimum static design load used for strength determination shall be weight of supported components plus 200 lb .

C. Mounting and Anchorage of Surface-Mounted Equipment and Components: Anchor and fasten communications items and their supports to building structural elements by the following methods unless otherwise indicated by code:
1. To Wood: Fasten with lag screws or through bolts.
2. To New Concrete: Bolt to concrete inserts.
3. To Masonry: Use approved toggle-type bolts on hollow masonry units and expansion anchor fasteners on solid masonry units.
4. To Existing Concrete: Use expansion anchor fasteners.
5. Instead of expansion anchors, powder-actuated-driven threaded studs, provided with lock washers and nuts, may be used in existing standard-weight concrete 4 inches thick or greater. Do not use for anchorage to lightweight-aggregate concrete or for slabs less than 4 inches thick.
6. To Steel: Beam clamps (MSS SP-58, Type 19, 21, 23, 25, or 27), complying with MSS SP-69 .
7. To Light Steel: Sheet metal screws.
8. Items Mounted on Hollow Walls and Nonstructural Building Surfaces: Mount cabinets, panelboards, disconnect switches, control enclosures, pull and junction boxes, transformers, and other devices on slotted-channel racks attached to substrate by means that comply with seismic-restraint strength and anchorage requirements .

D. Drill holes for expansion anchors in concrete at locations and to depths that avoid the need for reinforcing bars.

3.5 INSTALLATION OF FABRICATED METAL SUPPORTS

A. Comply with installation requirements in Section 055000 "Metal Fabrications" for site-fabricated metal supports.

B. Cut, fit, and place miscellaneous metal supports accurately in location, alignment, and elevation to support and anchor communications materials and equipment.

C. Field Welding: Comply with AWS D1.1/D1.1M.

3.6 PAINTING

A. Touchup: Clean field welds and abraded areas of shop paint. Paint exposed areas immediately after erecting hangers and supports. Use same materials as used for shop painting. Comply with SSPC-PA 1 requirements for touching up field-painted surfaces.
   1. Apply paint by brush or spray to provide minimum dry film thickness of 2.0 mils .

B. Galvanized Surfaces: Clean welds, bolted connections, and abraded areas, and apply galvanizing-repair paint to comply with ASTM A780.

3.7 FIELD QUALITY CONTROL

A. Field Tests and Inspections:
   1. Tests: (Not used)
   2. Inspections:
      a. Inspection for correct hanger and support installation practices is the responsibility of the Project Manager.

END OF SECTION

SECTION 270533 - IDENTIFICATION FOR COMMUNICATIONS SYSTEMS

PART 1 GENERAL

1.1 SUMMARY DESCRIPTION

A. This Section addresses identification rerquirements for communications systems including labeling and signage.

1.2 RELATED REQUIREMENTS

A. Section 270526 - Grounding And Bonding For Communications Systems

B. Section 271116 - Communications Cabinets, Racks, Frames, and Enclosures

C. Section 271323 - Communications Optical Fiber Backbone Cabling

D. Section 271513 - Communications Copper Horizontal Cabling

1.3 REFERENCE STANDARDS

A. ANSI Z535.1 - Standard for Safety Colors; 2022.

B. ANSI Z535.2 - American National Standard for Environmental and Facility Safety Signs; 2023.

C. ANSI Z535.3 - American National Standard for Criteria for Safety Symbols; 2022.

D. ANSI Z535.4 - American National Standard for Product Safety Signs and Labels; 2023.

E. NFPA 70 - National Electrical Code; Most Recent Edition Adopted by Authority Having Jurisdiction, Including All Applicable Amendments and Supplements.

F. TIA-606-D - Administration Standard for Telecommunications Infrastructure

1.4 ABBREVIATIONS AND ACRONYMS

A. AHJ – Authority Having Jurisdiction

B. AP – Access Point

C. AV – Audio Video

D. BBC – Bonding Backbone Conductor

E. IDF – Intermediate Distribution Frame

F. MDF – Main Distribution Frame

G. TBB – Telecommunications Bonding Backbone

H. TBC – Telecommunications Bonding Conductor

I. UL – Underwriters Laboratories

J. VSS – Video Surveillance System

1.5 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
   1. Coordinate labeling requirements of this specification with the Owner.

1.6 SUBMITTALS

A. Action Submittals:
   1. Product Data:
      a. Submit product data in .pdf format for review no later than 60 days before beginning work.
         1) Label holders
         2) Bonding busbar labels
      b. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for communications identification products.
   2. Samples: For each type of label and sign to illustrate composition, size, colors, lettering style, mounting provisions, and graphic features of identification products.
   3. Identification Schedule:
      a. Outlets: Scaled drawings indicating location and proposed designation.
      b. Backbone Cabling: Riser diagram showing each communications room, backbone cable, and proposed backbone cable designation.
      c. Racks: Scaled drawings indicating location and proposed designation.
      d. Patch Panels: Enlarged scaled drawings showing rack row, number, and proposed designations.
   4. Shop Drawings:
      a. See Section 270500 - Common Work Results for Communications Systems, for shop drawing requirements.

B. Informational Submittals:
   1. See Section 270500 - Common Work Results for Communications Systems for requirements.

C. Closeout Submittals:
   1. See Section 270500 - Common Work Results for Communications Systems for requirements.

1.7 QUALITY ASSURANCE

A. Comply with NFPA 70 NFPA 70.

B. The labeling scheme is intended to comply with TIA-606-D and the owner's standard for labeling and administration of a cable plant. It is the responsibility of the contractor to acquire, understand, and utilize the owner's labeling scheme for all components of the voice data communications system. The final labeling scheme and all other label requirements shall be coordinated and confirmed with the Owner and Engineer.

C. See Section 270500 - Common Work Results for Communications Systems for additional requirements.

PART 2 PRODUCTS

2.1 LABELS

A. Vinyl Wraparound Labels: Preprinted, flexible labels laminated with a clear, weather- and chemical-resistant coating and matching wraparound clear adhesive tape for securing label ends.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following: Brady, Hellermann Tyton, and Panduit .

B. Self-Adhesive Wraparound Labels: Preprinted , 3-mil- thick, vinyl flexible labels with acrylic pressure-sensitive adhesive.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following: Brady, Dymo, and Panduit .
   2. Self-Lamination: Clear; UV-, weather- and chemical-resistant; self-laminating protective shields over the legend. Labels sized such that the clear shield overlaps the entire printed legend.
   3. Marker for Labels: Machine-printed, permanent, waterproof black ink recommended by printer manufacturer.

C. Self-Adhesive Labels: Vinyl, thermal, transfer-printed, 3-mil- thick, multicolor, weather- and UV-resistant, pressure-sensitive adhesive labels, configured for intended use and location.
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following: Brady, Dymo, and Panduit .
   2. Minimum Nominal Size:
      a. 1-1/2 by 6 inches for raceway and conductors.
      b. 3-1/2 by 5 inches for equipment.
      c. As required by authorities having jurisdiction.

D. Other Label Requirements:
   1. Characters on labels shall be black text on a white background.
   2. Permanent ink and handwritten labels are not permitted.
   3. Label size shall be appropriate to cable size, outlet faceplate layout, patch panel design, or other related equipment sizes and layouts. Label manufacturer and font shall be consistent throughout the project.

2.2 UNDERGROUND-LINE WARNING TAPE

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: Brady or Ideal Industries .

B. Tape:
   1. Recommended by manufacturer for the method of installation and suitable to identify and locate underground communications utility lines.
   2. Printing on tape shall be permanent and shall not be damaged by burial operations.
   3. Tape material and ink shall be chemically inert and not subject to degradation when exposed to acids, alkalis, and other destructive substances commonly found in soils.

C. Color and Printing:
   1. Comply with ANSI Z535.1, ANSI Z535.2, ANSI Z535.3, and ANSI Z535.4.
   2. Inscriptions for Orange-Colored Tapes: "TELEPHONE CABLE, CATV CABLE, COMMUNICATIONS CABLE, OPTICAL-FIBER CABLE" .

D. Tag, Detectable, Reinforced: :
   1. Reinforced, detectable three-layer laminate, consisting of a printed pigmented woven scrim, a solid aluminum-foil core, and a clear protective film that allows inspection of the continuity of the conductive core; bright-colored, continuous-printed on one side with the inscription of the utility, compounded for direct-burial service.
   2. Width: 3 inches.
   3. Overall Thickness: 8 mils.
   4. Foil Core Thickness: 0.35 mil.
   5. Weight: 34 lb/1000 sq. ft..
   6. Tensile according to ASTM D882: 300 lbf and 12,500 psi.

2.3 MISCELLANEOUS IDENTIFICATION PRODUCTS

A. Paint: Comply with requirements in painting Sections for paint materials and application requirements. Retain paint system applicable for surface material and location (exterior or interior).

PART 3 EXECUTION

3.1 EXAMINATION

A. Verification of Conditions:
   1. Verify rooms, walls, telecommunications outlets, patch panels, and ceiling are complete and ready for label installation.

3.2 PREPARATION

A. Self-Adhesive Identification Products: Before applying communications identification products, clean substrates of substances that could impair bond, using materials and methods recommended by manufacturer of identification product.

3.3 INSTALLATION

A. Verify and coordinate identification names, abbreviations, colors, and other features with requirements in other Sections requiring identification applications, Drawings, Shop Drawings, manufacturer's wiring diagrams, and operation and maintenance manual. Use consistent designations throughout Project.

B. Install identifying devices before installing acoustical ceilings and similar concealment.

C. Verify identity of each item before installing identification products.

D. Coordinate identification with Project Drawings, manufacturer's wiring diagrams, and operation and maintenance manual.

E. Apply identification devices to surfaces that require finish after completing finish work.

F. Install signs with approved legend to facilitate proper identification, operation, and maintenance of communications systems and connected items.

G. Elevated Components: Increase sizes of labels, signs, and letters to those appropriate for viewing from the floor.

H. Vinyl Wraparound Labels:
   1. Secure tight to surface of raceway or cable at a location with high visibility and accessibility.
   2. Attach labels that are not self-adhesive type with clear vinyl tape, with adhesive appropriate to the location and substrate.
   3. Provide label 6 inches from cable end.

I. Self-Adhesive Wraparound Labels:
   1. Secure tight to surface at a location with high visibility and accessibility.
   2. Provide label 6 inches from cable end.

J. Self-Adhesive Labels:
   1. On each item, install unique designation label that is consistent with wiring diagrams, schedules, and operation and maintenance manual.
   2. Unless otherwise indicated, provide a single line of text with 1/2-inch- high letters on 1-1/2-inch- high label; where two lines of text are required, use labels 2 inches high.

K. Underground-Line Warning Tape:
   1. During backfilling of trenches, install continuous underground-line warning tape directly above cable or raceway at minimum 12 inches below finished grade. Use multiple tapes where width of multiple lines installed in a common trench or concrete envelope exceeds 16 inches overall.
   2. Align tape parallel to and within 3 inches of centerline of duct bank.
   3. Provide an additional warning tape for each 12-inch increment of duct-bank width over a nominal 18 inches. Space additional tapes 12 inches apart, horizontally.
   4. Install underground-line warning tape for direct-buried cables and cables in raceways.

3.4 SYSTEM INTEGRATION

A. General labeling:
   1. Telecommunications outlet labeling shall match the patch panels, test results, and the As-builts. Discrepancies shall be corrected immediately at no additional cost.
   2. Clean surfaces before attaching labels.
   3. Install mechanically printed labels firmly, neatly, and level.
   4. Complete labeling no later than 30 days before substantial completion.
   5. Labeling listed within this section shall be completed by the cabling contractor.

B. AP outlet labeling:
   1. Affix AP outlet labeling on the ceiling grid immediately adjacent to the AP in a highly visible area. In areas with no ceiling grid, affix label to AP.

C. AV labeling:
   1. Affix AV outlet labeling immediately adjacent to the device in a highly visible area.

D. Camera outlet labeling:
   1. Affix VSS outlet labeling on the camera housing in a highly visible area.

E. Copper and optical fiber backbone cable labeling:
   1. Label backbone cable within 12 inches of each end.
   2. Minimum tape width is 1/2 inch.
   3. Install label on label holder using cable ties in a highly visible area.

F. Copper patch panel labeling:
   1. Patch panel labeling shall be Room Number.
   2. The first patch panel on the rack shall be designated with the letter “A” and each patch panel shall follow sequentially to the last patch panel. Patch panel letter labels shall be installed on the lefthand side of the panel.
   3. Each patch panel port shall be designated numerically starting with the number “01” and continued sequentially until “48”. Each patch panel port shall be labeled regardless of termination status.
   4. Label copper patch panels with the corresponding telecommunications outlet within the plastic windows. Missing plastic windows are not acceptable.
   5. Minimum character height is 3/8 inch.

G. Firestop sleeve labeling:
   1. Affix adhesive wall label immediately adjacent to penetration/devices to communicate to future installers, the AHJ, and others the manufacturer of the device, installation date, and corresponding UL System number installed.

H. Grounding and bonding labeling:
   1. Label each bonding conductor using label holders. Each label shall show the purpose of each bonding conductor specifically.
   2. Snugly attach label holder using cable ties.
   3. Provide label for each bonding busbar:
      a. IF THIS CONNECTOR OR CABLE IS LOOSE OR MUST BE REMOVED, PLEASE CALL THE BUILDING TELECOMMUNICATIONS MANAGER.

I. Horizontal cable labeling:

1. Label horizontal cables with a self-laminating label within 4 inches of each end.
2. Minimum tape width is 3/8 inch.

J. Ladder rack:
1. Install signage as follows:
   a. WARNING: DO NOT USE CABLE TRAY AS WALKWAY, LADDER, OR SUPPORT. USE ONLY AS MECHANICAL SUPPORT FOR CABLES AND TUBING.

K. Optical fiber patch panel labeling:
1. MDF patch panel labeling shall indicate the strand count and IDF to where the backbone cable terminates.
2. IDF patch panel labeling shall indicate the strand count and MDF to where the backbone cable terminates.
3. Label optical fiber patch panels on the front of each patch panel.

L. Telecommunications outlet labeling:
1. Telecommunications outlet labeling shall be MDF/IDF–Rack Number–Patch Panel Letter–Port Number.
2. Label outlets with the corresponding copper patch panel port within the plastic window. Missing label windows are not acceptable.
3. Minimum character height is 3/8 inch.

M. Telecommunications racks:
1. Label racks numerically from left to right beginning with the number 1.
2. Adhere label centered on the top horizontal support.
3. Label width shall be minimum 1-inch.

3.5 IDENTIFICATION SCHEDULE

A. Install identification materials and devices at locations for most convenient viewing without interference with operation and maintenance of equipment. Install access doors or panels to provide view of identifying devices.

B. Identify conductors, cables, and terminals in enclosures and at junctions, terminals, pull points, and locations with high visibility. Identify by system and circuit designation.

C. Faceplates: Label individual faceplates with self-adhesive labels. Place label at top of faceplate. Each faceplate shall be labeled with its individual, sequential designation, numbered clockwise when entering room from primary egress, composed of the following, in the order listed:
1. Wiring closet designation.
2. Colon.
3. Faceplate number.

D. Equipment Room Labeling:
1. Racks, Frames, and Enclosures: Identify front and rear of each with self-adhesive labels containing equipment designation.
2. Patch Panels: Refer to project drawings

3. Data Outlets: Unless otherwise noted on project drawings label each outlet with a self-adhesive label indicating the following, in the order listed:
   a. Room number being served.
   b. Colon.
   c. Faceplate number.

E. Backbone Cables: Label each cable with a self-adhesive wraparound label indicating the location of the far or other end of the backbone cable. Patch panel or punch down block where cable is terminated should be labeled identically.

F. Horizontal Cables: Label each cable with a self-adhesive wraparound label indicating the following, in the order listed:
   1. Room number.
   2. Colon.
   3. Faceplate number.

G. Grounding Equipment: Refer to Section 270526 - Grounding And Bonding For Communications Systems.

H. Termination Hardware: Refer to Section 271513 - Communications Copper Horizontal Cabling.

I. Locations of Underground Lines: Underground-line warning tape for copper, coaxial, hybrid copper/fiber, and optical-fiber cable.

J. Instructional Signs: Self-adhesive labels.

K. Warning Labels for Indoor Cabinets, Boxes, and Enclosures: Self-adhesive labels .
   1. Apply to exterior of door, cover, or other access.

L. Equipment and Raceway Identification Labels:
   1. Indoor Equipment: Self-adhesive label Laminated-acrylic or melamine-plastic sign.
   2. Outdoor Equipment: Laminated-acrylic or melamine-plastic sign.
   3. Equipment to Be Labeled:
      a. Communications cabinets.
      b. Equipment Racks
   4. Raceway to Be Labeled:
      a. Riser conduit
      b. Service entrance conduit

3.6 FIELD QUALITY CONTROL

A. Field Tests and Inspections:
   1. Tests: (Not used)
   2. Inspections: Inspection for correct labeling scheme and installation is the responsibility of the Project Manager.

END OF SECTION

SECTION 270536 - CABLE TRAYS FOR COMMUNICATIONS SYSTEMS

PART 1 GENERAL

1.1 SUMMARY DESCRIPTION

A. Section addresses the requirements for cable trays, fittings, supporting hardware, grounding hardware and related materials. This section also addresses installation requirements.

1.2 RELATED REQUIREMENTS

A. Section 270500 - Common Work Results for Communications Systems

B. Section 270526 - Grounding And Bonding For Communications Systems

1.3 REFERENCE STANDARDS

A. ASCE/SEI 7 - Minimum Design Loads and Associated Criteria for Buildings and Other Structures; 2017.

B. ASTM A1 - Standard Specification for Carbon Steel Tee Rails; 2000 (Reapproved 2026).

C. ASTM A510/A510M - Standard Specification for General Requirements for Wire Rods and Coarse Round Wire, Carbon Steel, and Alloy Steel; 2025.

D. ASTM A1008/A1008M - Standard Specification for Steel, Sheet, Cold-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, Required Hardness, Solution Hardened, and Bake Hardenable; 2025.

E. ASTM A1011/A1011M - Standard Specification for Steel, Sheet and Strip, Hot-Rolled, Carbon, Structural, High-Strength Low-Alloy, High-Strength Low-Alloy with Improved Formability, and Ultra-High Strength; 2025.

F. ASTM D 769 - Standard Specification for Black Synthetic Iron Oxide; 2025.

G. NECA 105 - Standard for Installing Metal Cable Tray Systems (ANSI); 2015.

H. NEMA VE 1 - Metal Cable Tray Systems; 2017.

I. NEMA VE 1 - Metal Cable Tray Systems; 2017.

J. NEMA VE 2 - Cable Tray Installation Guidelines; 2018.

K. NFPA 70 - National Electrical Code; Most Recent Edition Adopted by Authority Having Jurisdiction, Including All Applicable Amendments and Supplements.

L. TIA-569 - Telecommunications Pathways and Spaces; 2019e, with Addendum (2022).

M. TIA-569-D - Telecommunications Pathways and Spaces Standard; 2015.

1.4 ABBREVIATIONS AND ACRONYMS

A. EMI – Electromagnetic Interference

1.5 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
   1. Coordinate cable tray pathways with the Owner, Architect, Division 22 Contractor, Division 23 Contractor, Division 26 Contractor, and other Subcontractors with concurrent work.

1.6 SUBMITTALS

A. Action Submittals:
   1. Product Data:
      a. Submit product data in .pdf format for review no later than 60 days before beginning work. Include data sheets for each product (and accessories) indicating dimensions and finishes for each type of cable tray indicated.
   2. Shop Drawings: For each type of cable tray.
      a. Show fabrication and installation details of cable trays, including plans, elevations, and sections of components and attachments to other construction elements. Designate components and accessories, including clamps, brackets, hanger rods, splice-plate connectors, expansion-joint assemblies, straight lengths, and fittings.
      b. Cable tray layout, showing cable tray route to scale, with relationship between the tray and adjacent structural, electrical, and mechanical elements. Include the following:
         1) Vertical and horizontal offsets and transitions.
         2) Clearances for access above and to sides of cable trays.
         3) Vertical elevation of cable trays above the floor or bottom of ceiling structure.
         4) Load calculations to show dead and live loads as not exceeding manufacturer's rating for tray and its support elements.
      c. Submit shop drawings for review no later than 60 days before beginning work.
   3. See Section 270500 - Common Work Results for Communications Systems, for submission requirements

B. Informational Submittals
   1. Coordination Drawings: Floor plans and sections, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
      a. Scaled cable tray layout and relationships between components and adjacent structural, electrical, and mechanical elements.
      b. Vertical and horizontal offsets and transitions.
      c. Clearances for access above and to side of cable trays.

d. Vertical elevation of cable trays above the floor or below bottom of ceiling structure.

2. Seismic Qualification Data: Certificates, for cable trays, accessories, and components, from manufacturer.
   a. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   b. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions.
   c. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

C. Closeout Submittals:
   1. Format:
      a. See Section 270500 - Common Work Results for Communications Systems, for submission requirements.
   2. Warranty Documentation: (Not used)
   3. Record Documentation:
      a. As-builts:
         1) Include wire basket cable tray pathways, including sizes, fill percentage, and elevations

1.7 QUALITY ASSURANCE

A. Qualifications:
   1. Installers:
      a. The project requires installers experienced in cable tray installations.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Cable trays and supports shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
   1. The term "withstand" means "the cable trays will remain in place without separation of any parts when subjected to the seismic forces specified."
   2. Component Importance Factor: 1.5.

B. Thermal Movements: Allow for thermal movements from ambient and surface temperature changes in cable tray installed outdoors.

2.2 GENERAL REQUIREMENTS FOR CABLE TRAYS

A. Cable Trays and Accessories: Identified as defined in NFPA 70 and TIA-569 TIA-569-D TIA-569, and marked for intended location, application, and grounding.
   1. Source Limitations: Obtain cable trays and components from single manufacturer.

B. Sizes and Configurations: See the Cable Tray Schedule on Drawings for specific requirements for types, materials, sizes, and configurations.

C. Structural Performance: See articles for individual cable tray types for specific values for the following parameters:
   1. Uniform Load Distribution: Capable of supporting a uniformly distributed load on the indicated support span when supported as a simple span and tested according to .
   2. Concentrated Load: A load applied at midpoint of span and centerline of tray.
   3. Load and Safety Factors: Applicable to both side rails and rung capacities.

2.3 LADDER CABLE TRAY

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: Cooper B-line; brand of Eaton, Electrical Sector, CPI Chatsworth Products, and Legrand.

B. Ladder cable tray shall form a wireway system for cable management inside communications rooms.

C. Runways shall be classified by UL and rated as an equipment grounding conductor.

D. Configuration: Two longitudinal side rails with transverse rungs swaged or welded to side rails, complying with NEMA VE 1 .

E. Width: Indicated on Drawings.

F. Straight Section Lengths: 10 feet, except where shorter lengths are required to facilitate tray assembly.

G. Rung Spacing: 9 inches o.c.

H. Radius-Fitting Rung Spacing: 9 inches at center of tray's width.

I. Minimum Cable-Bearing Surface for Rungs: 7/8-inch width with radius edges.

J. No portion of the rungs shall protrude below the bottom plane of side rails.

K. Cable Runway Accessories
   1. Fittings: Tees, crosses, risers, elbows, and other fittings as indicated, of same materials and finishes as ladder cable tray.
   2. Barrier Strips: Same materials and finishes as for ladder cable tray.
   3. Specific Accessory Products: Furnish and install all accessories, including but not limited to radius drops, splice kits, support kits, end closing kits, protective end caps, ground wire supports, elevation kits, and other accessories as indicated on the project drawings, and as required for a complete ladder cable tray system.
   4. Splicing Assemblies: Bolted type using serrated flange locknuts.
   5. Splice-Plate Capacity: Splices located within support span shall not diminish rated loading capacity of cable tray.

L. Materials and Finishes:
   1. Steel:

a. Straight Section and Fitting Side Rails and Rungs: Steel complies with the minimum mechanical properties of ASTM A1011/A1011MSS, Grade 33 or ASTM A1008/A1008M, Grade 33, Type 2.
b. Steel Tray Splice Plates: ASTM A1011/A1011M, HSLAS, Grade 50, Class 1.
c. Fasteners: Steel complies with the minimum mechanical properties of ASTM A510/A510M , Grade 1008.
d. Finish: Black oxide finish for support accessories and miscellaneous hardware according to ASTM D 769.

2.4 CABLE TRAY ACCESSORIES

A. Fittings: Tees, crosses, risers, elbows, and other fittings as indicated, of same materials and finishes as cable tray.

B. Cable tray supports and connectors, including bonding jumpers, as recommended by cable tray manufacturer.

C. Provide all components of the cable tray system (cable tray, turns, splices, supports and other accessories) for a complete and compliant system.

PART 3 EXECUTION

3.1 EXAMINATION

A. Verification of Conditions:
1. Visually verify and plan cable tray pathways before installation for feasibility and to confirm the absence of obstructions, conflicts with other trades, EMI sources, or other detriments.

3.2 CABLE TRAY INSTALLATION

A. Cable tray installation shall conform to NEMA VE 2 and NECA 105 NECA/NEMA 105.

B. Install cable tray level, plumb, and at right angles to the structure.

C. Install cable tray so the cable jackets cannot be damaged during installation of cable. Remove sharp edges and burs from cable tray.

D. Install cable tray so the maximum distance of horizontal cable is no more than 225 feet.

E. Install cable tray to allow the cable bend radius to be followed.

F. Install cable tray in such a manner as to avoid obstructions from other trades after cable tray installation is complete. Other building infrastructure is not permitted to route through or inside cable tray.

G. Maintain clearances of a minimum of 12 inches above, 3 inches below, and 8 inches to one side of the wire basket tray.

H. Cable tray fill shall not exceed 40 percent of available space after cabling is complete.

I. Properly firestop or fill penetrations through fire, smoke, or acoustically rated barriers.

J. Cable tray shall be electrically continuous. Provide bonding jumpers when cable tray breaks between walls or other barriers.

K. No additional bonding is required when the cable tray is installed using a threaded rod attached with galvanized connections to building steel. If cable tray supports are attached to concrete or other nonconductive materials, bond cable tray to building steel every 50 feet.

L. Cable tray sections not electrically connected to the main run shall be bonded to building steel every 50 feet.

M. Use fittings from the cable tray manufacturer to provide all material required to deliver a fully functional cable tray pathway.

N. Provide radius drop fittings where cable exits the cable tray to below.

O. Shop drawings shall be submitted by installing contractor.

P. Complete cable tray installation before installing cables.

Q. Install cable trays as a complete system, including fasteners, hold-down clips, support systems, barrier strips, adjustable horizontal and vertical splice plates, elbows, reducers, tees, crosses, cable dropouts, adapters, covers, and bonding.
   1. Provide all components of the cable tray system (cable tray, turns, splices, supports, and accessories) from a single manufacturer.

R. Install cable trays so that the tray is accessible for cable installation and all splices are accessible for inspection and adjustment.
   1. Minimum clearance of 12” above the cable tray.
   2. Leave a minimum of 12” in between cable tray and ceiling/building truss structure.
   3. Leave a minimum of 3” in between ladder cable tray and the tops of equipment racks and/or cabinets.
   4. Minimum clearance of 12” in between each tier of cable tray.
   5. When located above an acoustical drop ceiling, leave a minimum of 3” clearance between the top of the drop ceiling tiles and the bottom of the cable tray.
   6. Maintain a 2’ separation between ladder cable tray used for communications cables and pathways for other utilities or building services.

S. Provide non-curing, re-penetrable, intumescent firestop materials around communications cable trays or ladder racks penetrating through a fire rated wall.

T. Remove burrs and sharp edges from cable trays.

U. Fasten cable tray supports to building structure and install seismic restraints.

V. Design fasteners and supports to carry cable tray, the cables, and a concentrated load of 200 lb. Comply with requirements in Section 270528 - Pathway for Communications Systems. Comply with seismic-restraint details according to Section 270548 - Seismic Controls for Communications Systems.

W. Place supports so that spans do not exceed maximum spans on schedules and provide clearances shown on Drawings. Install intermediate supports when cable weight exceeds the load-carrying capacity of the tray rungs.

X. Construct supports from channel members, threaded rods, and other appurtenances furnished by cable tray manufacturer. Arrange supports in trapeze or wall-bracket form as required by application.

Y. Support bus assembly to prevent twisting from eccentric loading.

Z. Locate and install supports according to NEMA VE 2. Do not install more than one cable tray splice between supports.

AA. Ladder cable tray:
1. Install all ladder cable tray per the manufacturer's recommended installation instructions, and as indicated in the project drawings.
2. Ladder cable tray shall be installed with side stringers facing down so that the ladder forms an inverted U-shape.
3. Ladder cable tray shall be secured to the structural ceiling, building truss system, wall, floor or the tops of equipment racks and/or cabinets using the manufacturer's recommended supports and appropriate installation hardware and methods as defined by local code or the authority having jurisdiction (AHJ).
4. Ladder cable tray splices will be made in mid-span, not over a support, with the manufacturer's recommended splice hardware.
5. Ladder cable tray support:
    a. Every 5' or less in accordance with TIA-569-D.
    b. Within 2' of every splice and within 2' on both/all sides of every intersection.
    c. Within 2' on both sides of every change in elevation.
    d. Every 2' when attached vertically to a wall.
6. Heavy-duty splices:
    a. Recommended for 18" wide or wider ladder cable tray.
    b. Required for any splice formed in the vertical orientation including changes in elevation formed using vertical-to-horizontal 90° turns or horizontal-to-vertical 90° turns.
    c. To secure all overhead turns to the overhead horizontal pathway(s).

BB. Support wire-basket cable trays with trapeze hangers and/or wall brackets.
1. Construct supports from channel members, threaded rods, and other appurtenances furnished by cable tray manufacturer.
2. Support for wire-basket trays with 1/2-inch diameter threaded rods.

CC. Install expansion connectors where cable trays cross building expansion joints and in cable tray runs that exceed dimensions recommended in NEMA VE 2. Space connectors and set gaps according to applicable standard.

DD. Make changes in direction and elevation using manufacturer's recommended fittings.

EE. Make cable tray connections using manufacturer's recommended fittings.

FF. Seal penetrations through fire and smoke barriers. Comply with requirements in Section 078413 "Penetration Firestopping."

GG. Install capped metal sleeves for future cables through firestop-sealed cable tray penetrations of fire and smoke barriers.

HH. Cover the exposed ends of cable tays that do not terminate against a wall, the floor or the ceiling, with end caps or an end closing kit.

II. Install permanent covers, if used, after installing cable. Refer to project drawings for requirements.

3.3 CABLE TRAY GROUNDING

A. Ground cable trays according to NFPA 70 unless additional grounding is specified. Comply with requirements in Section 270526 - Grounding And Bonding For Communications Systems.

B. Cable trays shall be bonded together with splice plates listed for grounding purposes or with listed bonding jumpers.

C. Cable trays with single-conductor power conductors shall be bonded together with a grounding conductor run in the tray along with the power conductors and bonded to the tray at 72-inch intervals. The grounding conductor shall be sized according to NFPA 70, Article 250.122, "Size of Equipment Grounding Conductors," and Article 392, "Cable Trays."

D. When using epoxy- or powder-coat painted cable trays as a grounding conductor, completely remove coating at all splice contact points or ground connector attachment. After completing splice-to-grounding bolt attachment, repair the coated surfaces with coating materials recommended by cable tray manufacturer.

E. Bond cable trays to power source for cables contained within with bonding conductors sized according to NFPA 70, Article 250.122, "Size of Equipment Grounding Conductors."

F. Verify continuity through the bonds at splices and intersections between individual cable tray sections and turns and through the bond to the telecommunications grounding busbar.

3.4 CONNECTIONS

A. Remove paint from all connection points before making connections. Repair paint after the connections are completed.

B. Connect pathways to cable trays according to requirements in NEMA VE 2 and NEMA FG 1.

3.5 PROTECTION

A. Protect installed cable trays and cables.

1. Install temporary protection for cables in open trays to safeguard exposed cables against falling objects, paint or debris during construction. Temporary protection for cables and cable tray can be constructed of wood or metal materials and shall remain in place until the risk of damage is over.
2. Repair damage to galvanized finishes with zinc-rich paint recommended by cable tray manufacturer.
3. Repair damage to paint finishes with matching touchup coating recommended by cable tray manufacturer.
    a. The installer will provide touch-up paint color-matched to the finish on the cable tray and will correct any minor cosmetic damage (chips, small scratches, etc.) resulting from normal handling during the installation process prior to delivery to the owner. If a component is cosmetically damaged to the extent that correction in the field is obvious against the factory finish, the component will be replaced with a new component finished from the factory. If a component is physically damaged due to mishandling or modification during the installation process, it shall not be used as part of the cable tray system.

3.6 FIELD QUALITY CONTROL

A. Field Tests and Inspections:
    1. Tests:
        a. Test the bonding as outlined in Section 270526 - Grounding And Bonding For Communications Systems.
    2. Inspections:
        a. Inspection for correct installation and bonding of cable tray is the responsibility of the Project Manager.
        b. If requested by the Owner, Architect, or Consultant, the cable tray manufacturer representative shall perform a site visit to verify the cable tray is correctly installed at no additional cost to the Owner.

END OF SECTION

SECTION 270543 - UNDERGROUND DUCTS AND RACEWAYS FOR COMMUNICATIONS SYSTEMS

PART 1 GENERAL

1.1 SUMMARY DESCRIPTION

A. This Section addresses metal conduits and fittings, including GRC and PVC-coated GRC, rigid nonmetallic duct, duct accessories, including rigid innerduct and fabric innerduct, precast concrete handholes, fiberglass handholes, and boxes with polymer concrete covers, precast manholes, and utility structure accessories.

1.2 RELATED REQUIREMENTS

A. Section 260533.13 - Conduit for Electrical Systems

B. Section 260533.16 - Boxes for Electrical Systems

1.3 REFERENCE STANDARDS:

A. ASTM C858 - Standard Specification for Underground Precast Concrete Utility Structures; 2019.

1.4 ABBREVIATIONS AND ACRONYMS:

A. AFF – Above Finished Floor

B. AWG – American Wire Gauge

C. CCS – Copper Clad Steel

D. IDF – Intermediate Distribution Frame

E. MDF – Main Distribution Frame

F. NECA – National Electrical Contractors Association

G. PVC – Polyvinyl Chloride

1.5 ADMINISTRATIVE REQUIREMENTS

A. Coordination:
   1. Coordinate exterior underground and pull box locations, under slab conduit, and acceptable fittings with the Division 26 Contractor.

B. Pre-installation meetings:
   1. Convene pre-installation meetings with the Division 26 Contractor. Include underground conduit stub-up locations and pull box requirements.

1.6 SUBMITTALS

A. ACTION SUBMITTALS
   1. Product Data:
      a. Submit product data in .pdf format for review no later than 60 days before beginning work.
         1) Fabric mesh innerduct
         2) Tracer wire markers
   2. Shop Drawings:
      a. Provide a site plan indicating the location of underground conduit and pull boxes, including conduit and pull box sizes.
   3. See Section 270500 - Common Work Results for Communications Systems, for submission information.

B. INFORMATIONAL SUBMITTALS (NOT USED)

C. CLOSEOUT SUBMITTALS
   1. Format:
      a. See Section 270500 - Common Work Results for Communications Systems, for additional information.
   2. Warranty Documentation: (Not used)
   3. Record Documentation:
      a. As-builts:
         1) Provide a site plan indicating the location of underground conduit and pull boxes, including conduit and pull box sizes.
   4. Test Reports: (Not used)

1.7 QUALITY ASSURANCE

A. Qualifications:
   1. Installers:
      a. The project requires installers experienced in installing conduit, underground boxes, tracer wire, and fabric mesh innerduct.

PART 2 PRODUCTS

2.1 METAL CONDUITS AND FITTINGS

A. GRC: Comply with ANSI C80.1 and UL 6 .

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: Atkore International (Allied Tube & Conduit), Appleton - O-Z/Gedney; Emerson Electric Co., Automation Solutions, or Southwire Company .

C. General Requirements for Metal Conduits and Fittings:
   1. Listed and labeled as defined in NFPA 70 0, by a nationally recognized testing laboratory, and marked for intended location and application.
   2. Comply with TIA-569-C and TIA-758 .

2.2 RIGID NONMETALLIC DUCTS

A. Underground Plastic Utilities Duct: Type EPC-40-PVCRNC or as indicated on project drawings, complying with NEMA TC 2 and UL 651, with matching fittings complying with NEMA TC 3 by same manufacturer as duct.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: Carlon, Dura-Line, or Lamson & Sessions .

C. General Requirements for Nonmetallic Ducts and Fittings:
   1. Listed and labeled as defined in NFPA 70, by a nationally recognized testing laboratory, and marked for intended location and application.
   2. Comply with TIA-569-C 69-C and TIA-758 .

2.3 DUCT ACCESSORIES

A. Fabric Innerduct: Continuous, polyester, multi -pocket fabric innerduct, with internal pull tape and tracer wire.
   1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: MaxCell or approved equal. .
   2. Standard Outdoor Textile Innerduct: Micro, 2-inch, 3-inch and 4-inch single or multi-cell polyester/nylon textile innerduct containing 1250 lb polyester flat woven pull tape.
   3. Each innerduct shall be installed with unique color striping, and with corresponding color-matched pull tapes.
   4. Fabric Innerduct Fittings:
      a. Conduit Plugs: Compression-type conduit plugs with locking nuts for sealing and securing one or more textile innerducts within a 4-inch inside diameter conduit, e.g.:4-inch plug with nine holes for cables in a 3 pack (9-cell) configuration.
      b. Termination Bags: Inflation-type bags for sealing and securing around one or more textile innerducts and cables within 2-inch outside diameter or larger conduit.

B. Duct Spacers: Factory-fabricated rigid PVC interlocking spacers, sized for type and size of duct with which used, and selected to provide minimum duct spacing indicated while supporting duct during concreting or backfilling.

1. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: Atkore International (Allied Tube & Conduits), Cantex, Carlon, or Dura-Line .

C. Underground-Line Warning Tape: Underground-line warning tape specified in Section 270553 "Identification for Communications Systems."

D. Tracer Wire: Use a continuous sheathed solid conductor copper wire line, minimum #12 AWG. Sheathing shall be color coded to match the utility, unless otherwise noted on the Design Drawings.

2.4 PRECAST CONCRETE HANDHOLES AND BOXES

A. Description: Monolithically poured, factory-fabricated, reinforced-concrete walls and bottom unless open-bottom enclosures are indicated. Frame and cover shall form top of enclosure and shall have load rating consistent with that of handhole or box.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: Christy Concrete Products, Oldcastle Precast, and Utility Concrete Products .

C. Comply with ASTM C858 for design and manufacturing processes.

D. Frame and Cover: Weatherproof steel frame, with steel cover with recessed cover hook eyes and tamper-resistant, captive, cover-securing bolts.

E. Cover Finish: Nonskid finish shall have a minimum coefficient of friction of 0.50.

F. Cover Legend: Molded lettering, " COMMUNICATIONS ."

G. Configuration: Units shall be designed for flush burial and have closed bottom unless otherwise indicated.

H. Extensions and Slabs: Designed to mate with bottom of enclosure, and made of same material as enclosure.
1. Extension shall provide increased depth of 12 inches .
2. Slab: Same dimensions as bottom of enclosure, and arranged to provide closure.

I. Joint Sealant: Asphaltic-butyl material with adhesion, cohesion, flexibility, and durability properties necessary to withstand maximum hydrostatic pressures at the installation location with the ground-water level at grade.

J. Knockout Panels: Precast openings in walls, arranged to match dimensions and elevations of approaching duct and duct banks, plus an additional 6 inches vertically and horizontally to accommodate alignment variations.
1. Knockout panels shall be located no less than 6 inches from interior surfaces of walls, floors, or frames and covers of handholes, but close enough to corners to facilitate racking of cables on walls.

2. Knockout panel opening shall have cast-in-place, welded-wire fabric reinforcement for field cutting and bending to tie in to concrete envelopes of duct banks.
3. Knockout panel openings shall be framed with at least two additional No. 3 steel reinforcing bars in concrete around each opening.
4. Knockout panels shall be 1-1/2 to 2 inches thick.

K. Duct Entrances in Handhole Walls: Cast end-bell or duct-terminating fitting in wall for each entering duct.
1. Type and size shall match fittings to duct or conduit to be terminated.
2. Fittings shall align with elevations of approaching duct and be located near interior corners of handholes to facilitate racking of cable.

L. Handholes 12 inches wide by 24 inches long and larger shall have inserts for cable racks and pulling-in irons installed before concrete is poured.

2.5 UTILITY STRUCTURE ACCESSORIES

A. Accessories for Utility Structures: Utility equipment and accessory items used for utility structure access and utility support, listed and labeled for intended use and application.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following: Christy Concrete Products, Oldcastle Precast, or Quazite; Hubbell Incorporated, Power Systems .

C. Pulling Eyes in Concrete Walls: Eyebolt with reinforcing-bar fastening insert, 2-inch- diameter eye, and 1-by-4-inch bolt.
1. Working Load Embedded in 6-Inch, 4000-psi Concrete: 13,000-lbf minimum tension.

D. Pulling Eyes in Nonconcrete Walls: Eyebolt with reinforced fastening, 1-1/4-inch- diameter eye, rated 2500-lbf minimum tension.

E. Pulling-In and Lifting Irons in Concrete Floors: 7/8-inch- diameter, hot-dip galvanized, bent steel rod; stress relieved after forming; and fastened to reinforcing rod. Exposed triangular opening.
1. Ultimate Yield Strength: 40,000-lbf shear and 60,000-lbf tension.

F. Bolting Inserts for Concrete Utility Structure Cable Racks and Other Attachments: Flared, threaded inserts of noncorrosive, chemical-resistant, nonconductive thermoplastic material; 1/2-inch ID by 2-3/4 inches deep, flared to a minimum of 1-1/4 inches at base.
1. Tested Ultimate Pullout Strength: 12,000 lbf minimum.

G. Ground Rod Sleeve: 3-inch, PVC duct sleeve in manhole floors 2 inches from the wall adjacent to, but not underneath, the duct entering the structure.

H. Cable Rack Assembly: Nonmetallic. Components fabricated from nonconductive, fiberglass-reinforced polymer.
1. Stanchions: Nominal 36 inches high by 4 inches wide, with minimum of nine holes for arm attachment.

2. Arms: Arranged for secure, drop-in attachment in horizontal position at any location on cable stanchions, and capable of being locked in position. Arms shall be available in lengths ranging from 3 inches with 450-lb minimum capacity to 20 inches with 250-lb minimum capacity. Top of arm shall be nominally 4 inches wide, and arm shall have slots along full length for cable ties.

I. Duct-Sealing Compound: Nonhardening, safe for contact with human skin, not deleterious to cable insulation, and workable at temperatures as low as 35 deg F. Capable of withstanding temperature of 300 deg F without slump and adhering to clean surfaces of plastic duct, metallic duct, duct coatings, concrete, masonry, lead, cable sheaths, cable jackets, insulation materials, and common metals.

2.6 SOURCE QUALITY CONTROL

A. Test and inspect precast concrete utility structures according to ASTM C1037.

B. Nonconcrete Handhole and Pull-Box Prototype Test: Test prototypes of manholes and boxes for compliance with SCTE 77. Strength tests shall be for specified tier ratings of products supplied.
1. Tests of materials shall be performed by an independent testing agency.
2. Strength tests of complete boxes and covers shall be by either an independent testing agency or manufacturer. A qualified registered professional engineer shall certify tests by manufacturer.
3. Testing machine pressure gages shall have current calibration certification, complying with ISO 9000 and ISO 10012 , and traceable to NIST standards.

PART 3 EXECUTION

3.1 PREPARATION

A. Coordinate layout and installation of duct, duct bank, manholes, handholes, and boxes with final arrangement of other utilities, site grading, and surface features as determined in the field. Notify Architect if there is a conflict between areas of excavation and existing structures or archaeological sites to remain.

B. Coordinate elevations of duct and duct-bank entrances into manholes, handholes, and boxes with final locations and profiles of duct and duct banks, as determined by coordination with other utilities, underground obstructions, and surface features. Revise locations and elevations as required to suit field conditions and to ensure that duct runs drain to manholes and handholes, and as approved by Architect.

C. Clear and grub vegetation to be removed, and protect vegetation to remain according to Section 311000 "Site Clearing." Remove and stockpile topsoil for reapplication according to Section 311000 "Site Clearing."

3.2 UNDERGROUND DUCT APPLICATION

A. Duct for Communications: Type EPC-40-PVC RNC, shall be installed in a direct-buried duct bank unless otherwise indicated.

B. Underground Duct Crossing Driveways Roadways and Railroads: Type EPC-40-PVC RNC, shall be encased in reinforced concrete or GRC.

C. Stub-Ups for Communications: Concrete-encased GRC.

3.3 UNDERGROUND ENCLOSURE APPLICATION

A. Handholes and Boxes for Communications:
   1. Units in Roadways and Other Deliberate Traffic Paths: Precast concrete. AASHTO HB 17, H-20 structural load rating.
   2. Units in Driveway, Parking Lot, and Off-Roadway Locations, Subject to Occasional, Nondeliberate Loading by Heavy Vehicles: Precast concrete, AASHTO HB 17, H-20 or Fiberglass enclosures with polymer concrete frame and cover, SCTE 77, Tier 15 structural load rating.
   3. Units in Sidewalk and Similar Applications with a Safety Factor for Nondeliberate Loading by Vehicles: Precast concrete, AASHTO HB 17, H-5 Precast concrete, AASHTO HB 17, H-10 or Heavy-duty fiberglass units with polymer concrete frame and cover, SCTE 77, Tier 8 structural load rating.
   4. Units Subject to Light-Duty Pedestrian Traffic Only: structurally tested according to SCTE 77 with 3000-lbf vertical loading.
   5. Cover design load shall not exceed the design load of the handhole or box.

3.4 EARTHWORK

A. Excavation and Backfill: Comply with Section 312000 "Earth Moving," but do not use heavy-duty, hydraulic-operated, compaction equipment.
   1. Determine exact location of existing underground utilities before excavation.
   2. Excavation shall be no longer or deeper than necessary. Backfill material shall be free from rocks and debris.
   3. Compact backfill as the excavation is filled.

B. Restoration: Replace area immediately after backfilling is completed or after construction in immediate area is complete.

C. Restore surface features at areas disturbed by excavation, and re-establish original grades unless otherwise indicated.

D. Restore areas disturbed by trenching, storing of dirt, cable laying, and other work. Restore vegetation and include necessary topsoiling, fertilizing, liming, seeding, sodding, sprigging, and mulching. Comply with Section 329200 "Turf and Grasses" and Section 329300 "Plants."

E. Cut and patch existing pavement in the path of underground duct, duct bank, and utility structures according to the "Cutting and Patching" Article in Section 017300 "Execution."

3.5 DUCT AND DUCT-BANK INSTALLATION

A. Where indicated on Drawings, install duct, spacers, and accessories into the duct configuration shown. Duct installation requirements in this Section also apply to duct bank.

B. Install duct and duct bank according to NEMA TC 2 and TIA-758 .

C. Slope: Pitch duct and duct bank a minimum slope of 1:100 down toward manholes and handholes and away from buildings and equipment. Slope duct and duct bank from a high point in runs between two manholes, to drain in both directions.

D. Curves and Bends: Use 5-degree angle couplings for small changes in direction. Use manufactured long sweep bends with a minimum radius of 12.5 feet , both horizontally and vertically, at other locations unless otherwise indicated.
   1. Duct and duct banks shall have maximum of two 90-degree bends, or the total of all bends shall be no more 180 degrees between pull points.

E. Joints: Use solvent-cemented joints in duct and fittings, and make watertight according to manufacturer's written instructions. Stagger couplings, so those of adjacent ducts do not lie in same plane.

F. Installation Adjacent to High-Temperature Steam Lines: Where duct or duct banks are installed parallel to underground steam lines, perform calculations showing the duct or duct bank will not be subject to environmental temperatures above 40 deg C. Where environmental temperatures are calculated to rise above 40 deg C, and anywhere the duct or duct bank crosses above an underground steam line, install insulation blankets listed for direct burial to isolate the duct bank from the steam line.

G. End-Bell Entrances to Manholes and Concrete and Polymer Concrete Handholes: Use end bells, spaced approximately 6 inches o.c. for 4-inch duct, and vary proportionately for other duct sizes.
   1. Begin change from regular spacing to end-bell spacing 10 feet from the end bell without reducing duct slope and without forming a trap in the line.
   2. Expansion and Deflection Fittings: Install an expansion and deflection fitting in each duct in the area of disturbed earth adjacent to manhole or handhole. Install an expansion fitting near the center of all straight-line direct-buried duct and duct banks, with calculated expansion of more than 3/4 inch.
   3. Grout end bells into structure walls from both sides to provide watertight entrances.

H. Terminator Entrances to Manholes and Concrete and Polymer Concrete Handholes: Use manufactured, cast-in-place duct terminators, with entrances into structure spaced approximately 6 inches o.c. for 4-inch duct, and vary proportionately for other duct sizes.
   1. Begin change from regular spacing to terminator spacing 10 feet from the terminator without reducing duct slope and without forming a trap in the line.
   2. Expansion and Deflection Fittings: Install an expansion and deflection fitting in each duct in the area of disturbed earth adjacent to manhole or handhole. Install an expansion fitting near the center of all straight-line duct or duct bank, with calculated expansion of more than 3/4 inch.

I. Building Wall Penetrations: Make a transition from underground duct to GRC at least 10 feet outside the building wall, without reducing duct slope away from the building or forming a trap in the duct.

Use fittings manufactured for RNC duct-to-GRC conduit transition. Install GRC penetrations of building walls as specified in Section 270544 "Sleeves and Sleeve Seals for Communications Pathways and Cabling."

J. Sealing: Provide temporary closure at terminations of duct that has cables pulled. Seal spare ducts at terminations. Use sealing compound and plugs to withstand at least 15-psig hydrostatic pressure.

K. Innerduct: Install immediately after mandreling duct. Size and type as indicated on Drawings.

L. Pulling Cord: Install 200-lbf- test nylon cord in empty duct and innerduct.

M. Concrete-Encased Duct and Duct Bank:
1. Excavate trench bottom to provide firm and uniform support for duct or duct bank. Prepare trench bottoms as specified in Section 312000 "Earth Moving" for pipes less than 6 inches in nominal diameter.
2. Width: Excavate trench 12 inches wider than duct or duct bank on each side.
3. Width: Excavate trench 3 inches wider than duct or duct bank on each side.
4. Depth: Install top of duct and duct bank at least 24 inches below finished grade in areas not subject to deliberate traffic, and at least 30 inches below finished grade in deliberate traffic paths for vehicles unless otherwise indicated.
5. Support duct and duct bank on duct spacers coordinated with duct size, duct spacing, and outdoor temperature.
6. Minimum Space Between Duct: 3 inches between edge of duct and exterior envelope wall, 2 inches between ducts for like services, and 4 inches between power and communications ducts.
7. Spacer Installation: Place spacers close enough to prevent sagging and deforming of duct, with not less than four spacers per 20 feet of duct. Place spacers within 24 inches of duct ends. Stagger spacers approximately 6 inches between tiers. Secure spacers to earth and duct to prevent floating during concreting. Tie entire assembly together using fabric straps; do not use tie wires or reinforcing steel that may form conductive or magnetic loops around duct or duct bank.
8. Elbows: Use manufactured duct elbows for stub-ups, at building entrances, and at changes of direction in duct run unless otherwise indicated. Extend concrete encasement throughout length of elbow.
9. Elbows: Use manufactured GRC elbows for stub-ups, at building entrances, and at changes of direction in duct run.
    a. Couple GRC to duct with adapters designed for this purpose, and encase coupling with 3 inches of concrete.
    b. Stub-Ups to Outdoor Equipment: Extend concrete-encased GRC horizontally a minimum of 60 inches from edge of base. Install insulated grounding bushings on terminations at equipment.
        1) Stub-ups shall be finished floor and minimum 3 inches from conduit side to edge of slab
    c. Stub-Ups to Indoor Equipment: Extend concrete-encased GRC horizontally a minimum of 60 inches from edge of wall. Install insulated grounding bushings on terminations at equipment.

1) Stub-ups shall be minimum 4 inches abovefinished floor and no less than 3 inches from conduit side to edge of wall

10. Reinforcement: Reinforce concrete-encased duct and duct bank where they cross disturbed earth and where indicated. Arrange reinforcing rods and ties without forming conductive or magnetic loops around ducts or duct groups.
11. Forms: Use trench walls to form side walls of duct and duct bank where soil is self-supporting and concrete envelope can be poured without soil inclusions; otherwise, use forms.
12. Concrete Cover: Install a minimum of 3 inches of concrete cover between edge of duct to exterior envelope wall, 2 inches between ducts, and 4 inches between power and communications duct.
13. Concreting Sequence: Pour each run of envelope between manholes or other terminations in one continuous operation.
    a. Start at one end and finish at the other, allowing for expansion and contraction of duct as its temperature changes during and after the pour. Use expansion fittings installed according to manufacturer's written recommendations, or use other specific measures to prevent expansion-contraction damage.
    b. If more than one pour is necessary, terminate each pour in a vertical plane and install 3/4-inch reinforcing-rod dowels extending a minimum of 18 inches into concrete on both sides of joint near corners of envelope.
14. Pouring Concrete: Comply with requirements in "Concrete Placement" Article in Section 033000 "Cast-in-Place Concrete." Place concrete carefully during pours to prevent voids under and between ducts and at exterior surface of envelope. Do not allow a heavy mass of concrete to fall directly onto duct. Allow concrete to flow to center of bank and rise up in middle, uniformly filling all open spaces. Do not use power-driven agitating equipment unless specifically designed for duct-bank application.

N. Direct-Buried Duct and Duct Banks:
1. Excavate trench bottom to provide firm and uniform support for duct and duct bank. Comply with requirements in Section 312000 "Earth Moving" for preparation of trench bottoms for duct less than 6 inches in nominal diameter.
2. Install duct with a minimum of 3 inches between duct for like services and 6 inches between power and signal duct.
3. Width: Excavate trench 12 inches wider than duct or duct bank on each side.
4. Width: Excavate trench 3 inches wider than duct or duct bank on each side.
5. Depth: Install top of duct or duct bank at least 36 inches below finished grade unless otherwise indicated.
6. Set elevation of bottom of duct or duct bank below frost line.
7. Support duct on duct spacers coordinated with duct size, duct spacing, and outdoor temperature.
8. Spacer Installation: Place spacers close enough to prevent sagging and deforming of duct, with not less than four spacers per 20 feet of duct. Place spacers within 24 inches of duct ends. Stagger spacers approximately 6 inches between tiers. Secure spacers to earth and duct to prevent floating during concreting. Tie entire assembly together using fabric straps; do not use tie wires or reinforcing steel that may form conductive or magnetic loops around duct or duct bank.
9. Elbows: Install manufactured duct elbows for stub-ups, at building entrances through floor, and at changes of direction in duct unless otherwise indicated. Encase elbows for stub-ups throughout length of elbow. Extend encasement minimum of 36 inches beyond elbow joints.

10. Install manufactured GRC elbows for stub-ups, at building entrances, and at changes of direction in duct.
    a. Couple GRC to duct with adapters designed for this purpose, and encase coupling with 3 inches of concrete.
    b. For equipment mounted on outdoor bases, extend GRC horizontally a minimum of 60 inches from edge of equipment pad or foundation. Install insulated grounding bushings on terminations at equipment.
11. After installing first tier of duct, backfill and compact. Start at tie-in point and work toward end of duct run, leaving duct at end of run free to move with expansion and contraction, as temperature changes during this process. Repeat procedure after placing each tier. After placing last tier, hand place backfill to 4 inches over duct and hand tamp. Firmly tamp backfill around duct to provide maximum supporting strength. Use hand tamper only. After placing controlled backfill over final tier, make final duct connections at end of run and complete backfilling with normal compaction. Comply with requirements in Section 312000 "Earth Moving" for installation of backfill materials.
    a. Place minimum of 3 inches of sand as a bed for duct and duct bank. Place sand to a minimum of 6 inches above top level of duct and duct bank.
    b. Place minimum of 6 inches of engineered fill above concrete encasement of duct bank.

O. Underground-Line Warning Tape: Bury conducting underground-line warning tape specified in Section 270553 "Identification for Communication Systems" no less than 12 inches above all concrete-encased duct and duct bank and approximately 12 inches below grade. Align tape parallel to and within 3 inches of centerline of duct bank. Provide an additional warning tape for each 12-inch increment of duct-bank width over a nominal 18 inches. Space additional tapes 12 inches apart, horizontally.

3.6 INSTALLATION OF CONCRETE MANHOLES, HANDHOLES, AND BOXES

A. Precast Concrete Handhole and Manhole Installation:
1. Comply with ASTM C891 unless otherwise indicated.
2. Install units level and plumb and with orientation and depth coordinated with connecting duct, to minimize bends and deflections required for proper entrances.
3. Unless otherwise indicated, support units on a level bed of crushed stone or gravel, graded from 1-inch sieve to No. 4 sieve and compacted to same density as adjacent undisturbed earth.

B. Elevations:
1. Manhole Roof: Install with rooftop at least 15 inches below finished grade.
2. Manhole Frame: In paved areas and trafficways, set frames flush with finished grade. Set other manhole frames 1 inch above finished grade.
3. Install handholes with bottom below frost line.
4. Handhole Covers: In paved areas and trafficways, set surface flush with finished grade. Set covers of other handholes 1 inch above finished grade.
5. Where indicated, cast handhole cover frame integrally with handhole structure.

C. Drainage: Install drains in bottom of manholes where indicated. Coordinate with drainage provisions indicated.

D. Waterproofing: Apply waterproofing to exterior surfaces of manholes and handholes after concrete has cured at least three days. After duct has been connected and grouted, and before backfilling, waterproof joints and connections, and touch up abrasions and scars. Waterproof exterior of manhole chimneys after mortar has cured at least three days.

E. Dampproofing: Apply dampproofing to exterior surfaces of manholes and handholes after concrete has cured at least three days. Dampproofing materials and installation are specified in Section 071113 "Bituminous Dampproofing." After duct has been connected and grouted, and before backfilling, dampproof joints and connections, and touch up abrasions and scars. Dampproof exterior of manhole chimneys after mortar has cured at least three days.

F. Hardware: Install removable hardware, including pulling eyes, cable stanchions, and cable arms, and insulators, as required for installation and support of cables and conductors and as indicated.

G. Fixed Manhole Ladders: Arrange to provide for safe entry with maximum clearance from cables and other items in manholes.

H. Field-Installed Bolting Anchors in Manholes and Concrete Handholes: Do not drill deeper than 3-7/8 inches for manholes and 2 inches for handholes, for field-installed anchor bolts installed. Use a minimum of two anchors for each cable stanchion.

3.7 INSTALLATION OF INNERDUCT

A. General:
1. Protect products from the effects of moisture, UV exposure, corrosion and physical damage during construction.
2. Select approved innerduct suitable for specific installation environments.

B. Textile Innerduct Installation:
1. Provide in conduit and wire ways using continuous unspliced lengths between maintenance holes, pull boxes, and/or termination points as indicated on the drawings.
2. Provide suitable textile innerduct slack in the maintenance holes, hand holes, pull boxes, and at turns to ensure there is no kinking or binding of the product.
3. Textile Innerduct Mountings, Hangers and Attachments: When exposed indoors or in maintenance holes, hold firmly in place using independent support.
    a. Design & install hangers and other similar fittings adequate to support loads and so as to not damage innerduct.
    b. Do not fasten textile innerduct to steam, water, or other piping, ductwork, mechanical equipment, electrical equipment, electrical raceways, or wires.
    c. Secure textile innerduct using UV-resistant plastic cable ties.
4. Maintenance Hole and Hand Hole Installation:
    a. At locations where textile innerduct will be continuous through a manhole or hand hole, allow sufficient slack so that the innerduct may be secured to the side of the vault maintaining the minimum bend radius.
    b. At maintenance holes serving as the junction location, pull the exposed end of the innerduct to the far end of the vault, install termination bag, and secure to the vault.

C. Penetrations:
   1. Seal all conduit and textile innerduct entering structures at the first box or outlet to prevent gases, liquids or vermin from entering the structure.

3.8 GROUNDING

A. Ground underground duct, duct bank, and utility structures according to Section 270526 - Grounding And Bonding For Communications Systems.

3.9 SYSTEMS INTEGRATION:

A. Underground conduit stubbing into the MDF or IDF should be no taller than 3 inches AFF and no further away than 3 inches from the backboard.

B. Division 26 Contractor shall install detectable warning tape at a minimum of 6 inches above buried exterior underground conduit.

C. Division 27 Contractor shall install minimum 14 AWG CCS orange tracer wire in buried exterior underground conduit. Leave 3 feet of wire exposed on IDF end. Securely fasten tracer to orange Rhino HideOut™ using 1 inch conduit.

D. Division 26 Contractor shall install Muletape® (WP1800P/3000FT) within each underground conduit.

E. See contract drawings for conduit sizes.

F. Provide rated lids and boxes. Provide lids with a minimum of 2 bolts.

G. Provide 2 inches of number 2 gravel to entirely cover the ground inside of the box.

H. Pull box lids shall be labeled, “COMMUNICATIONS”.

I. Install pull boxes for underground conduit runs over 400 feet.

J. Install fabric mesh innerduct with a swivel.

3.10 EXAMINATION

A. Verification of Conditions:
   1. Verify conduit has been installed as shown on the contract drawings.

3.11 FIELD QUALITY CONTROL

A. Perform the following tests and inspections and prepare test reports:
   1. Demonstrate capability and compliance with requirements on completion of installation of underground duct, duct bank, and utility structures.

2. Pull solid aluminum or wood test mandrel through duct to prove joint integrity and adequate bend radii, and test for out-of-round duct. Provide a minimum 12-inch- long mandrel equal to duct size minus 1/4 inch. If obstructions are indicated, remove obstructions and retest.
3. Test manhole and handhole grounding to ensure electrical continuity of grounding and bonding connections. Measure and report ground resistance as specified in Section 270526 "Grounding and Bonding for Communications Systems."

B. Correct deficiencies and retest as specified above to demonstrate compliance.

3.12 FIELD QUALITY CONTROL

A. Field Tests and Inspections:
1. Tests: (Not used)
2. Inspections:
a. Inspections for appropriate installation of underground conduit, fittings, pull boxes, and fabric mesh innerduct are the responsibility of the Project Manager.

3.13 CLEANING

A. Pull leather-washer-type duct cleaner, with graduated washer sizes, through full length of duct until duct cleaner indicates that duct is clear of dirt and debris.

B. Clean internal surfaces of manholes, including sump.
1. Sweep floor, removing dirt and debris.
2. Remove foreign material.

END OF SECTION

SECTION 270544 - SLEEVES AND SLEEVE SEALS FOR COMMUNICATIONS PATHWAYS AND CABLING

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Round sleeves.
   2. Firestopping
   3. Firestopped Sleeve Assemblies

B. Related Requirements:
   1. Section 078413 "Penetration Firestopping" for penetration firestopping installed in fire-resistance-rated walls, horizontal assemblies, and smoke barriers, with and without penetrating items.

1.3 ACTION SUBMITTALS

A. Product Data: For each type of product.

PART 2 PRODUCTS

2.1 ROUND SLEEVES

A. Wall Sleeves, Steel:
   1. Description: ASTM A53/A53M, Type E, Grade B, Schedule 40, zinc coated, plain ends and integral waterstop.

2.2 FIRESTOPPING

A. Where applicable, refer to section 078413, "Penetration Firestopping."

B. Description: 1. Firestops shall consist of an asbestos-free fill material, forming/backing/damming materials, and accessories needed to complete a UL classified through-penetration firestopping system. Fill material shall not slump or sag and shall be the required thickness in the fully cured state.

C. Firestops shall be designed to seal through-penetrations against flame, heat, smoke, and water in compliance with ASTM E84-2016, ASTM E119-2016a, ASTM E814-2013a, UL 1479 and UL 723-2008.

D. Firestops shall be specifically designed and rated for the individual application, including movement, materials, moisture, penetrating item material, and fire and smoke ratings of the penetrated construction.

2.3 FIRESTOPPED SLEEVE ASSEMBLIES

A. Description: An enclosed fire rated cable management device where cable bundles penetrate rated partitions.
   1. The cable management device shall contain integrated intumescent firestop wrap strip materials sufficient to maintain the hourly rating of the barrier being penetrated.
   2. The cable management device shall contain a smoke seal fabric membrane or intumescent firestop plugs sufficient to achieve the L-Rating requirements of the barrier type.

B. The firestop system assembly shall be able accessible and re-installed from one side of the wall.

C. UL classified for use in wall and floor systems rated for up to 3 hours

D. Manufacturers: Subject to compliance with requirements, provide products by the following:
   1. Specified Technologies, Inc. - EZ-Path
   2. Legrand – FlameStopper
   3. Hilti Speed Sleeve
   4. Abesco Fire Ltd. - Cable Transit System

2.4 SMOKE & ACOUSTICAL SLEEVE ASSEMBLIES

A. Description: An enclosed smoke & acoustic rates cable management device where cable bundles penetrate partitions.
   1. The cable management device shall contain integrated materials to stop smoke transfer and maintain STC rating of the penetrated barrier or partition.
   2. The cable management device shall contain a smoke seal fabric membrane or intumescent firestop plugs sufficient to achieve the L-Rating requirements of the barrier type.

B. The sleeve assembly shall be accessible and re-installed from one side of the wall.

C. UL classified for use in wall and floor systems.

D. Manufacturers: Subject to compliance with requirements, provide products by the following:
   1. Specified Technologies, Inc.
   2. Legrand
   3. Hilti
   4. 3M™

2.5 FIRE RATED PUTTY PADS

A. Description: Moldable firestop putties for use around boxes and gaps.

B. Putty pads shall be made of intumescent material.

C. UL classified.

D. Manufacturers: Subject to compliance with requirements, provide products by the following:
   1. Specified Technologies, Inc.
   2. Hilti
   3. 3M™

PART 3 EXECUTION

3.1 INSTALLATION OF SLEEVES FOR NON-FIRE-RATED ELECTRICAL PENETRATIONS

A. Comply with NECA 1.

B. Sleeves for Conduits Penetrating Above-Grade, Non-Fire-Rated, Concrete and Masonry-Unit Floors and Walls:
   1. Interior Penetrations of Non-Fire-Rated Walls and Floors:
      a. Seal space outside of sleeves with mortar or grout. Pack sealing material solidly between sleeve and wall or floor so no voids remain. Tool exposed surfaces smooth; protect material while curing.
      b. Seal annular space between sleeve and pathway or cable, using joint sealant appropriate for size, depth, and location of joint. Comply with requirements in Section 079200 "Joint Sealants."
   2. Use pipe sleeves unless penetration arrangement requires rectangular sleeved opening.
   3. Size pipe sleeves to provide 1/4-inch annular clear space between sleeve and pathway or cable, unless sleeve seal system is to be installed or seismic criteria require different clearance.
   4. Install sleeves for wall penetrations unless core-drilled holes or formed openings are used. Install sleeves during erection of walls. Cut sleeves to length for mounting flush with both surfaces of walls. Deburr after cutting.
   5. Install sleeves for floor penetrations. Extend sleeves installed in floors a minimum of 2 inches above finished floor level unless otherwise noted on project drawings. Install sleeves during erection of floors.
   6. Wall sleeves shall extend 4" from each side of the walls.
   7. Openings through slabs for communications risers shall be finished with a 4" wide by 2" high curb around the opening.

C. Sleeves for Conduits Penetrating Non-Fire-Rated Wall Assemblies:
   1. Use circular metal sleeves unless penetration arrangement requires rectangular sleeved opening.
   2. Seal space outside of sleeves with approved joint compound for wall assemblies.
   3. Wall sleeves shall extend 4" from each side of the walls.

D. Roof-Penetration Sleeves: Seal penetration of individual pathways and cables with flexible boot-type flashing units applied in coordination with roofing work.

E. Aboveground, Exterior-Wall Penetrations: Seal penetrations using steel pipe sleeves and mechanical sleeve seal systems. Size sleeves to allow for 1-inch annular clear space between pipe and sleeve for installing mechanical sleeve seals.

F. Underground, Exterior-Wall and Floor Penetrations:
   1. Install steel pipe sleeves with integral waterstops. Size sleeves to allow for 1-inch annular clear space between pathway or cable and sleeve for installing sleeve seal system. Install sleeve during construction of floor or wall.
   2. Install steel pipe sleeves. Size sleeves to allow for 1-inch annular clear space between pathway or cable and sleeve for installing sleeve seal system. Grout sleeve into wall or floor opening.

3.2 INSTALLATION OF SLEEVE SEAL SYSTEMS

A. Install sleeve seal systems in sleeves in exterior concrete walls and slabs-on-grade at pathway entries into building.

B. Install type and number of sealing elements recommended by manufacturer for pathway or cable material and size. Position pathway or cable in center of sleeve. Assemble mechanical sleeve seals and install in annular space between pathway or cable and sleeve. Tighten bolts against pressure plates that cause sealing elements to expand and make watertight seal.

C. Install in accordance with the manufacturer's published instructions to achieve ratings and classifications specified herein. A copy of these instructions shall be maintained and available on site.

D. Install sleeve-seal fittings in new walls and slabs as they are constructed.
   1. Provide where cables pass through walls or elevated floor slabs within communications rooms.
   2. Provide where cable trays pass through rated walls or elevated floor slabs. Install 4 sleeves at each penetration, minimum.
   3. Install associated rating information decal on both sides of sleeve. Sign and date the decal.
   4. Install sleeve systems with flanges and fire-rated caulk as recommended by the manufacturer.

E. Assemble fitting components of length to be flush with both surfaces of concrete slabs and walls. Position waterstop flange to be centered in concrete slab or wall.

3.3 INSTALLATION OF FIRESTOP SYSTEMS

A. Close and firestop abandoned penetrations and penetrations through fire- and smoke-rated construction. Materials used to seal these penetrations shall continue the construction’s fire and smoke resistance ratings uninterrupted and shall maintain an effective barrier against the spread of flame, smoke, water and hot gases.

B. Install after installation of raceways and cable trays.

3.4 INSTALLATION OF SLEEVE ASSEMBLIES

A. Install through-penetration firestop systems in accordance with Performance Criteria and in accordance with the conditions of testing and classification as specified in the published design.

B. Comply with manufacturer’s instructions for installation of firestopping products.

END OF SECTION

SECTION 270548 - SEISMIC CONTROLS FOR COMMUNICATIONS SYSTEMS

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
1. Elastomeric isolation pads.
2. Neoprene Isolation Washers and Grommets
3. Restraints - rigid type.
4. Restraints - cable type.
5. Restraint accessories.
6. Post-installed concrete anchors.
7. Concrete inserts.

B. Related Requirements:
1. Section 270529 "Hangers and Supports for Communications Systems" for commonly used communications system supports and installation requirements.

1.3 DEFINITIONS

A. Designated Seismic System: A communications system component that requires design in accordance with ASCE/SEI 7, Ch. 13 and for which the Component Importance Factor is greater than 1.0.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.
1. Include rated load capacity for each seismic - and wind-load-restraint device.
2. Illustrate and indicate style, material, strength, fastening provision, and finish for each type and size of seismic - and wind-load-restraint component used.
3. Annotate types and sizes of seismic restraints and accessories, complete with listing markings or report numbers and load rating in tension and compression as evaluated by an agency acceptable to authorities having jurisdiction.
4. Annotate to indicate application of each product submitted and compliance with requirements.

B. Shop Drawings:
1. Detail fabrication and assembly of equipment bases.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Show coordination of seismic and wind-load bracing for communications components with other systems and equipment in the vicinity, including other supports and seismic restraints.

B. Field quality-control reports.

1.6 QUALITY ASSURANCE

A. Comply with NFPA 70.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Consequential Damage: Provide additional seismic and wind-load restraints for suspended communications components or anchorage of floor-, roof-, or wall-mounted communications components as indicated in ASCE/SEI 7-10 so that failure of a non-essential or essential communications component will not cause failure of any other essential architectural, mechanical, or communications building component.

B. Fire/Smoke Resistance: Seismic - and wind-load-restraint devices that are not constructed of ferrous metals must have a maximum flame-spread index of 25 and maximum smoke-developed index of 50 when tested by an NRTL in accordance with ASTM E84 or UL 723, and be so labeled.

C. Component Supports:
1. Load ratings, features, and applications of all reinforcement components must be based on testing standards of a nationally recognized testing agency.
2. All component support attachments must comply with force and displacement resistance requirements of ASCE/SEI 7-10 Section 13.6.

2.2 RESTRAINTS - RIGID TYPE

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. CADDY; nVent.
2. Gripple Inc.
3. International Seismic Application Technology (ISAT).
4. Kinetics Noise Control, Inc.
5. Mason Industries, Inc.
6. Vibration Eliminator Co., Inc.
7. Vibration Mountings & Controls, Inc.
8. Vibro-Acoustics.

B. Description: Shop- or field-fabricated bracing assembly made of ANSI/AISI S110-07-S1 slotted steel channels, ANSI/ASTM A53/A53M steel pipe, or other rigid steel brace member. Includes accessories for attachment to braced component at one end and to building structure at the other end and other matching components and with corrosion-resistant coating; rated in tension, compression, and torsion forces.

2.3 RESTRAINTS - CABLE TYPE

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. CADDY; nVent.
   2. Gripple Inc.
   3. International Seismic Application Technology (ISAT).
   4. Kinetics Noise Control, Inc.
   5. Mason Industries, Inc.
   6. Vibration Eliminator Co., Inc.
   7. Vibration Mountings & Controls, Inc.
   8. Vibro-Acoustics.

B. Seismic - and Wind-Load-Restraint Cables: ASTM A1023 galvanized or ASTM A603 galvanized-steel cables. End connections made of steel assemblies with thimbles, brackets, swivel, and bolts designed for seismic restraining cable service; with fittings attached by means of poured socket, swaged socket or mechanical (Flemish eye) loop.

C. Restraint cable assembly and cable fittings must comply with ASCE/SEI 19. All cable fittings and complete cable assembly must maintain the minimum cable breaking force. U-shaped cable clips and wedge-type end fittings do not comply and are unacceptable.

2.4 RESTRAINT ACCESSORIES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. CADDY; nVent.
   2. Gripple Inc.
   3. International Seismic Application Technology (ISAT).
   4. Kinetics Noise Control, Inc.
   5. Mason Industries, Inc.
   6. Vibration Eliminator Co., Inc.
   7. Vibration Mounting & Controls, Inc.
   8. Vibro-Acoustics.

B. Hanger-Rod Stiffener: Steel tube or steel slotted-support-system sleeve with internally bolted connections to hanger rod. Non-metallic stiffeners are unacceptable.

C. Hinged and Swivel Brace Attachments: Multifunctional steel connectors for attaching hangers to rigid channel bracings and restraint cables.

D. Bushings for Floor-Mounted Equipment Anchor Bolts: Neoprene bushings designed for rigid equipment mountings, and matched to type and size of anchor bolts and studs.

E. Bushing Assemblies for Wall-Mounted Equipment Anchorage: Assemblies of neoprene elements and steel sleeves designed for rigid equipment mountings, and matched to type and size of attachment devices used.

F. Resilient Isolation Washers and Bushings: One-piece, molded, oil- and water-resistant neoprene, with a flat washer face.

2.5 POST-INSTALLED CONCRETE ANCHORS

A. Mechanical Anchor Bolts:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. DeWALT.
      b. Hilti, Inc.
      c. Simpson Strong-Tie Co., Inc.
   2. Drilled-in and stud-wedge or female-wedge type in zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength for anchor and as tested according to ASTM E488/E488M.

B. Adhesive Anchor Bolts:
   1. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
      a. DeWALT.
      b. Hilti, Inc.
      c. Simpson Strong-Tie Co., Inc.
   2. Drilled-in and capsule anchor system containing PVC or urethane methacrylate-based resin and accelerator, or injected polymer or hybrid mortar adhesive. Provide anchor bolts and hardware with zinc-coated steel for interior applications and stainless steel for exterior applications. Select anchor bolts with strength required for anchor and as tested according to ASTM E488/E488M.

C. Provide post-installed concrete anchors which have been prequalified for use in seismic applications. Post-installed concrete anchors must conform to all requirements of ASCE/SEI 7-10, Ch. 13.
   1. Prequalify post-installed anchors in concrete in accordance with ACI 355.2 or other approved qualification testing procedures.
   2. Prequalify post-installed anchors in masonry in accordance with approved qualification procedures.

D. Expansion-type anchor bolts are not permitted for equipment in excess of 10 hp that is not vibration isolated.
   1. Undercut expansion anchors are permitted.

2.6 CONCRETE INSERTS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. DeWALT.
   2. Gripple Inc.
   3. Hilti, Inc.
   4. International Seismic Application Technology (ISAT).
   5. Simpson Strong-Tie Co., Inc.

B. Provide preset concrete inserts that are seismically prequalified in accordance with ICC-ES AC466 testing.

C. Comply with MSS SP-58.

PART 3 EXECUTION

3.1 EXAMINATION

A. Examine areas and equipment to receive seismic control devices for compliance with requirements for installation tolerances and other conditions affecting performance of the Work.

B. Examine roughing-in for reinforcement and cast-in-place anchors to verify actual locations before installation.

C. Proceed with installation only after unsatisfactory conditions have been corrected.

3.2 APPLICATIONS

A. Multiple Raceways or Cables: Secure raceways and cables to trapeze member with clamps approved for application by an agency acceptable to authorities having jurisdiction.

B. Hanger-Rod Stiffeners: Install hanger-rod stiffeners where indicated or scheduled on Drawings to receive them and where required to prevent buckling of hanger rods caused by seismic forces.

C. Strength of Support and Seismic-Restraint Assemblies: Where not indicated, select sizes of components so strength will be adequate to carry static , wind-load, and seismic loads within specified loading limits.

3.3 ACCOMMODATION OF DIFFERENTIAL SEISMIC MOTION

A. Install flexible connections in runs of raceways, cables, wireways, cable trays, and busways where they cross seismic joints, where adjacent sections or branches are supported by different structural elements, and where connection is terminated to equipment that is anchored to a different structural element from the one supporting them as they approach equipment.

END OF SECTION

SECTION 271100 - COMMUNICATIONS EQUIPMENT ROOM FITTINGS

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Backboards.
   2. Boxes, enclosures, and cabinets.
   3. Power strips.

1.3 DEFINITIONS

A. Access Provider: An operator that provides a circuit path or facility between the service provider and user. An access provider can also be a service provider.

B. BICSI: Building Industry Consulting Service International.

C. RCDD: Registered communications distribution designer.

D. Service Provider: The operator of a telecommunications transmission service delivered through access provider facilities.

E. TGB: Telecommunications grounding bus bar.

F. TMGB: Telecommunications main grounding bus bar.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for equipment racks and cabinets.
   2. Include rated capacities, operating characteristics, electrical characteristics, and furnished specialties and accessories.

B. Shop Drawings: For communications equipment room fittings. Include plans, elevations, sections, details, and attachments to other work.
   1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.

2. Equipment Racks and Cabinets: Include workspace requirements and access for cable connections.
3. Grounding: Indicate location of grounding bus bar and its mounting detail showing standoff insulators and wall mounting brackets.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer, qualified layout technician, installation supervisor, and field inspector.

B. Seismic Qualification Data: Certificates, from manufacturer.
1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions. Base certification on the maximum number of components capable of being mounted in each rack type. Identify components on which certification is based.
3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Cabling installer must have personnel certified by BICSI on staff.
1. Layout Responsibility: Preparation of Shop Drawings shall be under direct supervision of RCDD .
2. Installation Supervision: Installation shall be under direct supervision of Technician , who shall be present at all times when Work of this Section is performed at Project site.
3. Field Inspector: Currently registered by BICSI as RCDD to perform the on-site inspection.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Equipment shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

2.2 BACKBOARDS

A. Backboards: Plywood, fire-retardant treated, 3/4 by 48 by 96 inches, AC grade void-free.

B. Backboard Paint: Light-colored fire-retardant paint . Paint plywood face and all sides with two coats of paint, do not paint over fire rated stamp.

C. Mounting: Anchor with 3/8" toggle bolts or concrete expansion anchors, where applicable, and 2" washers on each corner and 4' on center as required on all walls and above door frame of each communications room/space. Install at 6" AFF to 8' 6" AFF with fire rating stamp facing outwards and visible.

2.3 BOXES, ENCLOSURES, AND CABINETS

A. Comply with requirements in Section 271116 "Communications Racks, Frames, and Enclosures."

2.4 POWER STRIPS

A. Comply with requirements in Section 271116 "Communications Racks, Frames, and Enclosures."

PART 3 EXECUTION

3.1 ENTRANCE FACILITIES

A. Contact telecommunications service provider and arrange for installation of demarcation point, protected entrance terminals, and a housing when so directed by service provider.

B. Comply with requirements in Section 270528 "Pathways for Communications Systems" for materials and installation requirements for underground pathways.

3.2 INSTALLATION

A. Comply with NECA 1.

B. Comply with the latest edition of BICSI's "Telecommunications Distribution Methods Manual" for layout of communications equipment spaces.

C. Comply with the latest edition of BICSI's "Information Technology Systems Installation Methods Manual" for installation of equipment in communications equipment spaces.

D. Bundle, lace, and train conductors and cables to terminal points without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

E. Coordinate layout and installation of communications equipment in tracks and in room. Coordinate service entrance configuration with service provider.
   1. Meet jointly with systems providers, equipment suppliers, and Owner to exchange information and agree on details of equipment configurations and installation interfaces.
   2. Record agreements reached in meetings and distribute them to other participants.
   3. Adjust configurations and locations of distribution frames, cross-connects, and patch panels in equipment rooms to accommodate and optimize configurations and space requirements of communications equipment.

4. Adjust configurations and locations of equipment with distribution frames, cross-connects, and patch panels of cabling systems of other communications, electronic safety and security, and related systems that share space in equipment room.

F. Coordinate location of power raceways and receptacles with locations of communications equipment requiring electrical power to operate.

G. Backboards:
1. Install from 6 inches to 8 feet, 6 inches above finished floor. If plywood is fire rated, ensure that fire-rating stamp is visible after installation.
2. Paint all sides of backboard with two coats of paint , leaving fire rating stamp visible.
a. If the stamp is painted-over, the contractor shall be required to replace and properly repaint the plywood.
3. Comply with requirements for backboard installation in BICSI's "Information Technology Systems Installation Methods Manual" and TIA-569-D.

3.3 SLEEVE AND SLEEVE SEAL INSTALLATION FOR ELECTRICAL PENETRATIONS

A. Install sleeves and sleeve seals at penetrations of exterior floor and wall assemblies. Comply with requirements in Section 270544 "Sleeves and Sleeve Seals for Communications Pathways and Cabling."

3.4 FIRESTOPPING

A. Comply with requirements in Section 078413 "Penetration Firestopping."

B. Comply with TIA-569-D, Annex A, "Firestopping."

C. Comply with BICSI's "Information Technology Systems Installation Methods Manual," "Firestopping Practices" Ch.

3.5 CLEANING

A. Remove dust, dirt, rust, stains, and temporary covers.

B. Foreign matter shall be blown, vacuumed, or cleaned out of and from new equipment, devices, switches, controls, and panels.

C. Clean and polish identification plates.

D. In equipment rooms, clean equipment, conduit and room surfaces from dust and dirt and maintain in a clean condition from date of substantial completion until final completion of work and corrective work.

E. Remove all excess material from the Project site.

END OF SECTION

SECTION 271116 - COMMUNICATIONS CABINETS, RACKS, FRAMES, AND ENCLOSURES

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
1. 19-inch equipment racks.
2. 19-inch freestanding equipment cabinets.
3. Power strips.
4. Grounding.
5. Labeling.

B. Related Requirements:
1. Section 271110 "Communications Equipment Room Fittings" for backboards and accessories.
2. Section 270526 "Grounding and Bonding for Telecommunications Equipment" for TMGBs and TGBs.
3. Section 270536 "Cable Trays for Communications Systems" for cable trays and cable tray accessories.
4. Section 271323 "Communications Optical Fiber Backbone Cabling" for optical-fiber data cabling associated with system panels and devices.
5. Section 271513 "Communications Copper Horizontal Cabling" for copper data cabling associated with system panels and devices.

1.3 DEFINITIONS

A. Access Provider: An operator that provides a circuit path or facility between the service provider and user. An access provider can also be a service provider.

B. BICSI: Building Industry Consulting Service International.

C. LAN: Local area network.

D. RCDD: Registered communications distribution designer.

E. Service Provider: The operator of a telecommunications transmission service delivered through access provider facilities.

F. TGB: Telecommunications grounding bus bar.

G. TMGB: Telecommunications main grounding bus bar.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.
   1. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes for equipment racks and cabinets.
   2. Include rated capacities, operating characteristics, electrical characteristics, certifications, standards compliance, and furnished specialties and accessories.

B. Shop Drawings: For communications racks, frames, and enclosures. Include plans, elevations, sections, details, and attachments to other work.
   1. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
   2. Equipment Racks and Cabinets: Include workspace requirements and access for cable connections.
   3. Grounding: Indicate location of TGB and its mounting detail showing standoff insulators and wall-mounting brackets.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For Installer, qualified layout technician, installation supervisor, and field inspector.

B. Seismic Qualification Data: Certificates, from manufacturer.
   1. Basis for Certification: Indicate whether withstand certification is based on actual test of assembled components or on calculation.
   2. Dimensioned Outline Drawings of Equipment Unit: Identify center of gravity and locate and describe mounting and anchorage provisions. Base certification on the maximum number of components capable of being mounted in each rack type. Identify components on which certification is based.
   3. Detailed description of equipment anchorage devices on which the certification is based and their installation requirements.

1.6 QUALITY ASSURANCE

A. Installer Qualifications: Cabling installer must have personnel certified by BICSI on staff.
   1. Layout Responsibility: Preparation of Shop Drawings shall be under direct supervision of RCDD.
   2. Installation Supervision: Installation shall be under direct supervision of Technician , who shall be present at all times when Work of this Section is performed at Project site.
   3. Field Inspector: Currently registered by BICSI as RCDD to perform on-site inspection.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. Seismic Performance: Equipment shall withstand the effects of earthquake motions determined according to ASCE/SEI 7.
   1. The term "withstand" means "the unit will remain in place without separation of any parts when subjected to the seismic forces specified and the unit will be fully operational after the seismic event."

B. UL listed.

C. RoHS compliant.

D. Compliant with requirements of the Payment Card Industry Data Security Standard.

2.2 BACKBOARDS

A. Backboards: Plywood, void-free, AC grade or better,fire-retardant treated, 3/4"D x 48"W x 96"H inches. Comply with requirements for plywood backing panels specified in Section 061000 "Rough Carpentry."

B. Comply with requirements in Section 271100 "Communications Equipment Room Fittings."

2.3 19-INCH EQUIPMENT RACKS

A. Description: Two- and four- post racks with threaded rails designed for mounting telecommunications equipment. Width is compatible with EIA/ECIA 310-E, 19-inch equipment mounting with an opening of 17.72-inches between rails.

B. Manufacturers: Subject to compliance with requirements, undefined:
   1. CPI Chatsworth Products.
   2. Great Lakes Case and Cabinet.
   3. Leviton Manufacturing Co., Inc.
   4. Middle Atlantic Products; Legrand North America, LLC.
   5. nVent (Hoffman).
   6. Ortronics, Inc.
   7. Panduit Corp.
   8. Siemon Co. (The).

C. General Requirements:
   1. Frames: Modular units designed for telecommunications terminal support and coordinated with dimensions of units to be supported.
   2. Material: Extruded steel.
   3. Finish: Manufacturer's standard, baked-polyester powder coat.
   4. Color: Black .

D. Floor-Mounted Racks:
   1. Overall Height: As indicated on Drawings .

2. Upright Depth: 3 inches.
3. Two-Post Load Rating: 400 lb.
4. Four-Post Load Rating: 2000 lb.
5. Number of Rack Units per Rack: 51.
   a. Numbering: Every rack units, on interior of rack.
6. Threads: 12-24.
7. Vertical and horizontal cable management channels, top and bottom cable troughs, grounding lug, and a power strip.
8. Base shall have a minimum of four mounting holes for permanent attachment to floor.
9. Top shall have provisions for attaching to cable tray or ceiling.
10. Self-leveling.

E. Cable Management:
1. Metal, with integral wire retaining fingers.
2. Baked-polyester powder coat finish.
3. Vertical cable management panels shall have front and rear channels, with covers.
4. Provide horizontal crossover cable manager at the top of each relay rack, with a minimum height of two rack units each.

2.4 UNINTERUPPTIBLE POWER SUPPLY (UPS)

A. System shall be a self contained unit designed for the support of IT equipment.

B. Provide one UPS for each active rack indicated on drawings.

C. Batteries: lead-acid type.

D. Integral lightning and surge protection complying with IEEE C62.41.1-2002 (R2008), IEEE C62.41.2-2002 (COR 1-2012), and UL 1449-2014.

E. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Schneider Electric (APC)
2. Vertiv
3. Eaton

F. RackUPS
1. Architecture: Line-Intera
2. Load: 5kVA.
3. Input Voltage: 208v.
4. Input Plug: NEMA L6-30P
5. Output Voltage: 120V & 208V
6. Output Receptacles: 2 NEMA L6-20R
7. Output Receptacles: NEMA 5-20R
8. Output Receptacles: 1 NEMA L6-30R
9. Runtime at Full Load: 9 minutes.
10. Form Factor: Rack-Mount.

11. Network Management Card
12. Environmental Monitoring Card
13. Rack-Mount Step Down Transformer.

2.5 POWER STRIPS

A. Power Strips: Comply with UL 1363.
   1. Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
   2. Rack mounting.
   3. LED indicator lights for power and protection status.
   4. LED indicator lights for reverse polarity and open outlet ground.
   5. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
      a. Chatsworth Products, Inc. (CPI)
      b. Eaton.
      c. Schneider Electric (APC)
   6. Vertical Surge-Protected Power Strips
      a. Input Plug: NEMA 5-20P
      b. Input Cord Length: 10
      c. Output: 10 NEMA 5-15R
      d. Metered: LED Display indicating Voltage and Amps.
      e. Provide two vertical power strips for each active rack as indicated on drawings.
      f. Provide all mounting hardware and standoff brackets as required.

2.6 GROUNDING

A. Comply with requirements in Section 270526 "Grounding and Bonding for Communications Systems" for grounding conductors and connectors.

B. Rack and Cabinet TGBs: Rectangular bars of hard-drawn solid copper, accepting conductors ranging from No. 14 to No. 2/0 AWG, NRTL listed as complying with UL 467, and complying with TIA-606-D. Predrilling shall be with holes for use with lugs specified in this Section.
   1. Rack-Mounted Horizontal TGB: Designed for mounting in 19- or 23-inch equipment racks. Include a copper splice bar for transitioning to an adjoining rack, and stainless-steel or copper-plated hardware for attachment to the rack.

2.7 LABELING

A. Comply with TIA-606-D and UL 969 for a system of labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

B. Comply with requirements in Section 270533 "Identification for Communications Systems."

PART 3 EXECUTION

3.1 INSTALLATION

A. Comply with NECA 1.

B. Comply with BICSI TDMM for layout of communications equipment spaces.

C. Comply with BICSI ITSIMM for installation of communications equipment spaces.

D. Bundle, lace, and train conductors and cables to terminal points without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.

E. Coordinate layout and installation of communications equipment in racks and room. Coordinate service entrance configuration with service provider.
   1. Meet jointly with system providers, equipment suppliers, and Owner to exchange information and agree on details of equipment configurations and installation interfaces.
   2. Record agreements reached in meetings and distribute them to other participants.
   3. Adjust configurations and locations of distribution frames, cross-connects, and patch panels in equipment spaces to accommodate and optimize configuration and space requirements of telecommunications equipment.
   4. Adjust configurations and locations of equipment with distribution frames, cross-connects, and patch panels of cabling systems of other communications, electronic safety and security, and related systems that share space in equipment room.

F. Coordinate location of power raceways and receptacles with locations of communications equipment requiring electrical power to operate.

G. Furnish and install a horizontal cable manager below each patch panel in the Rack. Refer to Project Drawings for size of Wire Managers. Horizontal cable managers are not required below angled patch panels.

H. Outdoor enclosures to be provided with ventilation according to equipment manufacturer's recommendations.

3.2 GROUNDING

A. Comply with NECA/BICSI 607.

B. Install grounding according to BICSI ITSIMM, "Bonding, Grounding (Earthing) and Electrical Protection" Ch.

C. Locate TGB to minimize length of bonding conductors. Fasten to wall, allowing at least 2 inches of clearance behind TGB. Connect TGB with a minimum No. 4 AWG grounding electrode conductor from TGB to suitable electrical building ground. Connect rack TGB to near TGB or the TMGB.
   1. Bond the shield of shielded cable to patch panel, and bond patch panel to TGB or TMGB.

3.3 IDENTIFICATION

A. Coordinate system components, wiring, and cabling complying with TIA-606-D. Comply with requirements in Section 260553 "Identification for Electrical Systems."

B. Comply with requirements in Section 099123 "Interior Painting" for painting backboards. For fire-resistant plywood, do not paint over manufacturer's label.

C. Comply with requirements in Section 270553 "Identification for Communications Systems."

END OF SECTION

SECTION 271323 - COMMUNICATIONS OPTICAL FIBER BACKBONE CABLING

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. 9/125 micrometer single-mode, indoor-outdoor optical fiber cable (OS2).
   2. Optical fiber cable connecting hardware, patch panels, and cross-connects.
   3. Cabling identification products.

1.3 DEFINITIONS

A. BICSI: Building Industry Consulting Service International.

B. Cross-Connect: A facility enabling the termination of cable elements and their interconnection or cross-connection.

C. RCDD: Registered Communications Distribution Designer.

1.4 OPTICAL FIBER BACKBONE CABLING DESCRIPTION

A. Optical fiber backbone cabling system shall provide interconnections between communications equipment rooms, main terminal space, and entrance facilities in the telecommunications cabling system structure. Cabling system consists of backbone cables, intermediate and main cross-connects, mechanical terminations, and patch cords or jumpers used for backbone-to-backbone cross-connection.

B. Backbone cabling cross-connects may be located in communications equipment rooms or at entrance facilities. Bridged taps and splitters shall not be used as part of backbone cabling.

1.5 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: Reviewed and stamped by RCDD.
   1. System Labeling Schedules: Electronic copy of labeling schedules, in software and format selected by Owner.

2. System Labeling Schedules: Electronic copy of labeling schedules that are part of the cabling and asset identification system of the software.
3. Cabling administration drawings and printouts.
4. Wiring diagrams to show typical wiring schematics including the following:
   a. Telecommunications rooms plans and elevations.
   b. Telecommunications pathways.
   c. Telecommunications system access points.
   d. Telecommunications grounding system.
   e. Cross-connects.
   f. Patch panels.
   g. Patch cords.
5. Cross-connects and patch panels. Detail mounting assemblies, and show elevations and physical relationship between the installed components.

C. Optical fiber cable testing plan.

1.6 INFORMATIONAL SUBMITTALS

A. Qualification Data: For RCDD, Installer, installation supervisor, and field inspector.

B. Source quality-control reports.

C. Product Certificates: For each type of product.

D. Field quality-control reports.

1.7 CLOSEOUT SUBMITTALS

A. Maintenance Data: For optical fiber cable, splices, and connectors to include in maintenance manuals.

B. Contractor to submit all cable test results and any test documentation required prior to acceptance by the Owner.

C. Subsequent to the installation, and prior to acceptance of the work, the contractor shall prepare and issue record (as-built) drawings, in Adobe PDF and BIM format, that reflect the lengths of cables installed, the actual manner and conditions of installation, including all deletions from, additions to or departures from the contract documents. These documents are to include the information outlet station numbers and cable routing where it varies from the original plan.

D. Provide cable termination schedules for all cables installed under the Work. Schedules shall be in printed form and on CD in Microsoft Excel format.

E. Provide Operation and Maintenance Manuals including wiring diagrams, parts list, shop drawings and manufacturers' information on all equipment and cables provided under this Work. Provide manuals within fifteen days of systems acceptance.

F. Upon completion of the work, the contractor shall coordinate with the manufacturer the issuance of a full warranty on the entire copper and fiber optic cable plant including the horizontal cabling for both parts and labor. The cabling contractor at his sole expense will correct any deficiencies determined by the manufacturer.

1.8 QUALITY ASSURANCE

A. Installer Qualifications: Cabling Installer must have personnel certified by BICSI on staff.
   1. Layout Responsibility: Preparation of Shop Drawings , Cabling Administration Drawings, and field testing program development by an RCDD.
   2. Installation Supervision: Installation shall be under the direct supervision of Technician , who shall be present at all times when Work of this Section is performed at Project site.
   3. Testing Supervisor: Currently certified by BICSI as an RCDD to supervise on-site testing.

1.9 DELIVERY, STORAGE, AND HANDLING

A. Test cables upon receipt at Project site.
   1. Test optical fiber cable to determine the continuity of the strand end to end. Use optical loss test set .
   2. Test optical fiber cable while on reels. Use an optical time domain reflectometer to verify the cable length and locate cable defects, splices, and connector, including the loss value of each. Retain test data and include the record in maintenance data.

1.10 PROJECT CONDITIONS

A. Environmental Limitations: Do not deliver or install cables and connecting materials until wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

1.11 COORDINATION

A. Coordinate layout and installation of telecommunications pathways and cabling with Owner's telecommunications and LAN equipment and service suppliers.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. General Performance: Backbone cabling system shall comply with transmission standards in TIA-568-C.1, when tested according to test procedures of this standard.

B. Surface-Burning Characteristics: As determined by testing identical products according to ASTM E 84 by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.

1. Flame-Spread Index: 25 or less.
2. Smoke-Developed Index: 50 or less.

C. Telecommunications Pathways and Spaces: Comply with TIA-569-D.

D. Grounding: Comply with TIA-607-E.

2.2 9/125 MICROMETER, SINGLE-MODE, INDOOR-OUTDOOR OPTICAL FIBER CABLE (OS2)

A. Description: Single mode, 9/125-micrometer, stranded loose tube, optical fiber cable. Number of strands as indicated on project drawings.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
1. Berk-Tek Leviton.
2. CommScope, Inc.
3. Corning Cable Systems.
4. General Cable; General Cable Corporation.
5. Optical Cable Corporation.
6. Superior Essex.

C. Standards:
1. Comply with TIA-492CAAB for detailed specifications.
2. Comply with TIA-568-C.3 for performance specifications.
3. Comply with ICEA S-104-696 for mechanical properties.

D. Maximum Attenuation: 0.4 dB/km at 1310 nm; 0.3 dB/km at 1550 nm.

E. Jacket:
1. Jacket Color: Black.
2. Type: Dielectric Armored.
3. Armor Material: Aluminum.
4. Cable cordage jacket, fiber, unit, and group color shall be according to TIA-598-D.
5. Imprinted with fiber count, fiber type, and aggregate length at regular intervals not to exceed 40 inches.

F. Listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with UL 444, UL 1651, and NFPA 70 for the following types:
1. Plenum Rated, Armored (Conductive): Type OFCP installed per NFPA 70, Article 300.22, "Wiring in Ducts, Plenums, and Other Air-Handling Spaces."

2.3 9/125 MICROMETER, SINGLE-MODE, ARMORED, INSIDE PLANT OPTICAL FIBER CABLE (OS2)

A. Description: Single mode, 9/125-micrometer, tight buffered, optical fiber cable. Number of strands as indicated on project drawings.

B. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Berk-Tek Leviton.
   2. CommScope, Inc.
   3. Corning Cable Systems.
   4. General Cable; General Cable Corporation.
   5. Optical Cable Corporation.
   6. Superior Essex.

C. Standards:
   1. Comply with TIA-492CAAA for detailed specifications.
   2. Comply with TIA-568-C.3 for performance specifications.
   3. Comply with ICEA S-83-596 for mechanical properties.

D. Conductive cable shall be aluminum armored type.

E. Maximum Attenuation: 0.4 dB/km at 1310 nm; 0.3 dB/km at 1550 nm.

F. Jacket:
   1. Jacket Color: Yellow.
   2. Cable cordage jacket, fiber, unit, and group color shall be according to TIA-598-D.
   3. Imprinted with fiber count, fiber type, and aggregate length at regular intervals not to exceed 40 inches.

G. Listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with UL 444, UL 1651, and NFPA 70 for the following types:
   1. Plenum Rated, Conductive: Type OFCP, complying with NFPA 262.

2.4 OPTICAL FIBER CABLE HARDWARE

A. Manufacturers: Subject to compliance with requirements, available manufacturers offering products that may be incorporated into the Work include, but are not limited to, the following:
   1. Berk-Tek, a Leviton Company.
   2. CommScope, Inc.
   3. Corning Optical Communications; Corning Incorporated.
   4. Optical Cable Corporation (OCC).
   5. Panduit Corporation.

B. Standards:
   1. Comply with Fiber Optic Connector Intermateability Standard (FOCIS) specifications of the TIA-604 series.
   2. Comply with TIA-568-C.3.

C. Fiber Optic Enclosure
   1. Shall provide cross connect, interconnect, and splicing capabilities and contain troughs for supporting and routing of the fiber cables and jumpers.
   2. Shall consist of a modular enclosure with retainer rings in the slack storage section to limit the bending radius of fibers.
   3. Shall have a window section to insert connector panels for mounting of connectorized fibers.

4. Shall provide capacity to accommodate quantity of terminations as indicated on the project drawings, plus 25% spare capacity for future growth.
5. Refer to Project Drawings for Wall-Mount and Rack-Mount requirements.

D. Fiber Connector Panels
1. Modular, quick-fastening steel plate, powder-coated to match the fiber enclosure finish.
2. Shall have a pre-installed array of fiber adapters of a specific connector type, available in low- or high-density versions.
3. Pre-installed, push-pull type quick-release fasteners for quick snap-in installation.
4. Suitable for mounting either vertically or horizontally.
5. Panels with SC or LC adapters shall have precision phosphor-bronze alignment sleeves that are suitable for either singlemode or multimode transmission. SC/APC adapters shall have precision ceramic alignment sleeves.
6. All fiber panels shall have dust caps installed.

E. Fiber Optic Connectors
1. Field Polish Connectors
   a. LC small form factor (SFF) field polish connectors with rear pivot latch are TIA-604 FOCIS-10 compatible. LC simplex and duplex connectors are field terminable. The fibers shall terminate in 1.25mm ceramic ferrules with non-optical disconnect functionality and an average insertion loss of 0.1dB per mated pair for multimode and singlemode fiber.
   b. SC field polish connectors are TIA-604 FOCIS-3 compliant. SC simplex and duplex connectors are field terminable. The fibers shall terminate in 2.5mm ceramic ferrules with non-optical disconnect functionality and an average insertion loss of .1dB (multimode) and .15dB (singlemode) per mated pair.
2. Connector Pigtails
   a. Optical fiber pigtails shall be constructed with a fiber connector, factory terminated onto a cut length of 900 micron buffered fiber cable of specific color.
   b. Connector pigtail terminations shall be heat-cured epoxy type with a machine polish, inspected 100% for polish quality and mated-pair insertion loss.
   c. Epoxy volume within each connector shall be sufficient to properly surround and strain relieve the buffer layer at the buffer/fiber transition inside the connector body.
   d. Pigtails shall be available in standard lengths of 3 meters.
   e. Connector shall be LC-Style complying with TIA-604-10-B.
   f. Factory terminated connectors shall comply with the applicable ANSI/TIA-604 Intermateability standard.

F. Splices and Closures
1. The fiber splice module shall be utilized for all outside plant terminations. The link shall consist of the fiber cable, the splice, the splice tray holder/closure, the fiber panel/coupler, a pre-manufactured fiber pigtail with pre-polished fiber connector, and a fiber jumper to connect the pigtail-coupled link to the appropriate electronic switch. The fiber splice module shall meet the following specifications:
   a. Fusion: Optical fiber splices shall not exceed a maximum optical attenuation of 0.3 dB when measured in accordance with ANSI/TIA-455-34, Method A (factory testing) or

ANSI/TIA-455-59 (field testing). Optical fiber splices shall have a minimum return loss of 20 dB for multimode, 26 dB for single mode, when measured in accordance with ANSI/TIA-455-107. The minimum single mode return loss for broadband analog video (CATV) applications is 55 dB.

b. All fusion splices shall be mounted in protective trays within the closure.
c. Joins single mode or multi-mode fibers.
d. Establishes a permanent fusion splice.
e. May be used in OSP and/or premises applications.
f. Accept 250 and 900 micron fibers.
g. Re-enterable, portable and reusable.
h. Require no polishing.
i. Require no adhesives.
j. No loose parts.
k. Unlimited shelf life.

G. Patch Panels: Modular panels housing multiple-numbered, duplex cable connectors.
1. Number of Connectors per Adapter Panel: Twelve for each fiber of cable or cables assigned to field, plus spares and blank positions adequate to suit specified expansion criteria.

H. Patch Cords: Factory-made, duplex cables in lengths as requested by Owner or indicated on project drawings unless specified otherwise.
1. Patch cord manufacturer shall match the selected fiber system solution and maintain the selected manufacturer's warranty.
2. Patch Cord Lengths: As indicated on the project drawings.
3. Quantities: Provide one fiber patch cord for 50% of strands installed.
4. The fiber optic patch cords shall be consistent with termination type and fiber optic cable type. (i.e. singlemode or multimode).
5. Field terminated patch cords are not acceptable.

2.5 GROUNDING

A. Comply with requirements in Section 270526 "Grounding and Bonding for Communications Systems" for grounding conductors and connectors.

B. Comply with TIA-607-E.

2.6 IDENTIFICATION PRODUCTS

A. Comply with TIA-606-D and UL 969 for a system of labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

B. Comply with requirements in Section 270553 "Identification for Communication Systems."

2.7 SOURCE QUALITY CONTROL

A. Factory test multimode optical fiber cables according to TIA-526-14-B and TIA-568-C.3.

B. Factory test pre-terminated optical fiber cable assemblies according to TIA-526-14-B and TIA-568-C.3.

C. Cable will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports.

PART 3 EXECUTION

3.1 ENTRANCE FACILITIES

A. Coordinate backbone cabling with the protectors and demarcation point provided by communications service provider.

3.2 WIRING METHODS

A. Wiring within Enclosures: Bundle, lace, and train cables within enclosures. Connect to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Provide and use lacing bars and distribution spools.

3.3 INSTALLATION OF OPTICAL FIBER BACKBONE CABLES

A. Comply with NECA 1, NECA 301, and NECA/BICSI 568.

B. General Requirements for Optical Fiber Cabling Installation:
   1. Comply with TIA-568-C.1 and TIA-568-C.3.
   2. Comply with BICSI ITSIMM, Ch. 6, "Cable Termination Practices."
   3. Terminate all cables; no cable shall contain unterminated elements. Make terminations only at indicated outlets, terminals, cross-connects, and patch panels.
   4. Ensure that the maximum pulling tensions of the specified distribution cables are not exceeded and cable bends maintain the proper radius during the placement of the facilities.
   5. Install plenum rated cables where cables are not installed in conduits or enclosed wireways.
   6. Install cables designed for the installation environment.
      a. For each cable distribution application, install fiber optic cables UL listed for the application.
      b. For cable distribution applications including enclosures or raceways underground or in slabs on grade, install fiber optic cables designed for use in wet locations.
   7. Cables may not be spliced. Secure and support cables at intervals not exceeding 30 inches and not more than 6 inches from cabinets, boxes, fittings, outlets, racks, frames, and terminals.
   8. Install lacing bars to restrain cables, to prevent straining connections, and to prevent bending cables to smaller radii than minimums recommended by manufacturer.
   9. Bundle, lace, and train cable to terminal points without exceeding manufacturer's limitations on bending radii, but not less than radii specified in BICSI ITSIMM, "Cabling Termination Practices" Chapter. Use lacing bars and distribution spools.

10. Do not install bruised, kinked, scored, deformed, or abraded cable. Do not splice cable between termination, tap, or junction points. Remove and discard cable if damaged during installation and replace it with new cable.
11. Cold-Weather Installation: Bring cable to room temperature before dereeling. Heat lamps shall not be used for heating.
12. In the communications equipment room, provide a 10-foot- long service loop on each end of cable.
13. Pulling Cable: Comply with BICSI ITSIMM, Ch. 4, "Pulling Cable." Monitor cable pull tensions.
14. Cable may be terminated on connecting hardware that is rack or cabinet mounted.
15. Place fiber-optic cable so as to maintain the minimum cable bend radius limits specified by the selected manufacturer.
16. Place fiber-optic cables transitioning between the cable trays and cabinets or racks in a neat and orderly manner per NEC 318.11(b) requirements and pathway requirements of TIA 569-A. Velcro transitioning bundles.
17. Secure the cables in the Communication Rooms with velcro cable ties or straps as needed to prevent cables from sagging or becoming disorderly.
18. Follow selected manufacturer’s installation instructions for connector installation.
19. Bring fiber optic cables into patch panels or cabinets at one location. Secure cables inside patch panels or cabinets at entrance points by securing fiber jackets. Break out individual fiber cables inside of panel or cabinet.
20. Fusion splices shall be located in attached splice trays.
21. Follow guidance of ANSI/TIA-568-C.3 regarding polarity management of fiber elements in the permanent link. Mate terminated fiber-optic cables on adapter panel housings, in standard color code order.
22. Use connector manufacturer’s recommended tools.
23. Fiber-optic connecting hardware and material including patch panels, connectors, cross-connect cables, patch cords, and other components used to connect fiber-optic cable shall be sourced from the same manufacturer.
24. Unarmored Fiber cables shall be installed in innerducts rated for the installation environment.

C. Open-Cable Installation:
1. Install cabling with horizontal and vertical cable guides in telecommunications spaces with terminating hardware and interconnection equipment.
2. Cable shall not be run through structural members or in contact with pipes, ducts, or other potentially damaging items.

D. Group connecting hardware for cables into separate logical fields.

3.4 FIRESTOPPING

A. Comply with requirements in Section 078413 "Penetration Firestopping."

B. Comply with TIA-569-D, Annex A, "Firestopping."

C. Comply with BICSI ITSIMM, "Firestopping" Chapter.

3.5 GROUNDING

A. Install grounding according to BICSI ITSIMM, "Grounding (Earthing), Bonding, and Electrical Protection" Chapter.

B. Comply with TIA-607-E and NECA/BICSI-607.

C. Locate grounding bus bar to minimize the length of bonding conductors. Fasten to wall allowing at least 2-inch clearance behind the grounding bus bar. Connect grounding bus bar with a minimum No. 4 AWG grounding electrode conductor from grounding bus bar to suitable electrical building ground.

D. Bond metallic equipment to the grounding bus bar, using not smaller than No. 6 AWG equipment grounding conductor.

3.6 IDENTIFICATION

A. Identify system components, wiring, and cabling complying with TIA-606-D. Comply with requirements for identification specified in Section 270553 "Identification for Communications Systems."
   1. Administration Class: Class 3.
   2. Color-code cross-connect fields and apply colors to voice and data service backboards, connections, covers, and labels.

B. Paint and label colors for equipment identification shall comply with TIA-606-D.

C. Comply with requirements in Section 271523 "Communications Optical Fiber Horizontal Cabling" for cable and asset management software.

D. Cable Schedule: Install in a prominent location in each equipment room and wiring closet. List incoming and outgoing cables and their designations, origins, and destinations. Protect with rigid frame and clear plastic cover. Furnish an electronic copy of final comprehensive schedules for Project.

E. Cabling Administration Drawings: Show building floor plans with cabling administration-point labeling. Identify labeling convention and show labels for telecommunications closets, backbone pathways and cables, entrance pathways and cables, terminal hardware and positions, horizontal cables, work areas and workstation terminal positions, grounding buses and pathways, and equipment grounding conductors.

F. Cable and Wire Identification:
   1. Label each cable within 4 inches of each termination and tap, where it is accessible in a cabinet or junction or outlet box, and elsewhere as indicated.
   2. Each wire connected to building-mounted devices is not required to be numbered at device if color of wire is consistent with associated wire connected and numbered within panel or cabinet.
   3. Exposed Cables and Cables in Cable Trays and Wire Troughs: Label each cable at intervals not exceeding 15 feet.
   4. Label each unit and field within distribution racks and frames.
   5. Identification within Connector Fields in Equipment Rooms and Wiring Closets: Label each connector and each discrete unit of cable-terminating and connecting hardware. Where similar

jacks and plugs are used for both voice and data communication cabling, use a different color for jacks and plugs of each service.

G. Labels shall be preprinted or computer-printed type with printing area and font color that contrasts with cable jacket color but still complies with requirements in TIA 606-D, for the following:
   1. Flexible vinyl or polyester that flexes as cables are bent.

3.7 FIELD QUALITY CONTROL

A. Perform tests and inspections.

B. Tests and Inspections:
   1. Visually inspect optical fiber jacket materials for NRTL certification markings. Inspect cabling terminations in communications equipment rooms for compliance with color-coding for pin assignments, and inspect cabling connections for compliance with TIA-568-C.1.
   2. Visually inspect cable placement, cable termination, grounding and bonding, equipment and patch cords, and labeling of all components.
   3. Optical Fiber Cable Tests:
      a. Test instruments shall meet or exceed applicable requirements in TIA-568-C.1. Use only test cords and adapters that are qualified by test equipment manufacturer for channel or link test configuration.
      b. Test equipment shall be of the quality and accuracy required to test and/or measure system performance with the tolerances specified and shall have been calibrated by the manufacturer within the last 12 months, or as specified herein. Equipment shall be calibrated according to the manufacturer's recommended intervals and when dropped or damaged. Calibration tags shall be affixed or certificates available on request.
      c. Test equipment and modules shall be within the calibration period recommended by the manufacturer of the test equipment in order to achieve the manufacturer-specified measurement accuracy, and shall be within 1 year of the test date.
      d. Link End-to-End Attenuation Tests:
         1) Horizontal and multimode backbone link measurements: Test at 850 or 1300 nm in one direction according to TIA-526-14-B, Method B, One Reference Jumper.
         2) Single-mode backbone links shall be tested bidirectionally at both 1310 nm and 1550 nm in accordance with TIA 526-7A-2015, Method A.1, One Reference Jumper. Single-mode links shall be certified with test tools using laser light sources at 1310 nm and 1550 nm.
         3) Attenuation test results for backbone links shall be less than 2.0 dB. Attenuation test results shall be less than those calculated according to equation in TIA-568-C.1.
      e. Cable test results with negative loss values shall be deemed invalid. Fiber terminations shall be cleaned, evaluated, and retested until the results contain no negative loss values at no additional cost to the Owner. Verify that the cable test results are valid.
   4. Optical Time Domain Reflectometer (OTDR) Tests:
      a. Perform OTDR testing on outside-plant fiber.

b. OTDR testing shall meet the following requirements for both single-mode and multimode fiber cabling:
   1) Reflective events (connections) shall not exceed 0.5 dB.
   2) Non-reflective events (splices) shall not exceed 0.15 dB.
   3) Fiber links shall be tested at the appropriate operating wavelengths for anomalies and to ensure uniformity of cable attenuation and connector insertion loss.
   4) Each fiber link and channel shall be tested in both directions.
      a) Multimode: 850 nm and 1300 nm.
      b) Single-mode: 1310 nm and 1550 nm.
   5) A launch cable shall be installed between the OTDR and the first link in the channel.
   6) A receive cable shall be installed between the last link connection.
   7) The length if each fiber shall be recorded.

C. Data for each measurement shall be documented.
   1. The test results/measurements shall be submitted in both the test equipment manufacturer's raw data file and searchable PDF format files.
   2. The database for the complete project shall be stored and delivered in digital format prior to Owner acceptance of the building. This digital format shall include the software tools required to view, inspect, and print any selection of the test reports.

D. Remove and replace cabling where test results indicate that it does not comply with specified requirements.

E. End-to-end cabling will be considered defective if it does not pass tests and inspections.

F. A representative of the Owner may elect to test 5% of the installed cables. The test results will be compared with the submitted results. In the event that more than 2% of the compared results differ from the submitted results, the Owner may contract with a third-party testing firm to retest 100% of the installation and the cost shall be borne by the Contractor.

G. Prepare test and inspection reports.

END OF SECTION

SECTION 271513 - COMMUNICATIONS COPPER HORIZONTAL CABLING

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Category 6 twisted pair cable.
   2. Category 6a twisted pair cable.
   3. Twisted pair cable hardware, including plugs and jacks.
   4. Cabling identification products.
   5. Grounding provisions for twisted pair cable.
   6. Source quality control requirements for twisted pair cable.

1.2 DEFINITIONS

A. Cross-Connect: A facility enabling the termination of cable elements and their interconnection or cross-connection.

B. EMI: Electromagnetic interference.

C. FTP: Shielded twisted pair.

D. F/FTP: Overall foil screened cable with foil screened twisted pair.

E. F/UTP: Overall foil screened cable with unscreened twisted pair.

F. IDC: Insulation displacement connector.

G. LAN: Local area network.

H. Jack: Also commonly called an "outlet," it is the fixed, female connector.

I. Plug: Also commonly called a "connector," it is the removable, male telecommunications connector.

J. RCDD: Registered Communications Distribution Designer.

K. Screen: A metallic layer, either a foil or braid, placed around a pair or group of conductors.

L. Shield: A metallic layer, either a foil or braid, placed around a pair or group of conductors.

M. S/FTP: Overall braid screened cable with foil screened twisted pair.

N. S/UTP: Overall braid screened cable with unscreened twisted pairs.

O. UTP: Unscreened (unshielded) twisted pair.

1.3 COPPER HORIZONTAL CABLING DESCRIPTION

A. Horizontal cable cabling system shall provide interconnections between Distributor A, Distributor B, or Distributor C, and the equipment outlet, otherwise known as "Cabling Subsystem 1," in the telecommunications cabling system structure. Cabling system consists of horizontal cables, intermediate and main cross-connects, mechanical terminations, and patch cords or jumpers used for horizontal-to-horizontal cross-connection.
   1. TIA-568-C.1 requires that a minimum of two equipment outlets be installed for each work area.
   2. Horizontal cabling shall contain no more than one transition point or consolidation point between the horizontal cross-connect and the telecommunications equipment outlet.
   3. Bridged taps and splices shall not be installed in the horizontal cabling.

B. A work area is approximately 100 sq. ft., and includes the components that extend from the equipment outlets to the station equipment.

C. The maximum allowable horizontal cable length is 295 feet. This maximum allowable length does not include an allowance for the length of 16 feet to the workstation equipment or in the horizontal cross-connect.

1.4 ACTION SUBMITTALS

A. General Requirements for submittals:
   1. Within 14 days after notice to proceed, submit an anticipated Project Schedule, and a schedule indicating the proposed submission date of each submittal specified herein. Schedule shall anticipate the submittal review time, the possible need for resubmittals, and the time required for fabrication, shipping and integration into the construction sequence. Architect and/or Engineer will advise of any conflicts in reviewing submittals that the proposed schedule presents.
   2. Submittals shall be prepared in a line-by-line format corresponding to these Specifications and shall indicate compliance with each requirement specified herein and indicated in the Drawings.
   3. Submittals shall be prepared with a table of contents and hyperlinks to the headers of each submitted item.
   4. Resubmittals that are required to address review comments shall include a cover transmittal with a written explanation of how each review comment has been addressed.
   5. Submittal data for each Specification Section shall be submitted as a single package.
   6. Submittals not specifically required, or not complying with the format requirements, will be returned unreviewed.
   7. All submittals shall be submitted electronically in PDF format unless stated otherwise.
   8. Submittals are required before installation begins. Equipment shall not be ordered, and pay requests will not be approved prior to receipt and approval of submittals.

B. Product Data: For each type of product.
   1. Product submittals shall include all equipment, materials and cables being utilized on the project.
   2. Data sheets shall clearly indicate the specific model or part number being submitted for review including sizes, color, finishes, and other attributes to adequately allow submitted product to be reviewed.

3. All related system components shall be submitted as part of the same submission (i.e. patch panels, jacks, faceplates, cable, etc.).
4. Indicate manufacturer's installation instructions, where applicable, including any deviations required due to project conditions.
5. Furnish sample products as required for review by Engineer and/or Architect including any assembly mockups.

C. Shop Drawings: Reviewed and stamped by RCDD.
1. Reproductions or electronic versions of design drawings shall not be used in the preparation of shop drawings.
2. Wiring diagrams indicating proposed connections of equipment, equipment types, model numbers, and designations for cables and termination points.
3. Floor plans indicating equipment locations including equipment identification and references to wiring details.
4. Major, coordinated conduit and cable tray pathways.
5. Shop drawings of fabricated or modified units, if any.
6. Seismic and wind restraint devices, including calculations, restraint selection, installation details and written confirmation that a licensed engineer prepared the calculations.
7. System Labeling Schedules:
   a. Electronic copy of labeling schedules, in software and format selected by Owner.
8. Cabling administration Drawings and printouts.
9. Wiring diagrams and installation details of telecommunications equipment, to show location and layout of telecommunications equipment, including the following:
   a. Telecommunications rooms plans and elevations.
   b. Telecommunications pathways.
   c. Telecommunications system access points.
   d. Telecommunications grounding system.
   e. Telecommunications conductor drop locations.
   f. Typical telecommunications details.
   g. Mechanical, electrical, and plumbing systems.

D. Twisted pair cable testing plan.

E. Samples: For telecommunications jacks and plugs, in specified finish, one for each type and configuration and cover plates for color selection and evaluation of technical features.

F. Field Quality-Control Submittals:
1. Field quality-control reports.

1.5 INFORMATIONAL SUBMITTALS

A. Qualification Data: For RCDD, Installer, installation supervisor, and field inspector.

B. Product Certificates: For each type of product.

C. Source quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Maintenance Data: For splices and connectors to include in maintenance manuals.

B. Contractor shall submit all cable test results and any test documentation required prior to acceptance by owner.

C. Subsequent to the installation, and prior to acceptance of the work, the contractor shall prepare and issue record (as-built) drawings, in Adobe PDF and BIM format, that reflect the lengths of cables installed, the actual manner and conditions of installation, including all deletions from, additions to or departures from the contract documents. These documents are to include the information outlet station numbers and cable routing where it varies from the original plan.

D. Provide cable termination schedules for all cables installed under the Work. Schedules shall be in printed form and on CD in Microsoft Excel format.

E. Provide Operation and Maintenance Manuals including wiring diagrams, parts list, shop drawings and manufacturers' information on all equipment and cables provided under this Work. Provide manuals within fifteen days of systems acceptance.

F. Upon completion of the work, the contractor shall coordinate with the manufacturer the issuance of a full warranty on the entire copper and fiber optic cable plant including the horizontal cabling for both parts and labor. The cabling contractor at his sole expense will correct any deficiencies determined by the manufacturer.

1.7 MAINTENANCE MATERIAL SUBMITTALS

A. Furnish extra materials that match products installed and that are packaged with protective covering for storage and identified with labels describing contents.
   1. Cover Plates: One of each type.
   2. Jacks: Ten of each type.
   3. Multiuser Telecommunications Outlet Assemblies: One of each type.
   4. Patch-Panel Units: One of each type.
   5. Plugs: Ten of each type.

1.8 QUALITY ASSURANCE

A. Installer Qualifications: Cabling Installer must have personnel certified by BICSI on staff.
   1. Layout Responsibility: Preparation of Shop Drawings , cabling administration Drawings, and field testing program development by an RCDD.
   2. Installation Supervision: Installation shall be under the direct supervision of Technician , who shall be present at all times when Work of this Section is performed at Project site.
   3. Testing Supervisor: Currently certified by BICSI as an RCDD to supervise on-site testing.

1.9 PROJECT CONDITIONS

A. Environmental Limitations: Do not deliver or install cables and connecting materials until wet work in spaces is complete and dry, and temporary HVAC system is operating and maintaining ambient temperature and humidity conditions at occupancy levels during the remainder of the construction period.

1.10 COORDINATION

A. Coordinate layout and installation of telecommunications pathways and cabling with Owner's telecommunications and LAN equipment and service suppliers.

PART 2 PRODUCTS

2.1 PERFORMANCE REQUIREMENTS

A. General Performance: Horizontal cabling system shall comply with transmission standards in TIA-568-C.1, when tested according to test procedures of this standard.

B. Telecommunications Pathways and Spaces: Comply with TIA-569-D.

C. Grounding: Comply with TIA-607-E.

2.2 GENERAL CABLE CHARACTERISTICS

A. Listed and labeled by an NRTL acceptable to authorities having jurisdiction as complying with the applicable standard and NFPA 70 for the following types:
   1. Communications, Plenum Rated:
      a. Type CMP complying with UL 1685 or Type CMP in listed cable routing assembly.
   2. Communications, Non-Plenum Rated:
      a. Type CMP or Type CMR in metallic conduit installed according to NFPA 70, Article 300.22, "Wiring in Ducts, Plenums, and Other Air-Handling Spaces."

B. Surface-Burning Characteristics: Comply with ASTM E84; testing by a qualified testing agency. Identify products with appropriate markings of applicable testing agency.
   1. Flame-Spread Index: 25 or less.
   2. Smoke-Developed Index: 50 or less.

C. RoHS compliant.

D. Cable Construction
   1. Listed CMP cable: Solid copper conductors with fluorinated ethylene propylene (FEP)/polyolefin insulation and an overall low smoke PVC jacket to achieve plenum rating by applicable NEC requirements.
   2. Indoor/Outdoor CMP cable: Rated for wet locations with solid copper conductors covered in fluorinated ethylene propylene (FEP)/polyolefin insulation and an overall low smoke PVC jacket to achieve plenum rating by applicable NEC requirements.

3. OSP outdoor cable rated for wet locations: Solid copper conductors with polyolefin insulation, polyolefin fluted center member with flooding compound, and black polyethylene jacket.

E. Minimum compliant cables are not acceptable.

F. Copper Clad Aluminum cables are not acceptable.

2.3 CATEGORY 6 TWISTED PAIR CABLE

A. Description: Four-pair, balanced-twisted pair cable, with internal spline, certified to meet transmission characteristics of Category 6 cable at frequencies up to 250 MHz.

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Belden Inc.
2. Berk-Tek, a Leviton Company.
3. General Cable; Prysmian Group North America.
4. Hitachi Cable America Inc.
5. Mohawk; a division of Belden Networking, Inc.
6. Siemon Co.
7. Superior Essex Inc.; subsidiary of LS Corp.

C. Standard: Comply with NEMA WC 66/ICEA S-116-732 and TIA-568-C.2 for Category 6 cables.

D. Conductors: 100-ohm, 23 AWG solid copper.

E. Shielding/Screening: Unshielded twisted pairs (UTP) .

F. Cable Rating: Plenum.

G. Jacket: Color shall be as indicated on project drawings; thermoplastic.

2.4 CATEGORY 6A TWISTED PAIR CABLE

A. Description: Four-pair, balanced-twisted pair cable, with internal spline, certified to meet transmission characteristics of Category 6a cable at frequencies up to 500 MHz.

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Belden Inc.
2. Berk-Tek, a Leviton Company.
3. General Cable; Prysmian Group North America.
4. Hitachi Cable America Inc.
5. Mohawk; a division of Belden Networking, Inc.
6. Panduit Corp.
7. Siemon Co.
8. Superior Essex Inc.; subsidiary of LS Corp.

C. Standard: Comply with TIA-568-C.2 for Category 6a cables.

D. Conductors: 100-ohm, 23 AWG solid copper.

E. Shielding/Screening: Unshielded twisted pairs (UTP) .

F. Cable Rating: Plenum.

G. Jacket: Color shall be as indicated on project drawings; thermoplastic.

2.5 TWISTED PAIR CABLE HARDWARE

A. Description: Hardware designed to connect, splice, and terminate twisted pair copper communications cable.

B. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
1. Leviton Manufacturing Co., Inc.
2. Ortronics, Inc.
3. Panduit Corp.
4. Siemon Co. (The).

C. General Requirements for Twisted Pair Cable Hardware:
1. Comply with TIA-568-C.2, IDC type, with modules designed for punch-down caps or tools.
2. Cables shall be terminated with connecting hardware of same category or higher.

D. Source Limitations: Obtain twisted pair cable hardware from single source from single manufacturer.

E. Patch Panel: Modular panels housing numbered jack units with IDC-type connectors at each jack location for permanent termination of pair groups of installed cables.
1. Features:
   a. Style: Flat
   b. Modular type panels utilizing insertable jacks.
      1) Provide additional insertable jacks, as needed, to populate all ports on modular panels.
   c. Universal T568A and T568B wiring labels.
   d. Labeling areas adjacent to conductors.
   e. Replaceable connectors.
   f. 24 or 48 ports as indicated on the project drawings.
   g. Rear strain-relief bar.
2. Construction: 16-gauge steel and mountable on 19-inch equipment racks.

F. Patch Cords: Factory-made, four-pair cables in lengths, quantities and colors as indicated on the project drawings; terminated with an eight-position modular plug at each end.
1. Patch cords shall have color-coded boots for circuit identification.
2. Modular data patch cords shall meet channel performance requirements specified herein, and shall be 28 AWG, stranded conductors insulated with solid polyolefin, tightly twisted into individual pairs and jacketed with flame retardant PVC.
3. Patch cords shall have latch guards to protect against snagging.
4. Field terminated patch cords are not acceptable.

5. Patch cords shall be provided as part of the warranted channel solution.
6. Patch cables shall be made of stranded cable and shall meet TIA/EIA 568B.2 requirements for patch cords. Cable used for the construction of patch cables shall be UL or ETL verified to meet the channel Category for voice, data and A/V requirements and the cable jacket shall be labeled to indicate verification. Patch cables shall be boot-less.

G. Modular Plug Terminated Link (MPTL) (Direct Connect)
1. Standard: Conform to TIA-568.2-D, Annex F
2. Uses: Termination at end device including Wireless Access Points, CCTV Cameras, TV Displays, Projectors, and other devices as indicated on the project drawings.
3. Use only where specifically indicated on the Project Drawings.

H. Jacks and Jack Assemblies:
1. Female; eight position; modular; fixed telecommunications connector designed for termination of a single four-pair, 100-ohm, unshielded or shielded twisted pair cable.
2. Designed to snap-in to a patch panel or cover plate.
3. Standard: Comply with TIA-568-C.2.
4. Marked to indicate transmission performance.
5. Refer to project drawings for exact quantities and configurations.
6. Keystone-Style jacks shall be provided in floor boxes, poke-thru's, modular furniture adapter plates, etc. where required on project drawings.

I. Industrial / Ruggedized Components
1. Specifier: For Hazardous Locations with specific Class X, Division Y classifications, additional specification edits are required.
2. Shall be used in areas containing dust, moisture, vibration, and chemicals as indicated on the project drawings.
3. IP66/IP67 rated.
4. Components include information outlets, Plugs, Patch Cords, Surface Mount Boxes, Stainless Steel faceplates, and other components as required.
5. Install dust caps on all unused ports.

J. Faceplates / Cover Plates:
1. Four port, vertical single gang cover plates designed to mount to single gang wall boxes or as indicated on project drawings.
2. Plastic Cover Plate: High-impact plastic. Coordinate color with Section 260533 "Raceway and Boxes for Electrical Systems" and with Architect.
3. For use with snap-in jacks accommodating any combination of twisted pair, optical fiber, and coaxial work area cords.
4. Faceplates shall be designed with flush port openings to accept jacks and other configurations indicated on the Drawings.
5. Faceplates shall not extend more that 0.25" from face of wall.
6. Faceplates shall have an integrated label holder with clear plastic cover. Single gang faceplates shall have 2 integrated label holders with clear plastic covers; one shall be above the jacks and one shall be below the jacks. Double gang faceplates shall have 4 integrated label holders with clear plastic covers; two shall be above the jacks and two shall be below the jacks.

K. Modular Furniture Adapter Faceplates
1. Faceplates shall be designed for use within modular furniture.

2. Faceplates shall have an integrated label holder with clear plastic cover.
3. Confirm dimension of furniture knockout with proposed modular furniture adapter to ensure compatibility.
4. Color: black for dark furniture; ivory for light colored furniture; as directed by architect.

L. Floor Box / Poke-Thru Adapter Plates
1. Coordinate with requirements of Division 26 as applicable.
2. Adapter Plates shall accept 8P8C Jack assemblies, A/V Inserts/Connectors and other connectivity as required by project documents.

M. Surface Mount Boxes
1. 1-Port and 2-Port surface mount boxes as indicated on the project drawings.
2. Plenum rated as required.
3. Shall accept jacks from the same manufacturer as other components used throughout the project.

N. Legend:
1. Snap-in, clear-label covers and machine-printed paper inserts.

2.6 IDENTIFICATION PRODUCTS

A. Comply with TIA-606-D and UL 969 for a system of labeling materials, including label stocks, laminating adhesives, and inks used by label printers.

2.7 SOURCE QUALITY CONTROL

A. Factory test cables on reels according to TIA-568-C.1.

B. Factory test twisted pair cables according to TIA-568-C.2.

C. Cable will be considered defective if it does not pass tests and inspections.

D. Prepare test and inspection reports.

PART 3 EXECUTION

3.1 WIRING METHODS

A. Routing:
1. Install cables in raceways and cable trays, except within consoles, cabinets, desks, and counters. Conceal raceway and cables, except in unfinished spaces.
   a. Install plenum cable in environmental air spaces, including plenum ceilings.
   b. Comply with requirements for raceways and boxes specified in Section 270528 "Pathways for Communications Systems."

B. Wiring within Enclosures: Bundle, lace, and train cables within enclosures. Connect to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Provide and use

lacing bars and distribution spools. Install conductors parallel with or at right angles to sides and back of enclosure.

3.2 INSTALLATION OF PATHWAYS

A. Comply with requirements for demarcation point, cabinets, and racks specified in Section 271100 "Communications Equipment Room Fittings."

B. Comply with Section 270528 "Pathways for Communications Systems."

C. Comply with Section 270529 "Hangers and Supports for Communications Systems."

D. Comply with Section 270536 "Cable Trays for Communications Systems."

E. Drawings indicate general arrangement of pathways and fittings.

3.3 INSTALLATION OF TWISTED-PAIR HORIZONTAL CABLES

A. Comply with NECA 1 and NECA/BICSI 568.

B. 8P8C Jack assemblies shall be wired per the pin/pair assignments indicated in ANSI/TIA-568.1D-2015 designated T568B configuration.

C. General Requirements for Cabling:
   1. Comply with TIA-568-C.0, TIA-568-C.1, and TIA-568-C.2.
   2. Comply with BICSI's "Information Transport Systems Installation Methods Manual (ITSIMM), Ch. 5, "Copper Structured Cabling Systems," "Cable Termination Practices" Section.
   3. Horizontal cables shall be installed in a star topology from each communications outlet to the Telecommunications room serving that area.
   4. The length of each horizontal cable from the Telecommunications room to the communications outlet shall not exceed 295'. Coordinate with the conduit and cable tray installation and modify as necessary to ensure distance requirements are not exceeded.
   5. Install 110-style IDC termination hardware unless otherwise indicated.
   6. Do not untwist twisted pair cables more than 1/2 inch from the point of termination to maintain cable geometry.
   7. Terminate all conductors; no cable shall contain unterminated elements. Make terminations only at indicated outlets, terminals, cross-connects, and patch panels.
   8. MUTOA shall not be used as a cross-connect point.
   9. Cables may not be spliced. Secure and support cables at intervals not exceeding 30 inches and not more than 6 inches from cabinets, boxes, fittings, outlets, racks, frames, and terminals.
   10. Install lacing bars to restrain cables, prevent straining connections, and prevent bending cables to smaller radii than minimums recommended by manufacturer.
   11. Bundle, lace, and train conductors to terminal points without exceeding manufacturer's limitations on bending radii, but not less than radii specified in BICSI Information Transport Systems Installation Methods Manual, Ch. 5, "Copper Structured Cabling Systems," "Cable Termination Practices" Section. Use lacing bars and distribution spools.

12. Do not install bruised, kinked, scored, deformed, or abraded cable. Do not splice cable between termination, tap, or junction points. Remove and discard cable if damaged during installation, and replace it with new cable.
13. Cold-Weather Installation: Bring cable to room temperature before dereeling. Heat lamps shall not be used for heating.
14. In the communications equipment room, install a 10-foot- long service loop on each end of cable.
15. Pulling Cable: Comply with BICSI Information Transport Systems Installation Methods Manual, Ch. 5, "Copper Structured Cabling Systems," "Pulling and Installing Cable" Section. Monitor cable pull tensions.
16. Observe and comply with manufacturer recommended bending radius and pulling strength requirements of the cables during handling and installation.
17. Provide clutch or shear pin protection for cables during cable pulling to ensure cable pulling tension is not exceeded.
18. Conceal horizontal cables within ceilings and walls.
19. Cables, when not installed in conduit or cable tray, shall be bundled in groups of no more than 48 cables for Category 5e and 6, and no more than 24 cables for Category-6A. Cable bundle quantities exceeding these limits may cause deformation of the bottom cables within the bundle and degrade cable performance. Cable raceways shall not be filled greater than the ANSI TIA-569-A maximum fill for the particular raceway type or 40%.
20. Cable shall be installed above fire-sprinkler systems and shall not be attached to the system or any ancillary equipment or hardware. The cable system and support hardware shall be installed so that it does not obscure any valves, fire alarm conduit, boxes, or other control devices.
21. Provide temporary protection of cables before termination. Cables shall not be left lying on the floor. Bundle and use Velcro or hook and loop tape to provide protection.
22. Provide a 3’ service loop at the entrance of conduits that terminate at communications wall outlets.
23. Provide a 10' service loop at the entrance of conduits that terminate at poke-thru's and floor boxes.
24. Provide a 20' service loop above accessible ceiling at all Wireless Access Point locations.

D. Open-Cable Installation:
1. Install cabling with horizontal and vertical cable guides in telecommunications spaces with terminating hardware and interconnection equipment.
2. Complete work actions requiring above ceiling access prior to ceiling tile installation.
3. Suspend twisted pair cabling, not in a wireway or pathway, a minimum of 8 inches above ceilings by cable supports not more than 60 inches apart.
4. Cabling routed above ceilings shall be supported with the following methods:
    a. In cable tray above accessible ceiling, where indicated on drawings.
    b. In conduit where indicated on drawings. A pull cord (Polyolefin; minimum 210lb Tensile Strength) shall be installed alongside all cables in enclosed raceways, conduits and areas where access is limited.
    c. On J-hooks and/or Cable Slings, unless otherwise indicated on the Drawings. Cables shall be supported at a maximum of 48 inch intervals. At no point shall cable(s) rest on acoustic ceiling grids or panels.
    d. Cables shall not be attached to ceiling grid, lighting fixture wires or any other MEP system supports.

5. Cable shall not be run through structural members or in contact with pipes, ducts, or other potentially damaging items.

E. Installation of Communications Outlets
1. Communications outlets shall be formed from an assembly of faceplates and jacks as indicated on the Drawings.
2. Communications outlets installed in walls shall be installed in a double-gang box, with a single-gang or double-gang plaster ring (see project drawings), terminating cables from the Telecommunications room as indicated on project drawings.
3. Install outlets straight and perpendicular to walls and ceilings.
4. Secure faceplates with machine screws provided with the faceplate.
5. Label appropriately and cover each label with the clear plastic cover provided with the faceplate.

F. Group connecting hardware for cables into separate logical fields.

G. Separation from EMI Sources:
1. Comply with recommendations from BICSI's "Telecommunications Distribution Methods Manual" and TIA-569-D for separating unshielded copper communication cable from potential EMI sources, including electrical power lines and equipment.
2. Separation between open communications cables or cables in nonmetallic raceways and unshielded power conductors and electrical equipment shall be as follows:
   a. Electrical Equipment Rating Less Than 2 kVA: A minimum of 5 inches.
   b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 12 inches.
   c. Electrical Equipment Rating More Than 5 kVA: A minimum of 24 inches.
3. Separation between communications cables in grounded metallic raceways and unshielded power lines or electrical equipment shall be as follows:
   a. Electrical Equipment Rating Less Than 2 kVA: A minimum of 2-1/2 inches.
   b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 6 inches.
   c. Electrical Equipment Rating More Than 5 kVA: A minimum of 12 inches.
4. Separation between communications cables in grounded metallic raceways, power lines, and electrical equipment located in grounded metallic conduits or enclosures shall be as follows:
   a. Electrical Equipment Rating Less Than 2 kVA: No requirement.
   b. Electrical Equipment Rating between 2 and 5 kVA: A minimum of 3 inches.
   c. Electrical Equipment Rating More Than 5 kVA: A minimum of 6 inches.
5. Separation between Communications Cables and Electrical Motors and Transformers, 5 kVA or HP and Larger: A minimum of 48 inches.
6. Separation between Communications Cables and Fluorescent Fixtures: A minimum of 5 inches.

3.4 FIRESTOPPING

A. Comply with requirements in Section 078413 "Penetration Firestopping."

B. Comply with TIA-569-D, Annex A, "Firestopping."

C. Comply with "Firestopping Systems" Article in BISCI's "Telecommunications Distribution Methods Manual."

3.5 GROUNDING

A. Comply with requirements in Section 270526 "Grounding and Bonding for Communications Systems" for grounding conductors and connectors.

B. Install grounding according to the "Grounding, Bonding, and Electrical Protection" chapter in BICSI's "Telecommunications Distribution Methods Manual."

C. Comply with TIA-607 and NECA/BICSI-607.

D. Locate grounding bus bar to minimize the length of bonding conductors. Fasten to wall, allowing at least a 2-inch clearance behind the grounding bus bar. Connect grounding bus bar to suitable electrical building ground, using a minimum No. 4 AWG grounding electrode conductor.

E. Bond metallic equipment to the grounding bus bar, using not smaller than a No. 6 AWG equipment grounding conductor.

3.6 IDENTIFICATION

A. Identify system components, wiring, and cabling complying with TIA-606-D. Comply with requirements for identification specified in Section 270553 "Identification for Communications Systems."
   1. Administration Class: Class 3.
   2. Color-code cross-connect fields and apply colors to voice and data service backboards, connections, covers, and labels.

B. Paint and label colors for equipment identification shall comply with TIA-606-D.

C. Cable Schedule: Install in a prominent location in each equipment room and wiring closet. List incoming and outgoing cables and their designations, origins, and destinations. Protect with rigid frame and clear plastic cover. Furnish an electronic copy of final comprehensive schedules for Project.

D. Cabling Administration Drawings: Show building floor plans with cabling administration-point labeling. Identify labeling convention and show labels for telecommunications closets, terminal hardware and positions, horizontal cables, work areas and workstation terminal positions, grounding buses and pathways, and equipment grounding conductors.

E. Cable and Wire Identification:
   1. Label each cable within 4 inches of each termination and tap, where it is accessible in a cabinet or junction or outlet box, and elsewhere as indicated.
   2. Each wire connected to building-mounted devices is not required to be numbered at the device if wire color is consistent with associated wire connected and numbered within panel or cabinet.
   3. Cables labeled within the bundle, where label is obscured from view shall not be accepted.
   4. Label each terminal strip, and screw terminal in each cabinet, rack, or panel.
      a. Individually number wiring conductors connected to terminal strips, and identify each cable or wiring group, extended from a panel or cabinet to a building-mounted device, with the name and number of a particular device.
      b. Label each unit and field within distribution racks and frames.

5. Identification within Connector Fields in Equipment Rooms and Wiring Closets: Label each connector and each discrete unit of cable-terminating and -connecting hardware. Where similar jacks and plugs are used for both voice and data communication cabling, use a different color for jacks and plugs of each service.

F. Labels shall be preprinted or computer-printed type, with a printing area and font color that contrast with cable jacket color but still comply with TIA-606-D requirements for the following:
1. Cables use flexible vinyl or polyester that flexes as cables are bent.

3.7 FIELD QUALITY CONTROL

A. Perform Tests and Inspections:
1. Visually inspect jacket materials for NRTL certification markings. Inspect cabling terminations in communications equipment rooms for compliance with color-coding for pin assignments, and inspect cabling connections for compliance with TIA-568-C.1.
2. Visually inspect cable placement, cable termination, grounding and bonding, equipment and patch cords, and labeling of all components.
3. Test twisted pair cabling for DC loop resistance, shorts, opens, intermittent faults, and polarity between conductors. Test operation of shorting bars in connection blocks. Test cables after termination but not cross-connection, Channel Performance Tests will not be accepted.
   a. Test instruments shall meet or exceed applicable requirements in TIA-568-C.2. Perform tests with a tester that complies with performance requirements in "Test Instruments (Normative)" Annex, complying with measurement accuracy specified in "Measurement Accuracy (Informative)" Annex. Use only test cords and adapters that are qualified by test equipment manufacturer for permenant link test configuration.
   b. Test equipment shall be of the quality and accuracy required to test and/or measure system performance with the tolerances specified and shall have been calibrated by the manufacturer within the last 12 months, or as specified herein. Equipment shall be calibrated according to the manufacturer's recommended intervals and when dropped or damaged. Calibration tags shall be affixed or certificates available on request.

B. Data for each measurement shall be documented.
1. The test results/measurements shall be submitted in both the test equipment manufacturer’s raw data file and searchable PDF format files.
2. The database for the complete project, including twisted-pair copper cabling links, if applicable, shall be stored and delivered in digital format prior to Owner acceptance of the building. This digital format shall include the software tools required to view, inspect, and print any selection of the test reports.
3. Testing of transmission performance of horizontal cabling includes the following:
   a. Insertion Loss
   b. Near End Crosstalk (NEXT)
   c. PowerSum Near End Crosstalk (PSNEXT)
   d. Attenuation-to-Crosstalk Ration Near End (ACRN)
   e. PowerSum Attenuation-to-Crosstalk Ratio Near End (PSACRN)
   f. Attenuation-to Crosstalk Ratio Far End (ACRF)
   g. PowerSum Attenuation-to-Crosstalk Ratio Far End (PSACRF)

h. Return Loss
i. Transverse Conversion Loss (TCL)
j. Equal Level Transverse Conversion Loss Transfer Loss (ELTCLTL)
k. Length
l. Propagation Delay
m. Delay Skew
n. Additional Category 6A requirements
    1) PowerSum Alien Near End Crosstalk
    2) PowerSum Alien Attenuation-to-Crosstalk Ratio Far

C. Nonconforming Work:
1. End-to-end cabling will be considered defective if it does not pass tests and inspections.
2. Remove and replace cabling where test results indicate that they do not comply with specified requirements.
3. Any cable damaged or exceeding recommended installation parameters during installation shall be replaced by the contractor prior to final acceptance at no cost to the Owner

D. Collect, assemble, and submit test and inspection reports.

E. A representative of the Owner may elect to test 5% of the installed cables. The test results will be compared with the submitted results. In the event that more than 2% of the compared results differ from the submitted results, the Owner may contract with a third-party testing firm to retest 100% of the installation and the cost shall be borne by the Contractor.

F. Prepare test and inspection reports. Contractor shall furnish test reports in both PDF and source data files.

END OF SECTION

SECTION 274010 - AUDIO-VISUAL GENERAL

PART 1 GENERAL

1.1 SECTION INCLUDES

A. The General Provisions herein are applicable to the following Specification Sections:
   1. 274105 - AUDIO-VISUAL EQUIPMENT ENCLOSURES AND TECHNICAL FURNITURE
   2. 274106 - AUDIO-VISUAL POWER DISTRIBUTION AND MANAGEMENT EQUIPMENT
   3. 274110 - MICROPHONES, CONFERENCING SYSTEMS, AND AUDIO SOURCE EQUIPMENT
   4. 274111 - MIXING, PROCESSING, AND AMPLIFICATION EQUIPMENT
   5. 274113 - LOUDSPEAKERS AND RELATED EQUIPMENT
   6. 274115 - PRODUCTION COMMUNICATION SYSTEMS
   7. 274116 - ACCESSIBILITY SYSTEMS
   8. 274121 - VIDEO CAMERA, SOURCE, AND RECORDING EQUIPMENT
   9. 274122 - VIDEO TRANSPORT, SWITCHING, AND PROCESSING EQUIPMENT
   10. 274123 - VIDEO DISPLAY EQUIPMENT
   11. 274125 - ELECTRONIC SIGNAGE AND WAYFINDING EQUIPMENT
   12. 274126 - PROJECTION SCREENS
   13. 274131 - AUDIO-VISUAL CONTROL SYSTEMS AND PROGRAMMING
   14. 274132 - AUDIO-VISUAL NETWORK EQUIPMENT
   15. 274140 - AUDIO-VISUAL CABLING AND CONNECTORS

B. The Audio-Visual Installation Contractor shall be responsible for providing all equipment, accessories, parts, and supplies as necessary to deliver complete and working systems as defined herein. Any equipment list or bill of materials included in the Contract Documents is for reference only and is not necessarily an exhaustive list of all components required to make the systems complete and operational. The Audio-Visual Installation Contractor shall be required to amend any such document or provide their own equipment list or bill of materials. Any equipment list or bill of materials provided by the Audio-Visual Installation Contractor shall not constitute a complete list of all equipment and supplies the Audio-Visual Installation Contractor intends to provide. Such a document shall not alleviate the Audio-Visual Installation Contractor from providing any and all necessary equipment and supplies beyond that which is on said equipment list or bill of materials to make the systems described herein and on the Drawings complete and operational.

C. The Audio-Visual Installation Contractor shall be responsible for interfacing power and grounding provisions with work covered under these Sections.

D. Anywhere this or any of the Sections listed above directs an entity to contact the Court, the primary contact person shall be the Contracting Officer of record. The Contracting Officer shall have the right to delegate this reponsibilty to any other person on a permanent or case-by-case basis.

E. All notices, subimttals, RFIs, requests, information, emails, and any other documentation or communications described herein or in any of the above sections shall be delivered to the Architect, unless otherwise directed in this or any other Specification Section, or the Drawings.
   1. The same entity will prepare all responses, unless another person or entity is specifically identified herein, in any of the above Sections, or on the Drawings.

1.2 RELATED REQUIREMENTS

A. Raceway and boxes for the Audio-Visual Systems are provided by others.

B. Audio-Visual power distribution equipment is covered in Section 274106, Audio-Visual Power Distribution and Management Equipment.

C. Provide additional power provisions, raceways, and boxes, beyond those indicated in the above referenced Drawings, as required to accommodate the system configuration.

D. Performance Verification responsibilities and obligations related to these Systems are specified herein and in the sections listed above.

1.3 REFERENCE STANDARDS

A. ANSI/INFOCOMM (AVIXA) 10:2013, Audio-Visual Systems Performance Verification.

B. ANSI/INFOCOMM (AVIXA) 2012, Audio-Visual Implementation Handbook.

C. Additional standards as identified in other Specification Sections included herein.

D. ISO 9001-2015.

E. NFPA 70-2017

1.4 DEFINITIONS

A. “Audio-Visual Installation Contractor,” "AVIC," or simply, “Contractor” – The organization charged with installation and configuration of the Systems described herein.

B. "Owner-Furnished Equipment" - A device that is currently in the posession of the Owner, but shall be incorporated into the design described herein by the Audio-Visual Installation Contractor.

C. "Owner-Furnished-Owner-Installed Equipment," - a device that is currently in the posession of the Owner, but will be connected to the systems described herein by the Owner.

D. “Basis of Design,” – A device representing the benchmark or minimum requirements in the Specifications or Drawings for this Project. This shall not be interpreted as a sole-source requirement.

1.5 FUNCTIONAL DESCRIPTIONS

A. General
   1. These descriptions shall be informational only. Where a discrepancy or conflict exists between this paragraph and another requirement in the Specifications or on the Drawings, the other requirement shall govern.

B. Conference Room

1. Video: Each conference room will be equipped with a non-interactive display screen. A USB-C input will be provided at the conference table, located inside an in-table A/V box that will also contain electrical receptacles and data jacks as needed. A camera at the display will provide BYOD conferencing to users via the USB-C connection at the table.
2. Audio: Audio will be provided through the display's built-in speakers.
3. Control: The receiver in each conference room will have signal sense capability which will allow the display to turn on or off depending on sensing signal, or when a device is plugged in/out.

C. Music Classroom
1. Audio: Full range speaker system for listening, simple fixed stereo recording to computer, playback from connected computer, auxiliary connection or Bluetooth.

D. Cafeteria
1. Video: A wall-mount motorized projection screen and projector in a wall niche will display shared content. An HDMI input plate on the wall and wireless presentation capabilities will allow users to share content from their device.
2. Audio: Wireless microphones will be provided to amplifier presenters' voices. The system will accept an audio input from the campus-wide paging system. Pendant speakers will reproduce all audio.
3. Control: A touch panel on the wall will allow users to adjust audio volume, select video source, and turn the system on/off.

E. Gym
1. Video: Wall-mount motorized projection screens and projector on motorized scissor-lift will display shared content. A/V inputs and wireless streaming will be provided.
2. Audio: High-power speakers attached to the ceiling structural beams will provide sound coverage throughout the gym. PA announcements will be broadcast over the same speakers. Both Wireless microphone capability and wired microphone inputs will be provided. An Assistive Listening system will be provided with receiver units in compliance with ADA requirements.
3. Control: A wall-mount Control Panel will be provided to allow control of the audio inputs and volume control. The headend A/V equipment will be located in a rack in a Storage Room adjacent to the gymnasium.

F. Black Box
1. Video: A motorized rear projection screen will be provided and supported from the pipe grid above the platform. A projector will be attached to the pipe grid behind the projection screen and will display shared content.. A/V inputs and wireless streaming will be provided. Wall-mount PTZ cameras will provide video for live and recorded events.
2. Audio: Full range performance speakers will provide stereo sound coverage throughout the space. Both Wireless microphone capability and wired microphone inputs will be provided. An Assisted Listening system will be provided with receiver units in compliance with ADA requirements. A basic wireless production communications system will be provided.
3. Control: Control of the audio and video systems will be located in a small control room adjacent to the platform. Operaters will be able to route video and mix audio on production equipment. A control panel will provide system preset operations for typical events.

1.6 QUALITY ASSURANCE

A. This paragraph contains general quality assurance requirements. Additional quality assurance requirements are identified in the Specification Sections listed in PART 1 of this Section.

B. Conform to the reference standards indicated herein and in other Sections covered by this Section.

C. Provision of manufactured components, installation, wiring, and testing shall be the responsibility of a single Contractor.

D. Supply only new equipment, parts, and material currently manufactured at the time of submittal and operate only for testing as part of the installation procedures.

E. Conduit sizes specified herein or indicated on the Drawings refer to the standard trade sizes, are for identification purposes only, and are not actual dimensions.

F. Codes, standards, and regulations referred to are minimum standards. Where the requirements of these Specifications or the Drawings exceed those of the codes, standards, and regulations, the Drawings or Specifications govern.

G. Codes, standards, and regulations specified herein include the edition date. Revisions and addenda to these codes, standards, and regulations shall be part of the Specifications. Provisions of referenced codes, standards, and regulations do not create duty or responsibility by the Owner, unless otherwise specified herein. The Audio-Visual Installation Contractor shall be responsible for modifying the Systems described herein and on the Drawings to comply with such revisions and addenda.

H. Adhesives and Sealants:
   1. Adhesives, sealants, and sealant primers used inside the building (defined as inside the weatherproofing envelope and applied on site) shall comply with SCAQMD Rule1168-2017 for volatile organic compound content limits.
   2. Aerosol adhesives shall comply with GS 36-2013 for volatile organic compound content limits.

I. Paints and Coatings:
   1. Anticorrosive and antirust paints applied to interior ferrous metal shall not exceed a volatile organic compound content limit of 250 g/L per GS 11-2015.

J. Audio-Visual Installation Contractor qualifications at the time of bid:
   1. All technical personnel assigned to this project shall have a current AVIXA CTS certification.
   2. The person(s) charged with managing the Audio-Visual Installation Contractor’s overall effort shall have either a Professional Engineer’s license (PE), a PMP certification, or one of the advanced AVIXA certifications (CTS-D or CTS-I).
   3. The person(s) charged with managing the Audio-Visual Installation Contractor’s design effort shall have a current AVIXA CTS-D certification.
   4. The person(s) charged with managing the Audio-Visual Installation Contractor’s physical installation and/or fabrication effort shall have a current AVIXA CTS-I certification.

1.7 SUBMITTALS

A. General

1. This paragraph contains general submittal requirements that apply to all Sections and all equipment and supplies in this Project. Additional submittal requirements are identified in PART 1 of the Specification Sections listed in PART 1 of this Section.
2. Submittals are required before installation or fabrication begins. The Audio-Visual Installation Contractor shall not procure any equipment or perform any fabrication on any portion of this scope that has not received approval as defined herein. The Audio-Visual Installation Contractor shall be responsible for any costs related to returning, replacing, or not using any component of this scope that is ordered, fabricated, or installed prior to receiving such approval. Pay requests will not be approved for any work performed without approved submittals.
3. Partial Submittals may be acceptable. The Audio-Visual Installation Contractor shall submit a written request in the form of an RFI to request approval to submit partial Submittals.
4. Any approval granted on a partial Submittal is only applicable to the submitted section or other portion(s) of the required submittals listed in the request. This approval is provisional based on the receipt and review of the remainder of the required Submittals and may be modified or rescinded based thereupon.

B. Pre-Installation Submittal (Shop Submittal) Requirements:
1. Submittals shall be prepared in a line-by-line format corresponding to these Specifications and the Drawings, and shall indicate compliance with each requirement specified herein and indicated in the Drawings:
   a. Indicate manufacturer's installation instructions.
   b. Indicate deviations, if any, including any from the manufacturer's installation instructions.
   c. Reproductions or electronic versions of Design Drawings shall not be used in the preparation of Submittals. Submittals containing such Drawings may be rejected.
   d. Resubmittals that are required to address review comments shall include a cover transmittal with a written explanation of how each review comment has been addressed.
   e. Submittals not specifically required, or not complying the format requirements, will be returned unreviewed.
   f. All electronic documents shall be provided in PDF format. PDF files containing multiple drawings or components shall include an index of the file contents and electronic bookmarks.
2. Submittals shall include the following:
   a. Wiring diagrams (functional diagrams) indicating:
      1) Equipment to be used, marked with make and model numbers.
      2) Proposed connections of equipment at device inputs and outputs. Unused connections shall be marked unused in a consistent fashion.
      3) Cable designations meeting the cable labeling requirements of Section 274140, Audio-Visual Cable and Connectors.
   b. Floor plans and reflected ceiling plans indicating equipment locations, including identification and references to wiring details. Other Specification Sections listed earlier in this Section contain additional requirements for floor plans. Floor plan requirements from multiple Sections may be combined on one or more floor plans as long as the document(s) remain clear and legible.
   c. Product data sheets on all equipment, materials, and cables to be used in this Project. Data sheets shall be combined into a single PDF file and arranged by Specification

Section number. The PDF file shall be indexed or bookmarked by Specification Section and each individual product. Bookmarks or indexes shall be renamed as necessary so that each manufacturer and model is shown in the index. The index or bookmarks shall provide a clickable link to the corresponding data sheet(s).

d. A table indicating the color of all pieces of equipment that will be mounted, installed, or used in any generally accessible area of the spaces included herein. Unless otherwise noted, this requirement does not apply to equipment permanently installed in equipment rooms, telecommunications rooms, or other closets that are generally accessible only by the Owner's staff or their designees.

e. A table indicating the proposed network configuration information. This shall include, at a minimum, proposed VLANs or physically isolated networks, IP addresses as needed, and necessary switch and router configuration information.

1) If it is necessary for the Audio-Visual Installation Contractor to obtain network information (i.e., IP address ranges, subnet masks, gateways, etc.) in order to properly configure the Systems included herein, such request shall be made prior to submission of the table described in this paragraph.

2) Submit in writing all requests for Audio-Visual Installation Contractor remote access to the Owner's network for configuration and maintenance of audio-visual equipment.

f. Dimensioned shop drawings of all fabricated, custom, or modified hardware and software equipment, components, or devices. Provide a finish sample for all connector plates furniture, consoles, carts, and stands.

g. Schematic drawings of all custom electronic components, assemblies, and circuitry.

h. A table containing all usernames and passwords assigned by the Audio-Visual Installation Contractor and the devices to which they are assigned.

i. Where applicable, seismic and wind restraint devices, including calculations, restraint selection, installation details, and written confirmation that a licensed engineer prepared the calculations.

j. Required raceways and power outlets, including quantity, locations, and capacity characteristics.

k. Environmental requirements, including heat release.

l. The Audio-Visual Installation Contractor's Test Plan, as defined herein.

C. Installation Submittal: No later than the time of the Substantial Completion Inspection, the following shall be submitted:

1. A list of test equipment, giving make and model numbers to be used for all testing in spreadsheet format.
2. A draft version of as-built drawings for every item depicting the current state of the systems to be tested.
3. A draft version of the simplified one (1) page instructions to be provided with final documentation.
4. A spreadsheet containing all network configuration and settings of equipment in this scope and the Owner's LAN.

5. A spreadsheet containing all Audio-Visual Installation Contractor-assigned usernames and passwords for devices that require them.
6. Test reports as defined herein indicating all Category cable signal paths pass the Category cable testing requirements."
7. A draft version of the Technical and User Manuals as defined in PART 3 herein.

D. Final Acceptance Submittal: Within thirty (30) days after Substantial Completion is achieved, and/or prior to Final System Acceptance, submittals (whichever is earlier) shall be provided and shall include the following:
1. Equipment manufacturer's operation and maintenance manuals for each piece of equipment.
2. Corrected as-built drawings for every item depicting the state of the system at the time of system acceptance.
3. One printed copy of the final version of the Technical and User Manuals.
4. A list of all fixed or static IP addresses and telephone numbers used for devices such as video codecs, telephone hybrids, and control system devices.
5. One (1) copy of all control software programming including control screens and all uncompiled source code. The source codes for the integration of all control system programming shall be delivered to the Owner with unlimited but not exclusive rights at the completion of the installation. This shall include software setup and configuration files for all configurable equipment, including control system processors, custom source code, compiled programs, software-controlled screens, computer workstation controllers, software-configured signal switchers, mixers, DSP units, or other signal processors. The contractor shall provide all installation programs and drivers necessary to transfer the software settings or programs to each respective piece of equipment. In addition, the contractor shall provide complete documentation of the software in the Maintenance Manual.
6. The Final version of the Operation and Maintenance Documentation package as defined in PART 3 of this Section.
7. The systems described herein shall not be deemed "finally accepted" until the final version of the Operation and Maintenance Documentation package has been delivered. The Audio-Visual Installation Contractor shall obtain a receipt stating that the Operation and Maintenance Documentation package has been received.

1.8 ENVIRONMENTAL REQUIREMENTS

A. Systems or equipment installed in environmentally controlled areas shall meet performance requirements specified herein in the following conditions:
1. Temperature: 40°F to 95°F.
2. Humidity: 20% to 80% RH.
3. Air purity: systems shall be capable of continuous operation in an environment where the level of dust, lint, paper fiber, and other airborne particles is equal to that found in a standard office.

B. Systems or equipment installed in indoor environmentally uncontrolled areas shall meet performance requirements specified herein in the following conditions:
1. Temperature: 0°F to 120°F.
2. Humidity: 5% to 95% RH.

C. Systems or equipment installed in outdoor areas shall meet performance requirements specified herein in the following conditions:

1. Wind-driven dust, dirt, sand, and snow for 6 hours.
2. Rain at a maximum rate of 4.0"/hour.
3. Ice loads up to 2.0" measured radially to exposed surfaces.
4. Wind: 85 mph, maximum.
5. Sleet with wind: 55 mph, maximum.
6. Snow cover: 2.0' maximum, measured vertically.
7. Humidity: 0% to 100% RH.
8. Temperature: -30°F to 150°F.

1.9 SPACE CONDITIONS

A. Drawings are diagrammatic in nature and, unless explicitly dimensioned, indicate approximate locations of equipment and components. Changes in the location and offsets of the same, which are not shown on the Drawings but are necessary in order to accommodate building conditions and coordination with the work of other trades, shall be made during the production of shop drawings and prior to initial installation, without additional cost to the Owner.

1.10 DELIVERY, STORAGE, AND HANDLING

A. Control the handling and installation of hardware and equipment items that are not immediately replaceable so that completion of the work will not be delayed by hardware or equipment losses, both before and after installation. Coordinate storage with the Architect.

B. Prior to installation, protect exposed surfaces with material that is easily removed without marring finishes.

1.11 PERFORMANCE VERIFICATION

A. Performance Verification is an ongoing process and shall be performed throughout the installation process. Performance Verification verifies that systems are operating in a manner consistent with the Construction Documents.

B. Performance Verification shall include but shall not be limited to identification of Audio-Visual System devices, cabling, equipment, cleaning, start-up, check-out, testing and adjusting of systems, preparation of equipment and systems documentation and of maintenance and operation manuals, Ownertraining, and preparation of Record Drawings.

C. Performance Verification shall conclude with the completion of required testing, training, and system documentation as specified herein and shall be required to demonstrate the proper operation of the Audio-Visual Systems.

D. Provide an Audio-Visual Systems Performance Verification Supervisor for the Audio-Visual Systems. The Audio-Visual Systems Performance Verification Supervisor shall have a current AVIXA CTS-I certification and 10 years' experience in audio-visual systems contracting. The Audio-Visual Systems Performance Verification Supervisor shall become familiar with the Owner's Project requirements and the requirements of the Performance Verification process as defined in this Section and if applicable, the commissioning process defined in Division 29. The Audio-Visual Systems

Performance Verification Supervisor shall coordinate and execute the required Performance Verification activities. for that subcontractor's scope of work.

E. The Audio-Visual Systems Performance Verification Supervisor shall review submittal data for conformance with the requirements of the Project, shall monitor compliance with the requirements specified herein for storage and protection of equipment during construction, shall oversee testing, and shall document that the scheduled and specified performance requirements of each system have been accomplished.

F. Conform to all codes and standards listed in PART 1, as well as all other applicable federal, state, and local regulations.

G. Comply with AVIXA Standard 10:2013 Audio-Visual Systems Performance Verification.

H. Refer to ASHRAE Guideline 0.2-2015, The Commissioning Process for Existing Systems and Assemblies, and ASHRAE Guideline 4-2008 (RA 2013), Preparation of Operating and Maintenance Documentation for Building Systems.

1.12 WARRANTY

A. Equipment shall be free of faulty workmanship and defects for a period of 1 year from date of Substantial Completion and as specified in the General Conditions.

B. To maintain certain manufacturers' warranties, all equipment must be installed, aligned, and serviced by those installers authorized by each manufacturer to perform those duties. If the Audio-Visual Installation Contractor is not authorized by said manufacturer, it is the Audio-Visual Installation Contractor’s sole responsibility to make the appropriate arrangements and bear all cost and consequences thereof.

C. Replace defective materials and repair faulty workmanship within 2 days of notification at no cost to the Owner during warranty period.

D. In addition to warranty service, provide maintenance service for the warranty period, including at least 2 semi-annual visits to site for checking and adjustment of equipment. During this period, answer service calls within 24 hours. During this period, maintenance calls shall be completed within 3 days of notification and at no cost to the Owner.

PART 2 PRODUCTS

2.1 GENERAL

A. Unless otherwise specified herein or in the Sections identified in PART 1 of this Section, quantities of equipment are indicated on the Drawings.

B. Unless specifically indicated otherwise on the Drawings, all equipment and material shall be new. Refurbished products are not permitted.

C. Performance Criteria listed in this or related Sections shall indicate the minimum performance allowed, unless otherwise noted.

D. Verify correctness of parts lists and equipment model numbers and conformance of each component with manufacturer's specifications.

E. All equipment, whether stock manufactured or custom built, shall be supported by complete and detailed schematic drawings and replacement parts lists. No "black boxes" or unidentified components shall be acceptable.

F. All equipment, except portable equipment, shall be held in place. This shall include equipment, enclosures, components, and cables. Fastenings and supports shall support their loads with a safety factor of at least 3 unless otherwise specified herein. Equipment cabinets shall be square and plumb.

G. Owner-Furnished Equipment:
   1. The Audio-Visual Installation Contractor is not responsible for providing, but is responsible for installing, configuring, and accepting all Owner-Furnished Equipment after testing the equipment.
   2. The Audio-Visual Installation Contractor shall inspect, test, and perform a general cleaning of all Owner-Furnished Equipment.
   3. If any of the equipment needs repair, the Audio-Visual Installation Contractor shall submit written notification that includes a detailed description of the needed repairs and an estimate of the cost of repair.
   4. Specific devices that are Owner-Furnished Equipment are so indicated on the Drawings.

H. Where equipment is specified by a brand name or manufacturer’s make and model number it is intended to be descriptive, but not restrictive, and to indicate the quality and performance characteristics of the article described.

I. Where multiple manufacturers are listed, a selection shall be made from one or more of those manufacturers. Where only one manufacturer is listed, substitutions shall not be allowed without written authorization.

J. Color of all equipment mounted, installed, or used in any generally accessible area of the spaces included herein shall be coordinated with and/or approved as necessary by the Architect.

K. All equipment substitutions and discrepancies identified after award shall be submitted in writing for approval using the same process described herein for requests for information. The substitution request shall include a narrative describing the reason for the substitution, product data sheet(s), functional sketch demonstrating that the proposed substitution will perform in a manner consistent with the design intent.

L. If, at any point after award, a newer model has superseded a manufacturer’s product specified herein, the newest model shall be furnished, provided the new model retains or exceeds all the characteristics of the superseded item specified herein. Submit immediate notification If there is no new or replacement model.

2.2 SEISMIC AND WIND RESTRAINTS

A. Seismic information is contained herein.

B. Seismic force design shall be determined in accordance with the following seismic design criteria:
   1. Seismic Design Category: B.
   2. Risk Category: III.
   3. Component Importance Factor, Ip: 1.25.

C. Provide restraint devices as required for vibration isolated and non-vibration isolated systems and equipment components. Provide calculations to determine restraint loadings for specific equipment to be installed resulting from seismic forces on equipment. Seismic restraint calculations shall be signed by a licensed engineer in the employ of the seismic restraint device manufacturer.

D. For roof-mounted equipment and components both the seismic acceleration and wind loads shall be calculated, and the highest load shall be utilized for the design of the seismic restraints and vibration isolators.

E. Exceptions for components listed within the applicable Project building code may be utilized. However, use of exceptions shall be noted with submitted seismic restraint calculations.

F. Seismic restraints and vibration isolators provided with integral seismic restraint capacity shall have Anchorage Preapproval "R" Number from OSHPD in the State of California listing minimum certified horizontal and vertical load ratings.

G. Floor-Mounted Restraints:
   1. Restraints for neoprene vibrations isolators shall consist of Type DN isolators with the addition of welded steel housings to resist seismic forces.
   2. Manufacturer: Kinetics Noise Control, Mason Industries, VMC Group, Vibration Eliminator, or Vibro-Acoustics.

H. Suspended Restraints:
   1. Restraints for vibration isolated suspended systems or equipment shall consist of galvanized or stainless-steel aircraft cables with end connection fittings designed to swivel to ensure proper cable alignment and avoid bending of cable.
   2. Restraints for non-vibration isolated suspended equipment or raceways shall consist of steel angle or Unistrut with anchor bolts and end connection fittings designed to swivel to the final installation angle.
   3. Manufacturer: International Seismic Application Technology, Kinetics Noise Control, Mason Industries, Tolco, VMC Group, Vibration Eliminator, or Vibro-Acoustics.

2.3 TEST EQUIPMENT

A. Standard testing equipment required to perform start-up, initial check-out, and required functional testing shall be provided by the Audio-Visual Installation Contractor for the equipment or system being tested.

B. Specific test equipment and devices and additional testing requirements are identified in each of the Sections listed in PART 1 of this section.

C. Test equipment shall be of the quality and accuracy required to test and/or measure system performance with the tolerances specified and shall have been calibrated within the last 12 months, or as specified herein. Equipment shall be calibrated according to the manufacturer's recommended intervals and when dropped or damaged. Calibration tags shall be affixed or certificates available on request. Accuracy of other sensors shall be at least twice that of the instrumentation being tested.

2.4 OPERATION AND MAINTENANCE DOCUMENTATION PACKAGE

A. Each manual shall contain printed operation instructions for all system functions whose format has been compiled specifically for each system. Providing standard factory equipment operating instructions alone is not acceptable .

B. Operation and Maintenance Documentation shall be provided in hardback 3-ring binders, except printed full size drawings, which shall be provided as stapled sets. All documents shall also be provided on USB drive or delivered via an electronic document service such as Dropbox, Google Drive, or MIcrosoft SharePoint. Electronic transfer of digital files is permitted if a write-protected electronic copy is delivered in addition to the electronically transferred files.

1. The “Maintenance Manuals” shall include:
    a. Contact information, to include regular service and emergency service (if different), for the Audio-Visual Installation Contractor.
    b. Copies of software configuration files and/or programming files, as applicable, on CDs or other write-protected media, for every system component for which software was used in the configuration. This includes, but is not limited to uncompiled control code files, audio matrix mixer configuration files, and video matrix switch configuration files.
    c. Emergency Information:
        1) Information for technical and nontechnical personnel about actions recommended during emergency situations to protect property and to minimize disruption to the building occupants. Emergencies shall, at a minimum, include:
            a) Power failure.
            b) Heating failure.
            c) Cooling failure.
            d) Control system failure.
            e) TCP/IP network failure.
    d. Manufacturer’s literature, to include descriptive literature and performance specifications, operating manuals, and servicing information.
    e. Schedule of nominal control settings for proper system operation.
    f. A restatement of the terms and conditions of the warranty system and warranty service including any extended Original Equipment Manufacturer (OEM) warranties beyond the standard one-year warranty required herein.
    g. Inventory Listing Reports.
    h. Complete documentation of installed software.
    i. Recommended list of spare parts, part numbers, and the place(s) from which they can be obtained if the Audio-Visual Installation Contractor is not able to provide them.
    j. Test Reports and Certifications:

1) Certification of seismic and wind restraints.
2) Reports from performance tests as outlined in Section 274010, Audio-Visual General and other Sections identified in PART 1 of this Section.

k. Construction Documents:
1) Record Documents, including but not limited to:
a) Detailed functional block diagrams which illustrate as-built conditions identifying each equipment item by manufacturer and model number, labeling alpha-numerically all contractor furnished controls, relays, patch panel jacks, and other similar devices and referencing these designations on fabrication drawings, patch panel details and other related instruments.
b) Final rack elevation drawings.
c) Detailed as-built drawings of all contractor fabrications illustrating the mechanical and electrical construction with manufacturer's part numbers and values for all components. Also included shall be floor and reflected ceiling plans indicating device layouts and locations throughout the spaces included in the contract.
2) Record Drawings.
3) Approved Submittals.
4) Warranty certificates.
5) Inspection certificates.
6) Performance Verification report.

l. A restatement of the terms and conditions of the warranty system and warranty service including any extended Original Equipment Manufacturer (OEM) warranties beyond the standard one-year warranty required herein.

m. All financial documentation related to the Project, including but not limited to proposals, contracts, purchase orders, and receipts.

2. The "Operation Manuals" shall include:
a. Systems operating instructions for each system specifically describing the functions, operation, and maintenance of the system installed. The instructions shall be written in full detail for comprehension by non-technical persons. This includes, but is not limited to:
1) System and/or equipment specifications.
2) Operating routines and procedures.
3) User programming instructions.
4) Special procedures.
5) Basic troubleshooting.
6) Administrative user IDs and passwords for all equipment provided that includes such a feature.

b. Schedule of nominal control settings for proper system operation.

c. Troubleshooting guide for system operators, listing the procedures to follow in the event of an apparent equipment failure, written in logical outline form.

d. Simplified as-built block diagrams deleting alpha-numeric references to controls, relays, patch panel jacks and other similar devices

PART 3 EXECUTION

3.1 GENERAL

A. This paragraph contains general execution, testing, performance verification support, and warranty requirements. Additional execution requirements are identified in PART 3 of the Specification Sections listed in PART 1 of this Section.

B. Installation shall include the delivery, unloading, setting in place, fastening to walls, floors, ceilings, counters, or other structures where required, interconnecting wiring of the system components, equipment alignment and adjustment, and all other work whether or not expressly required herein which is necessary to result in complete operational systems.

C. Provide all necessary incidental equipment or devices to deliver a complete and operable system.

D. Verify correctness of parts lists and equipment model numbers and conformance of each component with manufacturer's specifications.

E. Equipment shall be installed in accordance with the manufacturer's instructions.

F. Furnish special installation equipment or tools necessary to properly complete the system, including but not limited to, tools for terminating, testing, and splicing fiber optic and shielded Category cables.

G. Equipment, except portable equipment, shall be held in place. This shall include equipment, enclosures, components, and cables. Fastenings and supports shall support their loads with a safety factor of at least 3 unless otherwise specified herein.

H. Prevent and guard against electromagnetic and electrostatic hum and install the equipment to provide safety for the operator.

I. Repair or replace any equipment or materials damaged during the construction or installation period.

J. Provide firestopping for all new penetrations made in support of the installation. Repair or replace any firestopping that is damaged or removed during installation. Firestopping shall adhere to all applicable codes and building standards that may be in force.

K. Provide power connections from existing panels and/or to equipment included in this Scope as indicated on the Drawings.

3.2 SPACE CONDITIONS

A. General:

1. Verify dimensions of equipment, equipment arrangements, space availability (including any millwork or cabinetry provided by others), and provide systems that work within the constraints of the space available. Submit written notification of any situation where space constraints are a problem, prior to the ordering or purchase of equipment. The Audio-Visual Installation Contractor shall bear the expense of providing alternate equipment which will work within the available space if space availability problems are discovered after equipment is ordered.

2. Provide access to equipment and components requiring operation, service, or maintenance for the life of the system.
3. Coordinate layout and installation of all equipment in this scope, including, but not limited to, projection screens, mounted displays, and speakers with other construction supported by, or penetrating through, ceilings, including light fixtures, HVAC equipment, fire-suppression system, and partitions.

B. EQUIPMENT AND EQUIPMENT ROOMS
1. Protect any equipment stored or installed on-site covered by this Scope from extreme temperatures, corrosive agents, dust, water, or other debris until the spaces included herein are considered climate controlled and dust free. Re-protect any equipment as required when building modifications are required after the building is considered climate controlled and dust free.
2. Remove dust, dirt, rust, stains, and temporary covers.
3. Foreign matter shall be blown, vacuumed, or cleaned out of and from new equipment, devices, switches, controls, and panels.
    a. In equipment rooms, clean equipment conduit and room surfaces from dust and dirt and maintain in a clean condition from date of Substantial Completion until final completion of work and corrective work.

3.3 IDENTIFICATION

A. General:
1. Identification shall consist of UPPER-CASE LETTERS.
2. Where identification is applied to surfaces which require a finish, identification shall be installed after the surface has been finished.
3. Cables:
    a. Cables, regardless of length, shall be marked with preprinted, wrap-around number or letter cable markers at both ends. Markers shall be permanently affixed with heat-shrink tubing. There shall be no unmarked cables at any place in the system. Marking codes used on cables shall be indicated on the Record Drawings.
    b. See Section 274140, Audio-Visual Cabling and Connectors for additional requirements.
4. Equipment:
    a. Provide and install laser labels for each piece of rack-mounted equipment. Labels shall be white text on black background or black text on white background, as appropriate to make the text as visible as possible.
    b. Minimum labeling shall include a device identifier consistent with the as-built drawings and network or control identification (address) for each device.
    c. Except where otherwise specified herein, label switches, controls, and receptacles. Labeling material shall be laser labels. Labels shall be placed on cover plates or directly adjacent to switches, controls, and receptacles to facilitate service and replacement.
    d. Signs shall not cause interference with operation and maintenance of equipment. Attach signs with rustproof screws.
    e. All equipment, including cables, shall have externally visible labels tha tindicated the equipment's serial number or cable connection points.

3.4 PERFORMANCE VERIFICATION PROCEDURES

A. General
   1. The Audio-Visual Systems Performance Verification Supervisor shall be responsible for scheduling, supervising, coordinating, and executing the testing and Performance Verification activities as specified herein.
   2. Specific Audio-Visual performance verification procedures required at various milestones of the installation are described below.
   3. Submit additional documentation as required to support the Performance Verification process. This additional submittal documentation shall include, at a minimum, the proposed functional testing plan, and functional testing checklists.
   4. Change factory default usernames and passwords on all devices requiring log in. Record passwords in a table and include with Submittals as required above.

B. The Audio-Visual Installation Contractor's Test Plan shall include:
   1. Provide documentation of installed systems and equipment and develop functional testing procedures, prior to normal operation and maintenance manual submittals. This documentation shall include detailed manufacturer installation, operating, troubleshooting and maintenance procedures; full factory testing reports, if any; and full warranty information, including responsibilities of the Owner to keep the warranty in force. In addition, the installation materials that are actually shipped inside the equipment, and the actual field check-out sheet forms to be used by the factory or field technicians shall be submitted.
   2. Develop and submit for review and comment, prior to system functional testing, a complete functional testing plan using manufacturer's testing procedures and functional testing checklists for the performance of the equipment to be verified.
   3. Assist in clarifying the proposed operation and control of equipment in areas where the Specifications, Drawings, or equipment documentation is not sufficient for writing detailed testing procedures.
   4. Reference shall be made to all applicable standards for test methods, equipment, and reporting values, or to best industry practices when test requirements are not addressed by specific standards.
   5. Review the proposed functional test procedures to ensure feasibility, safety, and equipment protection. Obtain approval from the Architect for proposed functional test procedures.
   6. Prepare a preliminary schedule for Performance Verification activities, including equipment testing and adjusting from start to completion, and update the schedule during the construction period, as appropriate. Submit immediate notification when the verification activities not yet performed, or not yet scheduled, will delay construction.
   7. Provide functional testing for equipment and execute the Audio-Visual Systems-related portions of the functional checklists for the verification of the performance of all the equipment during the testing process.

C. Construction Phase Procedures:
   1. During the construction phase of the Project, transmit a status update report upon request. The status update report shall include digital photographs of areas where significant progress has been made. Digital photographs shall be minimum 10 MP in resolution. Both the detail in the report and the detail in the photographs shall be sufficient for the Engineer to assess the progress made to date . Periods of inactivity will require only a retransmission of the most recent form (via e-mail), updated to reflect the new date, and that no significant progress has

been made since the last status report was submitted. Status reports will be required not more than once every two weeks..

2. Perform and document functional tests results, and sumibt a copy of said results.
3. Correct noncompliance items before beginning acceptance testing. Discrepancies and problems shall be remedied before acceptance testing.

D. Construction Phase Testing:
   1. Functional testing shall be performed as required to ensure that the equipment and systems are properly installed and ready for operation, so that acceptance testing may proceed without delay. Follow the approved functional testing procedures. Sampling strategies shall not be used for functional testing unless explicit direction to do so is given in this or another Section. The functional testing for equipment and subsystems of a given system shall be successfully completed and documented prior to acceptance testing of a system.
   2. Specific test equipment and devices and additional testing requirements are identified in each of the Sections listed in PART 1 of this Section.
   3. Functional testing plan: develop the detailed functional testing plans for equipment and systems for which the performance is to be verified, as specified herein. Review the proposed procedures and functional testing documentation to ensure that there is written documentation the each of the manufacturer-recommended procedures has been completed.
   4. The functional testing plan shall include the manufacturer's standard written check-out procedures copied from the installation manuals and manufacturer's normally used field check-out sheets. The plan shall include checklists and procedures with specific boxes or lines for recording and documenting the tests recommended by the equipment manufacturer, and as specified herein. Each checklist shall include a summary statement with a signature block at the end of the plan.
   5. Interior finishes and furnishings shall be in place for all testing where finishes and furnishings could have an impact on the testing outcome(s).
   6. Documentation of performance tests shall be maintained for reference during the system acceptance tests.
   7. Tests may include subjective listening and/or viewing at various positions under various operating conditions, using live or recorded material.
   8. Grounding Tests:
      a. Measure the ground conductor impedance from the ground of each receptacle serving systems in this scope to the project ground electrode.
      b. Measure the impedance of the connection from each enclosure or enclosure group to the project ground electrode.
      c. In each case, the impedance shall be less than 5.0 Ω.
      d. Record results.

E. Acceptance Phase Procedures:
   1. Place equipment and systems into operation and continue their operation during each working day of the acceptance testing and verification activities, as required.
   2. Provide skilled technicians to execute acceptance testing of each system. Technicians shall be available and present during the agreed upon scheduled acceptance tests and for sufficient duration to complete the necessary tests, adjustments and problem-solving.
   3. Perform acceptance testing for specified systems and equipment as directed by the Architect and interpret the test data as necessary.

4. Correct deficiencies (differences between specified and observed performance) as identified and interpreted by the Architect and retest the equipment as required to demonstrate proper operation and performance.
5. Prepare operation and maintenance manuals as specified, including clarifying and updating the original sequences of operation to as-built conditions.
6. Maintain marked-up record drawings and produce final record drawings of Project Drawings and Contractor-generated coordination drawings.
7. Provide specified training of the Owner operating personnel.
8. Coordinate with equipment manufacturers to determine specific requirements to maintain the validity of the warranty.

F. Acceptance Phase Testing:
1. Before obtaining permission to schedule the acceptance tests, provide written certification that each system has been calibrated, tested, and is ready to begin the 14-day burn-in period and acceptance testing.
2. Conduct Final Acceptance test after a period of not less than 14 consecutive normal working days of trouble- free operation.
3. During this burn-in period, each system shall operate continuously for 24 hours per day. During the acceptance test, demonstrate the correct operation of features and capabilities specified herein.
4. The Architect reserves the right to witness the acceptance tests. Submit notification with at least 10 days prior to the date scheduled for the tests.
5. The Contractor's manufacturer-certified control systems programmer shall be available and on site to assist in the testing of the Systems and to perform control code, configuration, and GUI modifications as required during testing.

G. Retesting of Equipment and/or Systems
1. Provide labor and materials required for retesting of any functional test found to be deficient.
2. Prior to retesting, submit required data indicating that the deficient items have been completed and/or corrected for approval and rescheduling of the functional test. If during the retesting it becomes apparent that the deficient items have not been completed and/or corrected as indicated in the data provided by the Contractor, the retesting shall be stopped. Costs for the Design Team to further supervise the retesting of a functional test shall be the responsibility of the Contractor.

H. Testing Documentation, Nonconformance, and Approvals
1. Submit a list of outstanding items of the functional testing procedures that were not completed successfully within 48 hours of test completion. The Architect will then review the Contractor's functional testing reports and submit either a noncompliance report or an approval form to the Audio-Visual Installation Contractor. Retest deficiencies or uncompleted items. Correct items that are deficient or incomplete in the checklists and tests in a timely manner and indicate as soon as outstanding items have been corrected. Resubmit an updated report and a statement of correction on the original noncompliance report.
2. When requirements are completed, the Architect will recommend approval of the functional testing of each system and schedule the acceptance testing of the equipment or system
3. As acceptance testing progresses and deficiencies are identified, work with the Architect to resolve the deficiencies found.

I. Warranty Period:

1. Correct deficiencies and make necessary adjustments to operations and maintenance manuals, and as-built drawings system or equipment modifications made during the warranty period.

3.5 RECORD DRAWINGS

A. Refer to Section 01.

B. A record of field and as-installed conditions shall be maintained at the site, shall be kept current throughout the Project, and shall be used in preparation of the final Record Drawings. Field and as-installed conditions shall be recorded on Design Drawings and shall be marked to include addenda, change orders, field changes, and selections made during construction.

C. Concurrent with Substantial Completion, submit 2 sets of prints indicating field and as-installed conditions of raceways and equipment, and incorporating changes made during construction.

D. Upon completion of the Project, submit marked-up drawings indicating field and as-installed conditions, and shop drawings incorporating changes made during construction for raceways and equipment. This shall include two sets of bound prints and full-size PDFs delivered electronically using a mutually agreed-upon method.

3.6 MAINTENANCE

A. Equipment operated prior to the date of theSubstantial Completion shall be maintained in accordance with manufacturer’s recommendations.

B. Provide replacement fuses, lamps, batteries, and other necessary consumable supplies in sufficient quantities to last one (1) year under normal use conditions.

3.7 INSTRUCTION OF OPERATING PERSONNEL

A. General
   1. Conduct formal instruction sessions for operating personnel for all systems described herein and/or on the Drawings. This shall include separate types of sessions for “operating/user personnel” and “technical support personnel.” Each type of session shall be specifically geared toward the appropriate group, with the training for technical support personnel containing more information and detail than that of the operating/user personnel.
   2. In the event the Contractor does not have qualified instructors on staff for any given device, a manufacturer's representative capable of such instruction shall be provided by the Contractor at no additional cost to the Owner. All training shall take place after the Owner takes possession of the system, at a time convenient to the Owner.
   3. Coordinate the schedule of the training sessions with the Owner. Provide up to two occurrences of the same training session if required.
   4. Obtain a receipt signed by the Owner that all training has been completed. If the Owner declines any of the above training, the receipt shall so indicate.
   5. For each session, prepare and make available to each participant an outline indicating the components or major items to be reviewed.

B. Operational ("Operator/User") Training Sessions
   1. The total duration of all “operator/user personnel training” sessions shall be at least two hours and distributed amongst the system types as directed by the Owner.
   2. The content of these sessions shall include:
      a. General familiarization and operating procedures.
      b. All end-user functionality.
      c. User level trouble shooting and identification of common user errors.

C. Technician training shall include the following:
   1. The total duration of all “technical support personnel training” sessions shall be at least four hours and distributed amongst the system types as directed by the Owner.
   2. The content of these sessions shall include:
      a. All content presented (or to be presented) at the Operator/User training sessions.
      b. Routine maintenance procedures for equipment and systems.
      c. User level programming of programmable systems.
      d. Technician level troubleshooting, including resetting systems and equipment diagnostics.

D. All training sessions shall be video recorded. These shall be encoded in a common video format, such as MPEG-4, and delivered to the Owner via a mutually acceptable digital media storage device and/or electronically (cloud or file sharing service).

END OF SECTION

SECTION 274105 - AUDIO-VISUAL EQUIPMENT ENCLOSURES AND TECHNICAL FURNITURE

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Floor-mounted equipment cabinets.

B. Surface raceway systems.

C. Flip-top recessed connector boxes.

D. Enclosure accessories.

E. Responsibilities and obligations in support of the Performance Verification specified in Section 274010, Audio-Visual General.

1.2 RELATED REQUIREMENTS

A. 274010 - AUDIO-VISUAL GENERAL.

B. Section 274106, Audio-Visual Power Distribution and Management Equipment.

C. Section 270526, Grounding and Bonding for Communications Systems.

D. Additional requirements as shown on the Drawings.

1.3 REFERENCE STANDARDS

A. Conform to all codes and standards listed in PART 1 of Section 274010, Audio-Visual General.

B. AVIXA F502.01:2018, Rack Building for Audio-Visual Systems

1.4 SUBMITTALS

A. General submittal requirements as identified in Section 274010 - AUDIO-VISUAL GENERAL. In addition to those requirements, submittals for this Section shall include the following:
   1. Elevations of console or rack-mounted equipment including equipment locations. This shall include any accessories mounted to the sides, top, bottom, frame, or to the outside of the rack.
   2. General cabling routing paths into, out of, and through each equipment rack.
   3. Detailed drawings showing dimensions of all millwork elements and any other custom manufactured enclosures. This shall include, at a minimum, top view, bottom views, a view from each side, panels removed as required to show racks or other equipment locations on the

interior and cut outs for connector plates or recessed flip top boxes. It shall also include a parts list.

4. Drawings of existing furniture and millwork showing the location(s) where grommet holes and/or cut outs for flip top boxes will be drilled or cut.
5. A sample of all finish materials, including but not limited to stains, paints, and laminates for enclosures placed in view of general building occupants. Samples shall be no smaller than 12" H x 12" W and shall be prepared on the same material specified for the enclosure it represents. This paragraph explicitly excludes enclosures placed in rooms accessible only to system technical support staff.
6. Plans and elevations showing all surface mount raceway, dimensioned, and annotated with part numbers for all required components.

PART 2 PRODUCTS

2.1 GENERAL

A. Enclosures shall be rated and certified to seismic applications based on seismic information shown on the Drawings and specified in Section 274010, Audio-Visual General.

B. All products listed in this Section may have additional requirements shown on the Drawings.

C. Equipment racks shall have sufficient racking height or rack units (RUs) to accommodate the equipment as shown on the Drawings.

D. Unless otherwise noted, all equipment racks shall be configured for standard 19" rack panels.

E. All equipment racks with locking doors shall be keyed alike.

F. Provide lacing bars, fixed shelves, straps, side mounting rails, and any accessories as shown on the Drawings.

G. All equipment racks shall be black unless otherwise noted.

2.2 FLOOR-MOUNTED EQUIPMENT CABINETS

A. Minimum 16-gauge steel construction.

B. Gangable where shown immediately adjacent to another rack on the Drawings.

C. Ventilation to accommodate manufacturer's cooling recommendation(s) for equipment housed in the rack.

D. Provide side panels, doors, fan tops, and caster bases as indicated on the Drawings.

E. Minimum depth shall be 24", unless otherwise noted.

F. Manufacturer: Middle Atlantic, Lowell, Atlas, Panduit.

2.3 SURFACE RACEWAY SYSTEMS

A. Raceway that includes power distribution shall have UL-rated partitions to isolate the line voltage from the low voltage signal cable.

B. Over-The-Floor Raceway:
   1. ADA-compliant.
   2. Base constructed of extruded aluminum.
   3. Cover constructed of steel.
   4. Dimensions, channels, breakout boxes, and connectivity as shown on the Drawings.
   5. Transition pieces as shown on the Drawings.
   6. Color: Black, unless otherwise indicated on the Drawings.
   7. Manufacturer: Wiremold/Legrand, Extron, Connectrac.

C. Wall-Mounted Raceway:
   1. Dimensions, channels, breakout boxes, and connectivity as shown on the Drawings.
   2. Transition pieces as shown on the Drawings.
   3. Construction: Aluminum.
   4. Manufacturer: Wiremold/Legrand, Hubbell, Cables 2 Go, Panduit.

2.4 FLIP TOP RECESSED CONNECTOR BOXES

A. Aluminum construction.

B. Quantity as shown on the Drawings.

C. Dimensions as shown on the Drawings.

D. Connectivity and power as shown on the Drawings.

E. Manufacturer: Extron, Crestron, FSR.

2.5 RACK ACCESSORIES

A. Manufacturer: Middle Atlantic, Atlas, Lowell, Odyssey, Gator.

B. Rack Drawers:
   1. Steel construction.
   2. Key lockable.
   3. Compatible with standard 19” wide equipment racks.
   4. Depth: 14.25”.
   5. Height: 4 RU.

C. Rack Shelves:
   1. Steel construction.
   2. Pre-drilled as required to mount equipment as shown on the Drawings.

PART 3 EXECUTION

3.1 EQUIPMENT ENCLOSURES

A. See the Drawings for equipment rack layout and additional requirements.

B. For wall-mounted racks, prior to installation:
   1. Verify that blocking has been installed to support the rack in the position shown.
   2. Verify that raceway and box locations, and rack mount location, will allow rack to swing open to allow access to the rear of equipment and rack mounting pan.

C. Equipment enclosure assembly, loading, and dressing shall be in accordance with AVIXA F502.01:2018.

D. Secure enclosures in place with insulating hardware.

E. Enclosures shall be completely insulated from the raceway system, floor ducts, building structure, ductwork, and piping.

F. Adjacent enclosures shall be separated to prevent contact with each other.

G. Provide and install plastic laser-printed labels for each item of rack-mounted equipment.

H. Provide ventilation according to equipment manufacturer’s recommendations.

I. Where controls or equipment are specified herein or indicated on the Drawings for future installation, space shall be provided in the enclosures as necessary to accommodate that equipment.

J. Provide unused equipment enclosure panel space with blank or ventilating panels.

3.2 SURFACE RACEWAY SYSTEMS

A. Install power cables in separate channel from low-voltage cable.

B. Cut raceway to length as required and provide necessary coupling hardware.

C. Secure in place per manufacturer’s instructions.

D. Provide incidental parts, including but not limited to couplers, trim rings, mounting brackets, elbows, junctions, and other parts not specifically identified to provide the pathway(s) and continuity shown on the drawings.

3.3 FLIP TOP RECESSED CONNECTOR BOXES

A. Cut and/or route furniture as necessary to install recessed flip top boxes per manufacturer’s instructions at locations as shown on the Drawings. Coordinate locations with Architect.

B. Install recessed flip top boxes in cut-outs in furniture. Cut-outs are fabricated by others.

3.4 EQUIPMENT ENCLOSURE AND TECHNICAL FURNITURE PERFORMANCE VERIFICATION

A. General Performance Verification requirements are contained in Section 274010, Audio-Visual General.

B. Performance Verification of the equipment included herein should be conducted in accordance with requirements in other Specification Sections that cover related equipment.

END OF SECTION

SECTION 274106 - AUDIO-VISUAL POWER DISTRIBUTION AND MANAGEMENT EQUIPMENT

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Power distribution equipment.

B. Uninterruptible power supplies.

C. Equipment rack grounding bus bars for audio-visual equipment racks..

D. Grounding requirements.

E. Responsibilities and obligations in support of the Performance Verification specified in Section 274010, Audio-Visual General.

1.2 RELATED REQUIREMENTS

A. General provisions in Section 274010, Audio-Visual General, and other Sections of Division 27.

B. Section 270526, “Grounding And Bonding for Communications Systems.”

C. Section 274105, “Audio-Visual Equipment Enclosures and Technical Furniture.”

D. Additional requirements as shown on the Drawings.

1.3 REFERENCE STANDARDS

A. Conform to all codes and standards listed in PART 1 of Section 274010, Audio-Visual General.

1.4 SUBMITTALS

A. General submittal requirements as identified in Section 274010, Audio-Visual General. In addition to those requirements, submittals for this Section shall include the following:
   1. Single line diagrams of all power connections showing receptacles to which equipment included in this Project will connect.
   2. A detail showing sequence of power on and off operations when appropriate.
   3. Power cable routing paths into, out of, and through each equipment rack.
   4. Mounting of power equipment in equipment enclosures, furniture, and other surfaces (i.e. a surge suppressor mounted behind a speaker or display).
   5. A schedule of anticipated electrical loads to be coordinated with the Electrical Contractor as necessary.

PART 2 PRODUCTS

2.1 GENERAL

A. All products listed in this Section may have additional requirements shown on the Drawings.

B. Coordinate equipment covered by this Section with enclosures and furniture specified in Section 274105, Audio-Visual Enclosures and Technical Furniture.

C. Unless otherwise noted, all electrified components described in this section shall support or be rated for:
   1. Voltage: 120 V AC.
   2. Amperage: 20 A.

2.2 AC POWER DISTRIBUTION AND MANAGEMENT

A. General:
   1. Except as otherwise specified herein , grounding conductors shall be insulated. Insulation shall be rated 600 V. Conductors shall be continuous from connector to connector with no splices. Grounding connectors shall be solid bronze, compression type, and designed for the intended use.
   2. Power wiring for the extension of power circuits provided by others shall be #12 AWG THWN/THHN or XHHN, 600 V, rated at 194°F.
   3. AC power equipment shall have LED or lamp status devices to provide indication that the systems are on.
   4. Power configuration, unless otherwise noted: standard ground.
   5. All power and distribution devices shall be UL-rated.
   6. Voltage, unless otherwise noted: 120 V AC.
   7. Control protocol, unless otherwise noted: TCP/IP.
   8. Manufacturer: Middle Atlantic, Surge-X, APC, Furman.

B. Vertical AC Power Distribution and Management:
   1. Chassis configuration: fixed.
   2. Total maximum current draw, per circuit: 20 A.
   3. Lighted master power switch.
   4. Outlet control: individual.
   5. Mains power connection type: hardwire for connection to junction box.
   6. Unit shall have integral two-stage transient surge suppression:
      a. Unit shall be accordance with IEEE C62.41.1-2002 (R2008), IEEE C62.41.2-2002 (COR 1-2012), and UL 1449-2014 (R2018).
      b. Peak Impulse Current, 8/20 microseconds waveform, minimum: 30,000 A, one time, 19,500 A two times in 5 minutes.
      c. Maximum response time: 1 ns.

C. Rack-Mountable AC Power Distribution and Management:
   1. Outlets, minimum: 8 switched.

2. Total maximum current draw: 20 A.
3. Lighted master power switch.
4. Individual Outlet control.
5. Unit shall have integral two-stage transient surge suppression:
   a. Unit shall be accordance with IEEE C62.41.1-2002 (R2008), IEEE C62.41.2-2002 (COR 1-2012), and UL 1449-2014 (R2018).
   b. Peak Impulse Current, 8/20 ms waveform, minimum: 30,000 A, one time, 19,500 A two times in 5 minutes.
   c. Maximum response time: 1 nanosecond.

D. Stand-Alone AC Power Distribution and Management:
1. Chassis with brackets to allow surface or direct to device mounting.
2. Individually switched outlets, minimum: 2.
3. Voltage: 120 V AC.
4. Total maximum current draw: 20 A.
5. Unit shall have integral two-stage transient surge suppression:
   a. Unit shall be accordance with IEEE C62.41.1-2002 (R2008), IEEE C62.41.2-2002 (COR 1-2012), and UL 1449-2014 (R2018).
   b. Peak Impulse Current, 8/20µS waveform, minimum: 30,000 A, one time, 19,500 A two times in 5 minutes.
   c. Maximum response time: 1.0 ns.
6. Lighted master power switch.

2.3 UNINTERRUPTIBLE POWER SUPPLIES (UPS)

A. Capacity: 1000 VA.

B. Voltage, unless otherwise noted: 120 V AC.

C. Maximum transfer time: 0 ms.

D. Protection of AC power and network circuits.

E. Integral lightning and surge protection complying with IEEE C62.41.1-2002 (R2008), IEEE C62.41.2-2002 (COR 1-2012), and UL 1449-2014 (R2018).

F. Integral automatic current and overvoltage protection.

G. Batteries: Hot-swappable 12 V (9 AH) minimum, sized to sustain the rated full and half loads for the times indicated on the Drawings.

H. Rack-mountable.

I. Network controllable and manageable via software.

J. Manufacturer: Middle Atlantic, APC, Liebert, Eaton.

2.4 EQUIPMENT RACK GROUNDING BUS BARS (RBB)

A. See “RBB,” Section 270526, Grounding And Bonding for Communications Systems.

2.5 SECONDARY BONDING BUSBARS

A. See “SBB (TGB),” Section 270526, Grounding And Bonding for Communications Systems.

PART 3 EXECUTION

3.1 GENERAL

A. Provide power connections from electrical panels to equipment in this scope.

B. When the scope of work requires installing equipment into existing equipment racks, coordinate as required prior to procuring equipment to ensure that sufficient space exists to properly house equipment per this design and manufacturer recommendations.

3.2 EQUIPMENT ENCLOSURES

A. Mount an AC enclosure wiring diagram in each enclosure with the following information:
   1. The number of AC power circuits within the enclosure.
   2. A schematic diagram showing the incoming AC circuits and the location and quantity of outlets fed by each circuit.
   3. The current capacity of each circuit.
   4. The location of the breaker panel and the number of various breakers.

3.3 AC POWER

A. Provide master AC power switching capability for each circuit entering each enclosure.

B. Where multiple AC power circuits serve one system, each circuit shall have at least one power conditioner with AC power switching capability.

C. Provide sufficient receptacles via vertical and/or horizontal power strips for the equipment housed in the rack plus 20% overage.

3.4 GROUNDING

A. See Section 270526, “Grounding And Bonding for Communications Systems.”

B. The Contractor shall ensure that all power circuits are on the same electrical phase and that all ground cables are only connected to one point at the power breaker panel.

C. Equipment shall be grounded in accordance with the equipment supplier's recommendations.

D. Bus bars shall be electrically isolated from the mounting surface.

E. Size grounding conductors as follows:
   1. See Section 270526, “Grounding And Bonding for Communications Systems.”

F. A single primary specialty system ground shall be established for the specialty systems in each enclosure as indicated on the Drawings and as follows:
   1. Unless otherwise indicated on the Drawings, an “enclosure” shall be defined as a non-moveable free-standing or wall-mounted metallic equipment enclosure, or multi-post rack designed to house multiple devices. Such devices shall be either in a rack (RU) configuration or accessory device attachment panels or shelves.
   2. In each enclosure install a copper bus bar mounted to the enclosure on insulated support blocks to act as the ground unipoint for the connection of ground conductors used within that enclosure. Terminate insulated ground conductors to the bus bar with torqued machine screws. Bars shall be bounded to enclosures in accordance with the grounding conductor sizing requirements.
   3. Ladder rack and cable tray shall be bonded per NEC and isolated from the equipment enclosure.
   4. Conduit shall be isolated from enclosures with insulated fittings.

G. Surge Suppression Equipment Grounding:
   1. Connect each suppressor to the local ground bus in the terminal cabinet with wiring sized as recommended by the manufacturer. Where M-block-type terminations/suppressors are used, bond the ground rail to the local ground bar with wiring as recommended by the manufacturer.
   2. Coordinate to ensure that the 120 V AC power source/supply suppressor is also grounded to the same local ground bus as suppressors provided in this Section for the same system.

3.5 PERFORMANCE VERIFICATION.

A. General Performance Verification requirements are contained in Section 274010, Audio-Visual General.

B. Performance Verification of the equipment included herein should be conducted in accordance with requirements in other Specification Sections that cover related equipment.

END OF SECTION

SECTION 274110 - MICROPHONES, CONFERENCING SYSTEMS, AND AUDIO SOURCE EQUIPMENT

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Wired handheld and stand-mounted microphones.

B. Wired gooseneck microphones.

C. Performance wireless microphones.

D. Microphone mounts and other accessories.

E. Responsibilities and obligations in support of the Performance Verification specified in Section 274010, Audio-Visual General.

1.2 RELATED REQUIREMENTS

A. General provisions in Section 274010, Audio-Visual General, and other Sections of Division 27.

1.3 REFERENCE STANDARDS

A. Conform to all codes and standards listed in PART 1 of Section 274010, Audio-Visual General.

1.4 SUBMITTALS

A. General submittal requirements as identified in Section 274010, Audio-Visual General. In addition to those requirements, submittals for this Section shall include the following:
   1. Floor plan showing locations of all permanently installed equipment, including but not limited to microphones, wireless microphone transmitters, conferencing units, and wireless microphone antennae. “Permanently installed” includes microphones that are typically left in place, whether they are physically affixed or attached to a surface or not.
   2. Floor plan showing coverage lobes of digitally steerable microphones.
   3. Report of a frequency spectrum analysis performed at the project site showing available frequencies and the frequencies to be used by the wireless microphones in this Project.

PART 2 PRODUCTS

2.1 GENERAL

A. See Drawings for additional requirements.

B. Quantities of devices herein are indicated herein.

C. Performance criteria or physical characteristics specified herein represent minimum acceptable values unless noted otherwise.

D. Microphones of the same type shall be from a single manufacturer.

E. Microphones shall be black unless otherwise noted or the microphone is only available in a single color.

F. Outputs of microphones shall be 150 Ω nominal, balanced with respect to ground.

2.2 WIRED HANDHELD AND STAND-MOUNTED MICROPHONES

A. Provide microphone stand clip adapter and soft or hard storage case for each handheld microphone.

B. Element type, pick-up pattern, frequency response, and other properties as indicated on the Drawings.

C. Functionally designed for handheld vocal and/or instrument applications.

D. Multi-position frequency roll of switch and on/off switch when indicated on the Drawings.

E. Shock-isolated element.

F. Integral windscreen and pop filter.

G. Male 3-pin XLR connector.

H. Manufacturer: AKG Acoustics, Audio-Technica, Beyerdynamic, DPA, Electro-Voice, Neumann, Sennheiser, Shure.

2.3 WIRED GOOSENECK MICROPHONES

A. Functionally designed for podium or desk applications.

B. Form factor: manufactured as a single unit or modular (interchangeable capsules, goosenecks, base types, etc.) as shown on the Drawings.

C. Desktop or shock mount as indicated on the Drawings.

D. Length as indicated on the Drawings.

E. Polar pattern: Cardioid.

F. Removeable foam windscreen.

G. Switch, unless otherwise noted: membrane type with selectable mute, push to mute, and push to talk modes.

H. Status indicator: Multicolor LED element on the base.

I. Immune to RF interference.

J. Remote controllable via contact closure where shown on the Drawings.

K. Manufacturer: AKG Acoustics, Audio-Technica, Clock Audio, Beyerdynamic, Sennheiser, Shure.

2.4 PERFORMANCE WIRELESS MICROHPONE SYSTEMS

A. General:
1. Operating RF frequency range: selected from the manufacturer's standard bands available in the area the wireless microphones will be used, as determined by a frequency scan performed by the Audio-Visual Contractor.
2. Line-of-sight working range, minimum: 328.0'.
3. Up to 64 MHz tuning range.
4. Tuning step: 25 kHz.
5. 48 kHz / 24-bit digital audio encoding.
6. AES 256-bit encryption.
7. Latency: <2.9 ms.
8. Ethernet-controllable.
9. Digital modulation.
10. Minimum battery life: 8.0 hours.
11. Transmitters shall have gain adjustment.
12. Provide a soft or hard storage case for each transmitter.
13. Compliant with FCC Part 15, Subpart AC, 2018, and FCC Part 90, Subpart C, 2018.
14. Manufacturer: Shure, Sennheiser, Lectrosonics.

B. Receivers:
1. Outputs: as shown on the Drawings.
2. Predictive RF switching diversity.
3. Front panel LCD showing frequency and channel/group settings.
4. Audio, RF, and battery life LED meters.
5. Rack-mountable with remote-mountable antennae.
6. Multiple receivers in a single chassis sharing one pair of antennae where shown on the Drawings.
7. Antennae cascading ports where shown on the Drawings.
8. Automatic frequency scanning and infrared syncing with transmitters.

C. Handheld Transmitters:
1. Metallic construction with external solid antenna.
2. Provide a microphone stand clip adapter for all handheld transmitters.
3. Element: dynamic.
4. Polar Pattern: cardioid.

D. Bodypack Transmitters:

1. Metallic construction with external flexible antenna.
2. Metallic clip to secure pack to body or clothing of user.
3. Maximum dimensions: 3.4” H x 2.6” W x 0.9” D.
4. Microphone type: earworn.
5. Microphone Element: condenser.
6. One microphone element and one instrument cable for each bodypack.
7. Microphone element manufacturer: Countryman Associates.

E. Desktop Gooseneck Transmitters:
1. Functionally designed for use on a work surface.
2. Interchangeable goosenecks and microphone elements.
3. Gooseneck Length: 5.0”.
4. Polar Pattern: cardioid.
5. Multifunction button providing on/off toggle, push-to-mute, and push-to-talk functionality.
6. Molded plastic housing.
7. Internal antenna.
8. Battery life: 9.0 hours.

F. Boundary Microphone Transmitters:
1. Polar Pattern: cardioid.
2. Multifunction button providing on/off toggle, push-to-mute, and push-to-talk functionality.
3. Molded plastic housing.
4. Internal antenna.
5. Battery life: 9.0 hours.

G. Antennae and Related Equipment:
1. Powered Antennae and Power Distributors:
   a. Compatible with the system frequency range(s).
   b. Dual antenna channels.
   c. Functionally designed to distribute RF signal and power to the receivers as shown on the Drawings.
   d. Internal RF amplifiers.
   e. Cascading functionality to allow multiple distributors to use the same antennae.
   f. Rack-mountable.
2. Passive Antenna Splitters:
   a. Functionally designed to allow two receivers to use one pair of antennae.
   b. Impedance 50 Ω.
   c. Isolation: 20 dB.
   d. Insertion Loss: 2.0 dB.
3. RF In-Line Amplifiers:
   a. Remote-mountable.
   b. Powered through the receiver’s antenna output port or distribution amplifier.
   c. RF/Power overload indicator.
   d. Switchable gain: +6.0 dB and +12 dB.
4. Passive Remote-Mountable Antennae:
   a. Omnidirectional.

b. Half wave.
c. Hardened, impact resistant.
d. Mouting thread.

5. Active Directional Antennae:
   a. Integral amplifier powered by voltage from receiver or distribution amplifier.
   b. Beam Width: 70° @ 3.0 dB.
   c. Integrated thread adapter.
   d. Four-position gain adjustment switch: -6.0 dB, 0 dB, +6.0 dB, +12 dB.
   e. RF overload indicator.

H. Wireless System Accessories:
1. One rechargeable battery for each transmitter plus 20% as spare stock.
2. Charging station(s) with network connectivity to accommodate all batteries in this scope.

2.5 PHANTOM POWER SUPPLIES

A. Channels as shown on the Drawings.

B. Frequency response: 10 Hz to 25 kHz.

C. Output phantom power: 48 V DC, +/- 2.0 V DC.

D. Output noise: -115 dBV.

E. Manufacturer: ART, Audio-Technica, RDL.

2.6 MICROPHONE MOUNTS AND STANDS

A. Floor Stands:
1. Base: 10.0” round iron.
2. Three-piece removeable telescopic boom adapter with 18” to 30” extension.
3. Height: adjustable from 26” to 63”.
4. Counterweight.
5. Color: Black.
6. Manufacturer: Atlas Sound, Konig & Meyer, Whirlwind.
7. Quantity: one per handheld microphone.

B. Desk Stands:
1. Height: adjustable from 8.0” to 13”.
2. Low profile design with round or square base.
3. Color: Black.
4. Manufacturer: Atlas Sound, Konig & Meyer, Whirlwind.
5. Quantity: one per handheld microphone.

PART 3 EXECUTION

3.1 GENERAL

A. Provide matching transformers, buffer amplifiers or fixed attenuation pads as required to meet the signal levels specified herein.

B. See Section 274140, Audio-Visual Cabling and Connectors for additional requirements related to cables, connectors, and terminations.

3.2 WIRED MICROPHONES

A. Size microphone cabling based on cable run distance so that microphones that require receive +48 V phantom power with sufficient current the manufacturer's specifications. Provide local phantom power supplies when the supplying component and/or the cabling is unable to deliver this voltage and/or current.

3.3 WIRELESS MICROPHONES

A. Wireless microphone antennae shall be located to provide drop-out free performance over the entire area being served.

B. Mount receivers in the equipment racks where shown on the Drawings.

C. Provide RF amplifiers as required per manufacturer's antenna cable length distance recommendations and/or limitations.

D. Perform frequency scan to identify available frequencies. Coordinate final frequency selection(s) with the Architect.

E. Label transmitters with laser labels indicating room names or numbers where there are multiple spaces with dedicated wireless microphone systems.

F. Position permanently installed microphones to provide the best pickup of the intended source(s).

3.4 MICROPHONES, CONFERENCING SYSTEMS, AND AUDIO SOURCE EQUIPMENT PERFORMANCE VERIFICATION

A. General Performance Verification requirements are contained in Section 274010, Audio-Visual General.

B. Performance Verification of the equipment included herein should be conducted in accordance with requirements in other Specification Sections that cover related equipment.

C. Tests may include subjective listening at various positions under various operation conditions.

D. Microphone Tests and Adjustments:

1. Adjust positioning of permanently installed microphones to ensure that they are at the optimum position for picking up their intended source(s).
2. Adjust and document internal microphone preamplifier gain trim controls.
3. Test and verify switching and LED tally functions.

END OF SECTION

SECTION 274111 - MIXING, PROCESSING, AND AMPLIFICATION EQUIPMENT

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Automatic matrix mixers and related peripherals.

B. Mixing consoles, interface boxes, and related equipment.

C. Single and multi-channel distribution and line amplifiers

D. Headphone distribution amplifiers.

E. Power amplifiers.

F. Audio embedders and de-embedders.

G. Accessories related to the above devices.

H. Responsibilities and obligations in support of the Performance Verification specified in Section 274010, Audio-Visual General.

1.2 RELATED REQUIREMENTS

A. Section 274110, Microphones, Conferencing Systems, and Audio Source Equipment.

B. Section 274113, Loudspeakers and Related Equipment.

C. Section 274116, Accessibility Systems.

D. General provisions in Section 274010, Audio-Visual General, and other Sections of Division 27.

E. Additional requirements as shown on the Drawings.

1.3 REFERENCE STANDARDS

A. Conform to all codes and standards listed in PART 1 of Section 274010, Audio-Visual General.

1.4 SUBMITTALS

A. General submittal requirements as identified in Section 274010, Audio-Visual General. In addition to those requirements, submittals for this Section shall include the following:
   1. Proposed software signal flow diagrams within the mixing system.
   2. Audio mixing system network topology, if applicable.

3. Floor plan showing location of mixing system components not located in an equipment rack.
4. Power amplifier channel assignments showing the connected zone, output type, and power.
   a. For constant voltage systems, show 70 V or 100 V and power used / power available.
   b. For variable impedance systems, show wattage and impedance load.

PART 2 PRODUCTS

2.1 GENERAL

A. Inputs, outputs, and audio network topology as shown herein.

B. Capacity of a matrix described by this Section shall be defined by the quantity of the inputs and outputs (inputs x outputs).

C. Manufacturer: QSC, Biamp, BSS/Harman.

2.2 DIGITAL AUTOMATIC MATRIX MIXERS

A. General:
   1. Primary TCP/IP audio protocol: DANTE.
   2. Acoustic echo cancelling (AEC) available on all inputs.
   3. All components of the mixing system shall be from the same manufacturer, except as noted herein or on the Drawings and the network switch connecting the components.
   4. System control and configuration via Ethernet.
   5. Primary audio network minimum channel matrix capacity: 256 x 256.
   6. System shall supply +48 V DC phantom power to each microphone input individually.
   7. Analog inputs and outputs shall be balanced.
   8. Sampling rate: 24-bit @ 96 kHz.
   9. Digital signal processing integral to video matrix and presentation switchers is covered in Section 274122, Video Transport and Switching Equipment.

B. Fixed I/O Digital Automatic Matrix Mixers:
   1. Minimum DANTE matrix capacity: 32 x 32.
   2. Minimum AVB matrix capacity: 128 x 128.
   3. USB audio channels: 8.
   4. Minimum VoIP instances: 2.
   5. Minimum two network ports assignable to audio network, control network, and VoIP connections.
   6. Rack-mountable.
   7. Single RU chassis.

C. Expansion Card Frames:
   1. Available card slots as shown on the Drawings.
   2. Card types as shown on the Drawings.
   3. Connection to audio network.
   4. Rack-mountable.

2.3 AUDIO NETWORK PERIPHERALS

A. Manufacturer: Same as digital audio matrix mixers.

B. Expansion Modules:
   1. Fixed inputs, outputs, and control ports as shown on the Drawings.
   2. Power via POE, POE+, or local power.
   3. Chassis designed to be mounted to a surface or rack mounted.
   4. Minimum 8 discreet audio network channels converted to USB, where USB is shown on the Drawings.
   5. Audio and control network connection(s): Dual.

C. Remote-mount Audio Network PoE Amplifiers:
   1. Fixed inputs, outputs, and control ports as shown on the Drawings.
   2. Power via POE, POE+, or local power.
   3. Chassis designed to be mounted to a wall or ceiling.
   4. Manufacturer: same as audio matrix mixer manufacturer.

D. Audio Network Peripheral Hubs:
   1. Ports as shown on the Drawings.
   2. Support for the specified audio network topology.
   3. Supports PoE+ power for audio network peripherals.
   4. Manufacturer: Same as audio matrix mixer.

E. Audio Network USB Encoder/Decoders:
   1. Functionally designed to convert audio from the automatic matrix mixer to USB over the audio network for use as recording inputs and/or outputs.
   2. Channels: minimum 8, configurable as outputs or inputs.
   3. PoE, PoE+, or UPoE powered.
   4. Distance limitation 330’.
   5. Manufacturer: Same as audio matrix mixer.

F. Network Switches:
   1. See Section 274132, Audio-Visual Network Equipment.

2.4 DIGITAL MIXING CONSOLE SYSTEMS

A. General:
   1. All components shall be from the same manufacturer unless otherwise noted herein or on the Drawings.
   2. Primary system protocol and network topology as shown on the Drawings.
   3. Minimum system sample rate: 96 kHz / 24-bit, unless otherwise stated on the Drawings.
   4. Main system processing computer shall be housed in the console.
   5. Minimum software matrix buss capacity: 4.
   6. Support for Dante audio network formats.
   7. Support for primary and redundant audio network connections on all devices.
   8. Expansion card slots for additional inputs/outputs, alternate digital audio networks, control ports, and effects processing with cards as shown on the Drawings.

9. Remote control via computer or mobile device software through the audio system control network.
10. Remote control via portable or fixed hardware units as shown on the Drawings.
11. Integral automixing functionality.
12. Parametric equalizers shall have minimum four band fully parametric equalization with amplitude, frequency, and bandwidth controls.
13. Graphic equalizers shall have a minimum of 31 band controls.
14. On-board digital signal processing on inputs shall include, at a minimum, per channel: high pass, low pass, parametric equalizer, compressor, gate, delay, individual output routing, mute, and solo.
15. On-board digital signal processing on outputs shall include, at a minimum, graphic equalizer, parametric equalizer, compressor, and delay.
16. Full system matrix, allowing for any physical input or output to be patched via software to any physical fader.
17. Motorized 100 mm faders.
18. Support for multiple consoles on the digital mixing system network.
19. Manufacturer: Allen & Heath, Avid, Soundcraft, Yamaha, Digico, Midas.

B. Consoles:
1. On-board monitors shall be touch screens.
2. Number of physical faders as shown on the Drawings.
3. On-board local inputs and outputs as shown on the Drawings.
4. Digital labeling of input and output channels.

C. Accessories:
1. Dust cover.
2. ATA-approved transport case, with steel corners, steel latches, and casters.
3. Racks for rack-mount input/output chasses not shown in a fixed equipment rack shall be ATA-approved with metal corners, metal latches, and a caster base.
4. Metallic folding console stand that facilitates tilting the console from a vertical (storage/transport) to a horizontal (in use) position.

2.5 AUDIO NETWORK INTERFACES

A. Form factor and connectivity as shown on the Drawings.

B. Microphone inputs shall provide +48 V DC phantom power to each channel.

C. Microphone inputs shall provide selectable input gain.

D. Line inputs, where shared with a microphone input, shall be balanced.

E. Line-level only inputs shall be balanced or unbalanced.

F. Software-controllable output gain with mute.

G. Bluetooth shall provide duplex pairing at a minimum range of 30’.

H. PoE powered.

I. Manufacturer: same as digital audio matrix mixer.

2.6 DISTRIBUTION AMPLIFIERS

A. Inputs and outputs as shown on the Drawings.

B. Gain: 0 dB unbalanced; +6.0 dB balanced.

C. Rack-mountable or Surface mountable as shown on the Drawings.

D. Manufacturer: RDL, Extron, Rane, Audio Technologies, Drawmer, Whirlwind.

2.7 HEADPHONE AMPLIFIERS

A. Supported impedances: from 32 Ω to 600 Ω.

B. Active balanced or unbalanced inputs up to +20 dBu.

C. Individual (isolated) inputs per channel plus a stereo “mix” input feeding all channels.

D. Quantity of channels per amplifier as indicated on the Drawings.

E. LED metering for each channel.

F. Rack mountable when shown in an equipment rack. Modular (mountable in a gang box) when shown downstream of a field connection.

G. Manufacturer: Behringer, Presonus, RDL, Rane.

2.8 LINE COMBINERS

A. Functionally designed to combine two unbalanced line-level signals to one balanced line-level signal.

B. Input level: -10 dBV nominal -22 dBV minimum.

C. Input impedance: 10 kΩ.

D. Adjustable gain: unity to +14 dB nominal.

E. Output: 150 Ω balanced, +4 dBu to drive low or high impedance, balanced, or unbalanced lines.

F. Manufacturer: Quantum Technologies, RDL, Extron, Whirlwind.

2.9 AUDIO EMBEDDERS AND DE-EMBEDDERS.

A. Refer to Section 274121, Video Source, Recording, and Signal Processing Equipment.

B. Inputs and outputs as shown on the Drawings.

C. Line level input(s) and output(s) shall be balanced.

D. Support for computer and video resolutions up to and including 4K.

E. Support for HDMI data rates up to 10.2 Gbps, 12-bit deep color, and CEC pass through.

F. HCDP compliant.

G. Manufacturer: Extron, Kramer, Crestron, Atlona.

2.10 SMALL FRAME POWER AMPLIFIERS

A. Applies to smaller chassis power amplifiers designed to be mounted to a surface or within a rack with a rack-mounting accessory.

B. Power amplifiers contained in a video matrix or presentation switcher are covered in Section 274122, Video Transport and Switching Equipment.

C. Surface Induction Speaker Amplifiers:
   1. Applies to amplifiers by the surface induction speaker manufacturer.
   2. Refer to Section 274113, Reinforcement and Program Loudspeaker Systems, paragraph 2.07.

D. Output type: 70 V, 100 V, or variable impedance as shown on the Drawings.

E. Channels and inputs as shown on the Drawings.

F. Network controllable where shown on the Drawings.

G. Amplifier type: Class D.

H. Plenum-rated where shown on the Drawings as being installed above an accessible ceiling in a plenum airspace.

I. Watts per channel:
   1. Constant voltage systems: sufficient power to drive the loudspeakers as shown on the Drawings at the performance level indicated in Section 274113, Reinforcement and Program Loudspeaker Systems, up to 80% of available power.
   2. Variable impedance systems: wattage ratings matching specified loudspeaker's continuous power rating and to match the performance level indicated in Section 274113, Reinforcement and Program Loudspeaker Systems.

J. Manufacturer: RDL, Stewart, Extron, Atterotech.

2.11 MULTI-CHANNEL RACK-MOUNT POWER AMPLIFIERS

A. Applies to power amplifiers of two or more channels that have built-in rack mounting hardware and are designed to be mounted only in an equipment rack.

B. Applies only to power amplifiers that feed 70 V or 100 V loudspeaker circuits.

C. Channels and inputs as shown on the Drawings.

D. Ethernet and software controllable.

E. Channels bridgeable in pairs or groups of four.

F. Watts per channel:
   1. Constant voltage systems: sufficient power to drive the loudspeakers as shown on the Drawings at the performance level indicated in Section 274113, Reinforcement and Program Loudspeaker Systems.
   2. Variable impedance systems: wattage ratings matching specified loudspeaker's continuous power rating and to match the performance level indicated in Section 274113, Reinforcement and Program Loudspeaker Systems.

G. Dynamic power sharing across all channels.

H. Local analog inputs routable throughout audio network.

I. On-board dynamics processing, including equalization, compression, limiting, and filtering.

J. Stable under 2.0 Ω loads per channel.

K. Channel volume controls on front panel.

L. Channel output metering LEDs, including signal present and limit or overload.

M. Amplifier and load protection, including short circuit, open circuit, over current, over voltage, thermal, RF, DC fault shutdown, active inrush limiting, and on/off muting.

N. Channels independently switchable between constant voltage and variable impedance modes.

O. Manufacturer: Fulcrum Acoustic, Powersoft, Lab Gruppen, Crown, QSC,.

PART 3 EXECUTION

3.1 GENERAL

A. Configure audio mixing system as required to meet performance requirements in this and other Specification Sections pertaining to the audio system(s).

B. Configure network equipment as required to support the mixing system. Coordinate configuration with the Architect.

C. See Section 274140, Audio-Visual Cabling and Connectors for additional requirements related to cables, connectors, and terminations.

3.2 AUTOMATIC MATRIX MIXERS AND RELATED EQUIPMENT

A. Provide audio, control, and VoIP network topology as shown on the Drawings. Coordinate final topology with the Architect. Provide accessories, including but not limited to SFP modules, stacking cables, and license keys as required.

B. Card order on the Drawings shows design intent only. Install cards in card frame automatic mixers according to manufacturer's instructions.

C. Configure digital signal processing and routing as shown on the Drawings and in conjunction with the requirements shown in Section 274131, Audio-Visual Control Systems and Programming.

D. Any direction given herein or on the Drawings pertaining to digital signal processor programming shall be considered a starting point. Final routing and processing shall be coordinated with the Architect.

E. Configure matrix routing so that the system operates as a true mix minus system to the extent allowed by the loudspeaker zoning shown on the Drawings.

F. Auto-mixers with digital signal processors shall be gating auto-mixers.

G. Terminate all unused inputs and outputs on patch panels or other custom connector plates on the back of the equipment rack(s).

H. Follow manufacturer's recommendations regarding maximum network switch hops.

I. Configure audio matrix mixing system notification feature(s) that notify the user of network or audio signal faults on the system.

3.3 DIGITAL MIXING SYSTEMS

A. Observe manufacturer's distance limitations between the console and input chasses.

B. Configure audio mixing system as required to meet performance requirements in this and other specifications with related equipment.

C. Network and other digital connections between components shall be made in a way that minimizes audio latency.

D. Configure default routing preset configurations for the system based on typical use case scenario(s) identified by the Architect.

3.4 POWER AMPLIFIERS

A. Observe manufacturer's racking recommendations relative to thermal management.

B. Configure power amplifier internal DSP, power allocation, and other settings as required to meet the performance requirements in this and other Specification Sections pertaining to this audio system.

3.5 MIXING, PROCESSING, AND AMPLIFICATION EQUIPMENT PERFORMANCE VERIFICATION

A. General Performance Verification requirements are contained in Section 274010, Audio-Visual General.

B. Performance Verification of the equipment included herein should be conducted in accordance with requirements in other Specification Sections that cover related equipment, including, but not limited to:
   1. Section 274110, Microphones, Conferencing Systems, and Audio Source Equipment.
   2. Section 274113, Loudspeakers and Related Equipment.
   3. Section 274116, Accessibility Systems.

C. Perform audio network failover testing for each audio network device as follows:
   1. Where redundant paths are specified, disconnect the primary path, and verify that the audio network equipment provides an uninterrupted switch over to the secondary (redundant) path.
   2. Where a redundant path is not specified, disconnect, and reconnect the primary path to verify that the audio network device recovers and returns to a fully connected state.
   3. Test notification features of the audio network that notify the user of a failure.

END OF SECTION

SECTION 274113 - LOUDSPEAKERS AND RELATED EQUIPMENT

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Ceiling-recessed speakers and subwoofers.

B. Pendant speakers and subwoofers.

C. Surface-mounted program audio speakers and subwoofers, passive.

D. Control room monitors.

E. Volume controls, analog.

F. Headphones.

G. Performance loudspeakers, subwoofers, and rigging hardware.

H. Foldback (monitor) loudspeaker systems.

I. Loudspeaker mounting equipment.

J. Loudspeaker accessories.

K. Responsibilities and obligations in support of the Performance Verification specified in Section 274010, Audio-Visual General.

1.2 DEFINITIONS

A. “Reinforcement and Program Loudspeakers” shall mean ceiling and pendant speakers, wall-mount speakers, columnar speakers, desktop speakers, and similar used for speech, program audio, or light musical reinforcement of acoustic instruments.

B. “Performance Loudspeakers” shall mean loudspeakers, either as single enclosures or as an array, that are used for live performance, higher volume or ensemble musical reinforcement.

1.3 RELATED REQUIREMENTS

A. General provisions in Section 274010, Audio-Visual General, and other Sections of Division 27.

B. Section 274110 - Microphones, Conferencing Systems, and Audio Source Equipment.

C. Section 274111 - Mixing, Processing, and Amplification Equipment.

D. Additional requirements as shown on the Drawings.

1.4 REFERENCE STANDARDS

A. Conform to all codes and standards listed in PART 1 of Section 274010, Audio-Visual General.

B. Conform to AVIXA A102-01-2017, Audio Coverage Uniformity.

1.5 SUBMITTALS

A. General submittal requirements as identified in Section 274010, Audio-Visual General. In addition to those requirements, submittals for this Section shall include the following:
   1. Floor plan showing locations of speakers placed in any location other than in or above the ceiling.
   2. Reflected ceiling plan showing locations of speakers in or above the finished ceiling.
   3. Wall-mounted speakers shall be shown in an elevation showing height and spatial relationships to adjacent equipment or architectural elements that are on or in the wall where the speakers will be mounted.
   4. For performance loudspeakers, and any arrays, elevations of the speaker(s) or array(s) showing:
      a. The height and spatial relationships to adjacent equipment or architectural elements that are on or in the wall(s) adjacent to the speaker or array.
      b. Loudspeaker mounting or rigging systems, specifically identifying by make and model all components thereof.
      c. Dimensions of the speaker(s)/array(s), including height AFF and BFC.
      d. Dimensions of each individual loudspeaker component of the array.
      e. Total weight of the speaker(s)/array(s).
      f. Details depicting the method by which the speaker(s)/array(s) will be suspended.
      g. Vertical and horizontal tilt and pan angles for the speaker(s)/array(s).
      h. For arrays: vertical and horizontal splay angles between cabinets within the array.
      i. For any array or individual speaker cabinet weighing 100 lbs. or more: Certification from a licensed structural engineer that the structure will support the load.
      j. Contact information for the loudspeaker manufacturer's representative that was involved in the design of the proposed loudspeaker solution, if any.
   5. Wiring diagrams showing:
      a. Loudspeaker connections to other devices.
      b. Connections between loudspeakers within an array.
      c. Proposed loudspeaker zoning and circuiting, including voltage and proposed tap settings.
      d. Details showing speakers mounted in or on walls or hard ceilings.
      e. Processor settings for all loudspeakers with active internal signal processing.
   6. Loudspeaker modeling reports including coverage map indicating dB SPL and % ALCONS over the entire coverage area.
   7. Finish or color samples of any custom finished or colored component covered by this Section.

PART 2 PRODUCTS

2.1 GENERAL

A. Loudspeakers of the same type (i.e., ceiling speakers, pendant speakers) shall be from the same manufacturer unless otherwise noted.

B. Loudspeakers shall be governed by requirements herein and additional requirements on the Drawings.

C. Exterior-rated or wet-rated where shown on the Drawings on a schedule, with a symbol annotation tag, or placed on a plan in an exterior or wet location. “Exterior-rated” or “wet-rated” shall be defined as IP-65 as it relates to products covered by this Section.

D. Finish color, all exposed components, unless otherwise noted: Coordinate with Architect.

E. Provide manufacturer’s recommended mounting hardware, safety hardware, and seismic restraints (i.e., tile bridges, beam clamps, wall-mounts) as required.

F. Power ratings as shown on the Drawings.

G. Bi-amplified, tri-amplified, or powered (integral amplifiers) as shown on the Drawings.

H. Driver size and quantity as shown on the Drawings.

I. Any loudspeaker or array (or component thereof) shown suspended on the Drawings shall be rated for overhead suspension and have integral fly points.

J. Connectors:
   1. Speaker level signals: Neutrik SpeakON™ or terminal block connectors.
   2. Analog and digital line level audio: latching XLR connectors.
   3. Communication and network-audio: RJ-45 connectors. Cable-mounted connectors with latching metallic barrel shield (i.e., Neutrik EtherCON™) shall be used when connectors on the loudspeaker accept such a connector.
   4. AC Power: Neutrik PowerCON™ or latching connector.

2.2 CEILING SPEAKERS AND SUBWOOFERS

A. Loudspeaker, transformer, and enclosure shall be manufactured and sold as a single unit unless otherwise indicated on the Drawings.

B. Adjustable tap settings with transformer bypass. Tap adjustment shall be accessible without removing speaker assembly from its installed location unless otherwise noted.

C. Cylindrical enclosure unless otherwise indicated on the Drawings.

D. Dimensions as shown on the Drawings.

E. Driver component size(s) as shown on the Drawings.

F. Metallic enclosures shall have a rust-preventative coating.

G. Frequency response and power handling as shown on the Drawings.

H. Grilles as indicated on the Drawings.

I. Manufacturer: QSC, Electro-Voice, JBL, Tannoy

2.3 PENDANT SPEAKERS AND SUBWOOFERS

A. Adjustable tap settings with transformer bypass. Tap adjustment shall be accessible without removing speaker assembly from its installed location, unless otherwise noted.

B. Cylindrical enclosure unless otherwise indicated on the Drawings.

C. Dimensions as shown on the Drawings.

D. Suspension height as shown on the Drawings.

E. Metallic enclosures shall have a rust-preventative coating.

F. Frequency response and power handling as shown on the Drawings.

G. Manufacturer: QSC, Electro-Voice, JBL, Tannoy.

2.4 SURFACE MOUNTED PROGRAM AUDIO SPEAKERS AND SUBWOOFERS, PASSIVE

A. Adjustable tap settings with transformer bypass. Tap adjustment shall be accessible without removing speaker assembly from its installed location.

B. Dimensions as shown on the Drawings.

C. Frequency response and power handling as shown on the Drawings.

D. Mounting hardware and/or attachment points with tamper-resistant to allow multiple mounting positions.

E. Manufacturer: QSC, Electro-Voice, JBL, Tannoy.

2.5 CONTROL ROOM MONITORS

A. Active:
1. Bi-amplified configuration.
2. High frequency driver: (1) 1.0” Ø soft dome tweeter.
3. Low frequency driver: (1) 5.0” Ø woofer.
4. Frequency response: 47 Hz to 20 kHz, ±3.0 dB.
5. Power handling capacity: HF: 250 W, LF: 250 W.
6. Inputs as shown on the Drawings.
7. Selectable HF trim control.

8. Selectable boundary equalization.

B. Wall-mountable where shown on Drawings.

C. Manufacturer: Genelec, JBL, IK Multimedia.

2.6 VOLUME CONTROLS, ANALOG

A. For use with 70 V lines.

B. 10-step attenuation.

C. Control: integral paging override circuit/relay where shown on the Drawings.

D. Single-gang plate mounting.

E. Manufacturer: Atlas Sound, Lowell, Quam.

2.7 HEADPHONES

A. Pair, complete with headband, cord, and connector compatible with equipment headphone jacks.

B. Power handling capacity: 200 mW.

C. Impedance per headphone: 600 Ω.

D. Frequency response: ±3.0 dB, 20 Hz to 20 kHz.

E. Closed earmuff.

F. Manufacturer: AKG Acoustics, Beyer, Sennheiser, Shure, Sony.

2.8 PERFORMANCE POINT SOURCE LOUDSPEAKER ARRAY CABINETS

A. Passive:
1. Internal crossover where Drawings show signal feeding drivers supporting multiple frequency ranges.

B. Active:
1. Integral digital signal processing (DSP), including, at a minimum, limiting and equalization.
2. Network controllable.

C. Cabinet construction as shown on the Drawings.

D. Integral flying/hanging points intended for overhead suspension for all speakers shown as suspended on the Drawings.

E. Rotatable horn.

F. Integral handles on two or more sides.

G. Manufacturer: Fulcrum Acoustic, EAW, QSC, Electrovoice, Martin Audio, L'Acoustics.

2.9 PERFORMANCE LINE SOURCE LOUDSPEAKER ARRAY CABINETS

A. Passive:
   1. Internal crossover where Drawings show signal feeding drivers supporting multiple frequency ranges.

B. Active:
   1. Integral digital signal processing (DSP), including, at a minimum, limiting and equalization.
   2. Network controllable.

C. Integral adjustable rigging system that allows selection of vertical splay angles.

D. Cabinet construction as shown on the Drawings.

E. Manufacturer: Fulcrum Acoustic, EAW, QSC, Electrovoice, Martin Audio, L'Acoustics.

2.10 PERFORMANCE SUBWOOFERS

A. Passive:
   1. Multiple driver cabinets wired as single or multiple circuits or loads as shown on the Drawings.

B. Active:
   1. Integral digital signal processing (DSP), including, at a minimum, limiting and equalization.
   2. Network controllable.

C. Arrayable in omnidirectional or cardioid patterns.

D. Integral handles on two or more sides when shown ground stacked on the Drawings.

E. Integral flying/hanging points intended for overhead suspension when shown flown on the Drawings.

F. Manufacturer: Fulcrum Acoustic, EAW, QSC, Electrovoice, Martin Audio, L'Acoustics.

2.11 LOUDSPEAKER RIGGING HARDWARE

A. Applies to the following loudspeakers: all loudspeakers.

B. Steel construction.

C. Approved by the loudspeaker manufacturer for supporting the arrays as designed.

D. Working load limit of two times the array's weight.

E. Support raising and lowering speaker arrays where indicated on the Drawings.

F. Capable of suspending the array(s) at the angle(s) shown on the Drawings without modifications.

G. Manufacturer: same manufacturer as the specified loudspeaker(s) and/or subwoofer(s).

2.12 FOLDBACK (MONITOR) LOUDSPEAKER SYSTEMS

A. Enclosure with one or more angled sides to allow the cabinet to be placed on or near the floor and the on-axis point to be angled up.

B. Cabinet construction as shown on the Drawings.

C. Passive:
   1. Internal crossover where Drawings show signal feeding drivers supporting multiple frequency ranges.

D. Active:
   1. Integral digital signal processing (DSP), including, at a minimum, limiting and equalization.
   2. Network controllable.

E. Integral handles on two or more sides.

F. Parallel connections to allow daisy chaining monitors.

G. Manufacturer: Fulcrum Acoustic, EAW, QSC, Electrovoice, Martin Audio, L'Acoustics.

PART 3 EXECUTION

3.1 GENERAL

A. Coordinate loudspeaker array installation with structural, mechanical, electrical, theatrical rigging, or other Contractors as necessary to install the array(s) at location shown on the Drawings.

B. Observe loudspeaker manufacturer's installation instructions, including but not limited to installation procedures, accessories (i.e. tile bridges, mounts, safety cables, seismic restraints, and clamps), and supplies.

C. Loudspeakers shall not be relocated more than 12" in any direction without written approval from the Architect.

D. Color: Paint loudspeaker grilles to match finish color of mounting surface. Verify loudspeaker color with Architect prior to ordering.

E. Loudspeaker distribution lines shall be separate where indicated on the Drawings and shall be installed in conduit.

F. As a part of final acceptance testing, create a “default system configuration file.” The file shall consist of audio mixer software files and/or written documents (Microsoft Word, Excel, etc.) as necessary to describe and document the default system settings as they were at the time of final acceptance.

3.2 CEILING SPEAKERS

A. Confirm all speaker dimensions and installation locations with Architect prior to installation.

B. Provide tile bridges, safety cables, rough-in assemblies, and other necessary hardware to mount speakers at locations shown on the Drawings.

C. Unless otherwise indicated, use narrow dispersion loudspeaker assemblies where finished ceiling height is greater than 15’ above the finished floor.

D. Sound Pressure Level (SPL) shall be 20 dB above the ambient noise on-axis at 60” (standing) and 48” (seated) ear height. Set loudspeaker taps as required.

E. Loudspeaker coverage, throughout the space(s): ±3 dB.

F. Loudspeakers in ceiling grids shall be supported by the grid and/or the building structure. Safety restraints shall be attached to the structure.

G. No component shall be attached to or in contact with other building systems, such as mechanical, fire protection, electrical, or plumbing equipment.

H. Loudspeakers in inaccessible ceilings shall be supported by the building structure or using mounting accessories specifically approved for the type of ceiling in which the loudspeaker will be installed.

I. Permanently mounted loudspeakers, other than ceiling-mounted speakers, shall incorporate 50 durometer neoprene vibration isolation pads loaded to 40 psi.

3.3 PENDANT SPEAKERS

A. Confirm final pendant suspension height with Architect prior to installation.

B. Pendant speakers shall be supported by the structure.

C. Provide strain relief and safety cable as required by the loudspeaker manufacturer.

3.4 SURFACE MOUNTED SPEAKERS, PASSIVE

A. Confirm all speaker dimensions and installation locations with Architect prior to installation.

B. Coordinate speaker locations with adjacent equipment or architectural components, including but not limited to projection screens, displays, doors, windows, cameras, and lighting fixtures.

C. Provide blocking in wall as required to support the loudspeaker.

D. Follow manufacturer's installation instructions.

3.5 PERFORMANCE LINE AND POINT SOURCE LOUDSPEAKER AND SUBWOOFER ARRAY CABINETS

A. Coordinate loudspeaker array installation with structural, mechanical, electrical, theatrical rigging, or other contractors as necessary to install the array(s) at location shown on the Drawings.

B. Coordinate array locations with final locations of other items, including but not limited to display devices, so that one does not obstruct the other.

C. Provide loudspeaker manufacturer's on-site installation and configuration service.

3.6 PERFORMANCE LOUDSPEAKER RIGGING HARDWARE

A. Coordinate rigging installation with structural.

B. Coordinate rigging installation with theatrical rigging where applicable.

3.7 LOUDSPEAKER PERFORMANCE VERIFICATION

A. General:
   1. Performance Verification of these systems shall be performed in conjunction with the Performance Verification requirements in the following sections:
      a. Section 274010, "Audio-Visual General."
      b. Section 274110, "Microphones, Conferencing Systems, and Audio Source Equipment."
      c. Section 274111, "Mixing, Processing, and Amplification Equipment."
   2. rformance Verification of the equipment included herein should be conducted in accordance with requirements in other Specification Sections that cover related equipment.
   3. These requirements only apply to loudspeakers or loudspeaker systems covered by this section.
   4. Interior finishes and furnishings shall be in place for these tests.
   5. Documentation of performance tests shall be maintained for reference during the system acceptance tests.
   6. Tests and adjustments shall be performed in the sequence specified herein.
   7. Provide buffer amplifiers, transformers, or fixed attenuation pads to match signal levels, where required.
   8. Tests may include subjective viewing and listening at various points under various operating conditions, using live or recorded material.

B. Basic Loudspeaker System Tests and Adjustments:
   1. Background Noise:
      a. Using a calibrated ANSI/ASA S1.4-2014/Part 1/IEC 61672:1-2013 Type 1 or IEC 61672-1 ed2.0-2013 precision sound level meter, determine the average ambient noise level in the room. Record the level measured. The average background noise shall be 60 dBA or below during performance of the audio tests included herein. If the background noise level exceeds this criterion, promptly notify the Architect.

2. Impedance:
   a. Measure absolute overall impedance of each loudspeaker circuit. Ensure impedance is within load limitations of the specified power amplifier(s). Adjust circuiting if required.
3. Polarity:
   a. Verify that polarity is maintained throughout each loudspeaker system circuit, beginning with the power amplifier output through the last speaker in the circuit.
4. Gain Structure, Input Levels, and Output Levels:
   a. Adjust input and output gain controls of software and hardware components to achieve a 0 dBu reading through the entire signal chain up to the amplifiers. Set amplifier levels to allow the system to produce sound levels of at least 85 dBA in all spaces, unless otherwise indicated on the Drawings.
   b. Use pink noise to set gain structure.
   c. Bypass signal processing as required to set proper gain staging.
5. Hum, Noise Level, and RF Interference:
   a. Terminate inputs and outputs to prevent the introduction of hum or other noises into the audio signal chain. Hum and noise shall be at least 80 dBA below the output levels.
   b. Ensure that the system is free from spurious oscillation and RF pick-up with the absence of any input signal and with a 160 Hz signal at 0 dBu level on the audio mixer.
6. Buzzes and Rattles:
   a. Using a sine wave set to 0 dBu on the audio mixer, sweep all loudspeaker circuits from 50 Hz to 5.0 kHz. Identify and correct any buzzes, rattles, vibrations, or resonances caused by the system.
   b. If the cause is outside the system, promptly notify the Architect indicating the cause and recommended corrections.
7. Compression and Limiting:
   a. Set compressors as required to prevent drastic changes in audio levels. Compression levels shall be set to a minimum and increased as determined to be necessary during system testing or acceptance.
   b. Set hard limiters to prevent damage to loudspeaker components.
8. Equalization and Filtering:
   a. Equalization of all types, including high-pass and low-pass filtering, shall be set consistent with the intended primary use.
   b. The equalization process shall be repeated for each loudspeaker zone.
   c. Graphic equalizers on outputs shall have maximum 1/3 octave-band controls. Parametric equalizers on outputs shall have, at a minimum, the number of bands necessary to obtain the desired equalization settings.
   d. Equalization shall be set to maximize gain before feedback and shall maintain ±1.5 dB between low-pass and high-pass filter settings described herein.
   e. System equalization shall be set using a calibrated measurement microphone and a slow-response hardware or software 1/3 octave-band real time analyzer (RTA). With all equalizers and filters in bypass, obtain an average 1/3 octave frequency response in the room by placing the microphone at a minimum of four unique locations. Place the microphone at the one location that best represents the average of the frequency responses obtained. This location shall be used to set equalizers and filters for the system.

f. On 1/3 octave graphic equalizers, minimize the variation between adjacent filter settings.
g. Unless otherwise directed, set high and/or low pass filters with a 24 dB slope at the following frequencies:
    1) For voice-only systems (paging systems): high pass: 125 Hz, low pass: 10 kHz.
    2) For systems with voice reinforcement and program audio playback: high pass: 63 Hz, low pass: 12 kHz.
    3) For full music reinforcement systems without subwoofers: high pass: 50 Hz, low pass: none.
    4) For full music reinforcement systems with subwoofers: high pass: 32 Hz, low pass: none.
h. Feedback Stability:
    1) With required output levels set, measure, and record the available gain before feedback. Feedback stability margin shall be 6 dB, minimum.

C. Advanced Loudspeaker System Tests and Adjustments:
1. Time Delays:
    a. Set time delays on specific speaker circuits as necessary to prevent to the extent possible audio from two separate zones or circuits arriving at a specific area at different times.
    b. Adjust the delay settings using a TEF or FFT analysis and aural analysis to obtain the most natural sound possible.
    c. Document these settings.
2. Intelligibility:
    a. Using a TEF analyzer, measure the percent articulation loss of consonants (% ALCONS) for at least 4 various locations in the room in the 2.0 kHz octave band.
    b. % ALCONS shall be less than 10 for each location. Adjust system configuration as required, including equipment settings and loudspeaker positioning, as necessary. Notify the Architect in writing if the acoustical conditions in the room are preventing the system from meeting this requirement.
    c. Record results.

END OF SECTION

SECTION 274115 - PRODUCTION COMMUNICATION SYSTEMS

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Wireless production communication systems.

1.2 RELATED REQUIREMENTS

A. Section 274111, Mixing, Processing, and Amplification Equipment.

B. General provisions in Section 274010, Audio-Visual General, and other Sections of Division 27.

1.3 REFERENCE STANDARDS

A. Conform to all codes and standards listed in PART 1 of Section 274010, Audio-Visual General.

1.4 SUBMITTALS

A. General submittal requirements as identified in Section 274010, Audio-Visual General. In addition to those requirements, submittals for this Section shall include the following:
   1. Floor plan showing the position of all production communication equipment, including wall plates where portable devices will connect and antennae when wireless production communication systems are specified.
   2. Wiring diagram showing the interconnection of all components in the production communication system.
   3. Documentation showing proposed channel grouping of production communication outlets, speaker stations, or other devices where these devices will be permanently assigned to one or more channels.
   4. When wireless production communication devices are specified, a frequency spectrum analysis performed at the project site showing available frequencies and the frequencies to be used by the production communication system in this project.

PART 2 PRODUCTS

2.1 GENERAL

A. All components shall be from the same manufacturer, unless otherwise noted.

B. Connectors:
   1. Analog and digital audio: latching XLR connectors.

2. Communication and network audio: RJ-45 connectors. Cable-mounted connectors with latching metallic barrel shield (i.e., Neutrik EtherCON™) shall be used when connectors on the loudspeaker accept such a connector.

C. Manufacturer, except as noted: Clear-Com, RTS, or Reidel.

2.2 DIGITAL WIRELESS SYSTEMS

A. Main Stations:
1. Supported frequencies: 1.9 GHz and 2.4 GHz.
2. Minimum supported wireless belt packs: 5.
3. 2-Wire and 4-Wire signals supported as shown on the Drawings.
4. LAN uplink to communications network or matrix.
5. Dual antennae, expandable to 10 antennae.
6. Program audio input.
7. Stage announce output.
8. Four OLED displays with assignable soft keys.
9. 4-pin XLR headset connector.

B. Antennae (Transceivers):
1. Compatible with the selected system frequency.
2. IP-Based:
   a. For use with communications matrix.
   b. Support for AES67 IP based audio.
   c. Minimum 10 belt packs per antennae
   d. Support for 64 transceivers in a single communications matrix.
   e. 2 EtherCON RJ-45 connections and 2 SFP ports.
   f. IP-53 rated, minimum.
   g. PoE support up to 300’.
3. Non-IP-Based:
   a. Minimum 5 belt packs supported at 1.9 GHz.
   b. Minimum 65 belt packs supported at 2.4 GHz.
   c. IP-53 rated, minimum.
   d. EtherCON RJ-45 connection.
   e. Power: Local or from base station.
   f. Mountable on a microphone stand.
4. Connections to base stations as shown on the Drawings.
5. Splitters:
   a. Functionally designed to split one transceiver feed in to five transceiver feeds.
   b. SFP and RJ-45 uplink connection.
   c. LED status indicators.
   d. IP-63 rated, minimum.

C. Belt Packs:
1. Compatible with the selected system frequency.
2. 2-channel party line operation.

3. Range: 300’ indoors, 800’ outdoors.
4. Wireless registration.
5. Battery life, minimum: 18 hours.
6. USB port for wired power connection.
7. Built-in flashlight.
8. IP-53 rated, minimum.
9. 4-pin XLR headset connection.
10. Power and mute buttons.
11. Independent talk and call buttons for each channel.

D. Headsets:
1. Single or dual muff as shown on the Drawings.
2. 4-pin XLR connector.
3. Reversible (left or right worn).
4. Dynamic cardioid gooseneck microphone with 300 Hz to 20 kHz frequency response.
5. 300° boom mic rotation with mic mute switch activated by boom position.
6. Headphone: 40mm diameter neodymium driver in over-the-ear muff covering entire ear.

E. Chargers:
1. Drop in style charger for minimum of five batteries.
2. Wall-mountable with bracket.

F. Batteries:
1. Type: lithium-ion.
2. Voltage: 3.7 V.
3. Capacity: 1.9 AH.
4. Rechargeable.

PART 3 EXECUTION

3.1 GENERAL

A. Coordinate system configuration and programming with Architect.

B. Set system baseline volume levels for speech such that the baseline level is achieved when volume controls on user stations is between 40% and 50%. While the baseline level is subjective, said level shall be agreed upon by the Contractor, one or more Owner representatives, and the Engineer when present for initial system configuration.

3.2 DIGITAL WIRELESS SYSTEMS

A. Provide quantity of antennae, transceivers, or WAPs to cover required quantity of wireless belt packs.

B. Transceivers: Mount transceivers at locations shown on Drawings.

C. Provide sufficient RF coverage for the front of house, back of house, seating area, and stage areas.

D. Provide signal amplifiers as required to extend antenna cable length.

3.3 ACCESSORIES

A. Provide interconnects as required to inject program audio.

B. Provide interconnects as required and/or as shown on the Drawings to connect separate systems (i.e. wired and wireless party line systems used in the same space).

C. Provide 2-wire to 4-wire converters as required.

3.4 PRODUCTION COMMUNICATION SYSTEMS PERFORMANCE VERIFICATION

A. Performance Verification of these systems shall be performed in conjunction with the Performance Verification requirements in Section 274010, Audio-Visual General.

B. Performance Verification of the equipment included herein should be conducted in accordance with requirements in other Specification Sections that cover related equipment.

C. Audio Tests and Adjustments:
   1. Impedance:
      a. Measure absolute overall impedance of each production communication circuit. Ensure impedance is within load limitations of the specified amplifier, main station, or other component providing or controlling the signal. Adjust circuiting if required.
   2. Polarity:
      a. Verify that polarity is maintained throughout each production communication circuit.
   3. Hum, Noise Level, and RF Interference:
      a. Terminate inputs and outputs to prevent the introduction of hum or other noises into the audio signal chain. Hum and noise shall not be plainly audible in the system.
      b. Verify that the shield of all lines is intact and connected for the length of the installed cable run.
      c. Ensure that the system is free from spurious oscillation and RF pick-up with the absence of any input signal.

D. Wireless Systems:
   1. Using a wireless belt pack and headset and moving through the coverage area(s), verify that the wireless production communication system signals are constant and free of dropouts in the entire coverage area. Adjust antennae, transceivers, and WAPs as necessary.

E. Remote Power:
   1. Verify that all remotely powered components, regardless of the power source, receive voltage and amperage within the manufacturer’s operating specifications. Adjust and/or add power supply capacity as required.

F. Programming:
   1. Install and configure system management software on management PCs or servers. This includes all PCs or servers included in this scope as a part of the production communication system. This includes up to two PCs or servers per space that are owner-provided outside of this scope.

2. Verify all channels for proper grouping. Testing shall include voice communications as if the system was in use, as well as visual and audio signals (calls) and tally signals as appropriate for each station.
3. For stations with channel switching functionality, verify that the appropriate channel grouping is heard from, talked to, and signaled to and from as selected on the station.

G. Interfaces to other Systems:
1. Verify that all interfaces to or from other systems send or receive the desired signals or channel groups. This shall include but not be limited to front and back of house announce lines, tally signals, and program audio feeds to the production communication system.

END OF SECTION

SECTION 274116 - ACCESSIBILITY SYSTEMS

PART 1 GENERAL

1.1 SECTION INCLUDES

A. FM Assistive Listening Systems.

B. Responsibilities and obligations in support of the Performance Verification specified in Section 274010, Audio-Visual General.

1.2 RELATED REQUIREMENTS

A. Additional requirements as shown on the Drawings.

B. Section 274110, Microphones, Conferencing Systems, and Audio Source Equipment.

C. Section 274111, Mixing, Processing, and Amplification Equipment.

D. Section 274113, Loudspeakers and Related Equipment.

E. General provisions in Section 274010, Audio-Visual General and other Sections of Division 27.

1.3 REFERENCE STANDARDS

A. Conform to all codes and standards listed in PART 1 of Section 274010, Audio-Visual General.

B. FCC part 15

C. ISO ICS-03

D. CE, RCM, MIC, RoHS, and WEEE.

1.4 SUBMITTALS

A. General submittal requirements as identified in Section 274010, Audio-Visual General. In addition to those requirements, submittals for this Section shall include the following:
   1. Floor plans and/or RCPs as required to show locations of all field devices, including but not limited to emitters, permanently installed inductive loops, antennae, visual paging displays, and connection points for portable accessibility equipment covered by this Section.
   2. Inductive loop layouts shall be approved in writing by the loop system manufacturer prior to submission to the Design Team.
   3. Wiring diagram showing proposed interconnects from audio mixing or processing and other systems to deliver single or multi-channel audio, data, and RF signals as required.

PART 2 PRODUCTS

2.1 GENERAL

A. Inputs and outputs as shown on the Drawings.

B. Receiver quantities and other system capacities as necessary shall comply with Americans with Disabilities Act requirements at the time the system is installed. Changes in these requirements that, in the opinion of the Contractor, bear significant financial burden, shall be brought to the attention of the Architect in writing prior to system installation.

C. All components shall be from a single manufacturer, unless otherwise noted.

D. Color of exposed components shall be coordinated with the Architect.

E. Signage:
1. Provide one wall-mounted sign indicating the presence of the hearing assistance system per system.
2. Where one system is shared by more than one space, provide on sign for each space.
3. Signage shall indicate the availability of standard and telecoil loop compatible receivers.

F. Manufacturer: Listen Technologies, Sennheiser, Williams Sound.

2.2 FM ASSISTIVE LISTENING SYSTEMS

A. General:
1. System base RF frequency: 72 MHz.

B. Modulators:
1. Adjustable input level.
2. Audio processing: compression, switchable on/off.
3. Audio frequency contouring.
4. Integral test tone generator.
5. Front panel channel selector and input level adjustment.
6. LED channel, audio level, and transmit level indicators.
7. Rack-mountable where shown in an equipment rack on the Drawings.
8. RF channel support: 2.

C. Antennas:
1. Remote-mountable.
2. Compatible with system base RF frequency shown above.
3. Type: dipole.
4. Unity gain: 0 dB.
5. Antenna range: 1,000’.

D. Receivers:
1. Style: stethoscope, neck lanyard, or body pack as shown on the Drawings.
2. Channels: 2.

3. User controls for power on/off, volume up/down, and channel selection.
4. OLED display showing channel designation, status, battery level, and volume.
5. Programmable automatic squelch.
6. Frequency range: 216.0125 MHz to 216.9875 MHz.
7. Channels: 19 wide band, 38 narrow band.
8. Programming via software and USB port.
9. Earphones:
   a. Worn over the ear.
   b. Useable with hearing aids.
   c. Frequency response: 20 Hz to 20 kHz.
   d. Connector: compatible with specified receiver.
10. Inductive Neck Loops:
   a. Functionally designed as a lanyard and inductive loop.
   b. Connectors compatible with specified receiver.
   c. Field strength: 400 mA/m, ±3.0 dB.
   d. Frequency response: 100 Hz to 5.0 kHz, ±3.0 dB @ 1.0 kHz.
11. Rechargeable Batteries:
   a. Type: Lithium-ion.
   b. Capacity: 1200 mAh.
   c. Full charging time: 120 to 150 minutes.
   d. Battery life: 3750 discharge cycles @ 10% depth of discharge, minimum.

E. Accessories:
1. Battery Chargers:
   a. Simultaneous charging of 12 batteries.
   b. Chassis type: Desktop.

PART 3 EXECUTION

3.1 GENERAL

A. Install signage related to the hearing assistance system at location(s) in front of house spaces identified by the Architect. Verify locations prior to installation.

B. Coordinate receiver channel assignments with the Architect.

3.2 EMITTERS AND ANTENNAS

A. Place antennas and/or emitters to provide even coverage, free of dropouts for the entire listening area, unless a specific coverage area is shown on the Drawings.

B. Aim emitter panels where best performance is obtained in the space(s) the panels are intended to cover.

C. Mount emitter panels and antennas to limit interference from other devices or systems.

D. Observe manufacturer’s cable length limitations.

3.3 INFRARED, WIFI, AND FM ACCESSIBILITY SYSTEMS PERFORMANCE VERIFICATION

A. General:
   1. Performance Verification of these systems shall be performed in conjunction with the Performance Verification requirements in Section 274010, Audio-Visual General.

B. Infrared, FM, and WIFI Systems:
   1. Verify that selected frequency bands are free from interference of any kind, including from other radio sources occupying the desired frequency, and lighting instruments.
   2. Using a receiver, walk the extents of the coverage area and ensure that the assistive listening signal is heard in the entire area. Adjust antennas and emitter positioning and strength as required.
   3. Test the reception of the system at six points within the coverage area. Adjust antenna and emitters accordingly.

END OF SECTION

SECTION 274116.10 - INTEGRATED AUDIO-VIDEO EQUIPMENT FOR CLASSROOMS

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 REFERENCE STANDARDS

A. NFPA 70 - National Electrical Code; Most Recent Edition Adopted by Authority Having Jurisdiction, Including All Applicable Amendments and Supplements.

1.3 SUMMARY:

A. Section Includes:
   1. Stand-alone, networkable, scalable, one-room AV control and presentation system with user control panel and software.

B. Related Information:
   1. Division 27 Section "Common Work Results for Communications."
   2. Division 27 Section "Communications Copper Horizontal Cabling."
   3. Division 27 Section "Public Address System."

1.4 REFERENCES

A. Comply with the following codes, standards, and manuals:
   1. NFPA 70 - National Electrical Code.
   2. ANSI/TIA-588-C.0 - General Cabling Standards
   3. ANSI/TIA-568-C.1 -- Commercial Building Cabling Standard

1.5 SYSTEM DESCRIPTION

A. For each classroom, furnish and install a complete, networkable audio system that serves as a primary audio amplification for media and voice, and also an audio end-point for the Public Address system (see 27 51 16).
   1. Standard Classrooms with a mobile interactive display shall have a receiver (basis of design FRONTROW # 1000-00287 UNITY Campus Complete Kit) to be installed inside of a 2'x2' recessed, plenum-rated, ezRoom Trio enclosure with three integrated speakers (FRONTROW # 1000-00310), ClassLight, and a pre-installed analog page override (FRONTROW #1010-00004). The receiver must have one (1) teacher microphone, one (1) student microphone and a flip charger.
   2. Large classrooms with a mobile interactive display shall have an ezRoom 2x2 recessed, plenum-rated ceiling enclosure pre-installed with UNITY Campus Complete Kit, Powerline and ClassLight (basis of design FRONTROW # 1000-00309), pre-installed analog page override (FRONTROW #1010-00004), and shall be connected to four (4) 2x2 speakers (FRONTROW #SP-L2-4). The receiver must have one (1) teacher microphone, one (1) student microphone and a flip charger.
   3. Classrooms with a fixed, wall-mount displays shall have a receiver (basis of design FRONTROW # 1000-00287 UNITY Campus Complete Kit) to be installed inside of a 2x2 recessed, plenum-rated ezRoom Trio ceiling enclosure with three integrated speakers (FRONTROW # 1000-00310), ClassLight, a pre-installed analog page override (FRONTROW #1010-00004), and to the display via serial and audio cable (basis of design FRONTROW #6414-00028) for audio return. The receiver must have one (1) teacher microphone, one (1) student microphone and a flip charger.
   4. The System is to include all equipment, cabling, materials, labor, and training as required to install and test a complete operating System as described herein.
   5. Contractor shall follow installation instructions provided by the manufacturer. Installation drawings shall show the location and general arrangement of equipment, electrical systems and related items. They shall be followed as closely as elements of the construction will permit.
   6. Contractor shall examine the installation drawings and verify the conditions governing the work on the job site. Contractor shall arrange accordingly, providing such fittings, horizontal cable raceways, conduits, junction boxes and accessories as may be required to meet such conditions.
   7. Deviations from the installation drawings, except for minor changes in routing and other such incidental changes that do not affect the functioning or serviceability of the Systems, shall not be made without the written approval of the Engineer.

1.6 ACTION SUBMITTALS

A. Submit product data and shop drawings in accordance with Division 01 and Division 27 Section

B. "Communications Shop Drawings and Submittals" for products specified under PART 2 - PRODUCTS.

C. Specification Compliance Certification: Submit a Specification Compliance Certification in accordance with Division 27 Section "Communications Shop Drawings and Submittals".

D. Shop Drawings: Indicate the following:
   1. Schematic diagram of controlled circuits.
   2. Circuits and emergency circuits with capacity and phase, control zones, load type and voltage per circuit.

1.7 INFORMATION SUBMITTALS

A. Sample of manufacturer's warranty.

B. Installation and setup guides.

1.8 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For equipment and components to include in emergency, operation, and maintenance manuals. In addition to items specified in Division 01 Section "Closeout Procedures," include the following:
   1. Record of Owner's equipment-programming option decisions.
   2. All instructions necessary for proper operation and manufacturer's instructions.
   3. "Proof of Performance" information.
   4. Manufacturer's maintenance information.
   5. Copies of non-proprietary computer programs and system set up disks documenting all programmable features of the installed system.

B. Record Drawings: Prior to final acceptance, provide a complete set of drawings indicating all cable numbers and construction details in accordance with the actual system installation. Revise all shop drawings to represent actual installation conditions. These Record Drawings will be used during "Final Acceptance Testing".

C. System Training: Submit the following information describing the training programs and system trainers as outlined in this Section and in accordance with Division 01 Specifications.
   1. Include with the submittal a preliminary staff development training program in outline form for review and approval by the Owner's representative.
   2. Include with the submittal a current copy of the trainer's certification from the manufacturer that certifies and identifies the trainer(s) who are eligible to provide training and support for the project.
   3. Include with the submittal a current copy of trainer's needs assessment form which will be reviewed with the Owner's designated representative for the system's preliminary system programming and configuration.
   4. Include with the submittal copies of all documentation used to identify for the Owner those participants attending and completing the training programs.

D. A copy of the manufacturer's standard statement of warranty proving all equipment provided for the school communications network is covered with the required five-year warranty shall be included with the project submittal. This statement of warranty shall be provided on the manufacturer's stationary.

1.9 QUALITY ASSURANCE

A. Manufacturer Qualification: Manufacturer of controller with minimum five years record of satisfactory manufacturing and support of components comparable to basis of design system.

B. Source Requirements: Provide control panel, amplifier/switch, loudspeaker, receiver, microphone hardware and software through a single source from a single manufacturer.

C. Contractror shall be an authorized reseller and installer of the system as described in these specifications and on the project drawings. Installation of the systen shall be provided by a person or persons having completed, as a minimum, the factory training recommended by the system manufacturter and have direct field experience in the installation of a minimum of 3 projects of similar scope and size within the past 5 years.

D. All miscellaneous equipment required for a complete, professional installation shall be included in the base bid. No allowances for any additional equipment, hardware, cabling, or miscellaneous will be considered unless specifically excluded from the base bid.

E. All work materials shall be removed at the end of the work day and the work area left in the same condition as found.

F. The work herein specified shall be performed by fully competent workmen, in a thorough manner. All materials furnished by the Contractor shall be new, and all work shall be completed to the satisfaction of the Architect/Engineer.

G. All equipment shall be held firmly in place. This shall include speakers, receiver/amplifiers, cables, etc. Fastenings and supports shall be adequate to support their loads with a safety factor of at least three. All switches, connectors, outlets, etc., shall be clearly, logically, and permanently marked during installation.

H. Take such precautions as are necessary to guard against electromagnetic and electrostatic hum and ground loops, to supply adequate ventilation, and to install the equipment so as to provide maximum safety to the person who operates it.

I. Care shall be exercised in wiring so as to avoid damage to the cables (e.g., stapling, pinching, excessive bending) and to the equipment. All joints and connections shall be made with lead- free rosin-core solder or with mechanical connectors approved by the Engineer. All wiring shall be executed in strict adherence to standard broadcast practices.

J. The Contractor shall be an established communications and electronics Contractor that has had and currently maintains a locally run and operated business for at least five years. The Contractor shall utilize a duly authorized reseller of the equipment supplied for this project location with full Manufacturer's warranty privileges.

K. Test the installed System according to the Manufacturer's instructions and verify that the equipment has been installed properly and is functioning as designed.

1.10 WARRANTY

A. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace components of controls system that fail in materials or workmanship within the specified warranty period following substantial completion.
   1. Warranty Periods:
      a. Wireless transmitters, wireless receivers, infrared sensors, loudspeakers, and charging stands: Five (5) years.
      b. Rechargeable batteries, power cords, power supplies: One (1) year.
      c. Other components: Three (3) years.

B. Manufacturer's Extended Support Service: Extended telephone support for unlimited period.

PART 2 PRODUCTS

2.1 MANUFACTURER

A. Basis-of-Design Manufacturer: Subject to compliance with requirements, provide products ofFrontRow by Boxlight, 1609 Corporate Circle, Petaluma, CA 94954, Phone +1 707 227 0735, www.gofrontrow.com.

B. Unity receiver specifications
   1. Dimensions: 45mm tall (1 - 49/64”) 175.7mm wide (6 - 59/64”) 203.6mm deep w/o faceplate (8 - 1/64”) 222.6mm deep w/ faceplate & Knob (8 - 49/64”)
   2. Weight 0.760kg / 1.68lbs
   3. Network Support 10/100 Mb/s (auto sensing) Control RS 232 1, RS 232 connection – 500mA – Phoenix connector Serial Baud Rate 2400 to 115200
   4. GPI 2, General Purpose Inputs – Phoenix connectors Relay 1, Normally open / Normally closed – Phoenix connector, Normally open
   5. Alarm Input – Phoenix connector
   6. Analog Page Mute
   7. Page Override (PGO) – Phoenix connector IR Output
   8. IR out – Phoenix connector
   9. Power Out 1, 24 VDC – Phoenix connector (Trio Speaker Power)
   10. 12 VDC (1.5 Amp) – Phoenix connector 12 VDC (0.5 Amp)
   11. 5 VDC - USB-A connector (For Charging 1 Microphone)
   12. Power In Fulltime or backup PoE+ Type 2 / Class 4 (25.5W) 802.3at
   13. Fulltime or backup PoE++ Type 3 / Class 6 (51W) and Type 4 / Class 8 (71W) (802.3bt)
   14. PowerLine – 90W, 48VDC, up to 100ft.
   15. Amplifier Power 32W continuous (2 channels x 16W @ 4Ω).
   16. Use two (2) - 8 Ohm FrontRow Lay-In speakers for 16W for smaller rooms, or four (4) FrontRow SP-L2-4 for larger rooms.
   17. THD 1kHz, at nominal level (1 watt, 8-ohm load) Type Class D

18. Signal-to-Noise >84 dB @ 20 Hz to 20 kHz at maximum output (unweighted, with balanced input)
19. Audio Speaker Out Left / Right channel - Phoenix connector
20. Line Out 1, 0.14 inch line level output (TRS Stereo Unbalanced)
21. ALD Line Out 1, 0.14 inch line level output (TRS - Mono Unbalanced) with rotary volume control for assistive listening devices.
22. USB-C In/Out 1, USB-C bidirectional audio (USB-2.0)
23. Line In 2, 0.14 inch line level inputs (TRS Stereo Unbalanced)
24. Classroom Control MyFrontRow App Available for Boxlight displays, MacOS, Android tablets, iPad, and Windows PC.
25. Power Over Ethernet Compatibility PoE+ Standard 802.3at Type 2 Class 4 Power Sent 30W Power at Endpoint 25.5W Cabling Cat5e UNITY Support Maximum amp power may be limited to 25.5W (same as any device running PoE+)

C. Elevate microphones specifications
1. General Spec Battery Type/Voltage/Amperage LiPo 3.7V, 650mA
2. Battery Life (hours) - talk time 8+hrs US / 7+ EU/AUS
3. Recharge Time 3.5 hrs RF Power (dBm) 19dbm peak (teacher only), 6dbm average - US/CAN, 24/10 inch UK/EU/AUS
4. Weight 44.3g / 1.5oz (teacher) 89.7g / 3.16oz (student)
5. Size (HxWxD) 68 x 36 x 22mm / 2.7 x 1.4 x 0.9 inches (teacher) 118 x 36 x 22mm / 4.6 x 1.4 x 0.9 inches (student)
6. Headset in 3.5mm TRRS (T=left, R1=Right, R2=Mic, S=Gnd), use with FrontRow headworn mic (1000-00235) or plug in an audio source Wireless Communication ELEVATE™
7. FlipCharger Size (HxWxD) 127 x 71 x 1.5 inch / 5 x 2.8 x 1.5 inch Weight 110g/3.9oz Power Supply 5.9V / 700mA Mounting Options Wall Mount (frame included).

D. Contoller / Receiver
1. The receiver must connect to a two-gang wall plate and ZipControl Audio Controller (basis of design FRONTROW #1000-00306)
    a. Master volume/mute knob with visual LED tracking.
    b. Wall plate lock button.
    c. Microphone pairing button.
    d. Bluetooth pairing button.
    e. Assistive Listening Device 3.5mm port with variable gain knob.

E. Speakers
1. For large classrooms use FRONTROW # SP-L2-4 kit with the following specifications:
    a. Average sensitivity: 92dB-SPL 1W/1M
    b. Loudspeaker power rating: 12W-RMS EIA 426A Standard
    c. Calculated maximum system output: 102dB-SPL, 12W/1M
    d. Magnet type: BeFe Ceramic, 5 oz. Nominal
    e. Size (WxHxD): 60.5 x 60.5 x 8.74cm/23.82 x 23.82 x 3.44 inch
    f. Impedance: 8 Ohm
    g. Frequency response: 65Hz – 17kHz EIA 426A standard
    h. Nominal coverage angle: 100˚ included angle -6dB/2kHz
    i. half space

j. Audio connection: Pre-cut 17.8cm/7in color-coded leads
k. UL Listed 1480, UL Listed 2043
l. Model # 1000-00321

PART 3 EXECUTION

3.1 EXAMINATION

A. Prior to installation, examine work area to verify measurements, and that commencing installation complies with manufacturer's requirements.

3.2 INSTALLATION

A. Do not install AV or control devices until space is enclosed, HVAC systems are running, and overhead and wet work in work space are complete.

B. Install control devices in accordance with manufacturer's instructions.

C. Install speakers in accordance with manufacturer's instructions.

D. Install interactive display and mount in accordance with manufacturer's instructions.

E. Grounding: Provide electrical grounding in accordance with NFPA 70.

F. Perform setup for each audio-visual equipment component.

3.3 SYSTEM STARTUP

A. Provide system startup and adjustment to occupied conditions in accordance with manufacturer's recommendations.

B. Perform operational testing to verify compliance with Specifications. Adjust as required.

3.4 TESTING

A. Upon completion of installation of the, system and after electrical circuitry has been energized, demonstrate capability and compliance with requirements. Where possible, correct malfunctioning units at site, then retest to demonstrate compliance; otherwise, remove and replace with new units, and proceed retesting.

3.5 FINAL ACCEPTANCE TESTING

A. The Final Acceptance Testing shall be provided to the Owner or the Owners designated representative only. Final acceptance testing to any other trade or service provider for the project will not comply with the requirements of this section.

B. The contractor will provide a Final Acceptance Test record document signed by both the contractor and the Owner or designated Owner's Representative establishing the "In Warranty" date. The warranty period will not commence until the Final Acceptance Test is completed.

C. Be prepared to verify the performance of any portion of the installation by demonstration, listening and viewing test, and instrumented measurements. Make additional adjustments within the scope of work and which are deemed necessary by the Owner because of the acceptance test.

3.6 DEMONSTRATION AND TRAINING

A. The Contractor shall demonstrate the System to operate in accordance with the requirements of these specifications as well as the Manufacturer's performance specifications. The test shall be performed in the presence of an authorized representative of the Owner.

B. Should such a demonstration of performance show that the Contractor has not properly installed the System, the Contractor shall make all commercially reasonable changes or adjustments at no additional cost to the Owner.

C. Training: Provide a minimum of four (4) hours (minimum) training on the operation and maintenance of the audio/visual presentation system, at job site. Provide programming and software training as required to allow the district to do any programming that the supplier is allowed to do during commissioning, testing, service and field additions or deletions to the system. Illustrate utilization of all components and the interaction of the complete system. Conduct separate 2-hour sessions in each "pod" and each grade level. Provide this training at no cost to the Owner, including transportation, lodging, meals and training manuals.

END OF SECTION

SECTION 274121 - VIDEO CAMERA, SOURCE, AND RECORDING EQUIPMENT

PART 1 GENERAL

1.1 SECTION INCLUDES

A. High-Definition Cameras and Camera Mounts.

B. Responsibilities and obligations in support of the Performance Verification specified in Section 274010, Audio-Visual General.

1.2 RELATED REQUIREMENTS

A. 274122, Video Transport, Switching, and Processing Equipment.

B. 274123, Video Display Equipment.

C. 274124, Video Conferencing and Collaboration Equipment.

D. Additional requirements as shown on the Drawings.

E. General provisions in Section 274010, Audio-Visual General, and other Sections of Division 27.

1.3 REFERENCE STANDARDS

A. Conform to all codes and standards listed in PART 1 of Section 274010, Audio-Visual General.

1.4 SUBMITTALS

A. General submittal requirements as identified in Section 274010, Audio-Visual General. In addition to those requirements, submittals for this Section shall include the following:
   1. Floor plans and/or RCPs showing camera locations and other field devices within the associated spaces.
   2. Details (elevations, sections, and isometrics as necessary) showing mounting configurations at the appropriate locations.

PART 2 PRODUCTS

2.1 GENERAL

A. Inputs and outputs as shown on the Drawings.

B. Support of the base system resolution identified in Section 274122, Video Transport, Switching, and Processing Equipment.

2.2 HIGH DEFINITION SINGLE CHIP CAMERAS

A. Minimum supported resolution: 1080p @ 60 Hz, unless otherwise indicated on the Drawings.

B. Remote video, power, and control over one or two Category 6 cables via a rack-mountable control unit. Control function shall include but not be limited to white balance, color gain, brightness, gamma, chroma, and iris. It shall also include pan, tilt, and zoom control unless the specified camera is a fixed camera as noted on the Drawings.

C. Compatibility with video production switcher for native PTZ controls

D. User-definable presets (pan/tilt/zoom cameras only).

E. Cable distance limitation: 330’.

F. Native support for NDI HX3 video streaming format

G. Multiple simultaneous outputs.

H. 1/4-20 standard tripod thread.

I. Reversible image to allow the camera to be mounted upside down.

J. Pan, tilt, and zoom limits as shown on the Drawings.

K. Field of view as shown on the Drawings.

L. Rack-mountable Category cable extension interface where shown on the Drawings.

M. Remote controllable.

N. Mountable as shown on the Drawings.

O. Finish color as shown on the Drawings.

P. Browser-based user interface.

Q. Manufacturer: Birddog, PTZ Optics, Sony, Panasonic, AVer.

2.3 CAMERA MOUNTS

A. Additional details and dimensions as shown on the Drawings.

B. Manufacturer: same as the specified camera(s).

C. Wall-mount:
   1. Aluminum or steel construction.
   2. Color: same as camera.

PART 3 EXECUTION

3.1 GENERAL

A. Seismic restraints shall be provided as specified in Section 274010, Audio-Visual General.

B. See Section 274140, Audio-Visual Cabling for additional cabling requirements.

3.2 HIGH DEFINITION SINGLE CHIP CAMERAS

A. Use Category 6 or better for permanent Category cable links between cameras and interfaces or control units.

B. Use shielded Category cable where required by the specified signal type or the manufacturer.

C. Power all cameras from the equipment rack.

D. Use neoprene rings or mounts as necessary to isolate the camera from building vibration.

E. Adjust white balance as required.

F. Adjust pan-tilt limit settings and speed controls.

G. Verify and adjust focus, resolutions, limits, and speed settings.

H. Coordinate camera presets with the Architect.

3.3 CAMERA MOUNTS

A. Install mounts according to manufacturer’s instructions.

B. Wall-mounts shall be secured to structure, blocking, or to an electrical box.

3.4 VIDEO CAMERA, SOURCE, AND RECORDING EQUIPMENT PERFORMANCE VERIFICATION

A. General Performance Verification requirements are contained in Section 274010, Audio-Visual General.

B. Performance Verification of the equipment included herein should be conducted in accordance with requirements in other Specification Sections that cover related equipment.

C. Camera Equipment:
   1. Camera images shall be free of visible vibration.
   2. All cameras in a single system shall be white balanced, whether manually or automatically.
   3. Verify that presets are saved per Architect instructions.

4. Using automatic or manual white balancing, all cameras shall be white balanced uniformly.

END OF SECTION

SECTION 274122 - VIDEO TRANSPORT, SWITCHING, AND PROCESSING EQUIPMENT

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Flip-top recessed and table-top connector boxes.

B. Presentation switchers.

C. Video Matrix switchers.

D. Non-IP-based category cable video transmission equipment.

E. IP-based category cable and fiber video transmission equipment.

F. USB Extenders.

G. Display wall processors.

H. High-Definition multimedia streaming processors, encoders and decoders.

I. Responsibilities and obligations in support of the Performance Verification specified in Section 274010, Audio-Visual General.

1.2 RELATED REQUIREMENTS

A. Section 274121, Video Camera, Source, and Recording Equipment.

B. Section 274123, Video Display Equipment.

C. Section 274124, Video Conferencing and Collaboration Equipment.

D. Section 274132, Audio-Visual Network Equipment.

E. General provisions in Section 274010, Audio-Visual General, and other Sections of Division 27.

1.3 REFERENCE STANDARDS:

A. Conform to all codes and standards listed in PART 1 of Section 274010, Audio-Visual General.

1.4 SUBMITTALS

A. General submittal requirements as identified in Section 274010, Audio-Visual General. In addition to those requirements, submittals for this Section shall include the following:
   1. Floor plans showing locations of field-mounted devices. This includes but is not limited to input devices, transmitters, receivers, encoders, and decoders.
   2. Details showing specific mounting location of any devices mounted in or on millwork (including existing millwork, owner-furnished millwork, and millwork included in this scope).

PART 2 PRODUCTS

2.1 GENERAL

A. Inputs and outputs as shown on the Drawings.

B. All devices sending and/or receiving digital video signals shall be HDCP 1.4 compliant, unless otherwise noted, or unless a device category typically does not support HDCP in the use case defined herein.

C. All devices supporting HDMI shall support HDMI 1.4.

D. The base operating (default or native) resolution of the systems covered by this and related video Specifications is 3840 x 2160 @ 60 Hz. All devices covered by this and related video Specification Sections shall support this resolution unless otherwise noted.

2.2 FLIP TOP RECESSED BOXES

A. Steel or aluminum construction.

B. Quantity as shown on the Drawings.

C. Dimensions as shown on the Drawings.

D. Connectivity and power as shown on the Drawings.

E. Integral touch screen and/or keypad as shown on the Drawings.

F. Manufacturer: as shown on the Drawings.

2.3 TABLETOP BOXES

A. Construction: metallic.

B. Accommodates standard US size gang plates.

C. Quantity as shown on the Drawings.

D. Dimensions as shown on the Drawings.

E. Connectivity and power as shown on the Drawings.

F. Manufacturer: as shown on the Drawings.

2.4 PRESENTATION SWITCHERS

A. Functionally designed to accept multiple input signal formats, convert and/or scale them to one or more common signal format(s), and send the common signal format(s) out on one or more outputs.

B. Functionally designed to scale digital video signals up to 4096 x 2160 @ 4:4:4 (inclusive), and down to 3840 x 2160 @ 60 Hz.

C. Integral control system processor. See Section 274131, Audio-Visual Control Systems and Programming.

D. 10/100/1000 Mbps auto-switching/discovery/negotiating Ethernet.

E. Multiformat Ethernet stream encoding.

F. H.264 Ethernet stream decoding.

G. Wireless video input/presentation functionality.

H. HDCP compliancy: HDCP 1.4.

I. Minimum two independent scalers.

J. Audio and video matrix switching capabilities when the unit has two or more independent audio and/or video outputs.

K. Remote power of transmitter and receiver units.

L. Redundant power supplies where shown on the Drawings.

M. Scaled output(s).

N. Audio matrix switcher with input and output gain, DSP (delay, EQ, filtering, compression, and limiting), full matrixing of all audio inputs and outputs.

O. Audio break away.

P. Integral network switch.

Q. Ethernet control.

R. Switchable phantom power on all microphone inputs.

S. Integral power amplifier where shown on the Drawings, minimum 25 W/channel @ 8 Ω, 50 W/channel @ 70 V or 100 V.

T. Manufacturer: same as digital video matrix switching equipment.

2.5 VIDEO MATRIX SWITCHERS

A. Functionally designed to route any input to any one or more outputs.

B. Card frame chassis with card slots and cards as shown on the Drawings.

C. Conversion of signal formats for transmission over Category cable or fiber optic cable as shown on the Drawings.

D. Unless otherwise noted on the Drawings, minimum transmission distance for converted signals without a repeater or amplifier:
   1. On Category cable: 330'.
      a. Shielded or unshielded per manufacturer's requirements.
   2. On multimode fiber optic cable: 1000'.
   3. On single mode fiber optic cable: 7.5 miles.

E. Inputs and output signal formats as shown on the Drawings.

F. Frame and cards support digital video input signals up to and including 3840 x 2160 @ 60 Hz.

G. Scaling on local HDMI, DVI-D, and DisplayPort output that supports the same frequency range as the input cards.

H. Integral network switch with Ethernet pass through to remote devices.

I. HDCP compliancy: HDCP 1.4.

J. Serial control pass-through to remote devices.

K. Internal test pattern generator.

L. EDID management, including inter-device communication, EDID capture, and support for custom EDID files.

M. USB signal routing and extension.

N. Remote power for field devices.

O. Audio breakaway.

2.6 NON-IP CATEGORY CABLE AND FIBER OPTIC CABLE TRANSMITTERS AND RECEIVERS

A. Applies to equipment that uses a standard or proprietary non-IP transport protocol such as HDBase-T.

B. From the same manufacturer as the specified video matrix switcher, unless otherwise noted.

C. Compatible with the specified video matrix switcher.

D. Chassis style or wall-plate style as shown on the Drawings.

E. Extension of network, serial, and USB signals as shown on the Drawings.

F. Support digital video input signals up to and including 3840 x 2160 @ 60 Hz.

G. Internal scaling engine.

H. Unless otherwise noted on the Drawings, minimum transmission distance for converted signals without a repeater or amplifier:
   1. On Category cable: 330'.
      a. Shielded or unshielded per manufacturer's requirements.
   2. On multimode fiber optic cable: 1000'.
   3. On single mode fiber optic cable: 7.5 miles.

I. Remote power.

J. Manufacturer: same as matrix or presentation switcher to which it connects.

2.7 NETWORK VIDEO MATRIX ENCODERS AND DECODERS

A. Applies to encoders and decoders that are used in conjunction with a network switch to create an IP video matrix, sending streams from one encoder to one or multiple decoders.

B. Chassis style as shown on the Drawings: low-profile chassis, card-frame style, or OPS.
   1. Card frames shall have space and provide power for the card-frame style encoders and decoders shown.
   2. Low-profile shall be surface-mountable.
   3. OPS units shall conform to the Intel Open Pluggable Specification standard.

C. Category cable and/or fiber optic cable links as shown on the Drawings.

D. HDCP compliancy: HDCP 1.4.

E. Distance limitations shall follow IEEE standards for the specified network signal types.

F. Category cable links shall support up to and including 1000Base (1G) bandwidth.

G. Video Wall signal distribution functionality on decoders.

H. Control of connected devices via LAN, bi-directional serial, or unidirectional serial.

I. Scaled output.

J. Local or PoE, PoE+, or UPoE power, as indicated by the manufacturer.

K. Configurable as an encoder or decoder.

L. Fiber optic cable links shall support up to and including 10GBase (10G) bandwidth.

M. Manufacturer: QSC, Extron, or Crestron.

2.8 NETWORK VIDEO MATRIX ENCODER AND DECODER MANAGEMENT SOFTWARE AND HARDWARE

A. Manufacturer: Same as specified network video matrix encoders and decoders.

B. Sufficient capacity to support the quantity of encoders and decoders in the system(s) managed by each encoder plus 20%. Provide hardware and software keys as required.

C. Web or software-based configuration and control.

D. Secure communication with encoders and decoders.

E. Push firmware updates to connected encoders and decoders.

F. Compatible with the specified Audio-Visual control system as defined in Section 274131, Audio-Visual Control Systems and Programming.

G. Saving and recalling of routing presets.

H. Configuring ad hoc manual routs.

I. Hardware shall be rack mountable.

2.9 NETWORK SWITCHES FOR VIDEO TRANSPORT AND SWITCHING

A. See Section 274131, Audio-Visual Network Equipment.

2.10 USB EXTENDERS

A. Compatible with the specified touch panel displays and annotation processor specified.

B. Capable of transmitting touch coordinated data.

C. Ports as shown on the Drawings.

D. Support for USB 3.0 and data rates up to and including 480 Mbps.

E. Minimum supported transmission distance 330’.

F. Manufacturer: Extron, Icron, Geffen, Crestron

2.11 DISPLAY WALL PROCESSORS

A. Supported resolutions up to and including 3840 x 2160 @ 60 Hz.

B. HDCP compliancy: HDCP 1.4, unless otherwise noted.

C. Inputs and outputs as shown on the Drawings.

D. Rack-mount chassis with card slots and cards as shown on the Drawings.

E. Controlled via Ethernet.

F. Configured and controlled via software.

G. Data rate: 4.95 Gbps (1.65 Gbps per color).

H. Digital sampling: 24 bit, 8 bits per color.

I. Colors: 16.78 million (8-bit processing).

J. Upscaling and downscaling of all inputs to a selected resolution.

K. Restriction-free windowing.

L. Bezel compensation.

M. Manufacturer: Extron, RGB Spectrum, Crestron.

2.12 HIGH DEFINITION STREAMING MEDIA PROCESSORS/ENCODERS

A. Applies to encoders that are used to send compressed streams over a network for reception by generic devices, such as personal computers or set top boxes.

B. Simultaneous independent streaming of one input sources.

C. Internal storage: 400 GB SSD, minimum.

D. Simultaneous recording and streaming.

E. Recording source quantity: recording of one input source in H.264, AAC, MP4, JPEG, JSON, and XML formats.

F. HDCP compliant inputs.

G. Input Resolution: including 3840 x 2160 @ 60 Hz.

H. Dual bandwidth streaming on selected input(s).

I. Input cable equalization.

J. Compression and streaming format: H.264/AAC (ITU H. 264, ISO/IEC 14496-10) @ 4:2:0 8-bit color.

K. Rack-mountable.

L. Streaming bit rate: selectable between 200 kbps and 10 Mbps, inclusive.

M. Manufacturer: same as specified video switching equipment..

2.13 HIGH DEFINITION STREAMING MEDIA DECODERS

A. Applies to decoders that are used to receive a low bandwidth compressed video stream and display it on a display.

B. Live decoding of the streaming format(s) of the specified streaming media processor or encoder.

C. Supported resolutions: including 3840 x 2160 @ 60 Hz.

D. Aspect ratio management.

E. Channel list, playlist, and source management.

F. Minimum internal memory storage.

G. Playback from external USB drive and/or removeable SD card.

H. Manufacturer: Extron, Crestron, Teradek, Vaddio, Contemporary Research.

PART 3 EXECUTION

3.1 GENERAL

A. Configure all components of the video system described herein and in related Sections to operate at the specified base resolution. This includes but is not limited to video switching routes, control signal ingest and/or pass through, scalers, EDID tables, HDCP settings, and auto-switching functions.

B. Configure EDID and HDCP as required to support the base system resolution(s), as outlined herein.

C. Configure routing to provide the functionality described in the Functional Descriptions as shown in Section 274110, Audio-Visual General and in the Control System Programming and Functionality in Section 274131, Audio-Visual Control Systems and Programming.

3.2 FLIP TOP RECESSED BOXES

A. Cut and/or route furniture as necessary to install recessed flip top boxes per manufacturer's instructions at locations as shown on the Drawings. Coordinate locations with the Architect.

B. Install recessed flip top boxes in cut-outs in furniture. Cut-outs are fabricated by others.

3.3 TABLETOP BOXES

A. Secure table-top boxes in place at locations as shown on Drawings.

B. Table-top boxes shall not be secured to allow repositioning around the surface on which the box is installed. Provide rubber feet to prevent the box from scratching the surface on which it is placed.

3.4 PRESENTATION AND VIDEO MATRIX SWITCHERS AND RELATED EQUIPMENT

A. All outputs shall be scaled, either at the matrix switcher output or at the receiver or encoder at the display.

B. Configure scaled outputs to scale the outbound video signal to 3840 x 2160 @ 60 Hz.

C. Configure control pass throughs and/or the internal control system processor to provide the control identified in Section 274131, Audio-Visual Control Systems and Programming.

D. Configure inputs to properly accept source input signals.

E. Configure routing presets in accordance with the functional descriptions in Section 274110, Audio-Visual General.

F. Observe input and output distance limitations.

G. Unless otherwise noted, HDMI inputs shall be set to support embedded audio. Devices that have auto switching between digital and analog inputs shall also automatically switch the audio along with the video.

3.5 NETWORK VIDEO MATRIX ENCODERS AND DECODERS AND RELATED EQUIPMENT

A. For telecommunication switches and related equipment that is owner furnished: Coordinate installation with the Architect. The Contactor shall be responsible for guiding the Owner on configuring their own network equipment to pass IP video signals that are included in this scope.

B. For telecommunication switches and related equipment that is Contractor-furnished: The Contractor shall be responsible for full configuration of the switches to support the audio, video, control, and other network traffic included in this Project. This includes, but is not limited to configuring VLANs, IP addresses, gateways, subnet masks, and ports consistent with the Architect's requirements.

C. Configure units as encoders and decoders as necessary.

D. Configure encoder and decoder routing paths.

E. Configure scaling appropriate for the attached display device(s) and control functionality as required for connected equipment.

F. Limit switch hops to the extent possible, observing the manufacturer's recommendations and/or limitations concerning switch hops.

G. Register units with the control software and/or hardware.

3.6 DISPLAY WALL PROCESSORS

A. Provide manufacturer's on-site installation support and commissioning service.

B. Coordinate window layout, input routing, resolutions, content scheduling, and related features with the Architect.

C. Adjust system parameters to compensate for display mullions and physical display layouts.

3.7 HIGH DEFINITION STREAMING ENCODERS AND DECODERS

A. Mount at locations shown on the Drawings. Secure in place to display, mount, or wall behind display. Coordinate with the Architect.

B. Coordinate installation with the Architect. The Contactor shall be responsible for guiding the Owner on configuring their own network equipment to pass IP video signals that are included in this scope.

C. Configure channel lists to enable television style stepping through IP stream "channels."

3.8 VIDEO TRANSPORT, SWITCHING, AND PROCESSING EQUIPMENT PERFORMANCE VERIFICATION

A. General Performance Verification requirements are contained in Section 274010, Audio-Visual General.

B. Performance Verification of the equipment included herein should be conducted in accordance with requirements in other Specification Sections that cover related equipment.

C. All test sources, except for test generators, shall be sources typical of what will be used on the systems as designed under normal operation conditions.

D. All test generators shall have current, unexpired calibration certificates. Any results of a test performed by a test performed with expired calibration may be rejected. Any test rejected for this reason shall be reperformed.

E. Verify that all displays show an image that is centered, free of noise, and scaled properly for the display and/or the base resolution of the system. Test sources shall be set to output multiple resolutions to ensure the most common resolutions are scaled properly. Adjust scalers as required.

F. Verify that the EDID tables for all switches, EDID minders, and other devices that facilitate negotiation between source and display are properly configured to allow that all source resolutions display using the full display area of each display device. Adjust EDID tables and/or force EDID information as required.

G. Verify that HDCP support is consistent through the entire system. Coordinate with the Architect regarding global HDCP settings and possible resulting compatibility issues.

H. All Video Switching Equipment:
   1. Test all possible video routes as defined herein to ensure proper switches are made and that sources show on the displays in an appropriate amount of time. Correct any deficiencies found, including sync, HDCP, color, and EDID issues.
   2. Verify that digital video routing and switching occurs in a reasonable amount of time.
   3. If this system is replacing an analog video system, verify that the Architect is aware that digital video switching has inherent unavoidable delays.
   4. Verify that audio switching within the video switches is configured. Observe audio-follow-video and/or audio breakaway requirements. HDMI audio/analog audio switching.
   5. Verify that audio and video synchronization is maintained throughout the entire signal path. There shall be no noticeable delay between audio and video. Correct as required, adding delays where appropriate.
   6. Verify that any display mutes, such as all mute or mute groups as defined herein, blank the appropriate displays.
   7. Verify that all video signal paths are free from noise and artifacts of any kind.

I. Display Wall Processors:
   1. Verify that display mullion width and height has been factored into the display wall layout.
   2. Verify that all images and windows are clear, free of artifacts, flickering, EDID, or other defects.
   3. Verify that the audio is intelligible, clear, free of noise of any type, and properly synced with the video.
   4. Adjust settings as required. If a defect is introduced by a system or device outside of this scope, notify the Architect in writing.

END OF SECTION

SECTION 274123 - VIDEO DISPLAY EQUIPMENT

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Display monitors.

B. Display monitor wall mounts

C. Direct-view LED display walls.

D. Projectors.

E. Projector overhead mounts.

F. Projector Lifts.

G. Responsibilities and obligations in support of the Performance Verification specified in Section 274010, Audio-Visual General.

1.2 RELATED REQUIREMENTS

A. Section 274121, Video Camera, Source, and Recording Equipment.

B. Section 274122, Video Transport, Switching, and Processing Equipment.

C. Section 274124, Video Conferencing and Collaboration Systems.

D. Section 274125, Electronic Signage and Wayfinding Equipment.

E. Section 274131, Audio-Visual Control Systems and Programming.

F. Section 274126, Projection Screens.

G. General provisions in Section 274010, Audio-Visual General, and other Sections of Division 27.

1.3 REFERENCE STANDARDS

A. Conform to all codes and standards listed in PART 1 of Section 274010, Audio-Visual General.

B. ISO 9241-300:2008

C. ISO 9241-302, -303, -304, -305, -306, -307:2008

1.4 SUBMITTALS

A. General submittal requirements as identified in Section 274010, Audio-Visual General. In addition to those requirements, submittals for this Section shall include the following:
   1. Floor plans and/or RCPs showing:
      a. The locations of all display devices of all types, including but not limited to individual flat panel displays, display walls, and projectors.
      b. RCPs shall be dimensioned to show the distance between the front of the projector (lens) and the projection screen.
      c. Floor plans shall be dimensioned to show the distance from the center of the display device to the nearest column and to any adjacent devices on the same wall or that otherwise might be impacted by the display's location.
   2. For wall-mounted displays and display walls, elevations showing:
      a. Dimensioned display overall size and mounting height, and distance between columns and other devices as described above.
      b. Type of display mount to be used, including make, model, and any accessories. Any custom mount proposed shall have a dedicated elevation and detail.
      c. Mounting location of all accessories or other devices to be mounted on or behind the display.
      d. Annotations including the display make and model, viewing area size, native resolution, and mount make and model.
      e. Typical elevations may be used where multiple displays in this scope have the exact same mount type and location.
      f. The annotation information listed above may be shown in a table if desired.
   3. Sections through rooms with fixed-mounted projectors, dimensioned to show the projector mounting height below the finished ceiling or structure as appropriate, and the projection distance from the front of the projector (lens) to the projection screen. Section shall be annotated with projector mounting system makes and models.
      a. Verify projection distances on Contract Documents and at the project site as appropriate, projection screen sizes, lens throw ratios, and the presence of any obstructions in the path of the projector mounting components prior to ordering.
      b. Sections shall be annotated, or a table shall be included indicating proposed projector makes and models, lens model, and zoom ratio. Note any deviation from the Contract Documents.
      c. Type of projector mount to be used, including make, model, and any accessories. Any custom mount proposed shall have a dedicated elevation and detail.
   4. For projector lifts, details showing the lift housing mounted to the structure and/or in the finished ceiling as appropriate, and the projector mounted to the lift. Lift make and model shall be annotated. Proposed lift stop heights (stored, show, and service) shall be annotated.
   5. For all display devices mounted in an enclosure, details as necessary showing airflow around the display and hot air exhaust consistent with the display manufacturer's requirements.

PART 2 PRODUCTS

2.1 GENERAL

A. All displays shall be rated Class 0 per ISO 9241-3xx standards.

B. Minimum display native resolution, unless otherwise noted: 3840 x 2160 @ 60 Hz.

C. Inputs and outputs as shown on the Drawings.

D. All devices supporting HDMI shall support HDMI 1.4, unless otherwise noted.

E. All devices supporting HDCP shall support HDCP 1.4, unless otherwise noted.

F. Mounts and mounting accessories shall include anti-theft or locking functionality where indicated on the Drawings.

G. Unless noted otherwise, herein or on the Drawings, the color of all exposed components shall be: black.

2.2 DISPLAY MONITORS

A. Viewing area diagonal size as shown on the Drawings.

B. Outside dimensions shown on the Drawings are maximum dimensions.

C. Display type and brightness as shown on the Drawings.

D. Unless otherwise noted, minimum native resolution shall be 3840 x 2160 @ 60 Hz.

E. Maximum bezel size as shown on the Drawings.

F. Internal power supply.

G. VESA mounting hole pattern, except when shown with a proprietary display mounting system as a part of a display wall.

H. Touch functionality where shown on the Drawings. Touch functionality shall include:
   1. Applies to touch monitors used for content viewing, annotation, and control. Touch monitors by the control system manufacturer that are dedicated control interfaces are covered in Section 274131, Audio-Visual Control Systems and Programming.
   2. Touch membrane type: projected capacitive.
   3. Minimum simultaneous touch points: 10.
   4. Internal PC or signage processor where shown on Drawings.
   5. Content creation, editing/annotating, and management software where shown on the Drawings.
   6. USB interface.
   7. Maximum response time: 18 ms.
   8. Host compatibility: HID-compliant operation compatible with Windows 8, 10, and 11.
   9. Compatible with specified annotation processor or other specified equipment to which it connects.

I. Manufacturer: Planar, NEC, Samsung, Viewsonic, LG, Sharp.

2.3 DISPLAY MONITOR WALL MOUNTS

A. General:
1. Universal configuration to accommodate a range of VESA mounting patterns. Mounts shall not be custom or made for a specific display make and model unless otherwise noted on the Drawings.
2. Provide accessories as shown on the Drawings.
3. UL Listed.
4. Steel construction.
5. Support for variable stud spacing with mounting on two or more studs.
6. Rated to support the weight of the display the mount will support.
7. Color: black, unless otherwise noted.
8. Landscape and/or portrait orientation as shown on the Drawings.
9. Manufacturer: Chief, Premier, Peerless.

B. Tilt-Mounts:
1. Lateral shift to allow display centering.
2. Leveling.
3. Portrait or landscape orientation as shown on the Drawings.
4. Height adjustment.
5. Integrated security.
6. Tilt range: +2° to -12°.

C. Fixed Mounts:
1. Lateral shift to allow display centering.
2. Leveling.
3. Maximum depth from wall: 2.0”.
4. Portrait or landscape orientation as shown on the Drawings.
5. Height adjustment.
6. Integrated security.

D. Swing-Arm Mounts (Large Displays):
1. Dual arms.
2. Portrait or landscape display mounting.
3. Extension: minimum 25.0” for displays 50.0” diagonal and smaller; minimum 37.0” for displays larger than 50.0” diagonal.
4. Tilt range: +5° to -16°.

E. Swing-Arm Mounts (Small Displays):
1. For smaller swing-arm mounts used to mount smaller displays 32.0” diagonal or smaller or that are shipped from the factory with a desktop stand.
2. Supports one or two displays as shown on the Drawings.
3. Spring-assisted height adjustment: 13.0”.
4. Weight capacity: 25 lbs. per display.
5. Compatible with 75 mm x 75 mm and 100 mm x 100 mm VESA mounting patterns.
6. Tilt range: +75° to -10°.
7. Integral cable management.
8. Color: black, unless otherwise noted.
9. Manufacturer: Chief, Premier, Peerless, Ergotron, Ergomart.

F. Recessed Mounts:
   1. Functionally designed to recess the mount in the wall to reduce the display/mount assembly depth off the wall.
   2. UL Listed.
   3. Color: black.
   4. Wall Box:
      a. Dimensions as shown on the Drawings.
      b. Condit and wall-box knockouts as shown on the Drawings.
      c. Weight Capacity, excluding the mount assembly: 138 lbs.
   5. Mounting Assembly:
      a. Dual swing-arms.
      b. Landscape or portrait display orientation as shown on the Drawings.
      c. Extension: 22.0”.
      d. Display leveling (roll).
      e. Horizontal pivot up to ±76.5°.
      f. Weight capacity: 200 lbs.
      g. Tilt range: +2° to -15°.
   6. Manufacturer: Chief, Premier, Peerless, Ergotron, Ergomart.

2.4 DIRECT-VIEW LED VIDEO DISPLAY WALLS

A. Overall resolution and/or individual panel resolution as shown on the Drawings.

B. Overall dimensions and individual panel dimensions as shown on the Drawings.

C. Bezel dimensions as shown on the Drawings.

D. IP-30 rated where shown in an interior dry location.

E. IP-65 rated where shown on the Drawings in all exterior locations and all interior wet location.

F. Display brightness as shown on the Drawings.

G. Power supplies located as shown on the Drawings.

H. Pixel pitch as shown on Drawings.

I. Native resolution as shown on the Drawings.

J. Provide manufacturer’s display wall processor, when required, to distribute video signal to individual panels.

K. Rack-mountable control module.

L. Ethernet controllable and software configurable.

M. Minimum distance limitations between controller and display units:

1. Category 6 cable: 220’.
2. Multi-mode fiber optic cable: 1000’.
3. Single-mode fiber optic cable: 6.2 miles.

N. Manufacturer: SquareV, Planar, Taylorleds.

2.5 PROJECTORS

A. See the projector schedule on the Drawings for additional requirements.

B. Light source, brightness, and contrast ratio as shown on the Drawings.

C. Native resolution and aspect ratio as shown on the Drawings.

D. Dimensions and weight as shown on the Drawings.

E. Lens zoom ratio and throw distance as shown on the Drawings.

F. Mounting type as shown on the Drawings.

G. Manufacturer: Christie Digital, Digital Projection, Epson, Panasonic, Sony, Barco.

2.6 PROJECTOR OVERHEAD MOUNTS

A. Functionally designed to attach a projector to a metallic pipe column or other mounting system attached to the ceiling or structure above.

B. UL Listed.

C. Threaded for 1.5” NPT.

D. Color: Coordinate with the Architect.

E. Accessible Ceiling Mounts:
1. Functionally designed to be installed in a standard ceiling tile grid.
2. Dimensions as shown on the Drawings.
3. Provide plenum box where shown installed in a plenum airspace.
4. Weight rating: up to 50 lbs.
5. Mounts to structure via wire rope.
6. Knockouts as shown on the Drawings for receptacle plates and back boxes.
7. Metallic construction.

F. Projector Mounting Interfaces:
1. Compatible with the specified structural mounting assemblies.
2. Rated to support the weight of the specified projector.
3. Universal configuration to accommodate a range of projector makes and models, including the specified make and model. Mounts shall not be custom or made for a specific display make and model unless otherwise noted on the Drawings.

4. Micro-adjustable.
5. Quick-disconnect for projector service.
6. Roll: ±3°.
7. Pitch: ±20°.
8. Yaw: 360°.
9. Manufacturer: Chief, Premier, Peerless.

2.7 PROJECTOR LIFTS

A. Scissor style lift mechanism.

B. Dimensions and weight capacity as shown on the Drawings.

C. Compatible with specified projector.

D. Drop distance as shown on the Drawings.

E. Three configurable stop positions: stowed, show, and service.

F. Step distance: 0.0625” or better.

G. Quiet operation.

H. Integral cable management.

I. Provide an appropriate ceiling closure frame for ceiling in which lift is installed.

J. Provide plenum housing when mounted in a plenum space.

K. Low-voltage control as shown on the Drawings.

L. Housing and closure accessories, such as closures and plenum housings, as shown on the Drawings.

M. Manufacturer: Draper, Display Devices, Da-Lite.

2.8 STRUCTURAL MOUNTING ASSEMBLIES AND RELATED EQUIPMENT

A. Compatible with specified display and projector ceiling mounts.

B. All components shall be threaded for 1.5” NPT.

C. Color: Coordinate with the Architect.

D. Structural Adapters and Flanges:
   1. Functionally design for attachment directly to wood or concrete. Clamp accessory for attachment to the underside of steel beams.
   2. Minimum four attachment points to the structure.
   3. Weight capacity: 500 lbs.

4. Where shown on the Drawings, channel to allow cabling to travel down the inside of the extension column.

E. Extension Columns:
1. Aluminum construction.
2. Threaded on both ends.
3. Fixed or adjustable length as shown on Drawings.
4. Integral opening for routing cable inside the column.

F. Provide plenum box when mounted in a plenum airspace.

G. Manufacturer: Chief, Premier, Peerless.

PART 3 EXECUTION

3.1 GENERAL

A. Notify the Architect and receive confirmation in writing prior to relocating any device in any direction more than 12.0”.

3.2 DISPLAYS AND RELATED EQUIPMENT.

A. Mount displays at locations and with mount types as shown on the Drawings.

B. Position monitor on mount to achieve optimal viewing angles within the display viewing area.

C. Maintain ADA requirements where displays are shown mounted with the bottom of the display at 80” or lower. Coordinate opening in or size of architectural shroud or recess with Architect.

3.3 PROJECTORS AND RELATED EQUIPMENT

A. Projector shall be installed per the manufacturer’s recommendations.

B. Projectors shall be made level and secured in accordance with seismic requirements identified herein.

C. Field verify projector mounting heights and configurations, projection distances, projection screen sizes, lens throw ratios, and the presence of any obstructions in the path of the projector mounting components prior to installing.

D. Fixed projectors shall be installed at a height that is out of reach of most persons standing on the ground, but no higher than the top of the screen. The height shall minimize the need for lens shift. Coordinate height with lighting and other suspended elements in the space. If the projection path is obstructed, notify the Architect as soon as possible and prior to performing the installation.

E. Projectors shall be installed centered laterally on the projection screen, unless otherwise noted on the Drawings.

F. Do not attach any component to ductwork, piping, or any building component other than the structure. If necessary, use appropriately sized Unistrut to build a sub-structure around any obstructions or across any expansion joints in the path of any of the mounting components.

G. Use neoprene mounts and/or rings where the projected image is affected by building vibration.

3.4 VIDEO DISPLAY EQUIPMENT PERFORMANCE VERIFICATION

A. General Performance Verification requirements are contained in Section 274010, Audio-Visual General.

B. Performance Verification of the equipment included herein should be conducted in accordance with requirements in other Specification Sections that cover related equipment.

C. Verify that all images are clear, free of artifacts, flickering, EDID, or other defects.

D. Verify that the audio is intelligible, clear, free of noise of any type, and properly synced with the video.

E. Adjust settings as required. If a defect is introduced by a system or device outside of this scope, notify the Architect in writing.

F. Display Devices:
   1. Verify that displays are properly secured to their mounting structures and that blocking has been provided where required.
   2. Verify that all wall-mounted display devices are compliant with current ADA requirements. Adjust mounting as required. Notify the Architect in writing immediately upon discovery of instances where a display device cannot be adjusted to meet ADA requirements.
   3. Using a video test generator, apply the following test patterns:
      a. Using a crosshatch pattern, adjust display devices to show full image at specified system base resolution.
      b. Verify that all displays within a single space display colors uniformly. Adjust color calibration as required.
      c. Adjust the black level:
         1) Display a PLUGE color bar test pattern on the screens.
         2) Adjust the brightness control upward until the “blacker than black” bar is visible on the screen.
         3) Decrease the brightness control slowly until this bar becomes fully extinguished. Continue until the test pattern background reaches the same point, i.e., there is no light output.
         4) The remaining vertical bar should be dimly visible.
      d. Adjust the contrast:
         1) Display a PLUGE color bar test pattern on the screens.
         2) Adjust the contrast control until the 100% white bar begins to bloom or distort in size or stops getting brighter.
         3) Decrease the contrast control until the white bar is at the threshold of maximum brightness without any of these distortions.

e. Projected images shall be compliant with AVIXA standard 3M-2011. Projected images shall be centered vertically and horizontally on each respective projection screen. Adjust as required, using zoom and lens shift controls prior to using keystone correction. Projected images shall be fully focused and have a uniform focus across the entire projected image. All images shall be free from distortion, stretching, twisting, keystone, barrel, and pincushion.
   1) Coordinate with Architect as required to mitigate ambient light spillage onto the projection screen while in use.

f. Examine all display devices for failed pixels. All displays shall be compliant with ISO standard 9241-302, 303, 305, 307:2008, concerning pixel defects. All displays covered by this scope shall be considered Type 0 when examining compliancy.

END OF SECTION

SECTION 274125 - ELECTRONIC SIGNAGE AND WAYFINDING EQUIPMENT

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Digital signage player hardware.

B. Small format computers used for digital signage.

C. Digital signage displays.

D. Digital signage display mounts.

E. Digital signage kiosks.

F. Responsibilities and obligations in support of the Performance Verification specified in Section 274010, Audio-Visual General.

1.2 RELATED SECTIONS

A. Section 274123, Video Display Equipment.

B. Section 274131, Audio-Visual Control Systems and Programming.

C. Section 274132, Audio-Visual Network Equipment.

D. Section 274140, Audio-Visual Cabling and Connectors.

E. General provisions: Section 274010, Audio-Visual General, and other Sections of Division 27.

1.3 REFERENCE STANDARDS

A. Conform to all codes and standards listed in PART 1 of Section 274010, Audio-Visual General.

1.4 SUBMITTALS

A. General submittal requirements as identified in Section 274010, Audio-Visual General. In addition to those requirements, submittals for this Section shall include the following:
   1. Detail showing the mounting configuration of all peripheral devices with respect to the display and the display mount.
   2. Proposed configuration of signage players, including panel layouts, schedules, integration with existing headend equipment (if appliable), network information, and other requirements as stated by the Architect.

PART 2 PRODUCTS

2.1 GENERAL

A. Support of the base system resolution identified in Section 274122, Video Transport, Switching, and Processing Equipment.

B. All components shall be compatible with the Owner's existing digital signage equipment and systems.

C. All components shall support the following media formats:
   1. Images: BMP, ANIMGIF, JPEG/JPG, PNG, TIFF and WMF.
   2. Video: MPEG 2, WMV, H.264, HEVC/H.265, Apple ProRes A4H/4444.
   3. Audio: WMA, WAV, MP3, M4A/AAC.
   4. Streaming: H.265, MPEG 2, RTP, RTSP, Unicast, Multicast.
   5. Web: HTML5.

2.2 DIGITAL SIGNAGE PLAYER HARDWARE

A. Externally mounted, OPS module, or integral to the display as shown on the Drawings.

B. Rated for 24-7 continuous operation.

C. Fanless.

D. Multi-zone operation when shown with two or more outputs.

E. Native output resolution on all outputs: the specified base system resolution as described in Section 274122, Video Transport, Switching, and Processing Equipment.

F. Minimum CPU characteristics:
   1. Operating System: Windows 10 or Linux.
   2. Processor: Intel Celeron N3160 with 1.60 GHz quad-core processor.
   3. Graphics card: Intel HD Graphics 400.
   4. Inputs and outputs as shown on the Drawings.
   5. RAM: 4 GB DDR3L per output.
   6. Storage: 64 GB solid state.
   7. Network: Gigabit Ethernet, 802.11 a/b/g/n/ac.
   8. USB: Four 3.0 type A.

G. Compatible with Owner's existing digital signage management and content creation systems.

2.3 SMALL FORMAT COMPUTERS

A. Small or thin chassis designed for mounting on a wall behind a display, on a display mount, or to the display itself.

B. Native output resolution on all outputs: the specified base system resolution as described in Section 274122, Video Transport, Switching, and Processing Equipment.

C. Rated for 24-7 continuous operation.

D. Fanless.

E. Other requirements as shown on the Drawings.

F. Manufacturer: Scala, Intel, Dell.

2.4 DIGITAL SIGNAGE DISPLAYS

A. Refer to Section 274113, Video Display Equipment.

2.5 DIGITAL SIGNAGE DISPLAY MOUNTS

A. Refer to Section 274113, Video Display Equipment.

2.6 DIGITAL SIGNAGE KIOSKS

A. Technical furniture functionally designed to house a digital signage display and related accessory components as shown on the Drawings.

B. Dimensions, materials, and finishes as shown on the Drawings.

C. Americans with Disabilities Act (ADA) compliant.

D. Other requirements as shown on the Drawings.

E. Manufacturer: as shown on the Drawings.

PART 3 EXECUTION

3.1 GENERAL

A. Coordinate configuration of all network-based components with the Architect as necessary.

3.2 DIGITAL SIGNAGE PLAYER AND CONTROL EQUIPMENT CONFIGURATION AND PROGRAMMING

A. Mount players and related hardware for wall-mounted displays to the wall behind the display unless otherwise shown on Drawings. For overhead-mounted displays, mount the player to the display mount.

B. Set the output resolution as required if not automatically negotiated by EDID.

C. For systems where all components are to be provided new as a part of this scope:
   1. Configure the management software as required to control all hardware and software players.
   2. Configure LAN settings as required.
   3. Configure players to receive control information and content from the management system.
   4. Load a test pattern or other signage file template onto the system to test all components.

D. For players and related equipment that will be integrated with an existing system:
   1. Register signage player software and hardware with the existing digital signage management suite.
   2. Perform an initial configuration of the player and load an initial or test signage file as directed by the Architect.

3.3 DIGITAL SIGNAGE DISPLAYS AND RELATED EQUIPMENT

A. Refer to Section 274113, Video Display Equipment.

3.4 DIGITAL SIGNAGE KIOSKS

A. Assemble as necessary and install kiosks at locations on the Drawings.

B. Register kiosk(s) with appropriate management applications and appliances.

C. For interactive kiosks, calibrate touch display.

3.5 ELECTRONIC SIGNAGE AND WAYFINDING PERFORMANCE VERIFICATION

A. General Performance Verification requirements are contained in Section 274010, Audio-Visual General.

B. Performance Verification of the equipment included herein should be conducted in accordance with requirements in other Specification Sections that cover related equipment.

C. Digital Signage Systems:
   1. Verify that all signage players and field equipment can communicate with the digital signage controller, by sending one or more executable command to each.
   2. Using a signage content test program, push the content to all players installed as a part of this scope.
      a. For systems where all components are to be provided new as a part of this scope, the Contractor shall use a simple test program.
      b. For players and related equipment that will be integrated with an existing system, a template provided by the Architect shall be used.
   3. Verify that motion video media plays without glitches, artifacts, or hangs due to network traffic congestion, including streaming video and video images stored locally or served by the controller.

4. Verify that crawls and other elements capable of importing data are showing the proper data.
5. For interactive (touch) systems, verify that touch controls are calibrated, and operate the correct functionality as indicated by the buttons in the digital signage program file.

D. Digital Signage Displays:
   1. Refer to Section 274113, Video Display Equipment.

END OF SECTION

SECTION 274126 - PROJECTION SCREENS

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Electrically operated retractable projection screens.

B. General Provisions are specified in Section 274010, Audio-Visual General.

1.2 RELATED REQUIREMENTS

A. Performance Verification responsibilities and obligations related to the projection screens are specified in Section 274010, Audio-Visual General.

1.3 REFERENCE STANDARDS

A. ISO 9001 - Quality Management Systems — Requirements; 2015, with Amendment (2024).

B. NFPA 70 - National Electrical Code; Most Recent Edition Adopted by Authority Having Jurisdiction, Including All Applicable Amendments and Supplements.

C. NFPA 701 - Standard Methods of Fire Tests for Flame Propagation of Textiles and Films; 2023, with Errata.

D. Conform to all codes and standards listed in Section 274010, Audio-Visual General.

1.4 SUBMITTALS

A. General submittal requirements as identified in Section 274010, Audio-Visual General. In addition to those requirements, submittals for this Section shall include the following:
   1. Floor Plans and/or RCPs showing the location of each projection screen and projection screen control device.
   2. The projection screen manufacturer’s submittal form completed specifically for this Project. When this scope includes multiple projection screens, one submittal form shall be submitted for each screen and shall indicated the space in which that screen will be installed.
   3. Drawings showing connections to suspension systems and details showing the screen’s anchoring to structure.
   4. Details of juncture of exposed surfaces with adjacent finishes.
   5. Submittals are required before installation or fabrication begins. The Contractor shall not procure any equipment or perform any fabrication on any portion of this scope that has not received approval as defined herein. The Contractor shall be responsible for any costs related to returning, replacing, or not using any component of this scope that is ordered, fabricated, or installed prior to receiving such approval. Pay requests will not be approved for any work performed without approved Submittals.

6. Dimensioned shop drawings of all fabricated, custom, or modified hardware, components, or devices. Provide a finish sample for all exposed finishes.

PART 2 PRODUCTS

2.1 GENERAL

A. Unless otherwise specified herein, quantities of equipment are indicated on the Drawings, and performance values specified herein are minimum acceptable values.

B. All projection screens shall be from a single manufacturer, unless otherwise noted herein or on the Drawings.

C. See the Projection Screen Schedule on the Drawings for additional requirements.

D. All products shall be UL listed.

E. Manufacturer: Draper, Da-Lite, Stewart Filmscreen.

2.2 FRONT PROJECTION SCREENS

A. Material and Viewing Surfaces:
1. Screen fabrics shall be mildew resistant and shall be flame resistant in accordance with NFPA 701-2019.
2. Viewing surfaces shall be seamless unless otherwise indicated on the Drawings.
3. Edge treatments hall be black masking borders unless otherwise indicated on the Drawings.

B. Electrically Operated Front Projection Screens:
1. Screens shall be mounted such that the top edge of the fabric is securely anchored to a rigid metal roller and the bottom edge is formed into a pocket holding a weighted metal rod with the ends of the rod protected by plastic caps.
2. Provide tab-tensioning where indicated on the Drawings.
3. Provide additional black drop as required to achieve desired viewing height as indicated on the Drawings.
4. Each screen shall include case, screen motor, controls, mounting accessories, and any other necessary components for a complete installation.
5. Provide three stage low voltage controller capable of raising, lowering, and stopping screen travel. Low voltage switch shall be a three-button keypad with cover plate at locations indicated on the Drawings.
6. Provide low voltage control connections to the Audio-Visual control system where shown on the Drawings.
7. Motors shall be instant-reversing, gear-drive, end-mounted type with permanently lubricated ball bearings, automatic thermal overload protection, preset limit switches to automatically stop the screen in up and down positions, and positive stop action to prevent coasting.
8. Where indicated on the Drawings, an automatic closure shall cover the screen opening when the screen is in the retracted position.

PART 3 EXECUTION

3.1 GENERAL

A. Provide all necessary incidental equipment or devices to deliver a complete and operable system.

B. Verify correctness of parts lists and equipment model numbers and conformance of each component with manufacturer's specifications.

C. Equipment shall be installed in accordance with the manufacturer's instructions.

D. Equipment, except portable equipment, shall be held in place. This shall include equipment, enclosures, components, and cables. Fastenings and supports shall support their loads with a safety factor of at least 3 unless otherwise specified herein.

E. Prevent and guard against electromagnetic and electrostatic hum and install the equipment to provide safety for the operator.

F. Repair or replace any equipment or materials damaged during the construction or installation period.

G. Provide power connections as required.

H. Cut and repair walls and ceilings, including inaccessible and tile grid systems, as required to install the projection screens.

I. Coordinate layout and installation of projection screens with other construction supported by, or penetrating through, ceilings, including luminaries, HVAC equipment, fire protection systems, and partitions.

J. Projection screens shall not be supported by or suspended from any other building system, including but not limited to HVAC equipment, plumbing, telecommunications equipment, raceway, or fire protection equipment.

K. Initial projection screen delivery and installation shall include only the projection screen case and mounting hardware. Install the case when the building is enclosed and other construction within spaces where screens will be installed is substantially complete. Deliver and install the roller assembly, motor, and fabric at a time when the building is dust-free. Coordinate with other trades as required.

L. Procure and install each projection screen as a complete unit, including mounting hardware and accessories. Do not deliver projection screens until the building is enclosed, other construction within spaces where screens will be installed is substantially complete, and installation of screens is ready to begin.

M. Coordinate and verify with the Architect the screen size, black drop, height of the bottom of viewing area, case mounting height and configuration, mounted depth, and required edge tolerances with construction of wall recesses to house screens prior to ordering screens that are mounted in walls.

N. Coordinate requirements for blocking and structural supports to ensure adequate installation of screens.

O. Prior to installation of electrically operated screens, verify the type and location of the power supply.

P. Install projection screens at locations indicated on the Drawings and comply with the projection screen manufacturer's written instructions and shop drawings.

3.2 FRONT PROJECTION SCREENS

A. Install manually and electrically operated front projection screens with screen cases in position and relationship to adjoining construction indicated on the Drawings. Securely anchor to supporting substrate in a manner that produces a smoothly operating screen with vertical edges plumb and viewing surface flat when screen is lowered.

B. Adjust limit switches to ensure correct positioning, screen tensioning, and silent screen case opening and closure.

C. Test electrically operated units to verify that screen, controls, limit switches, closure, and other operating components function.

D. Provide access to equipment requiring connections or service within the life of the assembly.

3.3 PROJECTION SCREENS PERFORMANCE VERIFICATION

A. Performance Verification of these systems shall be performed in conjunction with the Performance Verification requirements in 274010, Audio-Visual General.

B. Performance Verification of the equipment included herein should be conducted in accordance with requirements in other Specification Sections that cover related equipment.

C. Verify that projection screens are installed level and flat.

D. Verify that no extraneous noise is made by any component of the projection screen assembly as the tensioning bar at the bottom of the screen enters or exits the screen case.

E. Verify that the viewing surface is square and not contorted in any way.

F. Where projection screens are recessed in a tile grid ceiling, verify that the grid is properly installed around the case and tiles are cut as necessary.

G. Verify that projection screens descend to the proper viewing height and retract completely into the case. Where applicable, verify that the screen case closure opens and closes without extraneous noise.

H. Verify that projection screen switches operate the intended functions (i.e., UP, DOWN, and STOP).

END OF SECTION

SECTION 274131 - AUDIO-VISUAL CONTROL SYSTEMS AND PROGRAMMING

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Control system processors

B. Touch panel controllers.

C. USB Extenders.

D. Control system functionality and programming requirements.

E. Responsibilities and obligations in support of the Performance Verification specified in Section 274010, Audio-Visual General.

1.2 RELATED REQUIREMENTS

A. Section 274132, Audio-Visual Networking Equipment.

B. General provisions in Section 274010, Audio-Visual General, and other Sections of Division 27.

1.3 REFERENCE STANDARDS

A. Conform to all codes and standards listed in PART 1 of Section 274010, Audio-Visual General.

1.4 SUBMITTALS

A. General submittal requirements as identified in Section 274010, Audio-Visual General. In addition to those requirements, submittals for this Section shall include the following:
   1. Touch panel page layouts submitted in one of two ways:
      a. A screen shot of each page annotated with the functions and/or to what page each button links, as appropriate.
      b. A working demonstration executable file that allows the user to click or press buttons and navigate through the pages that will be used on the touch panels.
   2. Keypad layout showing all button labeling. Layouts shall be annotated with descriptions of each button’s functionality as needed. Keypad layout drawings with custom engraved button caps shall be the manufacturer’s shop drawings, and not recreations.

PART 2 PRODUCTS

2.1 GENERAL

A. Systems shall be compatible with existing systems.

B. Compatible with all devices shown on the Drawings and in other Sections as being controlled by devices covered in this Section.

C. Supported protocols: 10/100/1000Base-T, half/full duplex, auto-switching, auto-negotiating, auto discovery, industry-standard TCP/IP stack, UDP/IP, CIP, DHCP, SSL, TLS, SSH, SFTP (SSH FileTransfer Protocol), IEEE 802.1X, SNMP, HTTP, HTTPS.

D. Configurable I/O ports: analog or digital connections, input rated for 24 V DC @ 20 kΩ, minimum.

E. Relays: normally open, rated minimum 24 V DC @ 1.0 A.

F. Front panel LED status indicators.

G. Manufacturer, unless otherwise noted: Q-SYS (QSC), Crestron, Extron

2.2 CONTROL SYSTEM PROCESSORS AND RELATED EQUIPMENT

A. Applies to main control system processors, expansion control modules, and network peripheral control modules.

B. Inputs, outputs, and control ports as shown on the Drawings.

C. Expansion slots as shown and populated on the Drawings.

D. PoE, PoE+, or UPOE power where shown on the Drawings.

E. Serial ports shall support data rates up to and including 115.2k baud.

F. Minimum two serial ports shall support RS-232, RS-422, and RS-485.

G. Dual LAN ports, allowing connection to a main network and a separate AV network or subnet.

H. Minimum 4.0 GB internal flash memory.

I. Compatible with the specified control system management equipment.

J. Rack-mountable where shown on the Drawings in an equipment rack. Surface-mountable where shown on the Drawings mounted to a display, wall, millwork, or other surface.

2.3 TOUCH PANEL CONTROLLERS AND RELATED EQUIPMENT

A. Screen sizes as shown on the Drawings.

B. Physical bezel-mounted keys as shown on the Drawings.

C. Mounting as shown on the Drawings.

D. Capacitive touch membrane.

E. Integral streaming decoder.

F. Wall-mount panels shall mount in a standard electrical box unless otherwise noted on the Drawings.

G. Color depth: 24-bit, 16.7 million colors.

H. Memory: 2.0 GB, minimum.

I. Internal SSD storage: 4.0 GB, minimum.

J. Power: PoE, PoE+, or UPOE.

2.4 USB EXTENDERS

A. Compatible with the specified touch panel displays and annotation processor specified.

B. Capable of transmitting touch coordinated data.

C. Ports as shown on the Drawings.

D. Support for USB 3.0 and data rates up to and including 480 Mbps.

E. Minimum supported transmission distance: 330’.

F. Manufacturer: Extron, Icron, Geffen, Crestron.

2.5 AUDIO-VISUAL NETWORKING EQUIPMENT

A. See Section 274132, Audio-Visual Networking Equipment.

PART 3 EXECUTION

3.1 GENERAL

A. Coordinate as required with other trades to facilitate interconnects between the Audio-Visual Systems and other systems, including but not limited to lighting, window shades, building management and controls, building and/or client networks, and computer systems and software operated by the Owner.

B. Use control protocols as shown on the Drawings. Where no such connection or protocol is shown and control is required, or when multiple control connections are shown, such devices shall be controlled by the first protocol provided by the device manufacturer from the following list:
   1. Ethernet.
   2. Bidirectional hardwired serial control.
   3. Unidirectional hardwired serial control.
   4. Hardwired infrared emitter over infrared receiver on device.

5. Contact closures or relays.

3.2 CONTROL SYSTEM PROCESSORS, PERIPHERALS, AND RELATED EQUIPMENT

A. Control system processors shall be mounted as shown on the Drawings. Control equipment mounted in locations other than the equipment rack shall be secured to a surface in such a way that the device's ventilation is not obstructed.

B. Feedback shall be provided via programming code to control panels capable of receiving and displaying feedback from each feature or set of features found on the control panel for which device feedback is possible. When direct feedback is not possible because the controlled device does not provide it, state variables shall be used in the programming code to provide feedback to the user that the button in question has been pressed.

C. The master control system processor shall be used for AC sequential switching and should remain constantly powered.

D. Configure occupancy sensor lens masking as needed to minimize false triggers.

3.3 TOUCH PANELS, KEYPADS, AND ROOM SCHEDULING PANELS

A. Provide mounting accessories as required to mount or place panels and keypads at locations shown on the Drawings.

B. Apply programming to panels as described below.

C. Coordinate colors and numbering of stand-alone room availability indicators with the Architect.

3.4 CONTROL SYSTEM PROGRAMMING AND FUNCTIONALITY

A. General:
   1. The following are minimum functionality requirements.
   2. Coordinate final programming, terminology, and related functionality with the Architect.
   3. It shall be the responsibility of the Contractor to obtain and adhere to any templates or standards currently in use by the Owner. Any discrepancy between any such templates or standards and these requirements shall be brought to the attention of the Architect.
   4. Provide remote IP-based control of each space via local executable files or programs, web pages, and/or mobile device applications as directed by the Architect.
   5. For the purposes of this Section, the following definitions apply:
      a. "Volume control" or "volume controls:" two momentary buttons, one for volume up, one for volume down, and one latching button for a mute/unmute state for a given input or output. Volume controls shall have a bar graph or numerical indication of the current level relative to the minimum and maximum possible levels.
      b. "Latching toggle:" A single button that toggles the system from an original state to another state and back to the original state. When released, the toggled state shall remain active.

c. "Momentary toggle:" A single button that toggles the system from an original state to another state and back to the original state. The system shall remain in the toggle state only when the button is pressed. The system shall return to the original state when the button is released.

d. "Transport control:" Buttons that control any function that affects media stored in/on or played by a source device or the output image from a source device. This includes, but is not necessarily limited to play, stop, pause, advance, reverse, chapter selection, next, track, pan, tilt, focus, zoom, light on/off. Full control of devices shall be provided where indicated herein or on the Drawings. Each source or device requiring shuttle control have its own dedicated shuttle control page.

e. "All mute:" A single button or pair of buttons that cause all inputs and outputs to be muted. This applies to audio and video as applicable to this scope, including but not limited to audio inputs, loudspeaker zones, video inputs, display devices, and streaming encoders. "All Audio Mute" and "All Video Mute" shall have similar functionality only for the respective systems.

f. "Preset" or "Presets:" System states saved in a way that they can be recalled quickly and easily. Presets shall be approved by the Architect at the time of Substantial Completion.

1) "Default Preset(s): Preset programmed by the Contractor such that the user cannot overwrite it.

2) "User Preset(s)" Presets programmed by the Contractor such that the user can save, delete, or overwrite presets created by the user. When there is a requirement for presets on any given system, the user shall be able to save and recall a minimum of four presets.

g. "Projection screen control(s):" Three momentary toggle buttons, programmed for up, down, and stop motions of an electrically operated projection screen.

6. Adjustment buttons for volume controls and camera controls shall utilize fine adjustment for single button pushes and coarse adjustment for an extended button push.

7. The "all mute" function shall mute all audio sources to all outputs. When the user toggles out of the "all mute" state the system shall return to the same state it was in prior to entering the "all mute" state.

8. Single pages described herein, or functionality shown as a requirement of a page, may be divided into multiple pages as necessary to maintain clarity, ease of use, or an organized appearance.

9. Color selection shall provide the greatest contrast possible between the background and buttons or text. All text shall be in CAPITAL LETTERS. There shall be no spelling errors and correct grammar shall be used.

10. Buttons shall reflect feedback in one of two ways. If true bidirectional control of the device is indicated on the Drawings, then the buttons shall provide constant feedback by permanently changing colors to indicate the state the source equipment is in. If only one-way control is indicated on the Drawings, or if the device in question does not provide feedback, the buttons shall provide feedback by changing colors to indicate that the button has been pressed.

11. The following actions shall cause a user verification prompt ("are you sure?"):

a. System power on/off.

b. Overwriting any system preset.

c. Recalling any default preset.

d. Projector power on/off and projection screen up/down.

12. When a system shuts down, it shall remember the states of all controls. When the system is restarted, it shall start up in the same state that it was in when it was shut down, except as otherwise indicated herein.

B. System-specific control functionality: as shown on drawings.

3.5 CONTROL SYSTEMS AND PROGRAMMING PERFORMANCE VERIFICATION

A. Performance Verification of these systems shall be performed in conjunction with the Performance Verification requirements in Section 274010, Audio-Visual General.

B. Performance Verification of the equipment included herein should be conducted in accordance with requirements in other Specification Sections that cover related equipment.

C. Verify that all devices connect to and maintain a connection to the appropriate LAN.

D. Verify that remote control over the LAN is functional.

E. Verify that the occupancy sensors trigger only when a person enters the target area.

F. Verify that the appropriate system presets are called when the operable partitions are in the open and closed positions.

G. Verify that all buttons perform the intended function and reflect feedback properly.

H. Verify that presets are saved and recalled as desired.

I. Verify that the control system executes commands without any kind of delay.

J. Verify that the system powers on and off properly and powers up according to the Specifications.

K. Verify that there are no spelling or grammar errors in custom touch panel or keypad layouts.

END OF SECTION

SECTION 274132 - AUDIO-VISUAL NETWORK EQUIPMENT

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Managed edge switches.

B. Responsibilities and obligations in support of the Performance Verification specified in Section 274010, Audio-Visual General.

1.2 RELATED REQUIREMENTS

A. General provisions are specified in Section 274010, Audio-Visual General, and other Sections of Division 27.

B. Section 274111, Mixing, Processing, and Amplification Equipment.

C. Section 274122, Video Transport, Switching, and Processing Equipment.

D. Section 274124, Video Conferencing and Collaboration Systems.

E. Section 274125, Electronic Signage and Wayfinding Equipment.

F. Section 274131, Audio-Visual Control Systems and Programming.

1.3 REFERENCE STANDARDS

PART 2 PRODUCTS

2.1 GENERAL

A. The installation of the systems described in this Section shall be under the direct supervision of a person or persons having completed the factory training recommended by the network switch manufacturer.

B. Unless otherwise noted, all network switches shall be from the same manufacturer.

C. All switches shall be pre-programmed by the manufacturer as required to support the AVoIP proptocols shown connected thereto on the Drawings.

D. Supported protocols:
   1. Protocol support: IEEE 802.3-2015/COR1-2017 10Base-T, 100Base-TX, and 1000Base-T.
   2. Simple network management protocol (SNMP) with management information base (MIB) support, as well as support for SNMP v1, v2, and v3 commands.

3. Remote network monitoring (RMON I) for history, statistics, alarm and events.
4. IGMP snooping (multicast filtering).
5. Domain name service (DNS).
6. Simple network time protocol (SNTP).
7. Dynamic host configuration protocol (DHCP), and DHCP client.
8. Audio-Visual protocols supported: AVB, DANTE, Q-LAN, MADI over IP, AES-67, EtherSound, NDI, COBRANET.
9. Fault recovery in less than 0.5 second via rapid spanning tree protocol (RSTP) as defined in IEEE 802.1D-2004 (R2011).
10. Differentiated service (context-aware service).
11. Quality of service (QoS) as defined in IEEE 802.1D-2004 (R2011).
12. Virtual local area network (VLAN) trunking as defined in IEEE ISO IEC 802.1Q-2016/COR1 -2017 (E).
13. 19" rack-mountable.
14. Operating power: 120 V AC @ 60 Hz with redundant power supply.

E. Coordinate make and model switch with the Owner.

F. Manufacturer: Netgear, Extreme Networks, Cisco.

2.2 MANAGED NETWORK SWITCHES

A. Edge Switches:
1. Configuration:
a. Compatible with the specified audio and audio-video network platform(s).
b. Port quantity and type as shown on the Drawings, including RJ45 ports and SFP ports, used and unused.
c. Per-port bandwidth: 1.0 GHz, minimum, all ports.
d. Layer 3 switching.
e. Jumbo frames control per port.
f. VLAN assignment per port.
g. Support for UPoE on all ports.
h. Uplink: 10 GHz minimum, via built in port or SFP module.
i. Power supply: sufficient capacity to power all connected field devices that support PoE, POE+, and/or UPoE as shown.
2. Features:
a. Minimum switching capacity: 128 Gbps.
b. Minimum forwarding rate: 190 Mpps.
c. Minimum MAC address table size: 32000 entries
d. VLAN capacity: 4000 IDs.
e. Stackable.
f. Autosensing (10/100/1000 Mbps) and auto-negotiation (full or half duplex and flow control).
g. Port mirroring.
h. Rate limiting on a per-port basis.

i. Link aggregation control protocol (LACP) between switches.
j. Password-protected with multiple user levels of access.
k. Web browser-based administration secured with HTTPS and command line interface (CLI).
l. Multicast routing by port.
m. Per port broadcast storm control.

PART 3 EXECUTION

3.1 GENERAL

A. The network shall be configured as indicated on the Drawings and in cooperation with the Owner's IT department. Configuration shall not be limited to the equipment provided but shall also include the existing switches and other equipment as necessary. Prior to commencing work, meet with representatives of that IT department to gain an understanding of local requirements regarding network configuration and personnel that shall be granted access to perform configurations that may be necessary to fully execute the scope described herein and on the Drawings. In the event that network security regulations prevent the Contractor from directly modifying the Owner's network equipment, the Contractor shall be responsible for directing the Owner in configuring the same.

B. Uplink switches to the Owner's existing LAN or WAN as directed by their IT staff. Depending on network policies in force at the time of installation, switches may not be uplinked to the existing LAN or may be connected as their own physically isolated LAN. Terminate or re-terminate existing structured cabling, including copper and fiber optic cabling, as necessary and/or as directed.

C. Network traffic shall be assigned to VLANs. Coordinate final VLAN configurations and assignment with the Owner. Assignments may be as follows:
1. VLAN 1: Audio-Visual control traffic.
2. VLAN 2: Audio traffic.
3. VLAN 3: IP Video traffic.
4. VLAN 4: VoIP traffic.
5. VLAN 5: Video Teleconferencing Traffic.

D. Specific configuration may include, but is not necessarily limited to:
1. Assigning IP addresses and ports to connected devices.
2. Applying local security policies to new equipment and modifying existing security policies to accommodate the systems in this scope.
3. Configuring devices with gateway and subnet mask information.
4. Assigning ports and/or addresses to VLANs.
5. Configuring VLANs across multiple switches.
6. Entering connected device MAC addresses into the switch’s MAC address table.
7. Configuring QoS per connected device requirements.
8. Configuring port trunking if necessary.
9. Configuring jumbo frames settings.
10. Configuring multicast permissions and other settings.
11. Configuring user account access to switch configuration pages.

3.2 AUDIO-VISUAL NETWORK EQUIPMENT PERFORMANCE VERIFICATION

A. General Performance Verification requirements are contained in Section 274010, Audio-Visual General.

B. Performance Verification of the equipment included herein should be conducted in accordance with requirements in other Specification Sections that cover related equipment.

C. Network Switches and Related Equipment:
   1. Verify that devices are using the correct IP address and on the correct VLAN.
   2. Verify that all devices have the necessary network access to perform as specified.
   3. Verify that one type of traffic (i.e., audio network traffic).

END OF SECTION

SECTION 274140 - AUDIO-VISUAL CABLING AND CONNECTORS

PART 1 GENERAL

1.1 SECTION INCLUDES

A. Category cabling.

B. Fiber optic cable and related equipment.

C. Coaxial cabling.

D. Single pair shielded cable.

E. Single pair unshielded cable.

F. Multipair shielded cable

G. Premade audio cables.

H. Premade video cables.

I. Active optical video cables.

J. Multi-adapter loops.

K. Audio connectors.

L. Video connectors.

M. Data connectors.

N. Responsibilities and obligations in support of the Performance Verification specified in Section 274010, Audio-Visual General.

1.2 RELATED REQUIREMENTS

A. General provisions in Section 274010 - AUDIO-VISUAL GENERAL and other Sections of Division 27.

B. 271313 - Communications Copper Backbone Cabling

C. 271323 - Communications Optical Fiber Backbone Cabling

D. 271333 - Communications Coaxial Backbone Cabling

E. 271513 - Communications Copper Horizontal Cabling

F. 271523 - Communications Optical Fiber Horizontal Cabling

G. 271533 - COMMUNICATIONS COAXIAL HORIZONTAL CABLING

H. 271611 - COMMUNICATIONS HYBRID CABLING

1.3 REFERENCE STANDARDS

A. AES3-4 Annex D - AES standard for digital audio - Digital input-output interfacing - Serial transmission format for two-channel linearly-represented digital audio data; 2009.

B. AES10 - Serial Multichannel Audio Digital Interface (MADI); 2008.

C. AVIXA F501-01-2015 - Cable Labeling for Audiovisual Systems; 2015.

D. SMPTE 259 - SDTV1 Digital Signal/Data — Serial Digital Interface; 2008.

E. SMPTE ST 292 - 1.5 Gb/s Signal/Data Serial Interface; 1-2008.

F. SMPTE ST 424 - 3 Gb/s Signal/Data Serial Interface; 2012.

G. SMPTE ST 2081-1 - 6 Gb/s Signal/Data Serial Interface — Electrical; 2023.

H. SMPTE ST 2082-1 - 12 Gb/s Signal/Data Serial Interface — Electrical; 2023.

I. Conform to all codes and standards listed in PART 1 of Section 274010, Audio-Visual General.

J. NEC 725

K. NEC 800

L. FT4

M. FT6

N. RoHS

1.4 SUBMITTALS

A. General submittal requirements as identified in Section 274010, Audio-Visual General. In addition to those requirements, submittals for this Section shall include the following:
   1. Run sheets or field wiring details.
   2. Floor plans and/or RCPs showing the locations of the equipment rack and all field connector boxes and plates. Cable pathway shall be shown for all cable that will be free-run or installed in raceway provided by the Audio-Visual Contractor.
   3. Shop Drawings of all panels, plates, and designation strips, including details relating to terminology, engraving, finish, and color.

4. A cable color scheme identifying the types of cabling, and where necessary the signal types, and the colors that will be used.
5. Category Cable submittal requirements as defined in 271313 - Communications Copper Backbone Cabling and 271513 - Communications Copper Horizontal Cabling.
6. Fiber Optic Cable submittal requirements as defined in 271323 - Communications Optical Fiber Backbone Cabling and 271523 - Communications Optical Fiber Horizontal Cabling.
7. Coaxial Cable submittal requirements as defined in 271333 - Communications Coaxial Backbone Cabling and 271533 - COMMUNICATIONS COAXIAL HORIZONTAL CABLING.

PART 2 PRODUCTS

2.1 GENERAL

A. This Section covers all cabling required to complete the scope defined by 274010 - AUDIO-VISUAL GENERAL and other sections listed therein. Not all cabling is used in every system. Reference the Drawings as necessary to correlate cable types to specific systems or cable links.

B. Cable gauges listed herein are the minimum required gauges.

C. Cables rated for use in wet locations shall be UL rated CM and CL3 and be RoHS compliant. Cable shall pass TIA455-82 Water Penetration Test.

D. Cables used for direct burial connections shall be UL rated for direct burial and factory marked as such on the outer jacket.

E. Cables shall be UL listed for direct burial where shown as run in the ground without a raceway.

F. All plenum cables shall UL listed CMP for use in plenums.

G. All non-plenum cables shall be UL listed CMR, riser rated.

H. Plenum cable use: All permanently installed cabling in this Project shall be plenum-rated, regardless of whether it is required by code or not.

I. Definitions:
   1. “Installed Cable” or “Permanent Links:” any cable of any type between the last connection in the equipment rack to the back side of connector plates in the field.
   2. “Patch Cables” or “Premade Cables” shall be defined as any cable of any type that connects a device in the equipment rack to another device or the patch bay, or any cable that connects a field connector plate to a device in the field.

2.2 CATEGORY CABLE AND RELATED EQUIPMENT

A. Refer to 271513 - Communications Copper Horizontal Cabling.

2.3 FIBER OPTIC CABLING AND RELATED EQUIPMENT

A. Refer to section 271523 - Communications Optical Fiber Horizontal Cabling.

2.4 COAXIAL CABLING

A. Refer to Section 271100, Broadband Cabling Systems.

B. Where shown on the Drawings carrying digital video signals, coaxial cabling shall be rated for use with serial digital signals per SMPTE 259, SMPTE ST 292, SMPTE ST 424, SMPTE ST 2081-1, and/or SMPTE ST 2082-1 as applicable.

C. RG/6U:
   1. Rated for use with MADI signals (AES10)

D. RG/59U:
   1. Rated for use with MADI signals (AES10)

2.5 SINGLE PAIR SHIELDED CABLING

A. General:
   1. Conductors: 7-strand tinned copper.
   2. Dielectric: Cellular polyethylene.
   3. Shield: 100% foil with 7-stranded tinned copper drain wire.
   4. UL voltage rating: 300 V.

B. Commercial Cabling:
   1. This paragraph applies to cabling used for the following signals or signal levels:
      a. Microphone.
      b. Analog line-level.
      c. RS-232C.
      d. Other signal paths as noted on the Drawings.

C. Precision Cabling:
   1. Complies with AES3-4 Annex D
   2. This paragraph applies to cabling used for the following signals or signal levels:
      a. All digital audio signal paths.
      b. All audio signal paths.
      c. RS-422 and RS-485.
      d. Other signal paths as noted on the Drawings.
   3. Rated for use with AES/EBU AES3 digital audio signals.
   4. Nominal impedance: 110 Ω.

2.6 SINGLE PAIR UNSHIELDED CABLING

A. Conductors: 19-strand copper.

B. Twist: 2.7/1.0’.

C. NEC UL rating: CL3, FPLR.

D. UL voltage rating: 300 V.

2.7 MULTIPAIR SHIELDED CABLING

A. Shield: individual pairs in aluminum foil, outer/overall aluminum foil shield.

B. Gauge: 22 AWG.

C. Pairs: enough to provide connectivity shown on the Drawings.

D. Characteristics and performance of individual pairs shall meet or exceed the Specification for single pair shielded cable as described herein and/or on the Drawings.

E. There shall be an overall shield.

F. UL voltage rating: 300 V.

2.8 PREMADE AUDIO CABLES

A. General:
1. Length: as shown on Drawings and/or as needed to make required connection(s).
2. Specifically designed for temporary or portable use on stage.
3. Manufacturer: Cables 2 Go, Whirlwind, ProCo, Mogami, Liberty Cable, BTX.

B. Microphone and Balanced Line-Level:
1. 3-conductor shielded, unless otherwise noted.
2. Connectors:
   a. Microphone: XLR-F and XLR-M. Shall meet or exceed XLR connector specification included herein.
   b. Line-Level: male or female XLR or TRS, as required by the device manufacturer and/or indicated on the Drawings without adapters.
3. Flex life: 131,000 cycles.
4. Tensile strength: 578 N.
5. Gauge: 22 AWG stranded copper.
6. Outer jacket: flexible PVC.

C. Production Communication Cables:
1. 3-conductor or 6-conductor shielded, as shown on the Drawings.
2. Connectors: microphone: XLR-F and XLR-M. Shall meet or exceed XLR connector specification included herein.
3. Flex life: 131,000 cycles.
4. Tensile strength: 578 N.
5. Gauge: 22 AWG.
6. Outer jacket: flexible PVC.

D. Speaker Cables:
   1. Connectors: Neutrik SpeakON, unless otherwise indicated on the Drawings.
   2. Outer jacket: flexible PVC.
   3. DC resistance: 0.005 Ω/ft.
   4. Capacitance: 32.3 pF/ft @ 100 Hz, 28.4 pF/ft @ 1.0 kHz.
   5. Inductance: 0.18 µH/ft.
   6. Voltage: 500 V, 15 second minimum.
   7. Gauge: 12 AWG stranded copper.

2.9 PREMADE VIDEO CABLES

A. Manufacturer: Crestron, Extron, BTX, Liberty Cable, Cables 2 Go, Belden, Gepco.

B. Factory terminated to match the connectors on the device(s) to which it will connect without the use of adapters.

C. Length: as short as possible to make the required connection without unnecessary strain on the cable and/or unnecessary length in the equipment rack.

D. Gold-plated contacts.

E. CM-rated where shown on the Drawings as installed in raceway.

F. Conductors: tinned copper, including drain wire.

G. Shielding: aluminum-mylar tinned copper braid.

H. Outer jacket: PVC.

I. HDMI Cables:
   1. Support for 4K (4096x21600) @ 60 Hz, 4:4:4 chroma sampling, maximum 8 bit per color, and 18.0 Gbps overall data rate for the entire length of the cable.
   2. Voltage: 30 V.
   3. HDMI 2.0 compliant.
   4. Pair impedance: 100 Ω, ±10 Ω.

J. DVI Cables:
   1. Applies DVI-DVI and DVI-HDMI cables.
   2. Support for 1920x1200 @ 60 Hz and 4.59 Gbps data rate for the entire length of the cable.
   3. Voltage: 30 V.
   4. Pair impedance: 100 Ω, ±10 Ω.

K. Display Port Cables:
   1. Support for 4K (4096x2160) @ 60 Hz, 4:4:4 chroma sampling, maximum 8 bit per color, and 21.6 Gbps overall data rate for the entire length of the cable.
   2. HDCP support: HDCP 1.4, HDCP 2.2.
   3. DisplayPort 1.2 compliant.
   4. Voltage: 40 V.
   5. Pair impedance: 100 Ω, ±10 Ω.

6. Latching connectors.

L. VGA Cables:
1. Molded HD-15 connectors with screws.
2. Integral stereo audio connection.
3. Transmission of EDID signals and +5.0 V on pin 9.
4. Electrostatic discharge protection.

2.10 ACTIVE OPTICAL VIDEO CABLES

A. Functionally designed as a hybrid copper and fiber optic cable designed to carry digital video and low voltage power beyond the distance limitations of copper cable.
1. Support for 4K (4096x2160) @ 60 Hz, 4:4:4 chroma sampling, maximum 8 bit per color, and 21.6 Gbps for the entire length of the cable.

B. Detachable or fixed connectors.

C. Video standards compliance, HDMI, HDCP2.2, CEC.

D. Audio support:
1. return channel.
2. 32 discreet channels.
3. 8-channel including PCM, Dolby Digital TrueHD, and DTS-HD.

E. Power: +5.0 V DC via HDMI pin 15.

F. No external power supply.

G. Passes hot plug detect signal.

H. Manufacturer: Liberty Cable, Covid, Kanex Pro, Legrand, Kramer.

2.11 MULTI-ADAPTER LOOPS

A. Functionally designed as a steel cable securing multiple adapters to convert multiple signal types to HDMI.

B. Input adapter types: as indicated on the Drawings.

C. Manufacturer: Liberty Cable, Covid, Digitalinx, Kramer.

2.12 CONNECTORS

A. General:
1. Manufacturer, unless otherwise noted: Neutrik, BTX, Leviton, Amphenol, Switchcraft, Whirlwind, West Penn, Belden, Liberty, Crestron, Canare.
2. Solderable connectors shall comply with IEC 68-2-20 for solderability.

3. Color: black or sliver, unless otherwise noted.

B. XLR:
1. Shall conform to ECIA RS297-A-1970, IEC 61076-2-103.
2. Mating cycles: 1000, minimum.
3. Shell: nickel plated zinc.
4. Latch: diecast zinc or steel.
5. Supports wire up to 14 AWG.
6. Contacts: silver plated bronze.
7. Cable mount: integral strain relief and insert, and polyurethane boot.
8. Panel mount: nickel housing, D shape, 1.024” x 1.22” face plate dimensions.

C. TRS and TS (Tip-Ring-Sleeve and Tip-Sleeve):
1. Shall conform to IEC 60603-11, EIA-453.
2. Mating cycles: 1000, minimum.
3. Shell: nickel plated zinc.
4. Supports wire up to 18 AWG.
5. Contacts: sulfur-plated brass or silver-plated bronze.
6. Cable mount: diecast zinc or steel latch, integral strain relief and insert, and polyurethane boot.
7. Panel mount: nickel housing, D shape, 1.024” x 1.22” face plate dimensions.

D. Multi-Pole Twist-Lock Speaker Connectors:
1. Poles: 2, 4, or 8 as required to support connected loudspeakers.
2. Rated current: 50 A, per contact.
3. Rated voltage: 250 V AC.
4. Mating cycles: 5000, minimum.
5. Supports wire up to 10 AWG.
6. Screw terminals.
7. Contacts: silver plated brass or sliver plated bronze.
8. Latch: diecast zinc, quick lock type.
9. Cable mount: integral strain relief, with polymer-based thermoplastic insert and shell.
10. Panel mount: polyamide or nickel housing, D type, 1.024” x 1.22” face plate dimensions.
11. Basis of design: Neutrik SpeakON SPX (NL) Series.

E. HDMI:
1. Standards compliance: HDMI 2.0.
2. Front connector: female HDMI.
3. Rear connector: female HDMI or phoenix type if all HDCP, HDMI and other standards are met and/or maintained.
4. Chassis: Panel mount: polyamide or nickel housing, D type, 1.024” x 1.22” face plate dimensions.
5. Mating cycles: 1000, minimum.
6. Contacts: silver plated brass.

F. RJ-45:
1. TIA/EIA-, IEC/ISO/EN-, IEEE-rated for the Category cable and signal path that will connect to it.
2. Chassis: Keystone snap-in type or polyamide/nickel housing D type.
3. Front connector: RJ-45.

4. Rear connector: 110 or IDC punch down.
5. Shielded where required by the signal path.
6. Cable mount: integral strain relief, with polymer-based thermoplastic insert and nickel-plated zinc diecast shell.
7. Mating cycles: 1000, minimum.
8. Supports POE, POE+, or UPOE where shown carrying such a signal on the Drawings.
9. Color: as indicated on the Drawings or approved by the Architect.
10. Manufacturer for shielded cable-mount RJ-45 connectors: Weidmuller or equal by Crestron, Neutrik, Panduit, or Leviton.

G. DB-9:
1. Brass contacts.
2. Metallic housing.
3. UL94V thermoplastic insulator.
4. Solder or phoenix-type connections.

H. HD-15:
1. Brass contacts.
2. Metallic housing.
3. UL94V thermoplastic insulator.
4. Solder or phoenix-type connections.

I. Fiber Optic Connectors:
1. TIA/EIA-, IEC/ISO/EN-, IEEE-rated for the Category cable and signal path that will connect to it.
2. Chassis: Keystone snap-in type or polyamide/nickel housing D type.
3. Tethered cover to protect optical connections when not in use.
4. Front connector: feed through, type as required by signal path and/or other connectors serving it.
5. Cable mount: integral strain relief, with polymer-based thermoplastic insert and nickel-plated zinc diecast shell.
6. Mating cycles: 1000, minimum.
7. Color: as indicated on the Drawings or approved by the Architect.

J. BNC:
1. Rated for 4.5 GHz.
2. Impedance: 75 Ω or 50 Ω.
3. Panel mount: barrel-type or D-type.
4. Mating cycles: 1000, minimum.
5. Connectors: BNC, both sides.
6. Bayonett-style locking mechanism.
7. Contacts: brass and aluminum.
8. Shell: brass.

PART 3 EXECUTION

3.1 GENERAL

A. This Section pertains to installation of the cabling and related equipment and supplies described in this Section.

B. Any person installing and/or terminating permanently installed category cable or fiber optic cable shall have a current BICSI installation certification.

C. Refer to the Drawings for related cabling scope that may interface with the audio-visual cabling. The Audio-Visual Systems Contractor shall be responsible for verifying and interfacing with the Structured Cabling Contractor as necessary to execute the scope described herein and on the Drawings.

D. These general requirements apply to all cable types in this Project.

E. Tie wraps (also known as cable ties or zip ties) shall not be used anywhere on this Project unless directed specifically to do so by a manufacturer. Cable shall be secured with Velco cable wraps.

F. Add raceway as required by code when it is necessary for a non-plenum cable to pass through a plenum space.

G. Install plenum-rated cable in all locations where cables are not installed in conduits or other enclosed wireways.

H. Wet-rated cabling as defined herein shall be used where cable is shown installed in raceway enclosures or raceways underground or in slabs on grade.

I. Cables and conductors installed in enclosures or raceways underground or in slabs on grade shall be UL listed for use in wet locations.

J. Permanent links terminating in equipment racks shall be connected to a patch panel or other back plane. Provide custom patch panels as required.

K. Where a connector plate is not shown on the Drawings, permanent links terminating in the field shall be connected directly to its destination device through a plate with a grommet hole. This plate is not required when a device mounts directly to the wall box.

L. Cut, drill, or otherwise provide cable pass through holes as required. Verify the locations of all pass throughs with the Architect prior to installation.

M. Cables leaving or entering the equipment rack(s) shall be strapped, dressed, and supported. Cabling within an equipment rack shall be completed prior to the rack being delivered to the installation site.

N. Make joints and connections with either 60/40 resin-core solder or mechanical connectors. Temperature-controlled soldering irons rated at least 60 W shall be use for soldering work.

O. Where possible, cables shall be grouped as follows:
   1. Data (Ethernet, digital audio, digital video, control).
   2. Analog video.
   3. Fiber-optic connections.
   4. Line-level audio and speaker-level audio.
   5. Microphone-level audio.

P. All cables, regardless of length, cable type, or signal format, shall be labeled as follows:
   1. AVIXA F501-01-2015.
   2. Provide self-laminating computer printed cable markers with black text and white background for all cable designations.
   3. No cables shall be marked with handwritten markers.
   4. Cable labels shall be full wrap unless otherwise noted. No label shall protrude from any cable, similar to a flag on a flagpole.
   5. Label both ends of every cable to correspond exactly with the approved shop drawings and run sheets provided during the submittal process. Coordinate with the Architect prior to labeling cables and adhere to any stated cable numbering or identification standards.
   6. Labels shall use text with a minimum height of 0.2".
   7. Label shall identify cable number, type, source, destination as shown below.
      a. Example: Where V=Video I=Input, 0010=Cable Number corresponding to the Shop Drawings (XXXX), R210=Source Room Number (SRC), R250=Destination room number (DST) PPP=Patch Point if applicable.
      b. Example: VI-0010-R210-R250
      c. Specific signal/cable types:
         1) Microphone level – M-XXXX-SRC-DST
         2) Line level audio – L-XXXX-SRC-DST
         3) AES digital audio – DA-XXXX-SRC-DST
         4) SPDIF – SP-XXXX-SRC-DST
         5) Speaker, 70 V – S70-XXXX-SRC-DST
         6) Speaker, low Ω – S-XXXX-SRC-DST
         7) STP Video – V(I or O)-XXXX-SRC/PPP-DST/PPP
         8) UTP – AV-XXXX-SRC/PPP-DST/PPP
         9) Multimode Fiber – AV-XXXX-SRC/PPP-DST/PPP
         10) Singlemode Fiber – AV-XXX-SRC/PPP-DST/PPP

Q. Cable color requirements are identified on the Drawings. If no cable color scheme is stated thereon, or if the required cable types are not available in the stated colors, the Contractor shall develop a cable color scheme for approval by the Architect.

R. It is the intent for all permanent links to be concealed. To this end, the Contractor shall provide materials and labor to drill holes through hard walls and provide surface mounted raceways as needed. If it is demonstrated to be impossible to drill the required holes, the Contractor shall provide wooden moldings (stained to match existing millwork) configured to best blend in with any existing finishes.

S. The Contractor shall remove all abandoned low voltage cable from conduits, wall boxes, and floor boxes that will be reused in this Project. This includes all abandoned cable, whether the abandonment was not caused by the Contractor's work or not. This also includes conduit that is connected to a wall or floor box that will be reused regardless of whether that conduit will be reused or not. It shall be the Contractor's responsibility to differentiate abandoned cable from cable to remain in use. If existing conduit contains cables that are to remain in service, and if the Contractor determines that it is necessary to remove those cables in order to install any new cabling, the Contractor shall be responsible for removing and reinstalling said existing cabling.

T. The Contractor shall ensure that all cabling in this scope is neatly dressed using split loom tubing or equivalent for pleasing appearance and safety.

U. When it is necessary to coil cables within an equipment rack, do so in a manner that does not obstruct the backs of the racked equipment.

V. Do not install any low voltage permanent links in the same cable pathway as high voltage cabling of any kind.

W. Secure cable to captive screw connectors per manufacturer's recommendations.

X. Cables shall be routed at least 24" from any fluorescent ballast and at least 3.0' from any electric motors or other high-level source of electromagnetic interference.

Y. All cables shall be cut to the length dictated by the run. NO splices shall be permitted in any pull boxes without prior permission of the Architect. For equipment mounted in drawers or on slides, the interconnecting cables shall be provided with a service loop of sufficient length for the slide or drawer to open fully.

Z. All cables in conduits must be insulated and shielded from each other and from the conduit for the entire length and must not be spliced. Ground all the shields at the high-level termination end of the respective circuits only, unless otherwise specified herein. Heat shrink tubing shall be used to dress the ends of all wire and cabling including a separate tube for the drain or ground wire.

AA. Ensure that the maximum pulling tensions of the specified permanent links are not exceeded, and cable bends maintain the proper radius during the placement of the facilities. No cable shall be installed with a bend radius less than that recommended by the cable manufacturer. Observe the bending radius and pulling strength requirements of the cables during handling and installation. Provide clutch or s hear pin protection from cables during the cable pulling process to ensure cable pulling tension is not exceeded.

BB. Provide temporary protection of cables before termination. Cables shall not be left lying on the floor. Bundle and tie cables to provide protection.

3.2 CATEGORY CABLE

A. Refer to Section 271513 - Communications Copper Horizontal Cabling.

B. General installation means and methods shall comply with the BICSI Telecommunications Distribution Methods Manual-2014, unless otherwise indicated.

C. All Category cable used for control signals, including but not limited to bidirectional serial, one-way serial (IR), real time transcription (RTT), USB, and Ethernet, shall use Category 6 or 6A cabling, unless otherwise directed by the Architect.

D. All Category cable used for video signal transmission, except for video over IP paths, shall be shielded Category cable. The shield shall be maintained for the entire length of the signal path.

E. All non-permanently installed field Category cables that connect a field device to a field plate (such as the connection between a desktop display and a field plate), shall use an RJ-45 connector with a metal shell protecting the connector at the field plate.

F. No permanent links shall be field terminated with male (cable mount) RJ45 connectors at/on field plates. The back side of plate-mounted RJ45 connectors shall be punch-down style. When the Specifications or Drawings require the equipment rack end of permanent links to be directly connected to its destination device (and not a patch panel), punch-down RJ45 cable-mount connectors shall be used.

G. Where patch bays are required, the patch bay shall be shielded as necessary, support up to and including 6a shielded cabling, and shall have punch-down connectors for permanent links.

H. Patch cables shall be factory pre-made cables of appropriate lengths. These cables shall be shielded or unshielded to match the cabling and/or signal originating or terminating in the field.

3.3 FIBER OPTIC CABLES AND CONNECTORS

A. Refer to Section 271523 - Communications Optical Fiber Horizontal Cabling.

B. All non-permanently installed field fiber optic cables that terminate to a field plate (such as from a field plate to a device), shall use a fiber optic connector with a metal shell that protects the connection at the field plate.

C. Provide necessary fiber optic cable termination tools.

D. Provide all necessary panels, clamps, covers, and couplings.

E. Follow manufacturer’s installation instructions for connector installation.

3.4 AUDIO CABLES

A. Do not increase cable gauge (provide smaller cable) without written consent from the Architect.

B. Reduce microphone cable gauge (provide larger cable) as required to carry full phantom power voltage and current required by the connected microphone from the audio mixer to the microphone location. Provide local phantom power supplies at microphone locations if the required voltage and/or current cannot be delivered to the microphone by a reasonable decrease in cable gauge.

C. Reduce loudspeaker cable gauge (provide larger cable) as required to deliver required wattage, current, and voltage to the specified loudspeakers.

D. Audio Cable Shields: All audio cable shields shall be grounded at one point only. There are no exceptions. For inter and intra-rack wiring this requires that the shield be connected at one end only. For ungrounded portable equipment, such as microphones, the shield shall be connected at both ends but grounded at only one end.

3.5 VIDEO CABLES

A. All video cables shall be rated for the resolution and refresh rate of the system at the distance required to make the necessary connections.

3.6 PREMADE CABLES

A. All pre-made cables used within an equipment rack shall be the shortest length available that completes the connection.

B. Provide equalizers as required to maintain resolution, refresh rate, chroma sampling, color bit depth, and data rate for the entire length of the cable.

C. Provide CM-rated cables for all pre-made cables shown on the Drawings as installed in raceway.

D. Verify length of pre-made cables used between field connector plates and source or destination devices with the Architect.

3.7 CONNECTOR ASSEMBLIES

A. Provide engraved wall connector assembly plates for all connector assembly plates for all connections. The finish of all connector assemblies shall be coordinated with and approved by the Architect. Thickness as required.

B. Coordinate the final placement of all connector assemblies with the Architect.

C. Unless otherwise specified herein or on the Drawings, female type receptacles shall be used for floor, wall, and panel mountings. Male type connectors shall be used for cable mountings.

D. Provide strain relief on all connectors.

E. Receptacles shall be insulated from the mounting panel, box, or cable pathway. Unless otherwise specified herein or on the Drawings, this shall be accomplished by using insulated-from-panel type receptacles.

F. Provide blank cover plates for all boxes shown on the Drawings but not used in the installation. Provide blank cover plates for all boxes vacated as a part of the removal of existing cabling and/or connectors.

G. Insulate cables from receptacle faceplates.

3.8 GENERAL CABLE AND CONNECTOR PERFORMANCE VERIFICATION

A. General:
   1. These requirements pertain to all cabling included in this Project, as applicable.
   2. Performance Verification of these systems shall be performed in conjunction with the Performance Verification requirements in Section 274010, Audio-Visual General.

3. Performance Verification of the equipment included herein should be conducted in accordance with requirements in other Specification Sections that cover related equipment.
4. The Contractor shall test all elements of the cabling as defined herein. This testing shall be conducted in accordance with the submitted and approved test plan.
5. Because of the great number of possible variations in grounding systems, it shall be the responsibility of the Contractor to follow good engineering practice, as outlined above, and to deviate from these practices only when necessary to minimize crosstalk and to maximize signal-to-noise ratios in the audio, video, and control systems. The Contractor shall submit a written request to the Contracting Officer, with justification and technical support materials, for approval of alternate grounding methods and practices.
6. The Contractor shall be responsible for terminating all cable provided by others that will be used by the systems included in this scope of work. The Contractor shall notify the Architect promptly if any such cable is found to be defective or otherwise unusable for the intended signal path.

B. Terminations:
1. Verify that all solder terminations are secure, strong, and not causing shorts.
2. Verify that all screw terminals are tightened, and the wire cannot pull out.
3. Verify that all phoenix connectors are properly attached.

C. Impedance:
1. Check the resistance and continuity of all circuits covered by this and other Sections included in Division 27. Document and repair any deficiencies fount.

D. Polarity:
1. Verify and document that polarity is maintained throughout the system on microphone and line level signals from field input and output connections to their respective active components and on loudspeaker from power amplifier outputs to the last speaker in each circuit.

E. Hum, Buzz, and Interference:
1. Verify that all cables are terminated such that they are not introducing hum, buzz, EMF, or any other unwanted noise into the signal chain.

F. Cable Shields:
1. Verify that the shield of all shielded lines is intact and connected for the length of the installed cable run.

3.9 CATEGORY CABLE AND CONNECTOR PERFORMANCE VERIFICATION:

A. Refer to Section 271513, Communications Copper Horizontal Cabling.

B. General:
1. These requirements apply to all Category and fiber optic cabling in this scope, regardless of the signal that any given cable will ultimately carry.
2. All individual installed Category and fiber optic cable lines shall be tested as follows for data rate and dropped bits.
3. Test 100% of the permanent links.

4. Input the test results into a spreadsheet created by the Contractor or the test equipment manufacturer's reporting software. Tabulate and analyze results to ensure cabling system meets requirements specified herein.
5. Document failed links, including individual pairs in Category cable. Repair or replace cable, then retest. Repeat procedure until cable passes requirements.
6. A representative of the Architect shall be invited to witness the field testing. The representative shall be notified of the start date of the testing phase at least 5 business days before testing commences.

3.10 OPTICAL FIBER CABLE AND CONNECTOR PERFORMANCE VERIFICATION:

A. Refer to section 271523, Communications Optical Fiber Horizontal Cabling.

B. General:
1. All individual installed Category and fiber optic cable lines shall be tested as follows for data rate and dropped bits.
2. Test 100% of the permanent links.
3. Input the test results into a spreadsheet created by the Contractor or the test equipment manufacturer's reporting software. Tabulate and analyze results to ensure cabling system meets requirements specified herein.
4. Document failed links, including individual pairs in Category cable. Repair or replace cable, then retest. Repeat procedure until cable passes requirements.
5. A representative of the Architect shall be invited to witness the field testing. The representative shall be notified of the start date of the testing phase at least 5 business days before testing commences.

END OF SECTION

SECTION 274200 - ELECTRONIC DIGITAL SYSTEMS

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 DESCRIPTION:

A. This Section covers LED message centers and control software.

B. Specialty systems general provisions are specified in Section 27 40 10, Audio-Visual General.

C. This Section includes responsibilities and obligations in support of the performance verification specified in Section 27 40 90, Audio-Visual Performance Verification.

1.3 REFERENCES:

A. Standard for Electric Signs, UL and CUL Listed.

B. Standard for Control Centers for Changing Message Type Signs

C. Federal Communications Commission Regulation Part 15

D. National Electric Code

E. Designed to current UBC or IBC standards

F. FCC Class A Compliant

1.4 SUBMITTAL:

A. The electronic LED display manufacturer shall provide a complete technical submittal within 60 days of contract award and shall not proceed with LED Matrix manufacture until the submittal is approved.

B. Submit the following:
   1. All LED display manufacturer qualifications, as specified herein.
   2. LED display shop drawing.
   3. LED display Riser diagram.
   4. AC Site Power Requirements, including legs and Amps per leg.
   5. LED display control software operator’s manual.
   6. LED display installation and maintenance manual.

1.5 QUALIFICATIONS:

A. LED Display Manufacturer shall:
1. Have been in the business of manufacturing permanently mounted outdoor LED displays for a minimum period of 15 years prior to the contract bid date. An “LED” display contains pixels constructed solely of high-intensity discrete LEDs.
2. Have in operation at bid date a minimum of 100 large outdoor permanently mounted LED displays as defined above. Each of these LED displays shall have operated successfully for a minimum period of one (1) year prior to the contract bid date.
3. Have been in business under the same corporate name for a period of no less than 40 years prior to the contract bid date.

B. Experience with manufacturing the following types of electronic sign products shall not satisfy the requirements of this LED display specification:
1. Indoor displays of any size or type.
2. Back-lit displays.
3. Any type of matrix display that cannot be programmed to show a nearly infinite quantity of messages.

1.6 WARRANTY:

A. Provide 5 years of parts coverage.

B. Provide toll-free service coordination.

PART 2 PRODUCTS

2.1 GENERAL:

A. Unless otherwise specified herein, quantities of equipment are indicated on the Drawings, and performance values specified herein are minimum acceptable values.

B. Obtain digital signs through one source from a single manufacturer. Obtain each as a complete unit, including mounting hardware and accessories.

C. Basis of DesignManufacturer:
1. Manufacturer: Daktronics
2. Model Number: GS6-40-125-15.85-RGB-SF

2.2 LED DISPLAY:

A. Cabinet Construction:
1. Cabinet dimensions 2' 7" high by 6' 9" wide. The front-to-back cabinet depth shall not exceed 5 inches.
2. The cabinet shall contain a full LED matrix measuring a minimum of 40 pixel rows high by 125 pixel columns wide.
3. Cabinet display configuration is:

a. Single-Face (SF), one sided display.

4. The distance from the center of one line or column of pixels to the center of all adjacent lines or columns shall be 15.85 mm both horizontally and vertically.
5. Maximum display power per face shall not exceed 570 watts when 100% of the pixels are operating at their maximum possible drive current.
6. Cabinet weight per face shall not exceed 130 lbs.
7. Display shall operate from the following power sources: 120/240 VAC, 60 Hz single-phase, including neutral and earth ground.
8. Display shall operate in a minimum ambient temperature range of -40° to +120°F (-40 to +50°C) and to a 95% humidity.
9. Internal display component hardware (nuts, bolts, screws, standoffs, rivets, fasteners, etc.) shall be fabricated from stainless steel, aluminum, nylon, or other durable corrosion-resistant materials suitable for the signage application.
10. Electrical display components shall be 100% solid-state.
11. The presence of ambient radio signals and magnetic or electromagnetic interference, including those from power lines, transformers, and motors, shall not impair performance of the display system.

B. Housing Frame:
1. Display materials shall use non-corrosive materials or have a protective coating so they shall be anti-corrosive and not degrade or oxidize.
2. Adequate ventilation shall be provided through convection without the need to provide extra space around the sides or behind the display.
3. Steel mounting points that can be used for mounting purposes shall be provided with the display and have the ability to be adjusted for alternative mounting methods.
4. Shall include lifting supports that can be removed after installation.

C. Exterior Finish:
1. The LED display border pieces shall be coated with an automotive-grade acrylic urethane paint.

D. Front Face Construction
1. To meet the display readability requirements, the front face must be constructed in such a manner that it provides high contrast, low sunlight reflection and durability in all weather and site conditions.
2. Minimum features of front face shall:
a. Provide UV resistance to prevent discoloring.
b. Include horizontal louvers for contrast enhancement.
c. Include vertical ribbing for contrast enhancement
d. Use surface materials in the active LED area, such as metal, plastic, or other face materials, designed for low sunlight reflectivity

E. Serviceability:
1. The display housing shall provide safe and convenient front service access for all modular assemblies, components, wiring, and other materials located within the housing.
2. All internal components shall be removable and replaceable by a single technician with basic hand tools.
3. Service access shall be easily obtained by removal of one or more modules in front of the associated internal component.

4. Each module should allow simple removal with a single latch system.
5. Displays shall be designed with service features that minimize potential bodily harm.

2.3 DISPLAY COMPONENTS:

A. LED display modules shall be constructed for good readability, long life, and ease of service. Each display module shall be constructed as follows:
   1. Each module within the product family shall be designed with the same physical footprint of 12.48” x 15.59”.
   2. All modules and their components shall be fully encapsulated and sealed to meet IP-67 standards.
   3. An LED module shall consist of LEDs with all drive electronics mounted on a single Printed Circuit Board (PCB).
   4. LEDs shall be auto-inserted in order to maintain quality and uniformity of the LEDs within each LED module.
   5. All PCBs shall be wave-soldered to ensure uniformity, quality, and durability of all solder joints.
   6. All PCBs shall be cleaned in a manner so as not to contain more than 2 parts per million contaminants.
   7. Module signal and electrical connections shall be of the positive locking and removable type. Removal of a module from the display shall not require a de-soldering operation.
   8. Data to the modules shall be redundant in that the signal can reach the module from multiple directions in the event of a loss in signal path from either direction.
   9. All LED display modules in a single display shall be identical in construction and interchangeable throughout the display with the ability to be field calibrated.
   10. All module rows shall include continuous louvers over the LEDs for sunlight shading and enhanced contrast.
   11. Modules shall be individually attached to the cabinet frame.
   12. Removal of one or more modules shall not affect the display’s structural integrity.
   13. The distance from the center of one line or column of pixels to the center of all adjacent lines or columns shall be 0.62" both horizontally and vertically.
   14. The failure of a single pixel, module or power supply shall not cause the failure of any other pixel, module or power supply in the display.
   15. All modules shall have no less than a 140° horizontal half-intensity viewing angle and a readability angle of 160° horizontal.
   16. The transition of the viewing intensity shall be consistent throughout the viewing cone.

B. Pixels shall be constructed with discrete LEDs, and these discrete LEDs shall conform to the following specifications:
   1. LEDs shall be non-diffused, ultra-bright, solid-state light emitting diodes.
   2. The red LEDs shall be constructed of AlInGaP technology and the green and blue LEDs shall be constructed of InGaN technology.
   3. Each color of LEDs used in all LED displays provided for this contract shall be from the same bin.
   4. LED half-life shall be an estimated minimum of 100,000 hours.
   5. Display shall have a minimum intensity of 12,000 cd/m2 for RGB maximum light output, 4,500 cd/m2 for Red maximum light output, and 6,000 cd/m2 for Amber maximum light output.

C. Power Supply:

1. All power supplies shall be regulated, auto-ranging AC to DC power, with protection for the LED pixel, LED display and driver circuitry in the event of power spikes or surges.
2. Each power supply and their connectors shall be fully sealed to protect from corrosive environmental factors meeting IP-67 standards.

D. Internal Wiring:
1. Wiring for LED display modules and other internal components shall be installed in the housing in a neat and professional manner.
2. Wiring shall not impede the removal of display modules, power supplies or other display components.
3. The display shall be protected from electrical spikes and transients.
4. The manufacturer shall provide an earth-ground lug on the display.

E. The display shall be protected from electrical spikes and transients.

F. The manufacturer shall provide an earth-ground lug on the display.

2.4 DISPLAY PERFORMANCE:

A. Display Capability
1. The LED display shall present messages that are continuous, uniform, and unbroken in appearance.
2. The LED display shall be capable of producing 281 trillion colors for RGB and 4096 shades of color for monochrome red or amber at all dimming levels.
3. Each display pixel shall be composed of one each – red, green, and blue LEDS or one red or one amber
4. The LED display shall be capable of displaying all true type fonts.
5. The display shall be able to display messages composed of any combination of alphanumeric text, punctuation symbols, graphic images, and pre-canned video files.
6. Video and message files shall have up to a 30 frame per second playback capability.

B. Controller
1. The display’s controller shall be able to run independently from a controlling computing device allowing the display to operate even when the controlling device is unhooked or turned off.
2. Communication protocol shall support other matrix products from the vendor such as other outdoor or indoor displays of varying sizes and/or colors.
3. Each controller shall be connected to a light sensor allowing each LED display to automatically adjust brightness according to display direction and lighting conditions.
4. The controller shall allow connection to a temperature sensor that provides accurate site temperatures.
5. Active presentations, stored presentations, schedules, display configuration, time and date shall be stored in non-volatile memory. No external power or battery backup will be required to maintain this data.

C. Control and Communications
1. The display controller should be DHCP-enabled and allow for static IP addressing.
2. Each single-face display shall be controlled and monitored by its own LED controller.

3. The LED controller shall be able to receive instructions from and provide information by accessing the Venus Control Suite using the following communication modes:
   a. Ethernet Cellular Modem

2.5 CONTROL SOFTWARE:

A. Control Software: Display content and scheduling shall be via Venus Control Suite (VCS) cloud-based solution. Software to be hosted on manufacturer's servers at no cost to the customer. Web browser access to the solution to support iOS Safari, Android Chrome, Internet Explorer v11+, Microsoft Edge, Google Chrome and Mozilla Firefox.

B. Basic content creation to be performed via browser-based online editor.

C. Expanded content creation tools available via PC-compatible Content Studio download.

D. Supports import of images (PNG, BMP, GIF, JPG, PSD) and video files (AVI, MPG, MP4, MOV) in both browser-based and downloadable content utilities.

E. Sign to be added to existing customer VCS account, if applicable.

PART 3 EXECUTION

3.1 GENERAL:

A. Coordinate layout and installation of digital sign with other construction including the outdoor monument to house the digital sign.

B. Mounting structure to be installed by contractor to support desired displays in all locations. Verify that separate conduit is in place for power and data to display unless fiber is being used. Verify that all control equipment has access to 120 VAC.

3.2 INSTALLATION:

A. Support structure design depends on the mounting methods, display size, and weight. The structure design is critical and should be done only by a qualified individual. It is the customer's responsibility to ensure that the structure and mounting hardware are adequate.

B. It is the customer's responsibility to ensure that the installation meet local standards. The mounting hardware shall be capable of supporting all components to be mounted.

C. All mounted displays must be inspected by a qualified structural engineer.

D. Possible power and signal entrances are designated by etched markings. Separate conduit must be used to route the power, signal in wires, and signal out wires.

E. Displays must be grounded according to the provisions outlined in Article 250 of the National Electrical Code. The display must be connected to earth-ground. Proper grounding is necessary for reliable equipment operation and protects the equipment from damaging electrical disturbances and lightning.

END OF SECTION

SECTION 275116 - PUBLIC ADDRESS SYSTEMS

PART 1 GENERAL

1.1 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.2 SUMMARY

A. Section Includes:
   1. Power amplifiers.
   2. Telephone paging adapter.
   3. Informacast Paging Adapter
   4. Loudspeakers.
      a. 70V Interior Speakers
      b. IP (Informacast) Outdoor Horn Speakers
   5. Line Matching Transformers
   6. Conductors and cables.

1.3 DEFINITIONS

A. Channels: Separate parallel signal paths, from sources to loudspeakers or loudspeaker zones, with separate amplification and switching that permit selection between paths for speaker alternative program signals.

B. VU: Volume unit.

C. Zone: Separate group of loudspeakers and associated supply wiring that may be arranged for selective switching between different channels.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product.

B. Shop Drawings: Power, signal, and control wiring.
   1. Include plans, elevations, sections, and attachment details.
   2. Include details of equipment assemblies. Indicate dimensions, weights, required clearances, method of field assembly, components, and location and size of each field connection.
   3. Rack arrangements.
   4. Wiring Diagrams: For power, signal, and control wiring.
      a. Identify terminals to facilitate installation, operation, and maintenance.
      b. Single-line diagram showing interconnection of components.

c. Cabling diagram showing cable routing.

1.5 INFORMATIONAL SUBMITTALS

A. Coordination Drawings: Reflected ceiling plans, drawn to scale, on which ceiling-mounted items including lighting fixtures, diffusers, grilles, speakers, sprinklers, access panels, and special moldings are shown and coordinated with each other, using input from installers of the items involved.

B. Field quality-control reports.

1.6 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For public address systems to include in emergency, operation, and maintenance manuals.
   1. In addition to items specified in Section 01 7700 "Closeout Procedures" and Section 01 7823 "Operation and Maintenance Data," include the following:
      a. List of tools and replacement items recommended to be stored at Project for ready access. Include part and drawing numbers, current unit prices, and source of supply.
      b. Operating instructions laminated and mounted adjacent to operating console location.
      c. Training plan.

1.7 QUALITY ASSURANCE

A. Installer Qualifications: Manufacturer's authorized representative who is trained and approved for installation of units required for this Project.
   1. At a minimum, CTS certified and qualified through Vendor for installation .

PART 2 PRODUCTS

2.1 MANUFACTURERS

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:
   1. Atlas Sound LP.
   2. Bogen Communications, Inc.
   3. Biamp (Vocia)
   4. Toa Electronics, Inc.
   5. Valcom, Inc.

B. Source Limitations: Obtain public address system from single source from single manufacturer.

C. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

D. Comply with NFPA 70.

2.2 FUNCTIONAL DESCRIPTION OF SYSTEM

A. System Functions:
   1. Selectively connect any zone to any available signal channel.
   2. Selectively control sound from microphone outlets and other inputs.
   3. "All-call" feature shall connect the all-call sound signal simultaneously to all zones regardless of zone or channel switch settings.
   4. Telephone paging adapter shall allow paging by dialing an extension from any local telephone instrument and speaking into the telephone.
   5. Produce a program-signal tone that is amplified and sounded over all speakers, overriding signals currently being distributed.
   6. Reproduce high-quality sound that is free of noise and distortion at all loudspeakers at all times during equipment operation including standby mode with inputs off; output free of nonuniform coverage of amplified sound.

2.3 SYSTEM DESCRIPTION

A. Paging and Bell Schedule is controlled by the existing Singlewire Informacast system. All paging equipment shall be integrated with Informacast.

B. Compatibility of Components: Coordinate component features to form an integrated system. Match components and interconnections for optimum performance of specified functions.

C. Equipment: Comply with UL 813. Equipment shall be modular, using solid-state components, and fully rated for continuous duty unless otherwise indicated. Select equipment for normal operation on input power usually supplied at 110 to 130 V, 60 Hz.

D. Equipment Mounting: Where rack, cabinet, or console mounting is indicated, equipment shall be designed to mount in a 19-inch housing complying with EIA/ECA-310-E.

E. Exterior Speaker Color & Finish: Provide finish options for selection by architect, or alternatively, provide outdoor speakers that are field paintable.

2.4 POWER AMPLIFIERS

A. Mounting: Rack.

B. Output Power: 70-V balanced line. 80 percent of the sum of wattage settings of connected stations and speakers connected in all-call mode of operation, plus a 20 percent allowance for future stations.

C. Total Harmonic Distortion: Less than 3 percent at rated power output from 50 to 12,000 Hz.

D. Minimum Signal-to-Noise Ratio: 80 dB, at rated output.

E. Frequency Response: Within plus or minus 3 dB from 20 to 12,000 Hz.

F. Output Regulation: Less than 2 dB from full to no load.

G. Controls: On-off, input levels, and low-cut filter.

H. Input Sensitivity: Matched to preamplifier and to provide full-rated output with sound-pressure level of less than 10 dynes/sq. cm impinging on speaker microphone or handset transmitter.

2.5 TELEPHONE PAGING ADAPTER

A. Adapters shall accept voice signals from telephone extension dialing access and automatically provide amplifier input and program override for preselected zones.
   1. Minimum Frequency Response: Flat, 200 to 2500 Hz.
   2. Impedance Matching: Adapter matches telephone line to public address equipment input.
   3. Rack mounted.

2.6 INFORMACAST PAGING ADAPTER

A. For use with Singlewire's InformaCast paging and emergency notification software. The Paging Adapter provides a direct connection to analog paging systems enabling InformaCast paging events to be broadcast.

B. Paging Adapter Features:
   1. Ethernet: 10/100 Mbps
   2. Protocol:SIP RFC 3261 Compatible
   3. Notification Software: Singlewire InformaCast v4.0 and abovePower
   4. Power Input: PoE 802.3af or 48VDC
   5. Input: PoE 802.3at or 802.3afAud
   6. Page Port Output: Balanced 600 Ohm
   7. Payload Types: G.711 a-law, G.711 μ-law, G.722, G.729
   8. Network Security: TLS 1.2, SRTP, HTTPS

2.7 LOUDSPEAKERS

A. Cone-Type Loudspeakers:
   1. Minimum Axial Sensitivity: 91 dB at 1 m, with 1-W input.
   2. Frequency Response: Within plus or minus 3 dB from 50 to 15,000 Hz.
   3. Size: 6 inches or 8 inches with 1-inch voice coil and minimum 5-oz. ceramic magnet.
   4. Rated Output Level: 3 Watt minimum.
   5. Minimum Dispersion Angle: 100 degrees.
   6. Matching Transformer: Full-power rated with four taps. Maximum insertion loss of 0.5 dB.
   7. Flush-Ceiling-Mounted Units: In steel back boxes, acoustically dampened. Metal ceiling grille with white baked enamel for white ceilings. Coordinate final color and finish with Architect prior to procurement.

B. IP (Informacast) Horn Speakers
   1. Ethernet: 10/100 Mbps
   2. Protocol: SIP RFC 3261 Compatible
   3. Notification Software: Singlewire InformaCast v4.0 and above
   4. Power Input: PoE 802.3at or 802.3af

5. Audio Output:
   a. 802.3at: 107.7 (+/- 0.2) dBC @1M and 1kHz
   b. 802.3af: 104.8 (+/- 0.2) dBC @1M and 1kHz
6. Network Security: TLS 1.2, SRTP, HTTPS
7. IP Rating: IP66
8. Operating Range Temperature: -40 degrees C to 55 degrees C (-40 degrees F to 131 degrees F)
9. Humidity: 5-95%, non-condensing

2.8 LINE MATCHING TRANSFORMERS

A. Matches a 100, 70 or 25 volt speaker line to an unbalanced line-level audio input.

B. Use for audio input to Audio-Visual system and/or Classroom Integrated Audio-Visual System from 70V speaker lines.

C. Products
1. RDL Model# TX-70A
2. Atlas Sound Model# TSD-TXHL
3. Approved Equal

2.9 CONDUCTORS AND CABLES

A. Jacketed, twisted pair and twisted multipair, untinned solid copper.
1. Insulation for Wire in Conduit: Thermoplastic, not less than 1/32 inch thick.
2. Plenum Cable: Listed and labeled for plenum installation.

PART 3 EXECUTION

3.1 WIRING METHODS

A. Wiring Method:
1. Install cables in pathways and cable trays except in gypsum board partitions where unenclosed wiring method may be used. Conceal pathway and cables except in unfinished spaces.
   a. Install plenum cable in environmental air spaces, including plenum ceilings.
   b. Comply with requirements for pathways and boxes specified in Section 27 0528 "Pathways for Communications Systems."

B. Wiring within Enclosures: Bundle, lace, and train cables to terminal points with no excess and without exceeding manufacturer's limitations on bending radii. Provide and use lacing bars and distribution spools.

3.2 INSTALLATION OF CABLES

A. Comply with NECA 1.

B. General Cable Installation Requirements:
   1. Terminate conductors; no cable shall contain unterminated elements. Make terminations only at outlets and terminals.
   2. Splices, Taps, and Terminations: Arrange on numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures. Cables may not be spliced.
   3. Secure and support cables at intervals not exceeding 30 inches and not more than 6 inches from cabinets, boxes, fittings, outlets, racks, frames, and terminals.
   4. Bundle, lace, and train conductors to terminal points without exceeding manufacturer's limitations on bending radii. Install lacing bars and distribution spools.
   5. Do not install bruised, kinked, scored, deformed, or abraded cable. Do not splice cable between termination, tap, or junction points. Remove and discard cable if damaged during installation and replace it with new cable.
   6. Cold-Weather Installation: Bring cable to room temperature before dereeling. Heat lamps shall not be used.

C. Open-Cable Installation:
   1. Install cabling with horizontal and vertical cable guides in telecommunications spaces with terminating hardware and interconnection equipment.
   2. Suspend speaker cable not in a wireway or pathway a minimum of 8 inches above ceiling by cable supports not more than 60 inches apart.
   3. Cable shall not be run through structural members or be in contact with pipes, ducts, or other potentially damaging items.

D. Separation of Wires: Separate speaker-microphone, line-level, speaker-level, and power wiring runs. Install in separate pathways or, where exposed or in same enclosure, separate conductors at least 12 inches apart for speaker microphones and adjacent parallel power and telephone wiring. Separate other communication equipment conductors as recommended by equipment manufacturer.

3.3 INSTALLATION

A. Coordinate layout and installation of system components and suspension system with other construction that penetrates ceilings or is supported by them, including light fixtures, HVAC equipment, fire-suppression system, and partition assemblies.

B. Match input and output impedances and signal levels at signal interfaces. Provide matching networks where required.

C. Identification of Conductors and Cables: Color-code conductors and apply wire and cable marking tape to designate wires and cables so they identify media in coordination with system wiring diagrams.

D. Equipment Cabinets and Racks:
   1. Group items of same function together, either vertically or side by side, and arrange controls symmetrically. Mount monitor panel above the amplifiers.
   2. Arrange all inputs, outputs, interconnections, and test points so they are accessible at rear of rack for maintenance and testing, with each item removable from rack without disturbing other items or connections.
   3. Blank Panels: Cover empty space in equipment racks so entire front of rack is occupied by panels.

E. Volume Limiter/Compressor: Equip each zone with a volume limiter/compressor. Install in central equipment cabinet. Arrange to provide a constant input to power amplifiers.

F. Conductor Sizing: Unless otherwise indicated, size speaker circuit conductors from racks to loudspeaker outlets not smaller than No. 18 AWG and conductors from microphone receptacles to amplifiers not smaller than No. 22 AWG.

G. Speaker-Line Matching Transformer Connections: Make initial connections using tap settings indicated on Drawings.

H. Connect wiring according to Section 27 1500 "Communications Horizontal Cabling" and Section 28 0513 "Conductors and Cables for Electronic Safety and Security."

3.4 GROUNDING

A. Ground cable shields and equipment to eliminate shock hazard and to minimize ground loops, common-mode returns, noise pickup, cross talk, and other impairments.

B. Signal Ground Terminal: Locate at main equipment cabinet. Isolate from power system and equipment grounding.

C. Install grounding electrodes as specified in Section 27 0526 "Grounding and Bonding for Communications Systems."

3.5 FIELD QUALITY CONTROL

A. Testing Agency: a qualified testing agency to perform tests and inspections.

B. Perform tests and inspections.

C. Tests and Inspections:
   1. Schedule tests with at least seven days' advance notice of test performance.
   2. After installing public address system and after electrical circuitry has been energized, test for compliance with requirements.
   3. Operational Test: Perform tests that include originating program and page messages at microphone outlets, preamplifier program inputs, and other inputs. Verify proper routing and volume levels and that system is free of noise and distortion.
   4. Signal-to-Noise Ratio Test: Measure signal-to-noise ratio of complete system at normal gain settings as follows:
      a. Disconnect microphone at connector or jack closest to it and replace it in the circuit with a signal generator using a 1000-Hz signal. Replace all other microphones at corresponding connectors with dummy loads, each equal in impedance to microphone it replaces. Measure signal-to-noise ratio.
      b. Repeat test for each separately controlled zone of loudspeakers.
      c. Minimum acceptance ratio is 50 dB.
   5. Distortion Test: Measure distortion at normal gain settings and rated power. Feed signals at frequencies of 50, 200, 400, 1000, 3000, 8000, and 12,000 Hz into each preamplifier channel.

For each frequency, measure distortion in the paging and all-call amplifier outputs. Maximum acceptable distortion at any frequency is 3 percent total harmonics.

6. Acoustic Coverage Test: Feed pink noise into system using octaves centered at 500 and 4000 Hz. Use sound-level meter with octave-band filters to measure level at five locations in each zone. For spaces with seated audiences, maximum permissible variation in level is plus or minus 2 dB. In addition, the levels between locations in same zone and between locations in adjacent zones must not vary more than plus or minus 3 dB.
7. Power Output Test: Measure electrical power output of each power amplifier at normal gain settings of 50, 1000, and 12,000 Hz. Maximum variation in power output at these frequencies must not exceed plus or minus 1 dB.
8. Signal Ground Test: Measure and report ground resistance at public address equipment signal ground. Comply with testing requirements specified in Section 27 0526 "Grounding and Bonding for Communications Systems."

D. Inspection: Verify that units and controls are properly labeled and interconnecting wires and terminals are identified. Prepare a list of final tap settings of paging speaker-line matching transformers.

E. Public address system will be considered defective if it does not pass tests and inspections.

F. Prepare test and inspection reports.
1. Include a record of final speaker-line matching transformer-tap settings and signal ground-resistance measurement certified by Installer.

3.6 ADJUSTING

A. On-Site Assistance: Engage a factory-authorized service representative to provide on-site assistance in adjusting sound levels, resetting transformer taps, and adjusting controls to meet occupancy conditions.

B. Adjust transformer taps for continuous and symmetrical sound levels. The dB levels shall be appropriate for the application and approved by the User.

C. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

D. Adjust devices, wall plates and speakers to be flush and level.

3.7 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain the public address system and equipment. Refer to Section 01 7900 "Demonstration and Training."

END OF SECTION

SECTION 275313 - CLOCK SYSTEMS

PART 1 GENERAL

1.1 SUMMARY

A. Section Includes:
   1. Secondary indicating clocks.
   2. Program signal devices.
   3. System wire and cable.

1.2 RELATED DOCUMENTS

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and Division 01 Specification Sections, apply to this Section.

1.3 DEFINITIONS

A. Federal Communications Commission (FCC): U.S. agency responsible for regulating the use of wireless frequencies.

B. Innovation, Science and Economic Development (ISED): Canadian agency responsible for regulating the use of wireless frequencies.

C. NIST: The National Institute of Science and Technology.

D. NTP: Network Time Protocol.

E. PC: Personal computer.

F. PoE: Power over Ethernet.

G. UTC: Universal time coordinated. The precisely measured time at zero degrees longitude; a worldwide standard for time synchronization.

1.4 ACTION SUBMITTALS

A. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes (including available colors) for each product indicated and describe features and operating sequences, both automatic and manual, for the following:
   1. Indicating clocks.
   2. Signal equipment.
   3. Equipment enclosures and back boxes.
   4. Accessory components.

B. Shop Drawings: For clock systems. Include plans, elevations, sections, details, and attachments to other work.
   1. Wiring Diagrams: For power, signal, and control wiring and correction circuits.
      a. Identify terminals and wiring color codes to facilitate installation, operation, and maintenance.
      b. Indicate recommended wire types and sizes, and circuiting arrangements for field-installed system wiring. Indicate protection from overcurrent, static discharge, and voltage surge.

C. Samples for Initial Selection:
   1. Manufacturer's color photographs or color chips indicating the full range of colors available for clocks, signal equipment, and control panels.
   2. Representative operating models of clock type .

1.5 CLOSEOUT SUBMITTALS

A. Operation and Maintenance Data: For clock and program control to include in emergency, operation, and maintenance manuals.

1.6 QUALITY ASSURANCE

A. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.

B. Comply with NFPA 70.

PART 2 PRODUCTS

2.1 MASTER AND SECONDARY CLOCK SYSTEM

A. Basis-of-Design Product: Subject to compliance with requirements, provide Primex Inc.; OneVue or comparable product by one of the following:
   1. American Time & Signal Co.
   2. Telecor, Inc.
   3. Sapling, Inc.

B. System Functions and Features:
   1. Ensure clock system components are designed to operate as part of complete system.
   2. Ensure system synchronizes all clocks and devices to each other.
   3. Maintain correct synchronized time and transmit time-correction signals utilizing Wi-Fi 802.11 b/g/n (2.4 GHz only).
      a. Analog Synchronous Clocks: Correct for minute- and second-hand synchronization and hour-hand synchronization at least once each day.
   4. Ensure system works with monitoring software for system controls from one location and including options as follows:
      a. Mark clocks as priority for quick viewing.

b. Displaying when clocks last received (S)NTP time.
c. Configuring email alerts.

5. Ensure Wi-Fi Monitoring Software is run on PC on same subnetwork as Wi-Fi clock system:
   a. Server installation is not required.
   b. No licensing restrictions or recurring service fees.
6. Ensure system is capable of operating without physical servers and software.
7. Ensure each clock in system has built-in web interface for programming.
8. Regulate system timing functions using Ethernet network NTP, backed up for power outages by an internal battery-powered, crystal-controlled oscillator.
9. Provide programming for automatic daylight saving time correction.

2.2 SECONDARY INDICATING CLOCKS

A. Analog Clock: Equipped with a sweep second hand. Movement shall be driven by self-starting, permanently lubricated, sealed synchronous motor equipped with a correcting solenoid actuator.
   1. Ensure secondary clock is capable of receiving NTP protocol through 2.4 GHz Wi-Fi 802.11 b/g/n.
   2. Clock Size and Design
      a. Clock Type: Analog
      b. Face Configuration: Single
      c. Display Size: 12-diameter. 16-inch at locations noted on drawings.
      d. Dial Face Color: white face with black numbers.
      e. Dial style: Hour, minute and second hands.
      f. Lens: Clear thermoplastic.
      g. Frame: High-impact thermoplastic.
      h. Finish:
         1) Brushed Aluminum in Offices & Classrooms
         2) Black in Gymmasium, Auxillary Gymnasium, Black Box, and Planetarium.
      i. Tamper-proof/theft resistant clock-lock mounting slots.
      j. Operating Temperature: 32 to 95 deg F.
      k. Power Connection: 120 V AC
   3. Built-in Web Interface includes features as follows:
      a. Three-level password protected interface. Open access is unacceptable;
      b. Naming of the clock;
      c. Selecting time interval clock receives NTP time;
      d. Bias seconds configuration for altering correct time +/- 9999 seconds;
      e. Setting UTC/GMT offset for time zone configuration;
      f. Built-in diagnostic mode;
      g. Troubleshooting capability;
      h. Select all IP settings;
      i. DHCP capability;
      j. Server redundancy capability. Up to 5 servers can be used as backup in case of failure.
      k. Domestic and International Daylight Saving Time capability

2.3 BACK BOXES FOR SECONDARY INDICATING CLOCKS AND PROGRAM DEVICES

A. Description: Box and cover-plate assembly shall be furnished by device manufacturer and be suitable for device to be mounted. Back boxes shall be equipped with knockouts and hanger straps or mounting adapters arranged for flush mounting the device unless otherwise indicated.
   1. Compliance: UL 50E.

2.4 GUARDS

A. Description: Formed-steel wire, shaped to fit around guarded device, with 1-inch maximum clearance.
   1. Mounting Provisions: Fixed tabs, welded to guard and arranged for screw attachment to mounting surface.
   2. Finish: steel with zinc plating.

B. Description: Clear polycarbonate, shaped to fit around guarded device, with 1-inch maximum clearance.
   1. Mounting Provisions: Fixed tabs, integral to guard.
   2. Water-resistant gasket for high-humidity areas.

2.5 PATHWAYS

A. Intercommunication and Program System Raceways and Boxes: Comply with requirements in Section 27 0528 "Pathways for Communications Systems."

B. Intercommunication and Program System Raceways and Boxes: Same as required for electrical branch circuits specified in Section 26 0533 "Raceway and Boxes for Electrical Systems."

C. Outlet boxes shall be no smaller than 2 inches wide, 3 inches high, and 2-1/2 inches deep.

D. Flexible metal conduit is prohibited.

PART 3 EXECUTION

3.1 INSTALLATION

A. Mount system components with fastening methods and devices designed to resist the seismic forces indicated in Section 27 0548.16 "Seismic Controls for Communications Systems."

B. Install Wi-Fi communication clock system in accordance with manufacturer’s written recommendations and in accordance with NFPA 70E.

C. Integrate clock system with Owner’s electrical and communications network.

D. Install wiring in accordance with requirements of local Authority Having Jurisdiction.

E. Install clocks only after painting and other finish work is completed in each room.

F. Install clocks and other devices square and plumb.

3.2 ELECTRICAL CONNECTIONS

A. Make splices, taps, and terminations on numbered terminal strips in junction, pull, and outlet boxes; terminal cabinets; and equipment enclosures.

B. Use splices for connections to clocks and signal devices.

C. Ground clocks, programming equipment, and conductor and cable shields to eliminate shock hazard and to minimize ground loops, common-mode returns, noise pickup, cross talk, and other impairments.

3.3 IDENTIFICATION

A. Comply with Section 27 0553 "Identification for Communications Systems."

B. Color-code wires, and apply wire and cable marking tape to designate wires and cables so they are uniformly identified and coordinated with wiring diagrams throughout the system.

3.4 FIELD QUALITY CONTROL

A. Tests and Inspections:
   1. Perform operational-system tests to verify compliance with the Specifications and make adjustments to bring system into compliance. Include operation of all modes of clock correction and all programming and manually programmed signal and relay operating functions.
   2. Fix or replace devices which fail test or are functioning incorrectly.
   3. Verify that units and controls are properly labeled and interconnecting wires and terminals are identified.

B. Clock system will be considered defective if it does not pass tests and inspections.

C. Prepare test and inspection reports.

3.5 ADJUSTING

A. Program system in accordance with Owner's requirements.

B. Occupancy Adjustments: When requested within 12 months of date of Substantial Completion, provide on-site assistance in adjusting system to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose.

3.6 DEMONSTRATION

A. Train Owner's maintenance personnel to adjust, operate, and maintain clock-and-program-control system components.

END OF SECTION

SECTION 280000 - FIRE ALARM SYSTEM

PART 1 - GENERAL

1.1 SCOPE AND RELATED DOCUMENTS

A. The work covered by and the intent of this section of the specifications includes the furnishing of all labor, equipment, materials, services, software, testing, programming and performance of all operations in connection with the installation of the Fire Alarm System as shown on the drawings, as herein specified and as required by the applicable codes.

B. The requirements of all other applicable conditions of the Contract, Supplementary Conditions and General Requirements, apply to the work specified in this section.

C. The complete installation shall conform to the applicable sections of NFPA-71, NFPA-72A, B, C, D, Local Code Requirements and National Electrical Code (Article 760). The requirements of any local fire department and the Authority Having Jurisdiction shall also be observed in the system installation and device layout.

D. The work included in this section shall be coordinated with related work specified elsewhere in these specifications.

1.2 QUALITY ASSURANCE

A. Every component, device, transmitter, software, etc., that are included in the work, to make up a complete Fire Alarm System shall be listed as a product by the manufacturer under the appropriate category by the Underwriters' Laboratories, Inc. (UL), and shall bear the "U.L." label.

B. The system power, signal and controls wiring shall be UL listed for Power Limited Applications per NEC 760. All circuits shall be marked in accordance with NEC Article 760.

1.3 GENERAL

A. Furnish and install a complete digital multiplex Voice Evacuation Fire Alarm System as described herein and as shown on the plans; to be wired, connected, completely tested, and left in first class operating condition. The contractor to provide any additional equipment necessary to make the system fully functional in compliance with NFPA 72, local AHJ and any other applicable codes. The system shall use individually addressable digital multiplex device circuit(s) with individual device supervision, appliance circuit supervision, incoming normal and stand-by power supervision. In general, systems shall include a control panel, manual pull stations, automatic fire detectors, horns, flashing lights, annunciators, raceways, all wiring, connections to devices, connections to valve tamper switches, water flow switches and mechanical controls, outlet boxes, junction boxes, and all other necessary materials for a complete, operating system.

B. The fire alarm control panel shall allow for loading or editing of any special instructions or operating sequences as required. No special tools, modems, or an off-board programmer shall be

required to program the system to facilitate future system expansion, building parameter changes, or changes as required by local codes. All instructions shall be stored in a resident non-volatile programmable memory.

C. All panels and peripheral devices shall be the standard product of a single manufacturer and shall display the manufacturer's name of each component. Any catalog numbers specified under this section are intended only to identify the type, quality of design, materials, and operating features desired.

D. The listing of specific catalog numbers and equipment parameters is not intended to limit competition among other manufacturers that propose to supply equivalent equipment and services. Fire alarm systems as manufactured by Simplex, Siemens/Cerberus, Edwards, Honeywell, or Notifier will be acceptable. However, equivalent manufacturer will be acceptable with AHJ approval.

E. Equipment submissions for shop drawing review must include a minimum of the following:

F. Floor plans showing the proposed fire alarm system equipment, device, and appliance locations, inclusive of candela ratings and wattage tap settings for all notification appliances. Corresponding riser diagram inclusive of information required by NFPA 72 requirements.

G. Wiring Diagrams: Point-to-point fire alarm control equipment installation diagrams inclusive of information required by NFPA 72 requirements.

H. Battery Calculations: Prepared in accordance with NFPA 72 requirements and showing total standby power and total alarm power required to meet the specified system requirements. Include a complete list of current requirements during normal, supervisory, trouble, and alarm conditions for each component of the system.

I. Voltage-drop Calculations: Prepared in accordance with NFPA 72 requirements to demonstrate that the system will operate per the prescribed backup time periods and under all voltage conditions per UL and NFPA standards.

J. Sequence of Operation: A sequence of operation that describes how the system responds during an alarm, supervisory and trouble condition. The description shall include fire alarm control unit LEDs, audible and visible indications, initiating devices, notification appliances, and auxiliary functions. The description shall provide sufficient information so that the exact function of each installed device and appliance is known.

K. Statement of Equipment Lifecycle: A written statement, signed by a representative of the equipment manufacturer stating that the equipment to be supplied is not at or near the end of its life cycle and that replacement components for all control equipment shall be available from the manufacturer for a minimum of 15 years from the date of installation.

L. Manufacturer Capabilities: The Owner may request a product demonstration of the proposed manufacturer equipment prior to installation.

M. Complete descriptive data indicating UL listing for all system components.

N. A copy of any state or local Fire Alarm System equipment approvals.

O. An Autocad (latest version) produced wiring diagram illustrating the basic floor plan of the building, showing all system wiring and equipment, as well as zoning boundaries and schedule of zone legends as intended to appear on annunciators. Provide three CD-Rom copies of as-built drawings and all system operational software at close of project, to be included in operation and maintenance manuals.

P. Provide as-built cabinet adjacent to fire alarm control unit. Provide complete fire alarm system as-built drawings (graphical map for building) in the cabinet.

Q. No work shall be done until the drawings are approved by the local Authority Having Jurisdiction.

1.4 OPERATION

A. The system alarm operation subsequent to the alarm activation of any manual station, automatic detection device, or sprinkler flow switch shall be as follows:
   1. The appropriate initiating device circuit indicator (red color) shall flash on the control panel until the alarm has been silenced at the control panel. Once silenced, this same indicator shall latch on. A subsequent alarm received after silencing shall flash the subsequent zone alarm indicator on the control panel and resound alarms and flashing signals. These same conditions shall occur at any remote annunciator.
   2. A pulsing alarm tone shall occur within the control panel until silenced.
      a. All alarm indicating appliances shall sound in a temporal code pattern until silenced by an alarm silence switch at the control panel (or the remote annunciator, if any).
      b. All doors normally held open by door control devices shall close. Doors shall also be released in the event of incoming normal power failure.
      c. A supervised signal to notify the local fire department or an approved central station (as required by local codes) shall be activated.
      d. A supervised signal shall directly activate, shut down or reconfigure the air handling systems as required by NFPA or as otherwise indicated herein. Provide necessary interlock wiring as required to control mechanical equipment..
      e. The Contractor(s) shall coordinate with each other as necessary to provide all required auxiliary contacts, DDC systems interfaces, equipment, etc., as needed to shut down or otherwise control air handling systems per NFPA and all applicable codes.
      f. The system shall be wired with two circuits to all Notification devices so that when an alarm is acknowledged, silencing the audibles, the visual units shall continue in operation until the main control panel has been reset. If local codes require other than this arrangement, the system shall be wired in accordance with the code that is applicable.
   3. The alarm indicating appliances shall be capable of being silenced only by authorized personnel operating the alarm silence switch at the main control panel or by use of a similar key operated switch at the remote annunciator (where remote units are provided). A subsequent alarm shall reactivate the signals. Operation of the alarm silence switch shall be indicated by trouble light and audible signal.
   4. The alarm activation of any elevator lobby shaft, pit or equipment room smoke detector shall, in addition to the operations listed above, cause the elevator cabs to be recalled according to the following sequence:
      a. If the alarmed detector is in any location or on any floor other than the main level of egress, the elevator cars shall be recalled to the main level of egress.

b. If the alarmed detector is on the main egress level elevator lobby, the elevator cabs shall be recalled to the pre-determined alternate recall level.
c. Provide auxiliary contacts within the base of each elevator lobby smoke detector, with each separate landing to be wired back separately to the elevator controller. Coordinate all equipment terminations and sequence of operation with the elevator installer. The use of digital to analog controllers to accomplish this function will be acceptable, if in compliance with codes.
d. Provide heat detectors within 12" of each sprinkler head where they are installed in elevator equipment rooms, shafts or pits, in accordance with code.
e. The temperature rating and wiring of the detectors shall be coordinated with the sprinklers, per ANSI Elevator Code and NFPA. Wire to interrupt elevator power per the applicable code.

5. The activation of any standpipe water valve tamper switch or sprinkler zone valve tamper switch shall activate a distinctive system supervisory audible signal and illuminate a "Sprinkler Supervisory Tamper Switch" indicator at the system controls (and the remote annunciator[s]). There shall be a distinction in the audible trouble signals between valve tamper switch activation and opens or grounds on fire alarm circuit wiring.
   a. Activating the trouble silence switch will silence the supervisory audible signal while maintaining the "Sprinkler Supervisory Tamper" indicator showing the tamper contact is still activated.
   b. Restoring the valve to the normal position shall cause the audible signal and visual indicator to pulse at a fixed rate.
   c. Activating the trouble silence switch shall silence the supervisory audible signal and restore the system to normal.
6. Include with the control panel, as an auxiliary function, a built-in test mode that, when activated, will cause the following operation sequence:
   a. The city connection circuit shall be disconnected.
   b. Control relay functions shall be bypassed.
   c. The control panel shall show a trouble condition.
   d. The panel shall automatically reset itself.
   e. Any momentary opening of an initiating or indicating appliance circuit shall cause the audible signals to sound for a minimum of two seconds to indicate the trouble condition.
7. A manual evacuation switch shall be provided to operate the system indicating appliances and/or initiate "Drill" procedures.
8. Activation of an auxiliary bypass switch shall override the automatic functions either selectively or throughout the system and initiate a trouble condition at the control panel.
9. Include any and all detection equipment and interface relays as required to provide a 100% code approved and supervised pre-action Fire Suppression system. Coordinate with the Fire Protection installer as required.

1.5 SUPERVISION

A. The system shall contain Class "B" (Style "B") independently supervised initiation circuits as required for the zoning indicated. Circuits shall be arranged so that a fault in any one zone shall not affect any other zone. The alarm activation of any initiation circuit shall not prevent the subsequent alarm operation of any other initiation circuit.

B. There shall be supervisory initiation circuit(s), as required, for connection of all sprinkler valve tamper switches. Wiring methods which require any fire alarm initiation circuits to perform this function shall be deemed unacceptable; i.e., sprinkler and standpipe tamper switches (N/C contacts) shall NOT be connected to circuits with fire alarm initiation devices (N/O contacts). These independent initiation circuit(s) shall be each labeled "Sprinkler Supervisory Tamper Switch" and shall differentiate between tamper switch activation and wiring faults. Provide individual annunciation for the main post indicator valve and each tamper switch as indicated by the zoning schedule on the plans or as otherwise required by codes. For these circuits and all exterior underground copper circuit wiring, provide proper surge suppression and protection for circuit.

C. There shall be independently supervised and independently fused indicating appliance circuits as required for alarm audible signals and flashing alarm lamps.

D. All auxiliary manual controls shall be supervised so that all switches must be returned to the normal (automatic) position to clear system trouble.

E. Each independently supervised circuit shall include a discrete (amber color) "Trouble" indicator to indicate disarrangement conditions, per each circuit.

F. The incoming power to the system shall be supervised so that any power failure shall be audibly and visually indicated at the control panel and the annunciator. A green color "power on" indicator shall be displayed continuously while incoming power is present.

G. The system batteries shall be lead-acid type, supervised so that disconnection or failure of a battery shall be audibly and visually indicated at the control panel (and the annunciator).

H. Wiring to a remote annunciator (if provided for system) shall be supervised for open and ground conditions. An independent annunciator trouble indicator shall be activated and an audible trouble signal shall sound at the control panel.

1.6 POWER REQUIREMENTS

A. The control panel shall receive 120 VAC power via a dedicated circuit. The incoming circuit shall have suitable overcurrent protection within the control panel, as well as at the circuit source. If additional circuits are required for this or other control units, they shall be provided by the Contractor.

B. If the facility is equipped with an emergency standby power generator, the fire alarm equipment shall be connected to this system, per N.E.C.

C. The system control panel and auxiliary equipment, such as power supplies shall be provided with sufficient battery capacity to operate the entire system upon loss of normal 120 VAC power in a normal supervisory mode for a period of time as required by codes for the building occupancy. There shall be reserve battery capacity to drive all alarm appliances for five minute indication at the end of this period. The system shall automatically transfer to the standby batteries upon power failure. All battery charging and recharging operating shall be automatic. Batteries, once discharged, shall recharge at a rate that will provide a minimum of 70% capacity in 12 hours, or sooner if required by codes.

D. All circuits requiring system operating power shall be 24 VDC and shall be individually fused at the control panel.

E. Power supplies for Notification signals, whether in the main panel or within remote power supply cabinets, shall be designed to provide a minimum of 20% spare capacity for future signals.

1.7 FIRE ALARM CONTROL PANEL

A. Where shown on the plans, provide and install the Fire Alarm Control Panel. Construction shall be modular with solid state, microprocessor based electronics. All visual indicators shall be high contrast, light-emitting diode type. Panel shall be provided with emergency voice evacuation communication equipment, including supervised amplifiers, back-up amplifiers, distributed amplification (where applicable), a digitized voice evacuation message and low frequency temporal pattern evacuation tone, and power supplies.

B. The control panel shall contain the minimum following features as per plans:
   1. Minimum Capacity of 120 Control or Monitor Points or greater, to Suit Building Requirements, expandable to 1000 points
   2. Initiation Device Circuits
   3. Alarm Indicating Appliance Circuit
   4. Supervised Annunciator Circuits
   5. Local Energy City Connection, if required
   6. Form C Alarm Contacts (2.0 Amps ea., minimum of two unless otherwise required)
   7. Earth Ground Supervision Circuit
   8. Automatic Battery Charger, of proper rating
   9. Standby Battery, Lead/Acid Type
   10. Resident non-volatile programmable operating system for all operating requirements
   11. Supervised Manual Evacuation Switch
   12. Internal power supplies as required for auxiliary functions as indicated
   13. Auxiliary contacts or relays for auxiliary functions as indicated
   14. All Custom Software and Programming as required to suit the project requirements

1.8 SYSTEM SOFTWARE AND PROGRAMMING

A. Provide all programming and software necessary to place annunciators and controls in full operation. System set-up shall allow for changes in annunciator legends without rewiring or addition of programming or electronics. Furnish initial programming and reprogramming as needed to accommodate changes in the system up to the time of system acceptance by the engineer without extra charge.

1.9 REMOTE ANNUNCIATOR

A. Where indicated on the plans, provide and install annunciator/control panel. The panel shall be of vandal-resistant construction and shall contain a liquid crystal illuminated display for alphanumeric indication of all required functions. The panel shall also contain the following control functions, activated by a master system enable key switch on front panel
   1. Remote system reset switch, to complement main control panel reset switch.

2. Remote alarm signal silence switch.
3. Remote manual evacuation switch, to initiate fire drill functions, same as at main control panel.
4. Remote trouble silence switch to silence trouble alarms in annunciator panel and main control panel.
5. Install panel on properly sized outlet box, 54" AFF to centerline. Panel shall contain tamper-resistant LED test switch in panel, local audible alarm, system power on, trouble LED indicators and master system enable key switch, keyed alike with the main control panel.

B. Annunciator legends shall be custom, to display both zone number and brief legend indicating the area or device associated with that zone. The legends shall be electronically generated on an alphanumeric display panel. The fire alarm system vendor shall coordinate the legends with the Engineer at shop drawing review.

C. Wiring between main control panel and annunciator(s) shall be fully supervised and accomplished over twisted shielded pair and/or THWN wiring as required by the manufacturer, per N.E.C. and NFPA.

1.10 WARRANTY

A. The Contractor shall guarantee all new equipment installed and new raceways, new wiring, and connections to existing wiring from defects in workmanship and inherent mechanical and electrical defects for a period of three (3) years from the date of substantial completion of the project. See Part 1 “Submittals”.

B. The Manufacturer or the authorized representative shall guarantee all new system equipment for a period of three (3) years from the date of substantial completion of the project. See Part 1 “Submittals”.

C. The Manufacturer or the authorized representative shall cover any software updates and associated costs for a period of five (5) years from the date of substantial completion of the project.

PART 2 - PRODUCTS

2.1 IDENTIFICATION

A. Nameplates
1. Comply with ANSI a13.1, 29 CFR 1910.144 and 29 CFR 1910.145, and ANSI z535.4 for safety signs provide nameplates for all equipment and components installed in enclosure. Nameplates shall designate equipment controller, function, ratings, source of power, and voltage.
2. Nameplates shall be laminated, black bakelite with 1/4" high, white recessed letters unless otherwise indicated on drawings or per owner standards. Nameplates shall be securely attached to the equipment with galvanized screws. Adhesives or cement shall not be used.

B. Wire Markers
   1. Markers for wire and cable circuits shall be brady self-laminating vinyl data labels or acceptable equal.

C. Cable Tags
   1. Cable tags for 600V or less rated circuits, self-adhesive vinyl labels: preprinted, flexible label laminated with a clear, weather and chemical resistant coating and matching wraparound adhesive tape for securing ends of legend label

2.2 FIRE STOPPING MATERIAL

A. Fire stopping materials shall consist of commercially manufactured products capable of passing ASTM e-814 (UL 1479).

B. Fire stopping materials shall maintain the rating of the wall, partition or floor opening that penetration is made.

C. Fire stopping materials shall be UL classified.

D. Acceptable products
   1. 3M: fire barrier
   2. Hilti: firestop
   3. Thomas & Betts: flame safe
   4. Nelson Electric: flameseal

2.3 MANUAL PULL STATION

A. Manual stations shall be double action and shall be constructed of high impact, red lexan or cast metal with raised white lettering and a smooth high gloss finish. The manual pull station shall have a hinged front with key lock. Stations shall be keyed alike with the fire alarm control panel. All pull stations shall have an alarmed cover. When the station is operated, the handle shall lock open in a protruding manner. Furnish one key for each manual station to owner at close of project, during instruction period. Install within 60" of each exit, per code, whether indicated on the drawings or not.

2.4 CEILING-MOUNTED SMOKE DETECTORS, PHOTOELECTRIC TYPE

A. Furnish and install where indicated on the plans or required, ceiling-mounted smoke detectors. Provide separate outlet-box mounted base with auxiliary relay, or standard base, as required.

B. Smoke Detectors shall be listed to U.L. Standard 268 and shall be compatible with their control equipment. Detectors shall be listed for this purpose by Underwriters' Laboratories, Inc. The detectors shall obtain their operating power from the fire alarm panel supervised detection loop. Loss of the operating voltage shall interrupt the supervisory circuit of the fire alarm detection loop and cause a trouble signal to be generated at the control panel. Detectors shall be capable of being reset at the main control panel.

C. No radioactive materials shall be used. Detector construction shall provide mounting base with twist-lock detector head. Contacts between the base and head shall be of the bifurcated type using spring-type, self-cleaning contacts. Removal of the detector head shall interrupt the supervisory circuit of the fire alarm detection loop and cause a trouble signal at the control panel. Detector design shall provide full solid state construction, and compatibility with other normally open fire alarm detection loop devices such as heat detectors, pull stations, etc.

D. To minimize nuisance alarms, voltage and RF transient problems, suppression techniques shall be employed as well as a smoke verification circuit and an insect screen. The detector head shall be easily disassembled to facilitate cleaning.

E. Remote LED alarm indicators shall be installed where required.

F. Smoke detectors (and all other system electronics) shall be shielded to protect circuitry from EMI problems generated by power fields, cellular phones, etc.

G. Special Note: The Contractor installing smoke detectors shall use care in the final positioning of all devices. They shall not be installed closer than 36" from an air diffuser or return grille, closer than 24" from a ceiling/wall intersection, or similar location that would diminish detector performance. Refer to and comply with NFPA 72E, "Standard On Automatic Fire Detectors".

H. Provide smoke detector at each fire alarm system control component, as required by code.

2.5 AUTOMATIC HEAT DETECTORS (RATE-OF-RISE TYPE)

A. Automatic heat detectors shall be combination rate-of-rise and fixed-temperature type. When the fixed-temperature portion is activated, the units shall be non-restorable and give visual evidence of such operation. Heat detectors shall be 135, 165 or 195NF, as indicated on plan. Where not indicated, provide 165º F units. Provide as indicated or required.

2.6 AUTOMATIC HEAT DETECTORS (FIXED TEMPERATURE TYPE)

A. Where indicated on the plans, provide automatic heat detectors of the non-restorable type, of the temperature rating as indicated or required. Detector heads shall be mounted to an outlet-box mounted base. Provide auxiliary contacts as needed. Provide as indicated or required.

2.7 AUDIBLE AND VISUAL UNITS

A. Audible signals shall be polarized and shall be operated by 24 VDC. Each audible assembly shall include separate wire leads for in/out wiring for each leg of the associated signal circuit. T-tapping of signal device conductors to signal circuit conductors will not be accepted. The audible visual units shall be equipped with a xenon-type strobe which shall be semi-flush mounted on 4" square outlet box. Each audible device shall produce a minimum sound pressure level of 92db at 36" on axis. Provide units as manufactured by Wheelock, Inc., or approved equivalent. Locate as indicated or required. All audible tones for same function shall be identical, per NFPA. Provide sufficient audible units to comply with code for required coverage. Provide temporal coded signals.

B. The output intensity of all visual units, their locations and mountings shall be in compliance with the latest version of the Americans with Disabilities Act requirements.

C. Audible units and visual units shall be wired to separate Notification circuits, allowing for silencing of audibles with alarm acknowledgment, continuing operation of strobes until system reset. Addressable devices may be used to fulfill this requirement.

D. Provide system-wide synchronization of all visual devices, so that all strobes flash at the same rate and at the same time, complying with A.D.A.

2.8 VISUAL UNITS

A. Stand-alone visual indicating units shall be xenon type strobe matching audio-visual units. These devices shall be UL listed and be or wall mounted. A high-impact clear lens shall project out from backplate. Lettering, if any, shall be oriented upright to the standing viewer. Candela output values of all visual units shall be selected for the covered spaces geometry and size, complying with A.D.A. and NFPA.

2.9 DOOR HOLDERS

A. Magnetic door holders shall be 24 volt A.C. and shall have an approximate holding force of 25 lbs or greater, if required to restrain door. The door-mounted portion shall have a plated steel pivot mounted armature with shock absorbing bearing. Unit shall be capable of being either surface, flush, semi-flush or floor mounted as required. Door holders shall be UL listed for their intended purpose. Where door mounted, locate armature 6" down from top and 6" in from strike side of leaf. Where door swing prevents direct contact between armature and holder pole piece, provide non-removable plated chain to close gap as tightly as possible. Verify holder positioning with Architect prior to mounting any devices. Unless otherwise indicated, provide semi-flush mounted holders 6" below top of door leaf as noted above, with blocking in wall to support force of door impact against holder and outlet box. Provide at all needed locations as indicated or required. Coordinate with architectural hardware schedule, as applicable to project.

2.10 DUCT SMOKE DETECTORS

A. Duct smoke detectors shall be of the solid state photoelectric type, operating on the light scattering photodiode principle. The detectors shall ignore invisible airborne particles or smoke densities that are below the set alarm point. No radioactive materials shall be used. The basic construction of duct smoke detectors shall be the same as that previously described for ceiling-mounted smoke detectors. Duct housing couplings shall be slotted to insure proper alignment of the sampling and exhaust tubes. Detector shall have an alarm status LED visible through a transparent cover, panel or in housing.

B. The Contractor shall furnish air duct smoke detectors with template to the sheetmetal or air handling unit installer for installation. Coordinate length of sampling probe required and furnish appropriate length. Probe tube shall be located in accord with manufacturer's recommendations, to give maximum sampling rate of airflow. Provide multiple detectors, as required, if a single device will not provide adequate sensing due to duct size or air velocity. Wire multiple detectors

on a single air handling system as a single zone or address unless otherwise required by prevailing codes. Field verify quantity of detectors needed to provide NFPA-compliant coverage of the air handling unit and provide as required.

C. Detector supervised power and alarm wiring (from F.A. control panel) is to be provided by the Contractor. Interlock wiring from auxiliary contacts to stop or otherwise control air handling unit fan motor(s) is to be provided by the Contractor. Provide auxiliary contacts as required. Zone wiring and indication for air duct smoke detectors shall be maintained separate from area detection devices. Detector shall be capable of being reset at the main control panel, and at a local test/reset station.

D. Where air duct smoke detectors are located in other than Mechanical Rooms or in spaces not easily visible, a remote alarm/power indicating LED key reset station shall be installed. These remotes shall be ganged together, if required, and labeled accurately as to which unit is reporting an alarm condition.

E. Where air duct smoke detectors are indicated to be furnished at concealed air handling units above ceilings or smoke damper locations, furnish as outlined above. Also provide remote indicating alarm LED flush in corridor wall at 7'-0" A.F.F. immediately below installation, or as close as practical to installation. The Contractor is to provide control wiring, E.P. switches, etc., as required to operate smoke dampers, as well as the required operating circuit. Coordinate all requirements with the installer of smoke dampers.

F. Ionization - type detectors shall not be utilized for air duct smoke detection.

G. All air duct smoke detector installations and materials shall be in accord with U.L., NFPA, and any other applicable codes.

2.11 WEATHERPROOF DEVICES AND EXPLOSION-PROOF DEVICES

A. Where the anticipated atmosphere or installation conditions require weather-proof, explosion-proof or other specially housed devices, they shall be U.L.-listed and NFPA-compliant and provided as indicated or required. Verify installation conditions and indicate type of device on shop drawing submission.

2.12 END OF LINE RESISTOR

A. End-of-line devices (if required) shall be flush-mounted, located at 7'-0" A.F.F. in corridor walls or as indicated.

2.13 GUARDS FOR DEVICES

A. Where detectors, manual stations, signals, etc., require or are indicated to be furnished with a guard, utilize a U.L. listed unit, compactly covering and compatible with the device. Provide as indicated or required. Guards shall not diminish the performance of any device.

2.14 DIGITAL ALARM COMMUNICATOR/TRANSMITTER

A. Provide a U.L.-listed and NFPA-compliant digital alarm communicator/transmitter (D.A.C.T.). Install at telephone terminal board or telephone service entrance and provide supervised wiring to fire alarm control panel as required. This unit may be semi-flush mounted at the F.A.C.P. location with prior approval by the Engineer. It may also be integrated within the main control panel, if U.L.-listed for the purpose.

B. The installation and connection of the D.A.C.T. shall be in compliance with all provisions of N.F.P.A. 71 and all other applicable codes. The installation and connection shall be acceptable to the Authority Having Jurisdiction, as well as the telephone company (or companies) over whose lines the signal(s) will be transmitted. Include any costs associated with telephone company work and services required in bid. Telephone connection shall be in compliance with NFPA 71, chapter five.

C. The D.A.C.T. shall be capable of transmitting all information relative to system status changes due to alarm, trouble, water flow, and any other information as required by current codes applicable to the facility. This information shall be transmitted to a U.L. listed Central Receiving Station, that also is maintained in accord with the requirements of NFPA 71. Connect system to transmit signals as required by local codes.

D. As a part of this contract, the services of a Central Receiving Station shall be engaged for a period of one year from the date of substantial completion, this date as defined elsewhere in these documents. The Central Receiving Station facility selected shall be in full compliance with NFPA and other applicable requirements. The Contractor shall initiate this service, provided on a contract basis, and shall include any costs associated with this provision in his bid. The actual beginning date of the contract with the central receiving station may be adjusted at the discretion of the Engineer, but in no case shall be for less than one year. The contractor shall notify the owner in writing by certified mail that this service has been contracted for and explain the provisions of this service adequately. A copy of this communication and the return receipt shall be forwarded to the Architect and the Engineer.

2.15 REMOTE POWER SUPPLY UNITS FOR PERIPHERAL

A. Provide remote power supply(ies) as required for proper system operation.

B. Remote power supplies shall be provided with local intelligence compatible with the digital multiplex network, so they have a unique address, providing the ability to monitor the supply for loss of power, shorts, grounds and other supervisory functions.

C. Where required by the fire alarm system manufacturer, remote power supplies shall be provided that will provide sufficient current to drive audio/visual or other required devices.

D. These units shall be located in electrical closets, mechanical rooms or similar spaces. They shall not be installed in finished areas, storage rooms, etc., without the permission of the Engineer. All locations shall be indicated on the shop drawing submissions.

E. Provide dedicated 120 volt power circuit(s) from nearby panelboards as required, whether indicated on the plans or not.

2.16 REMOTE FIRE ALARM TEST STATIONS

A. Remote fire alarm test stations shall be installed to test fire alarm devices including, but not limited to, duct smoke detectors, beam-type smoke detection.

B. Remote test stations shall be keyed with LED indicator.

2.17 ADDRESSABLE MONITOR MODULES

A. Each addressable monitor module shall be able to support any number of normally open (N/O) devices (including but not limited to sprinkler waterflow switches, sprinkler valve supervisory switches, etc). Wiring to the device(s) being monitored shall be supervised.

B. Module status (normal, alarm, supervisory, trouble) shall be transmitted to the FACU.

C. Addressable monitor modules shall include a mounting plate for installation in a junction box or shall be mounted in a locked cabinet or approved box, as shown on the manufacturer's recommended specifications.

D. The addressable monitor modules shall provide address-setting means.

E. An LED shall be provided which shall flash under normal conditions, indicating that the monitor module is operational and in regular communication with the control unit.

2.18 ADDRESSABLE CONTROL RELAY OUTPUT MODULES

A. Each relay shall operate according to the control program resident in the FACU.

B. Relays shall be supervised for trouble conditions (open, short, device missing/failed) at the FACU.

C. Relay output modules shall include a mounting plate for installation in a junction box.

D. The relay output module shall provide address-setting means and shall also store an internal identifying code which the control unit shall use to identify the type of device.

E. An LED shall be provided which shall flash under normal conditions, indicating that the Relay Output Module is operational and is in regular communication with the control unit.

F. Provide transient suppressors for inductive loads.

G. As applicable, the Contractor shall provide reliable power services for all relays.

H.

PART 3 - EXECUTION

3.1 GENERAL REQUIREMENTS

A. Refer to the Division 01 specifications for general requirements that relate to work provided by all contractors.

B. Refer to any project specific documents that the Owner's general contractor shall issue that references electrical work and coordination required by the Owner's electrical contractor.

3.2 SAFETY REQUIREMENTS

A. This contractor shall comply with the provisions of the "construction safety act" and the latest OSHA requirements as well as all other applicable federal, state and local requirements and specific requirements set forth by the division one spec and the GC.

B. This contractor shall be responsible for the safety, efficiency and adequacy of his furnished equipment, materials and methods, and for any damage which may result from their failure or their improper construction, maintenance or operation.

C. This contractor shall notify the general contractor of any flammable, combustible and/or toxic materials intended for use on this project and shall furnish the general contractor literature pertinent to the use and control of such materials.

D. If required by the GC, this contractor shall attend all project safety meetings scheduled by the GC.

3.3 PROTECTION AND CLEAN-UP

A. This contractor shall be responsible for the maintenance and protection of all materials and equipment furnished by him during the construction period from loss, damage or deterioration until final acceptance by the Owner. All materials and equipment on the job site shall be suitably stored and protected from the weather, dirt and debris. All piping and equipment openings shall be temporarily closed during construction to prevent obstruction and damage.

B. All equipment with damaged finished surfaces shall be cleaned and repainted with the same paints as was factory applied.

C. Remove all trash and empty containers at the end of each working day. All other materials and equipment shall be returned to the contractor's storage area at the end of the day. At the completion of the job, the contractor shall thoroughly clean the work area.

3.4 OWNER'S OPERATOR TRAINING

A. For all new equipment furnished, provide Owner's operator training to instruct Owner-designated personnel on the start-up, operation, shut-down and servicing of all equipment and systems furnished and installed by this contractor.

B. Coordinate the scheduling of all training with the Owner, giving a minimum of ten (10) days' notice for Owner to schedule with his personnel. Operator training shall be a prerequisite to system acceptance.

3.5 SYSTEM START-UP AND OPERATION

A. Provide all labor and materials and services necessary for the initial start-up and operation of all systems and equipment furnished and installed under this specification.

B. Provide the services of a qualified representative for all major equipment pre-start set-up, start-up and initial operation.

C. During start-up operation and the first-year operation of the new equipment and systems installed under this project, review and inspect equipment/systems to verify proper operation. Failure of equipment during this period due to lack of proper supervision is the responsibility of this contractor, and continued failures shall be grounds for the Owner to obtain such services from another contractor and back-charge this contractor.

D. INSPECTIONS AND TESTING

E. All work and materials covered by these specifications shall be subject to inspection at any and all times by representatives of the Owner.

F. If the Owner's inspector finds that any material does not conform to these specifications, the electrical contractor shall remove the material from the premises. If said material has been installed, the entire expense of removing and replacing same, including any cutting and patching that may be necessary, shall be borne by the electrical contractor.

G. At the time of final inspection, all connections at equipment must be completed.

3.6 COOPERATION WITH OTHER TRADES

A. Coordinate the installation of the fire alarm system and testing of associated equipment and circuits with all related trades, contractors, equipment maintenance and testing representatives, the Engineer, the Owner, and the authorities having jurisdiction.

B. Emergency Generator. The Contractor shall be responsible for all wiring, components, and connections required to supervise the emergency generator "generator running" contact. The Contractor shall verify correct operation of the interconnections during a generator running condition.

C. Door Hold Opens. The Contractor shall be responsible for all wiring, components, and connections required to interface the door-hold open devices and circuits to the fire alarm system. The Contractor shall verify that the appropriate door-hold open devices release upon receipt of an alarm condition.

3.7 COMPLETENESS

A. It is the intent of the specifications to provide a complete system. Completeness shall mean not only that all material and equipment has been installed properly, but that all material and equipment is operating properly as designed.

3.8 FIRE ALARM

A. Installation
   1. All interconnections shall be installed in accordance with the manufacturer's system wiring diagrams.
   2. Final connections, panel start up, program, editing, and testing shall be conducted by qualified personnel with one of the following qualifications:
      a. Factory trained and certified by the equipment manufacturer.
      b. National institute of certification in engineering technologies (NICET) or IMSA fire alarm certified.
      c. Trained and qualified by an organization listed by a national testing laboratory for the servicing of fire alarm systems.
   3. Provide UL certification of the installation by a UL certified testing company.
   4. The control panel manufacturer's representative shall be present to supervise panel start up, program, editing and all tests.
   5. A dedicated circuit connection for supplying power to each building fire alarm panel shall be provided. The power supply shall be equipped with a UL listed locking mechanism and identified with a red "fire alarm circuit control" label.
   6. Provide a terminal cabinet above FACP, as required. Provide at least one terminal cabinet per floor and as required.

B. Initiating Device Installation

C. In general, automatic detectors shall be mounted on the structural ceiling, finished ceiling, or finished wall; as shown on the drawing.
   1. Automatic detectors shall be installed as indicated on the plans and in conformance with all codes and Regulations and these specifications.
   2. The detectors shall be installed within five (5) feet of the location shown on the drawings to accommodate construction.

D. Automatic detectors shall be located near points where air currents normally intersect.
   1. Detectors shall not be located in the direct path of the draft from an HVAC air supply grille, a door, window, or hallway.
   2. Detectors shall be installed a minimum of three (3) feet from an HVAC air supply diffuser, in accordance with NFPA 72.

E. Addressable photoelectric smoke detectors shall be installed in accordance with this specification, and as shown on the drawings.
   1. Unless otherwise shown on the drawings, these detectors shall be spaced at thirty (30) foot centers, and in accordance with NFPA 72 and the manufacturer’s installation instructions.
   2. Smoke detectors shall only be installed in those environments suitable for proper smoke detector operation.

F. Addressable heat detectors shall be installed in environments appropriate for proper detection in accordance with NFPA 72 and the manufacturer's installation instructions.

G. Where the environment is not suitable for proper operation of addressable heat detectors, conventional spot-type heat detectors shall be furnished and installed.
   1. Conventional heat detectors shall be monitored and supervised by addressable monitor modules.
   2. Addressable monitor modules shall be installed in an area where the environmental conditions are suitable and the monitor modules' initiating circuits extended to the conventional heat detectors alarm contacts.

H. Linear heat detection shall be installed above all suspended ceilings and hard ceilings throughout.

I. Manual fire alarm boxes shall be installed at every exit and in common areas in accordance with NFPA 72, as shown on the drawings.

J. Manual fire alarm boxes shall be mounted at a height between 42 inches and 48 inches measured to the activating handle, above the finished floor, in accordance with NFPA 72 and the ADA Guidelines.

K. Labels
   1. All panels, terminal cabinets and annunciators shall be labeled with the red plastic nameplates in accordance with other sections of this specification.
   2. Remote alarm indicators and remote test and alarm stations shall be labeled with the red plastic nameplates in accordance with other sections of this specification.
   3.
   4. The label shall indicate the device monitored and associated mechanical equipment tag or room designation where applicable.
   5. All detectors shall be labeled with its assigned address on both the detector housing and the base with a black on clear typed label equal to KROY. The base address shall be legible without removal of the detector. The detector address shall be concealed when placed into the base.
   6. Provide an engraved brass nameplate at the exterior beacon, mounted on the weatherproof box, indicating "building fire alarm system in alarm".

L. Wiring
   1. Wiring for the fire alarm system shall not be installed in conduits, junction boxes, or outlet boxes with conductors of lighting and power systems.
   2. The conductors for the notification appliance circuits shall not be installed in the same raceway as the conductors for signaling line circuits unless written certification from the manufacturer is supplied to the Engineer indicating that the inclusion of these circuits in the same raceway is acceptable and that no additional consideration is needed for these circuits.
   3. Notification appliance circuits and control equipment shall be arranged and installed so that loss of anyone (1) notification appliance circuit shall not cause the loss of any other notification appliance circuit in the system.
   4. Color coding of conductors shall be approved by the Engineer and the Owner and shall be in accordance with the 2022 Connecticut State Life Safety Code (CSLSC). Contractor shall submit proposed color codes for fire alarm system wiring prior to installation of circuits.
   5. All fire alarm wiring shall be class 'A'. Provide a dedicated SLC per floor.

6. Provide fault isolation modules after every 18 devices; style 6 modified. Isolation modules shall be located in common areas where possible.
7. Wiring for the fire alarm system shall be installed in conduit with limitation.. The use of MC cable where accessible acoustical ceiling tile (ACT) exists. MC-cable is not permitted to be used where wiring would be exposed below the ceiling tiles. Exposed plenum rated wire/cable and/or fire alarm low energy cable will not be accepted.
8. Minimum wire sizes shall be as follows:
    a. Addressable loop wiring shall be utilize minimum #16 AWG.
    b. Notification appliance circuits shall utilize minimum #14 AWG.
    c. Network communications wiring shall be a solid conductor non-shielded #16 twisted pair minimum.
9. All junction boxes shall be sprayed red and labeled “fire alarm”. Conduit couplings shall be spray painted red prior to installation.
10. Connections and splices shall be made using screw terminal blocks. No more than one conductor shall be installed under any screw terminal. The uses of wire nut type connectors are prohibited in the system.
11. All circuit conductors entering or leaving any mounting box, outlet box enclosure or cabinet shall be labeled in accordance with the wiring diagram. Labeling and color coding shall be consistent throughout the conductor run.
12. Wiring within any enclosure shall be readily accessible without removing any component parts.
13. Exposed raceways shall be run parallel and perpendicular to the walls and ceilings only in permitted areas.
14. Raceway shall not be exposed in common corridors or common spaces.
15. Raceway shall only be exposed in mechanical spaces, electrical rooms, any storage spaces. MC cable is not permitted to be installed in exposed areas.
16. Wherever practical, exposed raceways shall be run on the ceiling as close as possible to a wall or as high as possible on a wall.
17. Where exposed raceways shall cross under a structural beam or rib, they shall be run down on one side of the beam or rib, across its bottom, and up to the ceiling on the other side of the beam or rib.
18. No spanning from beam to beam or rib to rib shall be permitted.
19. The use of a raceway body on one side of a beam or rib shall be permitted provided it shall be readily accessible.
20. No more than half loudspeaker/strobes or speaker/strobes serving any floor or zone shall be connected to same circuit. Adjacent devices shall be alternately wired between circuits.
21. The fire alarm equipment manufacturer's representative shall be present for the connection of wiring to the control panel.

M. Control panel
1. The control panel and its assorted components shall be mounted so that no part of the enclosing cabinet is less than 12 inches nor more than 78 inches above the finished floor.
2. All manually operable controls shall be between 36 inches to 42 inches above the finished floor.

N. Detectors
1. Detectors placement shall be in accordance with NFPA 72 requirements and recommendations.
2. Detectors shall be at least 12 inches from any part of any lighting fixture and at least 3 feet from diffusers of air handling systems.

3. Each detector shall be provided with appropriate mounting hardware as required by its mounting location.
4. Detectors, which mount in free space, shall be mounted directly to the end of the stubbed down rigid conduit drop. Conduit drops shall be firmly secured to minimize detector sway. Where length of conduit drop from ceiling or wall surface exceeds 3 feet, sway bracing shall be provided.
5. Smoke detectors shall not be installed until the building has been thoroughly cleaned. Dust covers shall be installed over all smoke detectors until final testing commences. All detectors, which indicate reduced sensitivity due to dirty condition, shall be cleaned prior to commencement of final cleaning.
6. Detectors shall be provided with wire guard cages where subjected to physical abuse, such as in gymnasiums.
7. All smoke detectors shall be programmed for smoke verification.

O. Notification appliances
1. Notification appliances shall be mounted in accordance with ADA between a minimum of 80” above finished floor or 6” below the ceiling and a maximum of 96” above the finished floor.

P. Testing
1. The contractor shall notify the Owner’s representative 10 business days before the tests are to be conducted. The tests shall be performed in accordance with the approved test procedures in the presence of the Owner’s representative. The contractor shall furnish all instruments and personnel required for the tests.

2. Preliminary tests
   a. The contractor shall perform insulation testing (megger), continuity and loop resistance checks on all system conductors to determine that the system is free from grounded, shorted, or open circuits. These tests shall be conducted prior to the installation of fire alarm equipment. Loop resistance measurement shall verify that the loop resistance does not exceed the manufacturers specified limits. Corrections shall be made and the system shall be retested to assure if deficiencies are found.
   b. The contractor shall perform complete functional and operational performance tests. Testing shall include verification that the circuits and components are electrically supervised and operate as intended.
   c. A written report shall be submitted detailing the results of the preliminary tests shall accompany the request for final acceptance test. The written preliminary test report shall be submitted with:
      (1) The operations and maintenance manual for the system.
      (2) The record (as-built) drawings.
3. Final acceptance test:
4. The fire alarm system, other systems and equipment associated with the fire alarm system and accessory equipment shall be tested in accordance with NFPA 72. The listed tests in NFPA 72 table 7-2.2 shall be conducted as well as manufacturer and job specific procedures to verify that the circuits and components are electrically supervised and operate as intended. The test shall include but shall not be limited to the following:
5. Visual inspection of all wiring connections.
6. Test of each function of the control panel.
7. Test of each circuit in both trouble and normal modes.

8. Tests of each alarm initiating device in both normal and trouble conditions. Open the circuits at each alarm-initiating device to test the wiring supervisory feature.
9. Tests of each control circuit and device.
10. Tests of each alarm notification appliance. Open the circuit at each notification appliance to test the wiring supervisory feature.
11. Tests of the primary and secondary power supplies and associated loss of each.
12. Complete operational tests under emergency power supply.
13. Ground fault monitoring circuit function.
14. Measurement of sound pressure levels in all rooms of the protected space.

Q. Maintenance Contract
1. The contractor shall include as part of their base bid the cost of a one-year test and inspection contract, to be held by the company which shall certify the completed installation. The contract shall provide for quarterly inspections in accordance with NFPA72 and local requirements. Any equipment found to be defective during the warrantee period shall be replaced by the contractor at no additional charge to the Owner.

R. Training
1. Training course shall be provided for the operations and maintenance staff. The course shall be conducted in the building where the system is installed or as designated by the Owner’s representative.
2. (Continued) The training period shall consist of one training day (8 hours per day) and shall start after the system is functionally completed but prior to final acceptance tests. The instructions shall cover all of the items contained in the operating and maintenance instructions.

END OF SECTION

SECTION 280500 - COMMON WORK RESULTS FOR ELECTRONIC SECURITY SYSTEMS

PART 1 GENERAL

1.1 SUMMARY DESCRIPTION

A. This Section covers general security system requirements, as well as components common to multiple subsystems specified in other sections of Division 28.

B. Division 1 requirements also apply to these sections.

1.2 RELATED REQUIREMENTS (DIVISION 28 SECTIONS TO WHICH THIS SECTION APPLIES)

A. Drawings and general provisions of the Contract, including General and Supplementary Conditions and other Division 01 Specification Sections, apply to this Section.

B. 280513 - Conductors and Cables for Electronic Security.

C. 280528 - Pathways for Electronic Security.

D. 280800 - Commissioning of Electronic Security.

E. 281000 - Access Control.

F. 281353 - Security IP Network Compatible Intercom Systems.

G. 282000 - Video Surveillance.

H. 283100 - Intrusion Detection.

1.3 REFERENCE STANDARDS

A. EIA/ECA-310 - Cabinets, Racks, Panels, and Associated Equipment; 2005e.

B. NEMA 250 - Enclosures for Electrical Equipment; 2020.

C. NFPA 262 - Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces; 2023.

D. NFPA 780 - Standard for the Installation of Lightning Protection Systems; 2026.

E. TIA-607 - Telecommunications Bonding and Grounding (Earthing) for Customer Premises; 2024e.

F. UL 497 - Standard for Protectors for Paired-Conductor Communications Circuits; Current Edition, Including All Revisions.

G. UL 1449 - Standard for Surge Protective Devices; Current Edition, Including All Revisions.

1.4 DEFINITIONS

A. Words which have well-known technical or trade meanings are used in accordance with such recognized meanings.

B. The words “Security Contractor,” or simply, “Contractor” means the organization charged with installation and configuration of the Systems described herein

C. The words “Basis of Design,” mean a device representing the benchmark or minimum requirements in the Specifications or Drawings for this Project. This shall not be interpreted as a sole-source requirement, unless it is stated that “no substitutions are allowed”.

D. The words "as required" mean: as required to provide a complete and satisfactory Work in conformance with the Drawings and Specifications.

E. The word "new" means: new Work provided by the Contractor. Work not indicated as existing shall be considered new work provided by the Contractor.

F. The word "provide" means: furnish, install, connect, test and make ready for use.

G. The words "relocate existing" mean: remove existing item from present location. Reinstall, reconnect, and test existing item and make ready for use at new location as indicated on the Drawings.

H. The words "remove existing" mean: remove existing item and return item to the Owner.

I. The word "replace" means: remove existing item and return item to the Owner. Provide new item as indicated on the Drawings or as specified herein.

J. The word "work" means: the Work is the completed construction required by the Drawings and Specifications, and includes labor necessary to produce such construction, and materials and equipment incorporated or to be incorporated in such construction.

K. The word "furnish" means: supply item as specified herein. Item will be installed by others.

L. Infrastructure: as used herein shall mean conduit, raceway with required boxes, fittings, connectors, and accessories, completely installed.

1.5 SUBMITTALS

A. See Division 1 for additional submittal requirements.

B. Within 5 days after notice to proceed, submit a schedule indicating the proposed submission date of each submittal specified herein. Schedule shall anticipate the submittal review time, the possible need for resubmittals, and the time required for fabrication, shipping, and integration into the construction

sequence. Architect will advise of any conflicts in reviewing submittals that the proposed schedule presents.

C. Resubmittals that are required to address review comments shall include a cover transmittal with a written explanation of how each review comment has been addressed.

D. Submittals not specifically required, or not complying with the format requirements, will be returned unreviewed. Work installed prior to submittal approval is

E. Submittals are required before installation begins. Equipment shall not be ordered prior to receipt and approval of submittals.

F. Action Submittals
   1. Submittals shall be submitted as a single package.
   2. Product Data:
      a. Provide product data sheets for equipment, materials, and cables in PDF format. PDF submittals shall be organized in the same order as the specifications and include a table of contents and hierarchical bookmarking system to clearly identify the location of each product within the submittal.
      b. For product data sheets that contain multiple options for the same component, indicate the exact model or option provided on the submittal cover sheet and on the product data sheet by highlighting or by use of a red arrow.
      c. Finish samples for selection of console work surface finish and color.
      d. Indicate deviations, if any, including any from the manufacturer's installation instructions.
   3. Shop Drawings:
      a. Reproductions or electronic versions of design drawings shall not be used in the preparation of shop drawings.
      b. Floor plans and diagram shop drawings shall be submitted as PDF plots on the same drawing size and at the same scale as the design drawings.
      c. Include floor and site plans indicating equipment locations.
      d. Wiring diagrams shall indicate proposed connections of equipment, model numbers, and designations for cables and termination points.
      e. Provide plans and elevations consoles, equipment cabinets, and equipment racks and include enlarged, to scale plan (top), and front views. Indicate the location of all specified electronics.
      f. Provide project specific manufacturer shop drawings of fabricated or modified units, if any.
      g. Provide riser diagrams indicating components of the system and proposed cabling between these components.
      h. Provide detailed project specific mounting diagram for each type of device including raceway and back box requirements. These details shall be referenced on the floor plans or schedules.
      i. Provide proposed elevation for each security enclosure location, including equipment identification and model/part numbers.

G. Informational Submittals:
1. Seismic and wind restraint devices, including calculations, restraint selection, installation details and written confirmation that a licensed engineer prepared the calculations.
2. Proposed project specific raceway layouts including conduit sizes, and back box sizes.
3. Required raceways and power outlets, including quantity, locations, and capacity characteristics.
4. Environmental requirements, including heat release.

H. Close-out Submittals:
1. Functional Test Reports: Provide a spreadsheet with all electronic security system devices and major components listed in the first column by device designator (e.g., camera number) with each test parameter listed by name (or code) in the remaining columns.
2. Operations and Maintenance Documentation Package: The Security Systems Performance Verification Supervisor shall compile and prepare documentation for equipment and systems covered in these Security Specifications and deliver this documentation for inclusion in the operation and maintenance manuals prior to the training of the Owner's personnel. The Architect shall receive a copy of the operation and maintenance manuals for review.
3. Instruction of Operating Personnel: The Security Systems Performance Verification Supervisor shall schedule, coordinate, assemble and deliver the documentation of the training required by this section.

1.6 QUALITY ASSURANCE

A. Provision of manufactured components, installation, wiring and testing shall be the responsibility of a single Contractor.

B. Qualifications of Electronic Security Systems Contractor:
1. Installation of each of the electronic security subsystems shall be provided by a person or persons having completed, as a minimum, the factory training recommended by the manufacturer of each subsystem and have direct field experience in the installation of a minimum of 3 projects of similar scope and size within the past 5 years.
2. The Electronic Security Systems Contractor shall be a contractor regularly engaged in the sale, installation, integration, maintenance, and service of electronic security systems.
3. Additional requirements are defined in other security sections.

C. Supervision of Work:
1. Contractor shall employ a competent Foreman to be in responsible charge of the Work. Foreman shall be on the project site daily during the execution of the Work.
2. Contractor's Foreman shall be a regular employee, principal, or officer of Contractor, who is thoroughly experienced in projects of a similar size and type.

D. Qualifications of Technicians:
1. All security systems Work shall be performed by electronic technicians thoroughly trained in the installation and service of specialty low-voltage electronic systems.
2. Journeymen or Master Electricians may be used to install conduit, raceways, wiring, and the like provided that final termination, hook-up, programming, and testing is performed by qualified electronic technicians, and that all such Work is supervised by the Contractor's Foreman.

3. Incidental Work, such as cutting and patching, lock hardware installation, painting, carpentry, and the like shall be accomplished by skilled crafts persons regularly engaged in such type of work. Such Work shall comply with the industry standards applicable to that respective industry or craft.
4. 120 V AC power wiring and connections shall be performed by a qualified Journeyman or Master Electrician, licensed to perform such work in the State of Conecticut.

E. Subcontractors:
1. Definition: a Subcontractor is a person or entity who has a direct contract with the Contractor to perform any of the Work at the site.
2. Use of any Subcontractor is subject to the approval of the Owner. The Contractor shall identify Subcontractors on the Bid Form. The Contractor shall make no substitution for any Subcontractor previously selected without approval from the Owner.
3. Contractor's Foreman shall be on the project site daily during periods when Subcontractors are performing any of the Work. Contractor's Foreman shall be in responsible charge of Work, including any Work being performed by Subcontractors.
4. By an appropriate written agreement, the Contractor shall require each Subcontractor, to the extent of the Work to be performed by the Subcontractor, to be bound to the Contractor by the terms of the Drawings and Specifications, and to assume toward the Contractor all the obligations and responsibilities which the Contractor, by these documents, assumes toward the Owner.

F. Supply only new equipment, parts and material currently manufactured at the time of submittal and operate only for testing as part of installation procedure.

G. Codes, standards, and regulations are defined on the Drawings and are minimum requirements. Where the requirements of these Specifications or other requirements shown or indicated on the Drawings exceed those of the codes, standards and regulations, the Drawings or Specifications shall govern.

1.7 DELIVERY, STORAGE, AND HANDLING

A. Electronic security equipment.
1. Store in temperature- and the humidity-controlled environment in the manufacturer's original sealed containers. Maintain ambient temperature between 50° and 85° Fahrenheit and not more than 80% relative humidity, non-condensing.
2. Open each container; verify contents against packing list, and file a copy of packing list, complete with container identification for inclusion in operation and maintenance data.

1.8 LICENSING

A. Licensing for product installation and/or use shall be provided by manufacturer for a period of one (1) year from date of Substantial Completion.

1.9 DISTRIBUTION

A. System shall be offered commercially through authorized resellers who will install its security components on customer premises and connect the customer's existing systems.

1.10 FIELD CONDITIONS

A. Systems or equipment installed in environmentally controlled areas shall meet performance requirements specified herein in the following conditions:
   1. Temperature:40°F to 95°F.
   2. Humidity: 20% to 80% RH.
   3. Air purity: systems shall be capable of continuous operation in an environment where the level of dust, lint, paper fiber, and other airborne particles is equal to that found in a standard office.

B. Systems or equipment installed in indoor environmentally uncontrolled areas shall meet performance requirements specified herein in the following conditions:
   1. Temperature: 0°F to 120°F.
   2. Humidity: 5% to 95% RH.

C. Systems or equipment installed in outdoor areas shall meet performance requirements specified herein in the following conditions:
   1. Wind-driven dust, dirt, sand, and snow for 6 hours.
   2. Rain at a maximum rate of 4" per hour.
   3. Ice loads up to 2" measured radially to exposed surfaces.
   4. Wind loads as indicated on the Drawings.
   5. Sleet with wind: 55 mph, maximum.
   6. Snow cover: 2' maximum, measured vertically.
   7. Humidity: 0% to 100% RH.
   8. Temperature:-30°F to 150°F.

1.11 SPACE CONDITIONS

A. Verify dimensions of equipment, equipment arrangements, space availability (including any millwork or cabinetry provided by others) and provide systems that work within the constraints of the space available. Notify the Architect of any situation where space constraints are a problem, prior to the ordering or purchase of equipment. The Contractor shall bear the expense of providing alternate equipment which will work within the available space if space availability problems are discovered after equipment is ordered.

B. Drawings are diagrammatic in nature and, unless explicitly dimensioned, indicate approximate locations of equipment and components. Changes in the location, and offsets, of same which are not shown on the Drawings but are necessary in order to accommodate building conditions and coordination with the work of other trades, shall be made prior to initial installation, without additional cost to the Owner.

C. Provide access to equipment and components requiring operation, service, or maintenance within the life of the system.

1.12 WARRANTY

A. Equipment shall be free of faulty workmanship and defects for a period of 1 year from date of Substantial Completion and as specified in General Conditions, unless otherwise noted.

B. Replace defective materials and repair faulty workmanship within 3 days of notification at no cost to the Owner during warranty period.

C. In addition to warranty, provide maintenance service for the warranty period, including at least 2 semi-annual visits to site for checking and adjustment of equipment. During this period, answer service calls within 24 hours. During this period, maintenance calls shall be completed within 5 days of notification and at no cost to the Owner.

D. Software/firmware maintenance: new releases or updates of hardware, software, applicable user manuals, technical and alert bulletins released by the security systems manufacturers shall be applied to the system at no cost to the Owner during the warranty period.

PART 2 PRODUCTS

2.1 GENERAL

A. Licenses and Licensing Requirements:
   1. Provide all software and hardware licenses required for complete and functional systems as indicated on the Security System Drawings and herein, whether specifically called out or not.

2.2 EQUIPMENT ENCLOSURES

A. General:
   1. Enclosures shall be rated and certified to seismic applications based on seismic criteria shown on the drawings and information specified herein under “Seismic and Wind Restraints”.

B. Exterior Equipment Enclosures:
   1. Outdoor, above grade:
      a. NEMA 250 4, with 19" mounting rails.
      b. Minimum 14-gauge thick mild steel, stainless steel, or aluminum with seams continuously welded and ground smooth and an outdoor grade polyester powder white paint finish.
      c. Continuous hinge with 3-point latching mechanisms and keyed locking handles.
      d. Heat exchanger or air conditioning where required to maintain an internal temperature of 125°F or less. Cooling capacity shall meet or exceed heat load generated due to internal components, maximum ambient air temperature, and direct sunlight.
      e. Size as required to contain the equipment and accommodate the heat load.
      f. Basis of Design: Hoffman CSD20168SS
      g. Manufacturer: Hoffman, Omega, or Purcell Systems.

C. Interior Equipment Enclosures:

1. Security Consoles:
   a. General Description:
      1) The contractor shall supply a system capable of supporting specified electronics.
      2) The console shall be comprised of end frames and/or intermediate frames with horizontal stringers and decorative end panels. The system shall include a hinged dual-channel duct cover with an integrated aluminum mounting system with articulating monitor support arms for the LCD monitor arrays.
   b. Standards:
      1) All rack rails for lower storage compartment shall comply with Electronic Industry Association specifications for rack mounting EIA/ECA-310.
      2) All monitor mounts used with the articulating arm mounting system shall be compliant with the Mounting Interface Standard established by the Video Electronics Standards Association (VESA).
   c. Modular Pre-engineered Construction: All components within the system shall be:
      1) Of a pre-engineered modular construction (constructed from a series of independent sectional compartments).
      2) Free from alterations to the design either prior to or following installation. The assembly of the console shall be accomplished without the need for either welding or carpentry work.
      3) Constructed of a steel super-structure framework consisting of end frames connected by a curved horizontal modesty panel.
   d. Self-Supporting Skeleton Framework: The self-supporting skeleton framework shall:
      1) Be installed at the site in advance of any external finishing panels. The framework shall be fully capable of supporting all specified electronics without the need for attachment of any external panels.
      2) Be capable of being supplied to site in knockdown (flat packed) form and be capable of assembly without welding or carpentry work.
      3) Include front and rear horizontal stringers constructed of 12-gauge formed sheet metal. Stringers shall connect, and span, 14-gauge end frames and/or intermediate frames to form a complete structure.
   e. Components:
      1) Intermediate and End Frames: 14-gauge intermediate and end frames shall be a minimum of 1-5/8” width and capable of supporting fully loaded console Intermediate and end fames shall incorporate 3/8" diameter threaded adjustable glides and 2" vertical slots for mounting two and four gang electrical boxes. End frames shall feature an anti-tip extension and the intermediate frames shall feature four grommet holes.
      2) Horizontal Stringers: 12-gauge formed sheet metal horizontal stringers with quick fastening system shall be 2" high and available in 24", 48", and 72" widths.
      3) Bottom Shelf: 16-gauge stationary steel shelf shall extend 17-5/8" from the front of the console to the rear. The shelf shall have four grommet holes and a load capacity of 200 pounds.

4) Lower Doors: Vented double-panel doors with of set face design and spring hinges for easy removal without the use of tools. Doors shall be supplied with a keyed-alike locking lever latch and integrated cable management. Doors shall be able to accept an optional CPU shelf or file/storage bin for convenient swing-out access.
5) Duct Cover: 18-gauge steel hinged duct cover conceals, and allows easy access to, dual cable raceway so signal and power cords can be separated.
6) Data/Power Rail: minimum 14-gauge angled data/power rail shall include cable grommets and openings for a universal data mounting plate and/or duplex power box. The data/power rail shall incorporate quick fastening system and combined with minimum 14-gauge shelf brackets, shall support the work surface.
7) Work Surfaces The console shall be provided with a minimum 1 1/8" thick MDF core PVC work surface. The work surface shall be one piece, not less than 22-3/4" deep overall, and should include a minimum 1-3/4" deep beveled edge covering the work surface's entire front width.
8) Monitor Support System with Articulating Arms: Fully integrated black anodized aluminum track system capable of supporting a wide variety of monitor arrays while providing simple horizontal adjustment. Constructed of extruded 6105-T5 aluminum with a T-slot profile. Monitor array support posts shall be available in 15", 28-1/2", and 42" heights. The support posts shall be minimum 1.9" in diameter with a minimum wall thickness of 0.110". Monitor arrays shall be mounted to the articulating arms with ball spring drop-in T-nuts.

f. Finish and Color:
1) All exterior and frame steel components including end frames, modesty panels, and optional CPU pedestal shall be zinc oxide wash primer with a black powder coat textured finish.
2) Work surface finish and color shall be as selected by the Architect from finish samples provided during the submittal process.

g. Accessories:
1) Each equipped with 6 electrical outlets and 6 outlet 15' cord.
2) Equipped with sufficient CPU pedestals to support equipment shown on the Drawings.

h. Mounting Hardware:
1) Provide mounting hardware for the specified electronics.
2) Provide all hardware needed for assembly.
3) Provide articulating arms as required to support the quantity of monitors shown on the Drawings.

i. Configuration and dimensions as indicated on the Drawings.
j. Basis of Design: Winsted Vue C 75 Open Dual Sit/Stand Console.

2.3 FIBER OPTIC TRANSMISSION AND SIGNAL EQUIPMENT:

A. Fiber Optic Transmission Systems:
   1. System shall operate between 1250 nm and 1350 nm wavelength.
   2. Full range automatic gain control.
   3. Signal-to-noise ratio: 54 dB minimum.
   4. Bandwidth: 5 Hz to 10 MHz.
   5. Components shall utilize LC type connectors.
   6. Operating temperature: -40ºF to 165ºF.
   7. Storage temperature: -40ºF to 185ºF.
   8. UL listed.
   9. Surface or rack mount.
   10. Distance up to 3.5 miles without repeaters.
   11. Manufacturer: American Fibertek, Comnet, or Interlogix (formerly IFS).

B. Rack or Wall Mount Fiber Enclosures:
   1. Fiber enclosures shall be a complete modular system of components and shall provide the following:
      a. Splicing.
      b. Termination.
      c. Routing.
      d. Strain relief.
      e. Radius limiting.
      f. Cable fastening: Panduit VWS106-C.
      g. Storage.
      h. Direct-connection, UON.
   2. Splice modules shall be fully equipped for required quantity of splices with:
      a. Cable strain relief hardware.
      b. Sliding splice trays.
      c. Routing guides.
   3. Fiber enclosures shall be equipped with either lockable or screw clamp doors.
   4. Fiber enclosures shall be sized to accommodate the required quantity and type of fibers.
   5. Fiber enclosures shall be complete with double-sided female LC Duplex couplers in each and every position.
   6. Fiber enclosures shall have panel front jumper and cross-connect cable management.

2.4 AC POWER

A. General:
   1. AC power equipment shall have LED or lamp status devices to provide indication that the systems are on.

B. AC Power Strips:
   1. AC power receptacles, 125 V, 20 A capacity.
   2. Outlets shall have integral transient suppression in accordance with UL 1449.
   3. Manufacturer: Emerson Network Power, Leviton, Lowell, or Middle Atlantic Products.

C. Power Supply Equipment:

1. Power Supplies:
   a. Power supplies shall be provided for detectors, panels, and accessories.
   b. Power supplies shall meet or exceed the manufacturer's recommendations for the individual devices served.
   c. Devices requiring common voltages shall be powered from a common power supply at the locations indicated on the Drawings. Provide power distribution modules with individually fused or PTC outputs.
2. Battery back-up:
   a. Standby batteries with charger shall power microprocessor-based units and panels in the event of a primary power failure.
   b. Batteries shall be sized to provide 125% capacity for 15 minutes.
   c. Standby batteries shall be sealed lead-calcium, lead-acid, or nickel-cadmium. Power supplies shall be solid state.
   d. Controls shall be designed to maintain full battery charge when primary power is available.
   e. Batteries shall be recharged to 85% capacity within 24 hours from battery use.
   f. Microprocessor-based units and panels shall be automatically transferred to battery power upon loss of primary power and return to primary power upon restoration.
   g. Alarms shall not be initiated during switchover. An alarm shall be initiated upon failure of battery and/or primary power.

2.5 GROUNDING AND SURGE PROTECTION

A. Low voltage surge protection devices (SPDs): SPDs shall incorporate silicon avalanche technology, shall operate bidirectionally, and have a turn-on and turn-off time of less than 5 nanoseconds. Additional minimum requirements include:
   1. Non-coaxial SPDs shall be UL listed in accordance with UL 497. Coaxial cable SPDs shall be designed in accordance with NFPA 780.
   2. Maximum single impulse current conductor-to-conductor or conductor-to-ground: 10000 A, 8 x 20 µs waveform, or 200 A, 10 x 1000 µs waveform.
   3. Pulse life rating: 3000 A, 8 x 20 µs waveform, 2000 occurrences, or 50 A, 10 x 1000 µs waveform, 200 occurrences.
   4. Maximum clamping voltage at 100 A, 10 x 1000 µs waveform, with the peak current not to exceed the normal applied voltage by 150%, except for coaxial cable suppressors with peak current, the maximum clamping voltage shall not exceed the normal applied voltage by 200%.
   5. Failure mode: fail short.
   6. Manufacturer: Advanced Protection Technologies, Ditek, Emerson, Lightning Eliminators & Consultants, or Transtector.

B. Ground Bus Bars:
   1. Solid copper, minimum 6" x 0.75" x 0.25".
   2. Free from surface corrosion.
   3. Drilled and tapped 1/4-20 and 10-24 to terminate incoming conductors individually.

2.6 UNINTERRUPTIBLE POWER SUPPLY (UPS):

A. Pole-Mounted or Wall-Mounted UPS:
   1. 350 W capacity, compact, integrated UPS system designed for operation in extreme environments.
   2. System shall be a self-contained wall mountable unit designed for the support of critical loads.
   3. Outputs: 120 V AC, 24 V AC, 24 V DC, and 12 V DC.
   4. Audible noise shall not exceed 45 dBA at 3'.
   5. Wide range automatic voltage regulation (AVR).
   6. Batteries: hot swappable 12 V/9 Ah lead-acid, maintenance free type, sized to sustain the UPS at full rated load for 3 minutes, and half rated load for 9 minutes.
   7. The UPS shall provide the following characteristics:
      a. Nominal input voltage: 120 V AC.
      b. Integral automatic current and overvoltage protection.
      c. Transfer time: 1 to 4 ms.
      d. Efficiency: 95%.
      e. Local and remote monitoring and control via USB port and Ethernet SNMP interface.
   8. Basis of Design: Alpha Technologies Micro 350 series.

2.7 SEISMIC AND WIND RESTRAINTS

A. Provide restraints devices as required for vibration isolated and nonvibration isolated systems and equipment components. Provide calculations to determine restraint loadings for specific equipment to be installed resulting from seismic forces on equipment. Seismic restraint calculations shall be signed by a licensed engineer in the employ of the seismic restraint device manufacturer.

B. For roof-mounted equipment and components both the seismic acceleration and wind loads shall be calculated, and the highest load shall be utilized for the design of the seismic restraints and vibration isolators.

C. Exceptions for components listed within the applicable project building code may be utilized. However, use of exceptions shall be noted with submitted seismic restraint calculations.

D. Seismic restraints and vibration isolators provided with integral seismic restraint capacity shall have Anchorage Preapproval "R" Number from OSHPD in the State of California listing minimum certified horizontal and vertical load ratings.

E. Floor-Mounted Restraints:
   1. Restraints for neoprene vibrations isolators shall consist of Type DN isolators with the addition of welded steel housings to resist seismic forces.
   2. Manufacturer: Kinetics Noise Control, Mason Industries, VMC Group, Vibration Eliminator, or Vibro-Acoustics.

F. Suspended Restraints:
   1. Restraints for vibration isolated suspended systems or equipment shall consist of galvanized or stainless-steel aircraft cables with end connection fittings designed to swivel to ensure proper cable alignment and avoid bending of cable.

2. Restraints for nonvibration isolated suspended equipment or raceways shall consist of steel angle or unistrut with anchor bolts and end connection fittings designed to swivel to the final installation angle.
3. Manufacturer: International Seismic Application Technology, Kinetics Noise Control, Mason Industries, Tolco, VMC Group, Vibration Eliminator, or Vibro-Acoustics.

2.8 MISCELLANEOUS EQUIPMENT

A. Identification materials: nameplates shall be white core plastic laminate with engraved lettering. Nameplates for individual devices shall have 0.25" high letters.

PART 3 EXECUTION

3.1 INSTALLATION

A. Provide incidental equipment or devices to provide a complete and operable system.

B. Verify correctness of parts lists and equipment model numbers and conformance of each component with manufacturer's specifications.

C. Equipment shall be installed in accordance with the manufacturer's instructions.

D. Equipment, except portable equipment, shall be held in place. This shall include equipment, enclosures, components, and cables. Fastenings and supports shall support their loads with a safety factor of at least 3 unless otherwise specified herein.

E. Prevent and guard against electromagnetic and electrostatic hum and install the equipment to provide safety for the operator.

F. Repair or replace any equipment or materials damaged during the construction period.

G. Provide power connections from panels to specialty equipment.

3.2 CYBERSECURITY REQUIREMENTS:

A. Change all default passwords upon setup. Provide unique passwords for each device type. Provide passwords to Owner upon turnover of the system. Create strong passwords:
1. Include numbers, symbols, uppercase and lowercase letters.
2. Password shall be more than eight characters long.
3. Avoid any password based on repetition, dictionary words, letter or number sequences, usernames, relative or pet names, or biographical information (birthday).

B. Two factor authentication (network, server, and client only).

C. Enable encryption, if not already enabled.

D. Where supported, configure the systems to provide alerts upon multiple failed login attempts.

E. Restrict access to open USB ports to prevent malicious agents or malware from being injected into the security network.

F. Configure the system to provide automated alert process if foreign devices (e.g., non-authorized devices like laptops, rogue APs, etc.) are attached to the security network.

G. Configure the system to provide automated alerts if unauthorized file deletions or modifications occur (network only).

H. Configure the systems to provide automated checking of drivers and firmware to detect if the drivers and firmware are up to date (network, server, and client only).

I. Configure the system to provide automated alerts if a camera or other device is tampered with (the lens is covered, the power removed, scene changes, etc.).

3.3 EQUIPMENT ENCLOSURES

A. Where controls or equipment are specified herein or indicated on the Drawings for future installation, space shall be provided in the control console and the equipment racks, and on the control panels.

B. Provide ventilation according to equipment manufacturer's recommendations.

C. Provide unused equipment enclosure panel space with blank or ventilating panels.

D. Mount an AC enclosure wiring diagram in each enclosure with the following information:
   1. The number of AC power circuits within the enclosure.
   2. A schematic diagram showing the incoming AC circuits and the location and quantity of outlets fed by each circuit.
   3. The current capacity of each circuit.
   4. The location of the breaker panel and the number of various breakers.
   5. Indicate that the enclosure and equipment are on an isolated ground system (if applicable).

3.4 FIBER OPTIC TRANSMISSION AND SIGNAL EQUIPMENT

A. Bond fiber optic enclosures, exposed building steel, cabinets, service boxes, and framework to the building grounding system in accordance with TIA-607 and local codes.

3.5 IDENTIFICATION

A. General:
   1. Identification shall consist of upper-case letters.
   2. Where identification is applied to surfaces which require a finish, identification shall be installed after the surface has been finished.

B. Equipment:
   1. Provide and install engraved labels for each item rack-mounted equipment.
   2. Except where otherwise specified herein, label switches, controls, and receptacles. Labeling material shall be engraved plastic laminate or metal plates. Labels shall be placed on coverplates or directly adjacent to switches, controls, and receptacles to facilitate service and replacement.
   3. Signs shall not cause interference with operation and maintenance of equipment. Attach signs with rustproof screws.

3.6 EQUIPMENT AND EQUIPMENT ROOMS

A. Remove dust, dirt, rust, stains, and temporary covers.

B. Foreign matter shall be blown, vacuumed, or cleaned out of and from new equipment, devices, switches, controls, and panels.

C. Clean and polish identification plates.

D. In equipment rooms, clean equipment, conduit, and room surfaces form dust and dirt and maintain in a clean condition from date of Substantial Completion until final completion of work and corrective work.

E. Remove excess material from the Project site.

3.7 SEISMIC AND WIND RESTRAINTS

A. Restraints shall be installed after the equipment is mounted, connected, and operating to ensure that no contact occurs during normal equipment operation.

B. Installation of seismic restraints shall not cause any change of position of equipment, or raceways resulting in stress and misalignment.

C. No rigid connections between equipment, conduit, or raceways and the building structure shall be made that degrade the vibration isolated system specified herein.

D. Do not brace a system to two different structures, such as a wall and a ceiling.

E. After installation, manufacturer shall verify that seismic and wind restraints are installed and operating properly and shall submit a certificate so stating.

3.8 GROUNDING AND SURGE SUPPRESSION

A. Equipment shall be grounded as specified herein, and in accordance with the equipment supplier's recommendations.

B. A single primary specialty system ground shall be established for the specialty systems in each area as follows:
   1. In each enclosure install a copper bus bar mounted to the enclosure to act as the ground unipoint for the connection of ground conductors used within that enclosure.
   2. A single #6 AWG insulated grounding conductor from each enclosure shall be run back to the ground bus bar located in the IDF.

C. Surge Protective Device Grounding:
